GLOBE ENCYCLOPÆDIA.

Kelp (Old Eng. *gelp*, 'dust,' 'powder') is the ashy residue left in burning in the open air various species of seaweed. It was formerly very much employed as a source of soda and potash salts for manufacturing purposes, and at that time K.-burning was an important industry in the northern and western islands and coasts of Scotland. The introduction of new chemical processes, and the discovery of new sources of these alkalis, has nearly extinguished the K. industry, and it is now only prepared for the extraction of iodine and bromine as primary products. The K. of different seaweeds varies much in composition, that obtained from *Laminaria digitata* and *L. saccharina* being rich in iodine; *Himanthalia lorea* yields potash salts chiefly, while the product of *Fucus vesiculosus* and *F. nodosus* abounds in soda. These seaweeds are thrown up on the coast, or collected during low water, and after drying in the sun are ignited and slowly burned at as low a temperature as possible, to avoid the dissipation of volatile iodides. The K. is dissolved in water, and concentrated by evaporation till the carbonates, chlorides, and sulphates of sodium and potassium crystallise out; the remaining mother-liquor contains the iodine and Bromine (q. v.). Mr. E. C. C. Stanford has patented, and works near Glasgow, a process by which he avoids the use of K. proper in the preparation of seaweed products. He submits the dried seaweed to destructive distillation in closed vessels, by which, in addition to securing the whole of the iodine and alkaline salts, he obtains a residue of charcoal valuable for sanitary purposes.

Law Regarding K.—The introduction of this article in the manufacture of glass gave rise to several questions as to the right to make it. It has been found that the taking of K. is not one of the uses for which the shore is held by the crown in trust for the public, and consequently the right is not inalienable by the crown, but is transferred to the grantor, where land is granted bounded by the sea or seashore.

Kel'so (anciently *Kalchu*, or *Calchou*, supposed to be from *Chalkheugh*, the name of a precipitous bank still so called), a town of Scotland, in Roxburghshire, beautifully situated on the N. bank of the Tweed, and opposite the embouchure of the Teviot, 5 miles W.S.W. of Coldstream, on the English border, and 45 S.W. of Edinburgh by rail. It consists mainly of four streets, radiating from a spacious market-place, on which stands the town-hall, built in 1816, and many well-built houses and elegant shops. The principal feature is the ruined Tironensian Abbey (1128-1152), partly in Norman and partly in Early Pointed style, shaped like a Greek cross, with the axis surmounted by a massive square tower 91 feet high, resting on four lofty centred arches, and four piers of clustered columns. It was the first endowment of David I., and its abbots long disputed precedence with the priors of metropolitan St. Andrews, and even with the parent-house of

Tiron in France. The abbey was destroyed by the English under the Earl of Hertford in 1545. On the opposite bank stood Roxburghe Castle, a famous Border bulwark, the slight remains of which are all that is left of what was formerly one of the four chief Scottish towns. A fine bridge connects K. with its southern suburb of Maxwellheugh. Floors Castle, the splendid seat of the Duke of Roxburghe, designed by Vanburgh in 1718, lies one mile N. of K., amid policies of unwonted beauty. K. has slight industries, but is the seat of important corn and cattle markets, and has four annual fairs. Pop. (1871) 4564.

Kemble, John Philip, a great English actor, son of a theatrical manager, was born at Prescott, Lancashire, February 1, 1757, and educated at Roman Catholic schools, at Sedgeley Park and Douai, France. He made his debut at Wolverhampton in 1776, and played for seven years in country theatres. He first appeared at Drury Lane on September 30, 1783, as Hamlet. K. was manager of Drury Lane, 1790-1801, and subsequently of Covent Garden. He retired in 1817, and died at Lausanne, in Switzerland, February 26, 1823. K.'s place as an actor is second only to Garrick's. Noble in appearance, stately in elocution, grand in manner, he was the most classical of tragedians. He had a cultivated literary taste; and was the author of *Lodoiska*, an opera, *Belshazzar*, a tragedy, and several comedies and essays. See Boaden's *Life of J. P. Kemble* (1825).—**Charles K.**, brother of John and of Mrs. Siddons, was born at Brecknock in Wales, November 25, 1775, and educated at Douai. He made his debut at Drury Lane in 1794, and left the stage in 1840, on being appointed Examiner of Plays. He died November 12, 1854. K. had a handsome appearance, and excelled in genteel comedy. His daughter, Miss Fanny Kemble (born in 1811), has maintained the dramatic traditions of her house.—**John Mitchell K.**, son of Charles K., was born at London in 1807, and educated at Trinity College, Cambridge, where he graduated B.A. in 1830. Three years after, he published *The Anglo-Saxon Poem of Beowulf*: a translation of Beowulf, 'with a copious Glossary, Preface, and Philological Notes' (1837); *Codex Diplomaticus Ævi Saxonici* (6 vols. 1839-48); *The Anglo-Saxon Charters* (1843); *Dialogue of Salomon and Saturnus* (1848); *Considerations upon the Government of England* (1849); and, in the same year, *The Saxons in England*, into which he garnered the best sheaves of his sustained research. *State Papers and Correspondence* appeared (1857), and *Flora Ferales* was making its appearance when he died at Dublin, March 26, 1857. It was afterwards published in 1863, under the editorship of Latham and Frauks.

Kempen, a town in the province of Düsseldorf, Prussia, 27 miles N.W. of Düsseldorf, has manufactures of silks, cottons,

linens, and hosiery, and was the birthplace of Thomas à Kempis. Pop. (1875) 5390.—**K** or **Kempno**, a town in the province of Posen, Prussia, on the Silesian frontier, 47 miles N.E. of Breslau, with breweries, wax-refineries, and tanneries, and a brisk trade in horses and cattle. Pop. (1875) 6267.

Kem'pis, **Thomas à**, or **Thomas Hamerken** (*Malleolus*), born at Kempen near Düsseldorf, about 1380, was the son of a labouring man and a village schoolmistress. He studied grammar and plain chant with 'The Brothers of Common Life' at Deventer, and in 1399 entered as a novice among the canons-regular of Mount St. Agnes near Zwoll. Here he devoted himself to copying such works as the Bible, the Missal, and the works of St. Bernard. Fifteen years were spent on a copy of the Bible in 4 vols. folio. He also wrote some devotional works, of which the best known are the *Soliloquium Animæ*, and the *Hortulus Rosarum*, both translated into English by Flower in 1853. There are also modern Oxford editions of K.'s works in Latin. He died July 24, 1471. See Busch, *Chronicon Windeshemense*. It was long supposed that K. was the author of *De Imitatione Christi*, perhaps the most popular of all devotional works, which Cornille translated into French verse, and on which Dr. Chalmers wrote an essay prefixed to Payne's translation in 1822. This book was also attributed to John Gerson, Chancellor of Paris University (1363-1429). But it is now almost certain that a similar book of the same name was in the family library of the ancient Italian family De Advocati or Avogadro of Biella ('Defenders of the Church' from the 7th c.) long before K. was born; and the evidence of the *Codex Aronensis*, and of other old MSS. and printed editions, is to the effect that it was written by John Gerson, or John of Cavaglia, Abbot of Vercelli. See *Mémoire sur le Véritable Auteur de l'Imitation*, by the Chevalier de Gregory; Introduction to Benham's Translation (Macmillan & Co. 1874), and *Authorship of the De Imitatione Christi*, by the Rev. S. Kettlewell (Lond. 1877).

Kemp'ten, a town of Bavaria, on the Iller, 66 miles S.E. of Munich, is a walled place divided into two quarters, the upper of which (Neustadt), inhabited by Catholics, arose round the abbey founded by Hildegard, wife of Karl the Great, has the finely-domed church of St. Peter, whilst the lower or Protestant quarter (Altstadt) was formerly a free imperial city, and is now the seat of trade; its cotton-works employing 37,000 spindles and 680 looms, besides which there is a considerable trade in linen. Pop. (1875) 12,681. K. is the ancient *Campodunum*, and on its southern side is a lofty Roman tower, the medieval Hilarimont, now known as the Burghalde. The town was stormed by the Imperialists in the Thirty Years' War (1633), and again by the French in the War of the Spanish Succession (1703), and near it the French were defeated by the Austrians, September 17, 1796.

Ken, **Thomas**, an English prelate and hymnist, born at Berkhamstead, Herts, July 1637, and educated at Winchester and New College, held the livings of Brixton in the Isle of Wight (1666), and of Wordhay, Hants, the latter with a prebend of Winchester (1669). In 1675 he visited Rome, and on his return was chaplain successively to Mary of Orange at the Hague (1679), to Lord Dartmouth at Tangier (1683), and to Charles II. (1684). Raised to the bishopric of Bath and Wells, he attended Charles in his dying moments, as also Monmouth on the scaffold, was one of the 'Seven Bishops' (1688), but as a nonjuror was deprived of his see (1689), and retired to Longleat in Wiltshire, where he died March 19, 1710. K.'s *Works* (4 vols. 1721) are mostly forgotten, but his Morning and Evening Hymns live on the lips of thousands. See his Life by J. L. Anderdon (Lond. 1853).

Ken'dal, or **Kir'by Kendal** (i.e., 'Kendal in the dale of the Ken or Kent'), a town of England, in Westmoreland, on the Kent, 20 miles N. of Lancaster by rail. It has a large parish church, restored in 1868, a market-house, a grammar-school (founded in 1525), a mechanics' institute, a museum, a theatre, &c. The chief industrial products are linseys, carpets, hosiery, doeskins, tweeds, lining-stuffs, paper, leather, iron-ware, beer, fish-hooks, and combs. There is an important weekly market. Pop. (1871) 13,446. K. sends one member to parliament. It was a market-town by licence of Richard I., and by a settlement of Flemings in the reign of Richard III. became the seat of a flourishing manufacture of woollen cloths, which are still well known as 'Kendals.' The town was incorporated by Elizabeth in 1576. Interesting antiquities are the ruined castle of the

barons of K., and the Castle Law Hill, crowned by an obelisk erected in commemoration of the Revolution of 1688.

Kenilworth, a market-town of England, in Warwickshire, 4 miles N. of Warwick by rail, is chiefly famed for its castle, built in the reign of Henry I. Here Edward I. founded a second Round Table, and Edward II. was deposed. John of Gaunt enlarged it, and through his son, Henry IV., it reverted to the Crown. Conferred by Elizabeth on Dudley, Earl of Leicester, it was for seventeen days the scene of the gorgeous entertainment given to that sovereign (1575), described in Scott's *Kenilworth*. Cromwell dismantled it in the Civil War, but its ruins are still the finest in England. Pop. (1871) 3335.

Kenn'icott, **Benjamin**, **D.D.**, a biblical critic, born at Totnes, Devonshire, 4th April 1718, succeeded his father in the mastership of a charity school, till in 1744 some gentlemen subscribed to send him to Wadham College, Oxford. As an undergraduate he published *Two Dissertations on the Tree of Life and on the Oblations of Cain and Abel* (1747), which gained him a fellowship at Exeter College. He received a pension of £200 (1761); was successively appointed Radcliffe librarian (1767), prebendary of Westminster (1770), canon of Christchurch, and rector of Culham; and died at Oxford, September 18, 1783. His first great work, *The State of the Hebrew Text of the Old Testament Considered* (Oxf. 1753), gave an account of all the Hebrew MSS. known to be extant, and prepared the way for his *Vetus Testamentum Hebraicum cum variis Lectionibus* (Oxf. 1776), which was based on a collation of 600 Hebrew and 16 Samaritan codices. He was the author of nine other works, mostly on textual criticism.

Ken'sington Gardens, a beautiful wooded park, forming an extension W. of the Serpentine of Hyde Park, London. The grounds (210 acres), which are intersected by fine avenues radiating in the form of a star, are a favourite and fashionable lounge. To the W. is Kensington Palace, the birthplace of Queen Victoria. In the south-eastern angle stands the magnificent Albert Memorial.

Kent ('the land of the Cantii'), a maritime county in the S.E. of England, is bounded N. by the Thames and the Thames' estuary, S. by Sussex, W. by Surrey, and E. by the Straits of Dover. Area, 1627 sq. miles; pop. (1871) 848,294. It is a bold promontory, terminating in the Isle of Thanet (q. v.), and the coast, low and sandy in the N. and S., presents to the W. between the N. and S. Forelands, and opposite the Goodwins (q. v.), a line of high chalk cliffs. On the N. lies the Isle of Sheppey (q. v.). The surface is for the most part undulating, and is traversed from E. to W. by the North Downs (see Downs), but in the S. is low and unbroken, including the Weald and the Romney Marsh. The formation is Tertiary in the N., chalk and greensand in the E. and centre, and wealden, a fresh-water deposit, in the S. K. is watered by the Medway, the Stour, and the Darent, has a mild climate, and a singularly fertile soil, producing an unusual variety of crops. In 1876 there were 240,205 acres under corn crops; 81,712 under green crops; 61,179 under clover, sainfoin, and grasses in rotation; and 294,377 in permanent pasture, exclusive of heath or mountain-land; also 30,076 horses, 66,284 cattle, 957,707 sheep, and 59,658 swine. The chief crops were wheat, oats, barley, beans and peas, turnips, hay, potatoes, mangold, and garden stuffs; while 44,755 acres were under hops. The orchards yield cherries, plums, filberts, &c., for the London markets. The county returns six members to parliament. The county town is Maidstone; other places are Canterbury, Greenwich, Woolwich, Chatham, Sheerness, Gravesend, Margate, Ramsgate, Tunbridge Wells, Dover, Hythe, and Folkestone. K. is especially rich in historical associations; its principal ecclesiastical structures are the cathedrals of Canterbury and Rochester, Aylesford Priory, and St. Radigund's Abbey near Dover. See Hasted's *History of K.* (4 vols. 1778-99).

Ken'tigern, **St.**, or **Mungo** (i.e., 'dear friend' of St. Columba), the successor of St. Ninian as apostle of Cumbria (q. v.), according to tradition was born 518 A.D. of a virgin, St. Thienew, daughter of Llew or Lothus, a semi-pagan prince of Lodoneis or Lothian. Educated by St. Servanus at the monastery of Culross, he was ordained bishop of the newly-founded see of Glasgow at the age of twenty-five, and laboured ten years for the conversion of the heathen, the recovery of

apostates, and the confirmation of the faithful, till in 553 Morken of Strathclyd expelled him from his kingdom, to seek a refuge in Wales, where he founded Llanelwy or St. Asaph. He was recalled in 573 by Rhydderch Hael (Roderick the Liberal), was for eight years bishop at Hoddellm, returned to Glasgow in 581, and paid seven visits to Rome during the papacy of Gregory I. (590-604). The date of his meeting with Columba at the Molendinar is uncertain, but must be placed before 597, that being the year of the latter's death. K. himself died in 603, and over his grave rose the cathedral of Glasgow, the arms of which city perpetuate three renowned miracles of this its patron saint. We have two lives of K., written the one by a foreign ecclesiastic during the episcopate of Herbert of Glasgow (died 1164), the second and longer by Joceline of Furness some twenty-five years later, both of which were edited by Bishop Forbes of Brechin in vol. v. of *The Historians of Scotland* (Edinb. 1874). Joceline's book is a string of conventional miracles, varied by contests with the secular power, in which the saint always comes off victorious. It is valuable, however, as the only record, with any show of authenticity, of the obscure history of Cumbria, and as forming a link between the legendary and historic periods—Arthur and Laloccen (Merlin) appearing in its pages side by side with characters whose history is beyond challenge.

Kentish Fire, rounds of applause, a term which owes its origin to the No-Popery meetings held in Kent, to protest against the Roman Catholic Relief Bill (1828-29).

Kentish Rag, a tough calcareous durable building stone, developed in the Hythe Beds, a local formation belonging to the Lower Greensand of the Cretaceous Period.

Kent's Cavern, a celebrated cave in the limestone rock near Torquay, Devonshire. It consists of two parallel series of galleries, the shorter of which is over 250 feet in length. Its floor deposits have been very fully described by a committee appointed by the British Association in 1864. Flint and bone implements, such as chisels, spoons, spear-heads, rings, potsherds, &c., have been obtained, evidently contemporaneous with the remains of living or recently extinct animals. The bones of the following mammals have been discovered in the red cave-earth which forms the fifth deposit in descending order: cave-lion, wild-cat, cave-hyæna, wolf, fox, badger, cave-bear, grizzly bear, brown bear, mammoth, rhinoceros, horse, bison, Irish elk, red-deer, reindeer, hare, water-vole, bank-vole, and beaver.

Kentucky, a central state of American Union, in the Mississippi valley, is bounded N. by Ohio, Illinois, and Indiana; S. by Tennessee; E. by Virginia and W. Virginia; and W. by Missouri. Area, 37,680 sq. miles; pop. (1870) 1,321,011. The Mississippi forms the western and the Ohio the northern boundary. The surface is table-land in the W., hilly in the S.E., where the Alleghenies have an elevation of 3000 feet, and in the centre is occupied by the valleys of the K., Licking, Green, Cumberland, Tennessee, and other rivers. The formation is Tertiary in the W., and Devonian and Silurian in the S. The coalfield of Illinois is continued into K., and has an aggregate area of 14,000 sq. miles in the latter State. Among other minerals extensively distributed are iron, lead, silver, salt, lime, and sandstones. The principal geological attractions in K. are the salt spring of Big Bone Lick, 60 acres in extent, with its thousands of huge fossil skeletons, and the famous Mammoth Cave, which is only one of thousands that are not so widely known. Saltpetre, gypsum, and syenite abound in the caves. The climate is generally delightful, and the soil is extremely fertile, yielding (1873) rich crops of Indian-corn, wheat, rye, oats, barley, cotton (1080 bales), flax (237,268 lbs.), hemp (7777 tons), tobacco (105,305,869 lbs.), maple, sugar, potatoes, &c. Other large products are silk-cocoons, wool, cheese, and butter. In January 1876 the number of cows in K. was 244,700; of other cattle, 389,600; of sheep, 683,600. The chief manufactures are iron and iron goods, tobacco and cigars, machinery, leather, and woollens, and there is extensive flour and saw milling, mining, brewing, and distilling. In 1875 there were 1519 miles of railway in operation. Frankfort is the capital. K. is an Indian name, meaning 'the dark and bloody ground.' The country was first settled by Boone (q. v.) in 1769, was organised as a territory in 1790, and admitted as a state two years later. It was frequently the scene of active hostilities, and its inhabitants were almost equally divided in sentiment during the Civil War.

Ke'okuk, a city of Iowa, U.S., on the W. bank of the Mississippi, near its confluence with the Des Moines, 90 miles S.E. of Iowa, with which it is connected by rail. It is at the foot of the lower rapids, and at the head of navigation for the larger steamers. From its position in the extreme S.E. corner of the state it is called the 'Gate City.' It has twenty churches, a medical college, a court house, public library, &c. The chief occupation is pork-packing, and there is a large wholesale trade in dry goods, groceries, &c. A splendid iron rail and highway bridge 2300 feet long spans the Mississippi. The government is constructing a ship canal 9 miles long skirting the lower rapids. Pop. in 1850, 2478, in 1860, 8136, and in 1870, 12,766.

Kepler, Johann, the celebrated astronomer, was born at Magstatt, near Weil in Württemberg, December 27, 1571. He studied at Tübingen with a view to entering the Church, but under the tuition of Mästlin, Professor of Mathematics there, and a disciple of Copernicus, he became a devoted student of mathematical and astronomical science, and resolved to abandon theology. In 1594 he became Professor of Mathematics at Grätz in Styria. His first publication was a calendar for 1595, and in 1596 appeared his *Mysterium Cosmographicum*, which abounds in fanciful analogies between the different parts of the universe. In 1599 he quitted Grätz on account of religious persecution, and on the invitation of Tycho Brahe went to Prag to aid that astronomer in his labours. On Tycho's death in 1601 K. was nominated Astronomer to the Emperor Rudolph, and in 1614 settled at Linz. After the death of his patron he was constantly in pecuniary difficulties, notwithstanding his many efforts to obtain a liquidation of his claims upon the imperial treasury. It was in 1630, on one of these fruitless endeavours, that he was seized with the fever which ended his life on November 13, in Ratisbon. K.'s great work is his *Astronomia Nova* (1609), containing the remarkable book *De Motibus Stellarum Martis*, which prepared the way for Newton's later discoveries. The reduction by him of Tycho's observation of Mars, begun with a view to the publication of the Rudolphine Tables, soon showed the impossibility of representing the revolution of Mars by uniform circular motion, and led to the discovery of his first law, that planets move in ellipses, of which the sun forms a focus. His second law, that the radius vector of a planet sweeps over equal areas in equal times, was a happy conjecture based upon the observed fact that at the apsides the times of describing equal small arcs were nearly proportional to the distances of the planet from the sun. The third law, that the square of the periodic time is proportional to the cube of the mean distance from the sun, was discovered only after numerous efforts to establish other numerical relations which his lively fancy had suggested. Newton showed that the mathematical consequence of the second law was that the planets moved under the action of a force directed to a fixed point, and that the first law led as infallibly to the conclusion that this force varied inversely as the square of the distance from the centre. See GRAVITATION. His other chief works are *Paralipomena ad Vitellionem* (1604); *Epitome Astronomiæ Copernicæ* (2 vols. 1618-22); *De Cometis* (1619); and *Tabulæ Rudolphinæ* (1627), which are famous as the first tables calculated with elliptic elements. His manuscripts were purchased for the library of St. Petersburg, but have never been published. One volume of his correspondence entitled *Epistolæ ad F. Keplerum* was edited by Haensch in 1718. The best edition of K.'s works is that by Frisch (8 vols. Frankf. 1858-71). See BREITSCHWERT, K.'s *Leben und Wirken* (Stuttg. 1831); Brewster, *Lives of Galileo, Tycho de Brahe, and Kepler* (Lond. 1841). Later German biographies are those of Reitlinger (1868) and Reuschle (1871).

Kerguelen Land, or **Desolation Island**, is in the S. Indian Ocean, and was discovered by the French navigator Yves Joseph de Kerguelen Tremarec in 1772. Christmas Harbour, at the N. extremity, is in 48° 11' S. lat., 69° 3' E. long. The island is 100 miles long and 45 miles broad on an average, but is deeply indented by inlets. Its surface is rugged, and lakes are numerous. Fossil wood is plentiful, and coal is also said to exist. See *Notes of a Voyage to K. L. to observe the Transit of Venus, December 1874*, by the Rev. S. J. Perry (Lond. 1876).

Kerguelen's Island Cabbage is a perennial cruciferous plant first brought into notice by Captain Cook, and since his day has proved a very acceptable addition to the rations of

many a ship's crew, as a wholesome and agreeable vegetable. From botanists it has received the name of *Pringia antiscorbutica*, being a powerful antiscorbutic. The whole plant is rich in a pungent volatile oil, giving a sort of mustard-and-cress flavour to the leaves, and a taste somewhat like horseradish to the long roots. The leaves in continuous growth are crowded cabbage-like into heads, beneath which the annual flower-stalks arise. These heads are cooked, and eaten in the same way as ordinary cabbage. Formerly supposed to be confined to Keiguelen Island where it ascends the mountain to 1400 feet, but luxuriates most on the sea coast; it is now, however, known from the *Challenger* expedition to grow in Tristan d'Acunha, and one or two other islands.

Kerman', or **Kirman** (anc. *Carmania*), a province in the S.E. of Persia, lies between the Great Salt Desert and the Persian Gulf, and is bounded W. by Fars, and E. by Seistan and Beluchistan. Area about 59,000 sq. miles; pop. estimated at 600,000. It is occupied in the N. by the Great Salt Desert, and in the centre is traversed by mountains between which and the sea lies the unhealthy hot country or Garmsar, a belt of saline sand, from 10 to 30 leagues broad, producing only inferior dates. There is no river in K., and but for the few mountain springs and karezes or aqueducts the natives could not live.—The town of **K.**, capital of the province, lies in the central mountain region, at an elevation of 5000 feet. It is girt with a high mud wall and a ditch 20 yards wide, has a governor's palace, a large bazaar, with elegant domes of a blue stone, and some ten caravansaries within the walls, and many inferior ones outside. Its shawls (which rival in delicacy those of Cashmere), carpets, matchlocks, and namads or felts are famed all over Asia. The trade consists in the exchange of the manufactures for dyes, drugs, skins, metal wares, firearms, tea, European cloths, &c. Pop. 30,000. K. was formerly the greatest trading city of Persia, has frequently been plundered and destroyed, and its trade has suffered much from the rise of Bushire (q. v.).

Kermanshah', the chief town of a district of the same name in Persia, on the Kerkhah, 250 miles S.W. of Teheran. It is surrounded by ruined walls, and has a palace and beautiful gardens, but is in great part gone to decay. It is of strategic importance, is governed by a prince of the blood, has an arsenal, and a garrison of 5000 regular troops. Its trade and manufactures are now things of the past. Pop. 12,000.

Kermes, or **Alkermes**, the name given to the dried bodies of female insects of various species of *coccus*, which like the cochineal insect yield a brilliant red dye-stuff. The K. dye has been known and used from the most remote antiquity. It is referred to in Scripture as well as by many classical writers, but the introduction of cochineal, after the discovery of America, has very largely superseded it; and it is now only used locally in the East, and in the countries in which the insects occur. Four species are used: *Coccus ilicis* or common K.; *C. polonicus*, or Polish grains; *C. fragaria* and *C. waurisi*; and these find their principal use among the Moors, Turks, Persians, &c.

Kermes Mineral, a ters-phide of antimony with a small proportion of antimony trioxide, and sulphide of potassium or sodium. It is much used in Continental medicine as a diaphoretic and emetic, occupying there the position held by James' Powder in British pharmacy.

Kerner, Andreas Justinus, a German poet, born at Ludwigsburg in Würtemberg, September 13, 1786, studied medicine at Tübingen, and after some years' travel settled down to a practice at Weinsberg. He died February 21, 1862. As a poet, K. belonged to the 'Swabian School'; his poems are marked at times by melancholy pathos, and again by fresh and vigorous humour. The best-known are *Reisschatten* (1811), *Gedichte* (1826), and *Letzter Blüthenstrauss* (1852). His medical works—notably *Die Scherin von Prevorst* (1829)—are mainly devoted to animal magnetism.

Kerowli (*Karauli*), the chief town of the native state of the same name in Rajputana, India, 80 miles S.W. of Agra. It was founded in 1348, and is surrounded by a sandstone wall. It contains a beautiful palace, and a temple of Krishna, which attracts many pilgrims.—The state of K., which lies along the left bank of the Chumbul River, has an area of about 1870 sq. miles; pop. 124,000; army, 3625 men; revenue, £50,000. The

country is wild and hilly, and contains many old forts. The late Rajah was conspicuously loyal during the Mutiny of 1857.

Kerry (Irish Gael. *Ciarraidhe*, the country belonging to 'the race of Ciar,' a son of the legendary King Fergus), a county in the S.W. of Munster, Ireland, is bounded N. by the estuary of the Shannon; S. by Cork and the Kenmare River; W. by the Atlantic; and E. by Cork and Limerick. Area, 1,185,918 statute acres; pop. (1870) 196,586. The coast line, 220 miles long, is deeply indented by Tralee and Dingle Bays, and is fringed with the Skelligs, the Blaskets, Valentia, and other islets. K. is for the most part mountainous, containing in the Macgillicuddy's Reeks the highest peaks in Ireland (Carn Tual, 3414 feet). The mountain ranges are of red or grey sandstone, overlaid in the lower parts by stratified limestone. Flags and slates are extensively exported to London from Valentia. The hydrography comprises the rivers Laune, Maine, and Cashan, and the famous Lakes of Killarney (q. v.). In 1871 the surface included 152,689 acres of tilled land, 638,149 of pasture, 15,101 of plantation, 31,882 of water, and 348,097 of mountain, bog, and waste. The climate is mild; the chief crops are barley, potatoes, turnips, oats, and flax. Other important products are fish, cheese, butter, and cider. The county sends two members to Parliament. Tralee is the capital, and other towns are Killarney, Listowel, and Dingle. K. is traversed by the Great South-Western Railway to Tralee.

Kersey, a coarse woollen fabric, usually ribbed, principally manufactured in the N. of England, though originally made at Jersey, of which name K. is probably a corruption.

Kertch, a seaport of the Crimea, on the Strait of K., forms with Yenikale, 5 miles higher up the strait, one township, having a total pop. (1870) of 22,449. K., which is built in the form of an amphitheatre at the foot of Mount Mithridates, was sacked by the Allies in 1855, and the importance of its port was much curtailed by the closing of the Black Sea to the Russians (1856), but is now reviving. In 1875 1983 vessels of 766,623 tons entered, and the value of imports (tobacco, tea, ironware, &c.) was £57,661; of exports (grain, butter, horses, cattle, &c.) £135,663. K. is the ancient *Panticapæum*, a Milesian colony, and in its museum is a splendid collection of antiquities discovered in the neighbourhood. It was the capital of the kings of Bosphorus, was annexed to the Roman empire (63 B.C.), and fell successively under the Huns (375 A.D.), Genoese (1280), Turks (1475), and Russians (1774).

Kestrel (*Tinnunculus alaudarius*), a familiar species of British hawk, distinguished by the peculiar attitude in which it hovers motionless in mid-air, with wings and tail outspread, on the watch for prey. From this peculiarity it has received the name of 'windhover.' The colour is an ashen grey above, marked with streaks of deeper grey: brown tints prevailing in the female. The average length is 14 inches; the females being larger than the males. The nest is usually placed on rocky heights and in ruined buildings. The eggs number three or four, and are of a reddish-brown colour. The K. preys largely upon field-mice, moles, and other quadrupeds.

Kestrel.

Keswick, an ancient market-town of England, in the county of Cumberland, on the Greta, and near the head of Derwentwater, may be considered the capital of the Lake district, and is a central point for tourists. Brewing, tanning, and the manufacture of woollens, hardware, and lead pencils are the chief industries. Southey resided here for forty years at Greta Hall. Pop. (1871) 2777.

Keszthely, a market-town of Hungary, in the comitat of Szalad, 26 miles N.E. of Kanizsa, and at the western end of the Balaton Lake. In the castle (converted into a Præmonstratensian monastery) is a splendid library, and a large agricultural training college is directed by the fathers of the order. Pop. (1869) 4888.

• **Ketch'up**, or **Cat'sup**, a sauce much used with meat and fish, the name of which is said to be derived from the Japanese *Kitchap*. Common or mushroom K. is prepared by mixing and stirring together fresh mushrooms and common salt for two or three days, after which the juice is lightly squeezed out. To every gallon of juice obtained half an ounce of cloves and mustard seed are added, and an ounce each of allspice, ginger, and black pepper. The mixture is gradually raised to the boiling point and left to macerate for fourteen days, when the liquid is strained off and is ready to bottle for use. Many other varieties of K. are prepared, among which may be mentioned *walnut K.*, *tomato K.*, *oyster K.*, and *wine K.*

Kett'ering, a market-town of England, in Northamptonshire, 13 miles N.E. of Northampton, has manufactures of boots, staves, farm implements, silk, &c. At Geddington, 3 miles N.E. of K., is one of the ten Eleanor Crosses. Pop. (1871) 7184.

Kettle-Drum, the chief musical instrument of percussion. A pair of kettle-drums are commonly used in the orchestra, tuned to the tonic and dominant of the key.

Keu'per, the highest member of the Triassic, or New Red Sandstone series. In Britain it rests upon the Bunter Sandstones (q. v.), but on the Continent it is separated from these by the *Murchellkalk* (q. v.). Its base consists of dolomitic conglomerate, which passes into thinly laminated sandstones and marls, and the whole is surmounted by the Red Marl Series, which frequently contains beds of gypsum and rock salt. The fossil species are few in number. *Encrinurus liliiformis* and *Terebratulula vulgaris* are characteristic crinoids. *Belemnites*, ammonites, and crustacea are represented; fishes and reptiles (*Mastodonsaurus*, *Nothosaurus*, crocodiles, &c.) occur, and the *Microlestes antiquus* may be cited as a characteristic Continental mammal.

Kew (a corruption of *Kayhoo*, 'the quay on the spit of land'), a parish in Surrey, on the Thames, opposite Brentford, 7 miles W. of Charing Cross. Pop. (in 1871), 1033. The Royal Botanic Gardens, 300 acres in extent, form one of the attractions of London, and contain the finest collection of exotic plants in the world. There are many conservatories, a palm house, 362 feet by 100; a winter garden, 212 feet by 137; a museum, and an observatory.

Key, Delivery of. In a sale of merchandise, deposited in a cellar or ware-room, delivery of the key of the place in which the goods are deposited is held to be equivalent to actual delivery of the articles to the purchaser. Possession by the seller of a master-key does not alter the case. In the transference of goods in a bonded warehouse, certain entries in the custom-house books are directed to be made by special statute.

Key (mus.) (1) A lever or other mechanical contrivance in the pianoforte, organ, flute, &c., by which the performer can operate on distant parts of the instrument. (2) The *wrest*, by which instruments with metal pegs are tuned. (3) The sign in notation usually called by the equivalent name *clef*. (4) That relation of six principal tones to a seventh (called the key-note), which is the foundation of modern music. On the pianoforte, seven white notes (or digitals) upwards from C (inclusive) constitute a pattern; other keys are to consist of similar intervals. If the minor mode be regarded as a distinct K., seven notes upwards from A, all white except G (which is altered to G \sharp), will give a pattern. But there is no separate signature for the minor K., either in the above form or in that in which two notes are sharpened in the ascending, and restored in the descending scale.

Key, or Ké Islands (pron. K), a small group in the Banda Sea, between 5° and 6° S. lat., and in about 133° E. long. They consist chiefly of two islands, Great and Little K., the former of which measures 50 miles by 10. The islands are very mountainous and densely timbered. They are inhabited by Papuans, and by a mixed race who profess Mahomedanism. The inhabitants trade in trepan, wild nutmegs, and tortoise-shell, but especially excel in boatbuilding. They annually turn out some hundreds of boats, some of 30 tons each, of which Mr. A. R. Wallace says they 'can hardly be surpassed for beauty of form and goodness of workmanship.' See *The Malay Archipelago* (vol. ii. p. 107).

Keys. In executing a Caption (q. v.) in Scotland, a Messenger-at-Arms (q. v.) may break open the doors. This in the writ is called using the Queen's K. See ENGLISH LAW, DWELLING-HOUSE, CAPIAS.

Keys, in Heraldry, as the emblem of St. Peter, are often borne—indorsed, interlaced, or in saltire—in the arms of sees or religious bodies dedicated to that saint. Borne singly, the key is commonly in pale, with the wards in chief.

Keys, Power of the, is the authority claimed by the Christian priesthood to administer the ordinances of the Church, and communicate or withhold its privileges; and is so called from the words of Christ to Peter in Matt. xvi. 19. It is maintained that the power here promised was afterwards conferred on St. Peter and the other apostles by Christ (John xx. 22, 23). In the Roman Catholic Church the P. of the K. is applied to the power of granting Absolution (q. v.) in the sacrament of penance; the claim to do which has a better foundation on Matt. xvi. 19 than Protestants are willing to allow. Archbishop Tillotson got rid of the difficulty by supposing that the power of knowing men's hearts must have been one of the miraculous gifts of the early Church. The phrase also means the supreme authority of the Church, which is vested in the Pope. St. Peter's keys represent his power in heaven, earth, and hell. In the Papal arms the golden key represents the power of absolution, the silver one that of excommunication.

Key West (a corruption of the Span. *Cayo Hueso*, 'bone reef'), a town of Florida, U.S., on an island of the same name, has a good harbour, seven churches, and three cigar-factories, which employ 2500 Cuban refugees. Fishing and sponge-gathering are the other principal industries. The pop., which has been much increased of late years by immigrants from Cuba and the Bahamas, is estimated at 9000.—The island, 7 miles long by 1 to 2 wide, is of coral formation, and nowhere attains an elevation of 20 feet above sea-level.

Khamgaon, a town in the district of Akola, Berars, India, 370 miles E. of Bombay, with which it is connected by a branch railway, 8 miles long, opened in 1870, joining the Great Indian Peninsula system: pop. (1867) 9432. K. is officially described as 'the largest cotton mart in all India.' It dispatches annually about 100,000 bales, collected from the surrounding country. In 1870, there were nine European firms, two factories for cotton cleaning, three steam-presses, and four half presses worked by hand. Each pressed bale contains about 3½ cwt. The native traders are chiefly Marwaris from Rajputana, and representatives of Bombay firms. Besides cotton, there is a considerable trade in English piece-goods, salt, opium, and ghee; wheat is imported. The town only dates from 1820.

Khan (properly *khaghan*, and given as *cham* by our older writers), a Mongolian title of supreme authority, assumed by Genghiz (q. v.), and adopted by his successors; also, a Persian word for a Caravanserai (q. v.), introduced into English through the crusaders in 'balcony' and 'barbican.' The cant *ken*, 'a house,' brought probably by the Gypsies, has passed into several provincial dialects, and is employed by Giles Fletcher in his *Christ's Victorie on Earth*, st. 52, l. 2—

'To crowne the bouzing *kan* from day to night.'

Khandesh, a district of Bombay, British India, occupying the valley of the Taptee river, but in other parts mountainous; area, 10,162 sq. miles; pop. (1872) 1,028,642. This is one of the great cotton growing tracts, and there is a Government model farm, which is not a financial success. The yield of cotton per acre is returned at only 23 lbs. The chief town is Dhulia.

Kha'nia. See CANEA.

Khargeh. See EL-KHARGEH.

Kharkov (formerly the *Slobodish Ukraine*, i.e., 'the borderland'), a government in the S. of Russia, lies to the N. of Jekaterinoslav, and has an area of 20,737 sq. miles, and a pop. (1870) of 1,681,486. It is watered by the Denez, a tributary of the Don, and by its affluents, one-fourth of the surface yielding grain, while 13 per cent. is covered with dense forest. Besides grain the chief crops are tobacco, potatoes, flax, and hemp, and there is great abundance and variety of fruits. The principal

industries are horse and sheep rearing, silk culture, corn, and brandy distilling. Two lines of railway connect it with the northern markets and the Black Sea.—**K.**, the capital of the above Russian government, at the confluence of the Dones, the Lopan, and the Kharkova, 415 miles S. of Moscow by rail. It is one of the finest cities in the E. of Russia, and has seventeen churches, a cathedral with a clock-tower 312 feet high, a university (since 1804), with a library of 50,000 vols., botanical gardens, &c., a government house, two gymnasia, numerous mansions of nobles and wealthy traders, a beautiful public garden, and a new theatre. The great fourteen days' winter fair of K. begins with a market at which are assembled some 10,000 horses, and attracts merchants from all parts of the empire, and as many as 80,000 sledges. The value of the furs, silver wares, tea, coffee, sugar, and other wares brought to the fair is 40 million roubles. Pop. 81,028.

Khartum ('the promontory'), a town of Upper Egypt, at the confluence of the White and Blue Niles, in a sterile desert zone, and 150 miles N. of the grassy region. It is the residence of a governor-general, and headquarters of the Upper Nile ivory traders. In 1871 were erected a large number of brick buildings, and a spacious quay on the banks of the Blue Nile. There are extensive gardens and rows of old date-palms, but the health of the town suffers from part of it lying below the high-water level, and being occasionally covered with stagnant pools. Besides the transit trade with the interior, the chief industry is the building of 'neggers,' the peculiar boats of the Upper Nile. Pop. 30,000.

Khasi, or Cossya Hills, a tract in Assam, on the N.E. frontier of India, lying between the Garo and Naga hills. Area, with the Jyntia hills, 6157 sq. miles; pop. (1872) 141,838. It consists of twenty-five small confederated states in qualified dependence on the British Government. The chiefs are elected for life by the votes of their tribesmen. Their total gross revenue is estimated at £6475. The food crop is rice; the exports are elephants, cotton, timber, caoutchouc, and lime.

Khatmandu, the capital of the state of Nepal, India, on the W. bank of the Baghmatty River, amid the Himalayas, about 60 miles N. of the British frontier; estimated pop. 50,000. It contains a large number of temples of brick and wood, with gilded pinnacles. The British Resident lives here with an escort of 100 native infantry, and it is the only place in Nepal which is known to Europeans. K. is the centre of a considerable trade, which converges here from India and Thibet.—The valley of **K.**, which for fertility and scenery has been compared with the valley of Ca-hmere, contains three successive capitals of Nepal. Its area is 300 sq. miles; its pop. about 400,000. See *History of Nepal*, ed. by Dr. W. Wright (Cambridge, 1877).

Kha ya is the name of a lofty Senegambian tree (*K. Senegalensis*) with a wood like mahogany, to which family it belongs. The bark is used as a febrifuge.

Khedive, the official title since 1867 of the Viceroy of Egypt. The first K. was Ismail, son of Ibrahim Pasha.

Kher'son, a government in Russia, on the Black Sea, between Taurida and Bessarabia. Area, 27,497 sq. miles; pop. (1870) 1,497,995. It is hilly and well wooded in the N. and W., but in the E. it forms part of the saline steppe. About half of the surface is uncultivable, while one-third is pasture, and one-fifth is cultivated. Bounded on the E. and W. by the Dniester and Dnieper respectively, it is watered by the Bug, Ingul, and Ingulez. The climate is one of extremes. The chief crops besides grain are flax, hemp, and tobacco.—**K.**, capital of the government, on the right bank of the Dnieper, above its estuary of Iliman, 115 miles E.N.E. of Odessa. In 1778 it was founded by Potemkin, and was only prevented from becoming the chief town of S. Russia by the shallowness of the Dnieper's mouth. It is strongly fortified and has ten churches, a navigation school, two wharfs, some shipbuilding, and an export trade of timber, grain, woollen, tallow, hemp, flax, &c. Important industries are wool-washing and the raising of melons and water-melons. Pop. (1870) 46,320. The Dnieper is here frozen from about 24th November to 12th February.

Khiva (the anc. *Chorasnia*), a khanate of Turkestan, which formerly extended from the Sea of Aral on the N. to Persia on the S., and had an area, mostly desert, variously estimated at

from 54,000 to 195,000 sq. miles, and a pop., stated with equal uncertainty, at from 480,000 to 2,600,000. By a treaty concluded after the Russian occupation of 1873, the Khivan territory E. of the Amu-Daria (anc. *Oxus*) was ceded to Russia, and the boundaries of the khanate were fixed as the Amu-Daria on the E. from Kukertli to the Sea of Aral and the 'ancient bed of the Oxus' S.W. to the Caspian. The khan exercises no practical sovereignty beyond the oasis of K., which has an area not exceeding 30,000 sq. miles, and a pop. of 280,000. The Amu flowing through the midst of the oasis irrigates large tracts by means of many artificial canals. Steady, intelligent culture has converted much of the oasis into a smiling garden, and among the products are abundance of wheat, rice, cotton, apples, peaches, pines, pomegranates, and melons. Frost prevails from October to April, but the midsummer heat is excessive; in December the Amu and Aral are covered with ice. Domestic animals are plentiful, including the horse, camel, and ass. The inhabitants of K. are chiefly Tajiks, Aryans, of affinity with the Persians, and of settled industrious habits; but the Uzbeks, a Turkish tribe, are the ruling people. The desert nomads are Turkomans, or Yomats, Kirghis and Karapalkacs. The Tajiks have fine, intellectual features, full brown beards, and a lighter complexion than the Persians. Most of them can read and write, and they are very clever as merchants, artisans, constructors of irrigation works, and agriculturists. The chief manufactures are woollens, silks, shawls, brass utensils, and earthenware. A large trade is carried on by caravans, chiefly with Orenburg and Astrakhan, and with Bokhara by exchanging European for Chinese and other Oriental merchandise. The Khivans are mostly Sunnite Mohammedans; they show an elegant taste in poetry and music, and have a considerable literature of songs and romantic tales.

The ancient *Chorasnia* was subject successively to Bactria, Parthia, and Persia, and became a monarchy with the name of Kharesm or Khorasm, under a Seljuk dynasty in 1092. The Kharesmians conquered the whole of Persia and Afghanistan, but were in turn subjected by Genghis Khan in 1221, by Timūr in 1370, and by the Uzbeks in 1511. Two Russian invasions (of dates 1717 and 1854), were wrecked in the deserts. In 1873, however, the ill-treatment of Russian captives afforded a pretext for a campaign which was skillfully conducted by General Kauffmann (q. v.), and which ended in the taking of the capital on the 10th of June. The Khan Seid Mohammed tendered his submission, and a treaty subsequently concluded abolished the slave-trade, fixed the frontier, deprived the Khan of the power of making treaties with foreign powers, imposed an indemnity of £310,000, and secured that the Turkoman tribes should be punished for continued hostilities against Russia. In accordance with promises made to England, the independence of K. was recognised. In 1875 the Russians again occupied the capital, by request of the native ruler, who had been unable to maintain order. The Russian domains in Turkestan, including the ceded portion of K., have been formally converted into the 'Trans-Caspian Territory,' with the capital at Krasnovodsk, a newly established port of the Caspian. The capital of the khanate is also named K.; other towns are Görtén, Gazavat, and Kiat Urgendj. K. is an irregular walled town, with a citadel, a rude palace, bazaars, a college, and several mosques. Most of the buildings are mud-built. Pop. about 9000. See Vambery's *Central Asia, &c.* (1874); Spalding's *K. and Turkestan* (1874); MacGahan's *Campaigning on the Oxus and the Fall of K.* (1874); Hellwald's *Russians in Central Asia* (Eng. transl. Lond. 1874); and Schuyter's *Turkistan* (Lond. 1876); and Captain F. Burnaby's *Ride to K.* (Lond. 1876).

Khoi, a town in Azerbaijan, Persia, 77 miles N.W. of Tabrez, stands in a fertile valley. The houses are of mud, but the bazaars of brick are, next to those of Shiraz, the finest in Persia. Cloths, linen, caps, socks, and copperware are the chief articles of trade. Near K. 30,000 Persians, under Shah Ismail, defeated 300,000 Turks, under Selim I. (1514), and the town was held by a Russian garrison (1827-28). Pop. 25,000-35,000.

Khojend, a Russian town in Central Asia, on the Sfr-Daria, 80 miles S. of Tashkend. It is girt by a well-armed double wall on all except the river side, and is considered the key to the Turkestan valley. Its transit trade is extensive. Pop. 20,000. K. formerly belonged to Khokan, but after a seven days' siege it surrendered at discretion to the Russians, June 6, 1866.

Khokan', a khanate of Central Asia, lying between the Russian government and Sir-Daria in the N., and Kashgaria in the S. It is about 160 miles long and 60 wide, is separated by the Thian-Shan mountains in the S. from the basin of the Amu-Daria, and lies chiefly in the valley of the Sir-Daria, with an average elevation of 1500 feet above the sea. The climate is one of extremes, and the soil is extremely fertile and well irrigated, yielding abundance of rice, wheat, cotton, barley, hemp, flax, tobacco, madder, &c. K. is famed for the richness and variety of its fruits; all the towns and villages are embowered in orchards and mulberry groves. In 1872 over 200,000 lbs. of silk were exported to Russia. Other products are turquoise, iron, coal, petroleum, and naphtha. The inhabitants, mostly Uzbeks and Tajiks, are extensively engaged in sheep-shearing. —**K.**, the capital, is situated on the Sir-Daria, has 360 mosques, is guarded by a mud-wall and a ditch, and has a pop. of 5000. Other towns are Namangan and Andijan. The khanate of K. was formerly of far greater size, but the western part, with the cities of Tashkend and Khojend, was annexed by Russia in 1865-66. According to a Russian report, it had in 1872 an area of 28,270 sq. miles, and a pop. of 800,000. After the war of 1866, Russia replaced the Khan Khudayer, who was thenceforth little more than a vassal of the Czar. A rebellion in 1874 against the khan, stirred up by Yakub Khan, Amir of Kashgar, led to another Russian invasion, under General Kaufmann, and the annexation of most of K. to the N. of the Sir-Daria in 1875.

Khorasan', the north-eastern frontier province of Persia, lies between the Khivan Desert on the N.E., and the Great Salt Desert on the S.W., and is bounded E. by Afghanistan, W. by the province of Mazanderan. Area, 150,000 sq. miles. The province is mountainous, consisting of narrow valleys, shut in by bare rocky hills, of which there are three distinct systems — the Elburz range in the N., a spur of Mount Elvand in the W., and in the S. a continuation of the Hindu Kush. The only rivers of importance are the Atrak, Tejand, and Pulabresham. The climate is extremely varied, as also is the soil, the northern districts being the most fertile, and yielding abundance of corn, gram, and rice. Among the manufactures are arms, stoneware, woollen and cloth goods, carpets, and velvets. Meshid (the capital), Astrabad, Yezd, and Nishapur, are the chief towns. The pop., of which we have no trustworthy estimate, is a mixed one, comprising Persians in the centre, Kurds and Turkomans in the N., and Arabs in the S.

Khorsabad'. See NINEVEH.

Khos'ru (Gr. *Chosroës*) I., surnamed **Nushirvan** ('noble-mind'), one of the greatest rulers of the Sassanid dynasty in Persia, succeeded his father Kobad in 531 A.D. during a war with the Greeks, and two years after wrested from Justinian an annual tribute of 440,000 pieces of gold. In 540 began a second war, of varying issues, which lasted till 562, when Justinian agreed to pay a tribute of 40,000 pieces of gold, retaining Colchis and Lazica. A third war dates from 571, but before its close K. died, March 579. Persian writers make K. a model of wisdom and justice, and his last lessons to his son and successor Hormuz IV. have been celebrated by Saadi and several other poets. —**K. II., Purviz** ('Generous'), succeeded his father Hormuz IV. in 591, and was the most powerful of all the Persian rulers. In a career of victory (603-616), he spread his empire from Chalcedon to Ethiopia and Yemen; but the successes of Heraclius (q. v.) as quickly turned the scale. K. lost all his conquests, and his own son Siroses imprisoned and murdered him, 28th February 628. See Sir J. Malcolm's *History of Persia* (Lond. 1815, 2d ed. 1828), Richter's *Historiko-Kritischer Versuch über die Arsaciden und Sassaniden-Dynastie* (Leips. 1804).

Khundwa' (Khandwa), the chief town of the district of Nimar, Central Provinces, British India, 352 miles N.E. from Bombay; pop. (1872) 14,119. It is a station on the Great Indian Railway, and the terminus of the Indore State Line, which is now (1877) being continued through Rajputana; as such, it is the centre of a growing transit trade. K. is a place of great antiquity, the town being built on a mound which is full of ruins of old Jain buildings. It was burned by Tantia Topee during the Mutiny in 1858.

Khuzistan', a province of Persia, in the extreme S.E. corner, is bounded N. and E. by Luristan and the Bakhtiari mountains,

S. by Fars and the Persian Gulf, and W. by the Shat-el-Arab and the pashalic of Bagdad. Area, 25,677 sq. miles. In the S. is a chain of limestone hills, ranging in height from 2000 to 5000 feet, and the whole province is well watered by numerous important streams—the Karun, Dizful, Kerkhah, &c. Next to cattle-rearing agriculture is the chief occupation, rice, tobacco, corn, and cotton being extensively grown. Among the articles of trade are tents, woollens, naphtha, and cottons, and dyeing is an important industry. Shuster (the capital) and Dizful are the principal towns. The pop. of K. is composed mainly of nomad tribes, those in the S. being of Arabian descent.

Khyber (*Khaibar*) **Pass**, the defile which leads from the N.W. frontier of India into Afghanistan, about 33 miles in length, and in one place not more than 10 feet wide. It is bordered by precipitous hills, occupied by wild tribes of the Afreedee stock; the rock is mostly slate, and a mountain torrent runs down the pass. It commences at Kadam, 10 miles W. of Peshawur, and terminates at Duka at the entrance to the plain of Jellalabad. The K. P. is the most practicable route into Afghanistan. During the Afghan war of 1839-42, it was repeatedly forced by the British, and formed the scene of their most disastrous loss. Traders only now pass, on condition of paying a fixed black-mail. See Havelock's *War in Afghanistan* (Lond. 1840).

Khyrpore' (*Khairpur*), the chief town of the native state of the same name in Scinde, India, 15 miles E. of the Indus; estimated pop. 10,000. The state of K. has an area of 6109 sq. miles; pop. (1872) 130,350. The land revenue, which is paid in kind, at the rate of one-third of the gross produce, amounts to about £45,350. The exports have been returned at £52,500, the imports at £27,500. The country, which extends from the left bank of the Indus into the desert of Rajputana, is only cultivated where irrigated by canals. The ruling Mahomedan family of Beluchi origin, established in 1783, was the only branch of the Ameers of Scinde allowed to exist after the British conquest in 1843. See *Gazetteer of Scinde* (Lond. 1874).

Kiach'ta, a town of Russia, Siberia, in the government of Trans-Baikal, touching the frontier of the Chinese Empire, and 180 miles S.E. of Irkutsk. It is guarded by a fortress, has government and customs buildings, and was the sole mart for the Chinese trade from its foundation in 1727 till the treaty of Peking (1860), which permitted commerce along the whole frontier. The trade, which is carried on by fairs, sometimes amounted in value to eight million dollars, but has greatly decreased of late. Pop. 5000.

Kiang-Chu, or **Kiang-Chow**, a port of China, on the N. side of the island of Hainan, opposite Hoi-on on a peninsula of the mainland. It was declared open to foreign commerce in 1858, but it was only formally opened by proclamation of 24th March 1876. Its chief exports are sugar (much of which comes from Hoi-on), leather, ground-nut cakes and oil, sesamum and melon seed, and betel nuts; its imports, opium, cotton and woollen goods. In the half year ending 30th September 1876 the port was entered by 23 steamers of 11,955 tons, and cleared by 22 of 10,996. Most of the trade is with Hong-Kong. Pop. about 200,000.

Kiang-Si, a province in the S.E. of China, lies W. of the Tajuling Mountains. It is watered by the Kia-Kiang, which enters the large lake Pojang-hu in the N. by innumerable branches. The surface is hilly, and the Yang-tsi-Kiang forms part of the N. boundary. The chief town is Nan-Chang. See CHINESE EMPIRE.

Kiang-Su, a province of China bordering on the Yellow Sea, at the delta of the Yang-tsi-Kiang. It is the richest and most populous province in the capital; its surface is low and flat, and the soil is extremely fertile, yielding much sugar and rice. It is watered by the net-work of streams into which the Yang-tsi divides, and by the Hôei-ho, which expands into several large lakes. Nan-King, is the capital, and the treaty ports are Chin-Kiang and Shanghai. See CHINESE EMPIRE.

Kidd'erminster, a town of England, in the county of Worcester, on the river Stour four miles from its confluence with the Severn, and 125 N.W. of London by rail. It is the chief English centre for the manufacture of the finest Brussels and velvet.

pile carpets, employing over 400 power-looms, and producing goods to the annual value of some £700,000. K. has also considerable worsted spinning, lamask silk weaving, paper-making, iron and brass founding, brewing, and tanning, and returns one member to Parliament. Pop. (1871) 20,814.

Kidnapping is the offence of carrying off a child or adult. When free from certain intent, K. is only a misdemeanour punishable with fine and imprisonment. See ABDUCTION.

Kidney is a glandular organ concerned in the secretion of urine. In the human body there are two, situated one on each side of the vertebral column, at the upper and back part of the abdomen. They are on a level with the last vertebræ

of the dorsal region and the upper two or three lumbar vertebræ. The *right* has in front of it the peritoneum, the ascending part of the colon or large bowel, and also at its upper part a portion of the liver. The *left* has in front of it the descending part of the colon, and is in contact, to the left, with the spleen. Each K. is about four inches in length, two inches in breadth, and about one and a half inches in thickness. Each has a convex border externally, and a concave border near the middle line. In this concave border there is a marked fissure or cleft, and to this the term *hilus* (*h*) is

Section of Kidney.

applied. In this hilus the renal artery, vein, and the duct or tube, the *ureter* (*u*), which carries away the urine from the K., are situated. The nerves and lymphatic vessels also enter into the substance of the K. through this fissure. On dividing the K. into two equal parts, by cutting it from its convex to its concave border, two distinct parts can be noticed. A part next the hilus, the medullary part, and a part further away, the cortical part (*a*). The medullary part is darker in colour than the cortical, and appears distinctly striated, these striæ converging to certain points near the hilus. Hence the appearance of a number of pyramids, the apices of which are directed towards the hilus, and the bases towards the cortical part. Attached to the sides of these pyramids, about midway between the apices and the bases, and completely enveloping the apices, we have the commencement of the excretory duct or ureter. This duct within the hilus is dilated into a bag, which is moulded upon the papillæ, and thus appears to have on it cup-like depressions. This bag-like dilatation of the ureter is called the *pelvis* (*p*), and the cup-shaped depressions, *calyces* (*c*). The cortical portion of the K. is not striated; it covers the medullary portion, and portions of it extend downwards between the pyramids. It has a granular appearance and is easily torn.

On examining the medullary portion by means of the microscope, the striated appearance is found to be due to this part being made up of tubes, the uriniferous tubules, placed side by side. These tubes communicate with the pelvis of the K. by a number of openings situated upon the apex of each papilla, and in the bottom of the calyces. Traced into the substance of the K. these tubes are found to become convoluted when they pass beyond the limits of the medullary portion into the cortical portion, and finally they end by the bag-like enlargements, the *Malpighian corpuscles*. These tubules have a diameter varying from $\frac{1}{100}$ th to $\frac{1}{200}$ th of an inch, and the *Malpighian corpuscles* a diameter of $\frac{1}{100}$ th of an inch.

The tubules are seen to be composed of an outer wall of connective tissue, the basement membrane, and lining this internally, epithelial cells which, in the straight portion of the tube, are columnar in form, but in the convoluted portion, are more or less globular. The Malpighian corpuscles have also this basement membrane, but the epithelium is of a scaly or flattened

form. The kidneys are supplied with blood by two large arteries, the *renal arteries*. Before entering the hilus of the K.

each artery breaks up into two or three branches, which again subdivide, and pass into the substance of the K. between the pyramids. On arriving near the bases of the pyramids, the branches communicate by means of arches which are formed here between contiguous vessels. From these arches branches are given off which pass on-wards between the straight tubes, and finally pierce the wall of the Malpighian corpuscles. At this point the artery receives the name of *afferent vessel*. Within the corpuscle the afferent vessel breaks up into a loop of capillary vessels. The blood in these is collected into a single vessel, the *efferent vessel*, and this pierces the capsule of the corpuscle. After leaving the Malpighian corpuscle this efferent vessel breaks up into

capillary plexus which surrounds the convoluted tubes, and this plexus pours its blood into larger vessels, the commencement of the *renal vein*. By means of this vessel the blood is conveyed to the *inferior vena cava*, and so to general circulation.

Recent observations have shown that, surrounding the smaller vessels, we have spaces filled with lymph which communicate with the general lymphatic system. Further, the convoluted tubules do not directly become continuous with the straight tubules, but after ceasing to run a convoluted course, they dip down and form a loop, the lower end of which is situated in the medullary part, and then ascend into the cortical part again. This looped tube joins at a right angle with the straight tubule. See diagram (*b*).

Each K. is enclosed in a fibrous capsule. This capsule is so loosely connected with the substance of the K. that it can readily be separated, except at the hilus, where it becomes united to, and continuous with, the pelvis. The pelvis and ureter consist of a fibrous coat, a middle coat of muscular fibres, and an external coat of columnar epithelium.

The nerves which are distributed to the kidneys are derived from the lesser splanchnic nerves, and from the renal plexus. The manner in which they terminate in the K. has not been made out, but from the effect which has been produced upon cutting them in the lower animals, it is very probable that they are distributed in the main part to the muscular coat of the arteries, and regulate the amount of contraction or dilatation of these vessels. Certain of the nerves are also probably distributed to the lining of the tubules, and regulate the activity of the secreting cells.

The chief modifications in the structure of the K. of mammals consist in the absence or alteration in the shape of the pyramids. In many mammals the K. consists of an aggregation of a number of smaller kidneys, each of these presenting a division into a medullary and a cortical part. The general character of the fluid secreted by the kidneys will be considered under article URINE, but it is necessary here to state that we have in urine

Diagram of the course of uriniferous tubules.

Water containing in it certain organic and inorganic substances. The organic substances are chiefly urea and uric acid; the inorganic, chlorides of sodium and lime, sulphates of potash and soda, and phosphates of lime and magnesia. The organic substances are separated from the blood by the action of the cells lining the convoluted tubes by a process of secretion. The water and inorganic salts are separated from the blood by a process of filtration, this process occurring within the Malpighian corpuscle. Anything which alters the amount of pressure within the *afferent* or *efferent* vessels, will alter the amount of water and inorganic salts separated. Normally, the *efferent* vessels have a smaller calibre than the *afferent*, and hence there will be a greater pressure in the *afferent* than in the *efferent*. Again, the pressure normally is greater within the blood-vessels than in the Malpighian body. If, by any means, the pressures in the *afferent* and *efferent* vessels and the Malpighian body be equalised, the process of filtration will be stopped. The separation of the water and salts is influenced by physical conditions. The separation of the urea and uric acid is a vital process, dependent upon the functional activity of the epithelial cells lining the tubules.

Diseases of the K.—The kidneys are subject to various affections, the most important of which is that known as *Bright's Disease* (q. v.), characterised by intense congestion, with exudation and hæmorrhage into the tubes, and desquamation of the epithelium. Inflammation of the K. or Nephritis is also of frequent occurrence, and one or more of the tissues may be affected, as the nerves, the vessels, the parenchyma, or the interstitial connective-tissue. In addition, the cortical substance, the pyramidal, the pelvis of the kidney, or all parts together may be affected, and the affection may be partial or diffused. The parenchymatous tissue is generally implicated, in the first instance, and afterwards, the interstitial tissue, which sometimes undergoes fatty or amyloid degeneration. The diagnosis of these affections is difficult during life, and can be effected only by chemical tests and microscopic examinations of the urine. Most of these affections may terminate in suppuration, which may also depend upon morbid conditions of the blood, external violence, retention of urine, or calculi in the kidney or ureters. The most frequent symptoms of D. of the K. are more or less pain in the region of these glands, shooting along the ureters; a sensation of numbness down the thigh; pain in and retraction of the testicle; frequent desire to void urine, and more or less febrile symptoms. D. of the K. are all of a very serious nature, more especially those of an acute form; but even the chronic forms greatly impair health, and ultimately cause premature death. Suppuration is the most rapidly destructive of all the lesions, and is generally considered to be a fatal disease. Neuralgia of the kidneys is not of very frequent occurrence, and the affection, so termed, usually depends upon the passage of a concretion through the ureter, one of the most painful of all diseases. The pain comes on in paroxysms, with intervening periods of comparative ease, and is usually accompanied by vomiting, profuse perspiration, and a small and feeble pulse. *Suppression of Urine*, or *Ischuria*, although generally a mere symptom of other diseases, is in some cases an independent or idiopathic affection, there being either a complete cessation of the secreting action of the kidney, or such a diminution as to indicate morbid action. If no urine be separated from the blood, the urea retained acts as a poison on the nervous system, causing coma or intense stupefaction, which invariably terminates in death, unless the action of the kidneys be restored. For further information on D. of the K., see BRIGHT'S DISEASE, ADDISON'S DISEASE, DIABETES, CALCULUS, NEPHRITIS, and URÆMIA.

Kidney Bean. The common K. B., French bean, or haricot, is *Phaseolus vulgaris*, largely cultivated for human food both in tropical and temperate regions. Its native country is supposed to be India, from whence it may have come to Europe through the conquests of Alexander the Great. It varies from a low, almost bushy sub-erect plant, to one with stems that twine 6 to 10 feet. As far back as English trustworthy garden records go, it has been grown in that island for the pods, which in the young green state are the most delicate legume in cultivation. They also make an excellent pickle. On the Continent of Europe the ripe seed, called haricots, is largely used, and when properly selected and cooked they are strongly recommended as an article of food, from their digestive and antibilious qualities. The scarlet runner (*P. multiflorus*) is grown for the same purpose as the K. B., and is

remarkably prolific. The pretty ripe beans, however, are unwholesome, or even in some degree poisonous, and the root contains a narcotic poison. It is a native of Central America, whence it is stated to have been introduced into Europe in 1633. The genus *Phaseolus*—distinguished by the keel of its flowers being prolonged into a very long beak, which forms a complete or nearly complete spiral—numbers in all about sixty species, mostly tropical, but many besides the above are widely cultivated, such as *P. Mungo*, with nearly cylindrical pods, in India and Africa; *P. lunatus*, in all hot climates; *P. perennis*, in America; *P. rostratus*, cosmopolitan within the tropics.

Kidney Vetch, the name given to the genus *Anthyllis*, belonging to the tribe *Lotæe* of the natural order *Leguminosæ*, from the former reputation of the commonest species, *A. vulnearia*, in kidney complaints. The genus numbers about twenty species, distributed through Europe, Asia, and N. Africa, and the above named is not very rare in Britain in dry pastures, &c. It is a good sheep fodder.

Kie'kie, the native name for *Freyinetia Banksii*, belonging to the *Pandanusæ* (screw palms), a lofty climber growing in the northern island of New Zealand. The bracts and young spikes make a very sweet preserve; the narrow leaves, 2 feet long, are used for basket-making.

Kiel, a seaport in the province of Slesvig-Holstein, Prussia, on an excellent harbour at the head of Kieler Hafen, 55 miles N. of Hamburg, has an important trade, manufactures of tobacco, sugar, oil, soap, woollen goods, and machinery, and a university (founded in 1605), with a library of 140,000 vols. Since 1864 its harbour has become an important station for Prussian war-ships. In 1875 there entered the port 3977 vessels, of 332,883 tons, and cleared 4000, of 322,729 tons. K., founded in the 11th c., entered the Hanseatic League in the 14th c. On the division of the duchies it fell to Gottorp, becoming in 1713 the seat of the duke and of the Government, but by the deed of exchange in 1773 was joined to the Danish part of Holstein. On the 14th January 1814, Denmark concluded peace here with England, and also with Sweden, which then lost Norway.

Kielce, a government of the former Russian province, known as the kingdom of Poland, bounded W. by Prutikov, N. and E. by Kadm, and S. by Galicia. Area, 3897 sq. miles; pop. (1870) 518,730. K. is one of the fairest and most fruitful parts of Poland; more than half the surface is cultivated, and one fourth is forest. The chief industries are iron-smelting, tanning, and the preparation of brandy, beer, and flour.—K., the chief town, 100 miles S.S.W. of Warsaw, and surrounded by high mountains, is a bishop's see, and has some copper-mines, great corn-markets, and considerable trade in iron, flour, and wood. Pop. (1870) 11,000.

Kie'pert, Heinrich, a geographical scholar and cartographer, was born at Berlin, 31st July 1818, and studied (1836-40) at the university of that city, where he showed the peculiar bent of his mind in designing and lithographing many maps of ancient Greece and Italy for the use of his fellow-students. In 1841 he was sent by Ritter, along with Schænborn and Læw, on a scientific expedition in Asia Minor, and in 1845 was appointed Director of the Geographical Institute at Weimar. He was called to the Statistical Bureau of Berlin in 1865. His chief works are an *Atlas von Hellas* (new ed. 1871), *Neuer Hand-atlas über alle Theile der Erde* (2d ed. 1867, 40 sheets), *Bibel-atlas* (2d ed. 1854), *Atlas Antiquus* (5th ed. 1869), and *Erdkarte* (1863, 38 sheets). These are all more remarkable for their fulness, freshness, and accuracy, than for their beauty of engraving.

Kiev, or **Kief** (*Kijev*, Polish *Kijów*), one of the four governments of the Ukraine, Russia, is surrounded by the governments Minsk, Tshernigov, Poltava, Kherson, Podolia, and Volhynia. Area, 19,687 sq. miles; pop. (1870) 2,144,276. K. is a fruitful, undulating plain, bounded on the E. by the river Dnieper, which receives from it Pripiet, Teteriv, Irpin, Ros, and Tjasmin. Corn-growing, cattle-rearing, and beet-sugar manufacture are the chief industries. One quarter of the surface is forest.—K., the chief town, on the Dnieper, 267 miles N. of Odessa, has numerous churches (including two cathedrals, one of which, St. Sophia, is the earliest monument of Russian ecclesiastical architecture), great barracks, an arsenal, an exchange, a theatre, and a university (St. Vladimir, founded in 1833), and carries on important manufactures, chiefly of leather, crockery, chemical

preparations, and mineral waters. There is an extensive fair every January. Pop. (1870) 70,820. K. is one of the oldest towns in Russia, was wrested from the Khazars in 864 by comrades of Rurik, and made the capital of Russia by Rurik's successor. Christianity was here proclaimed to be the national religion of Russia in 988, and the place continued to be the seat of the Russian rulers till 1300. It passed under Lithuania in 1320, and in 1650 under Poland, and reverted to Russia in 1686.

Kikin'da, or **Nagy-Kikinda**, chief town of the comitat of Torontál in Hungary, 130 miles S.S.E. of Pesth by rail, is the centre of an agricultural district with large cattle-rearing. Pop. (1869) 18,834.

Kil'da, **St.**, the most westerly of the Hebrides, Scotland, lies 60 miles W. of Harris, is 3 miles long by 2 broad, and has a precipitous coast, indented by two accessible bays. Area (including several small islets), 4000 acres; pop. (1871) 71. The surface is hilly, rising in one point to a height of 1380 feet, and affording pasture for some black cattle and a breed of Spanish sheep whose wool is of considerable value. There was formerly an export of grain, but now the inhabitants import supplies, and rough weather, by preventing vessels from approaching the island, often cause great hardship—notably in the winter of 1876-77. A curious and touching evidence of the stern religiosity of the islanders was furnished by the fact that when the relief vessel approached late on a Saturday night, they marched down to the shore with their minister at their head, and besought the captain *not to break the Sabbath*, but to wait till Monday before landing provisions (*Scotsman*, May 17, 1877). The chief occupations are fishing and fowling, and the exports are wool, salted fish, oil, and feathers. St. K. belongs to the parish, and is under a resident baron bailie. Gaelic is the common language.

Kildare, an inland county in the province of Leinster, Ireland, is bounded N. by Meath, E. by Dublin and Wicklow, S. by Carlow, and W. by Queen's County, King's County, and Westmeath. Area, 654 sq. miles; pop. (1871) 83,614, being a decrease of 30,874 since the census of 1841. With the exception of low offshoots of the Dublin and Wicklow Mountains in the E., and the conical Hill of Allen (560 feet) in the W., the surface is generally flat. The Boyne, Barrow, and Liffey are the chief rivers, and the Bog of Allen (q. v.) covers 36,000 acres in the N.W. of the county. The soil is a deep fertile loam; the climate, owing to the vast extent of bog, is the moistest of any inland Irish county. In 1871, 138,146 acres were under tillage, 218,035 in pasture, 7585 of plantation, and 53,741 waste, bog, mountain, &c. The rearing of stock and manufactures of cotton, woollen, and linen goods, with paper-making, brewing, and distilling, are the leading industries. K. contains limestone and sandstone, and sends large quantities of peat to Dublin. It is traversed by the Great Southern and Western Railway, and by the Grand and Royal Canals. The chief towns are Athy, Naas, Newbridge, and K. The county sends two members to Parliament. Amongst its antiquities are five round towers, three stone crosses, and numerous ruins of castles and religious houses.

Kildare (Irish Gael. *Cill-dara*, 'church of the oak,' see Joyce's *Irish Names and Places*, vol. i. pp. 106-7), a market-town of Ireland, in the county of the same name, 30 miles S.W. of Dublin by rail. The place is now much decayed, but its former importance is attested by a ruined castle and cathedral, a round tower 132 feet high, and many other antiquities. A weaving-mill, with 150 power-looms, is the only large manufactory. Pop. (1871) 2391.—The *Curragh of K.*, 3 miles E. of the town, is the most famous racecourse of Ireland. It is 6 miles long by 2 broad, and on it a camp has been formed for 10,000 men.

Kilia, a fortified river-port of Moldavia, on the left bank of the K. channel of the Danube, 20 miles from its mouth, has extensive fisheries, and is famed for its caviare. Pop. 6400.

Kilian, **St.**, the first apostle of the Franks, was an Irish monk who in 686 A.D. left his native land to devote himself to missionary labours, along with twelve companions, among them the presbyter Coloman and the deacon Donatus or Totman. Coming to Würzburg in the Austrasian kingdom, he was made first bishop of that place by Pope Conon (687), converted and baptized Gosbert, the Frankish duke, but was murdered (689) by Geilna, wife of the duke and at the same time his brother's

widow, whose marriage K. had pronounced unlawful. He is buried in the Neumünster Kirche at Würzburg, and his anniversary falls on July 8th.

Kilimandjaro ('the Great Mountain'), the highest mountain in Africa, near the western border of Zanzibar, in the range forming the watershed between the basin of the Nile and the Indian Ocean. It is covered with perpetual snow, and is thought to be about 20,000 feet high.

Kilkenny, an inland county of Ireland, in the province of Leinster, is bounded N. by Queen's County, E. by Carlow and Wexford, S. by Waterford, and W. by Tipperary. Area, 796 sq. miles; pop. (1871) 109,479. The surface is hilly, Mount Brandon in the E. attaining a height of 1696 feet, while in the W. are the Walsh Mountains. The chief rivers are the Barrow (q. v.) and its navigable tributaries the Suir and Nore. The soil is argillaceous, affording good tillage and pasture land. In 1871 there were 118,373 acres under tillage, 286,948 in pasture, 11,281 of plantation, and 90,074 of waste, bog, mountain, &c. Agriculture and stock-rearing are the chief occupations, and a once important woollen manufacture has now greatly declined. Anthracite coal of a sulphurous quality is raised from fourteen collieries, and limestone, sandstone, and a fine black marble are extensively quarried. K. returns two members to Parliament. Its only towns with a pop. of over 2000 are K. and Callan. At Dunmore is a remarkable stalactite cavern, and among the antiquities of the county may be noticed the abbeys of Jerpoint and Graig, Grandison Castle, five round towers, and the cromlech of Kilmogue.

Kilkenny, the capital of the county of the same name, Ireland, and itself a county, is situated on the Nore, 28 miles N. of Waterford by rail. It has a Protestant cathedral, dating from the 13th c., restored in 1864; a Roman Catholic cathedral, erected in 1857; and the Black Abbey Church, which, after lying in ruins since the Reformation, was restored in 1864 for the use of the order of St. Dominic. There are several other religious buildings, the ancient castle of the Ormonds, a Roman Catholic college, and a grammar-school, at which Swift, Congreve, and Farquhar were educated. The linen and woollen manufactures of K. have greatly declined, and its chief source of wealth is now a fine black marble, which is largely quarried in the neighbourhood. Pop. of parliamentary borough (1871), 17,012. K. returns one member to Parliament. K. takes its name from a St. Cainneach or Canice, who is mentioned by Adamnan, in his *Life of Columba*, and who died in 598. See Joyce's *Irish Names and Places* (vol. i. p. 140). Strongbow founded a castle here (1172), which was destroyed by Donald O'Brien (1193), but rebuilt by William le Mareschal (1195). A great council of barons of the Pale was held at K. in 1294, and its parliament of 1367 passed the Statute of K., abolishing Brehon Law (q. v.). Richard II. was entertained here by the Earl of Ormond (1399), who had purchased the place in 1391. It was taken by the Lancastrian Earl of Desmond in the Wars of the Roses, and surrendered to Ireton, after repulsing three assaults by Cromwell (1650).

Killarney (Irish Gael. *Cill-air-neadh*, 'the Church of the Sloes'), a market-town of Ireland, in the county Kerry, near the N.E. angle of the largest of the lakes of the same name, and 12 miles S. by E. of Tralee by rail. After Tralee it is the chief town in Kerry, and has a modern Roman Catholic cathedral, and several handsome hotels for the reception of the numerous visitors to the famous lakes. There is a slight industry in the carving of articles from the arbutus tree, which grows here wild as in Italy. Monthly fairs are held here. Pop. (1871) 5195.—The **Lakes of K.** are three in number, and are romantically situated at the N.E. base of the Macgillycuddy's Reeks. They are linked together, and are drained by the Leane, through Castlemain harbour, into Dingle Bay. The lower lake, which is the most northerly, is by far the largest, having a length of 5 miles and a breadth of 3. The upper lake is hemmed in by lofty mountains, opening here and there in beautiful glens, and is studded with woody islets.

Killicrankie, **The Battle of**, was fought in the pass or defile of Perthshire from which it takes its name, 27th July 1689. The forces of William III., 4000 strong, under General Mackay, were defeated by a wild onset of 2500 Jacobite Highlanders, led by Graham (q. v.) of Clavehouse, then Viscount

Kandee. But the death of Claverhouse in the moment of victory 'broke the only bond which held the Highlanders together, and in a few weeks the host which had spread terror through the Lowlands melted helplessly away.'

Kilmarnock, a town in the district of Cunningham, Ayrshire, Scotland, 12 miles N.N.E. of Ayr, on a small river of the same name which joins the Irvine close by the town. It is one of the principal stations on the Glasgow and South-Western Railway, and is the southern terminus of the Kilmarnock and Barrhead line, opened in June 1873. K. has a fine town hall, an opera house, an atheneum, a large fever hospital, several endowed schools (the Kay's schools), a public park (obtained in 1877), to be adorned with a statue of Burns, and numerous handsome churches. It has extensive engineering works, carpet manufactories, woollen mills, breweries, tanneries, &c., and is the centre of a rich mineral field. The calico-printing for which the town was noted some thirty years ago is nearly extinct, but block-cutting for floorcloths, wall-papers, &c., is carried on to some extent. The district of Cunningham has long been famed for its 'butter and cheese,' and K. is now the seat of the greatest cheese show in the United Kingdom. In October 1876 the 22d annual exhibition of dairy produce, and the 14th cheese fair, was held, when 460 tons of cheese were 'pitched,' representing a value of £35,000. K. owes its name to a St. Marnock (8th c.), but is first mentioned in the 12th c. It was made a royal burgh in 1591, and figures honourably in the Covenanting period. The first edition of Burns's poems was published here in 1786 (reprint and *fac simile* by M'Kie, Kilmarnock, 1867), and the 'Kilmarnock wabsters' are touched off in one of his pieces, the *Ordination*, with more humour than mercy. K. unites with Dumbarton, Port Glasgow, Renfrew, and Rutherglen in electing a member to Parliament. Pop. (1871) 22,952. About a mile N. of the town are the ruins of the Dean Castle (destroyed by fire in 1735), the seat of the once renowned family of the Boyds, Earls of K. See M'Kay's *History of K.* (3d ed. 1864).

Kilogramme, a French measure of weight equivalent to 1000 grammes or 2·2046 lbs. avoirdupois.

Kilrush ('the Church of the Wood or the Peninsula'), a seaport and market-town in Clare, Ireland, on a small inlet of the Shannon estuary, 36 miles W. of Limerick and 142 miles W.S.W. of Dublin, is a favourite bathing-place, and has a sheltered harbour, with considerable trade in fish, corn, turf, and farm-produce. K. has some manufactures of coarse linens and woollens, and quarries of stone and slate. Pop. (1871) 4424.

Kilsyth, a town in Stirling-shire, Scotland, 13 miles N.E. of Glasgow, and near the Edinburgh and Glasgow Railway, with stone quarries, and extensive mines of coal and iron. Weaving and paper-making are also carried on. Pop. (1871) 4895. K. was the scene of a crushing defeat of the Covenanters under Baillie, by the Marquis of Montrose, August 15, 1645.

Kilwinning, a town in the district of Cunningham, county of Ayr, Scotland, 3 miles N.W. of Irvine, and a station on the Glasgow and Ayr Railway whence a branch line runs to Ardrossan. It is a very ancient place, and consists mainly of one long irregular street. K. carried on at one time an important industry in hand sewing or embroidery, but the inhabitants are now chiefly engaged in mining. In the immediate neighbourhood are the Eglinton ironworks, employing (1877) 1000 men. Here are the remains of the famous Tironensian Abbey of K., founded in 1140 by the Constable Hugh de Morville, and dedicated to St. Winning (8th c.), from whom the town takes its name. Its last abbot was Gavin Hamilton of the Rosslock family, an ardent opponent of John Knox. The abbey was destroyed in 1560 by order of the Scottish estates, and little survives to enable one to form an adequate idea of the design and magnitude of the structure, or of the richness and splendour of the execution. The present parish church (built 1775) occupies part of its site. The old abbey-steeple (103 feet high) fell August 2, 1814, a few minutes before a band of masons was to have gone to its top to make repairs. K. is perhaps best known as the birthplace of Free Masonry (q. v.) in Scotland. It still continues the ancient game of archery, and has an annual contest for shooting at the Papingo. This game has been practised here for upwards of four centuries. In the neighbourhood is Eglinton Castle, the principal seat of the Earls of Eglinton (see

MONTGOMERY, FAMILY OF), and the scene of a memorable tournament in 1839. Pop. (1871) 3598.

Kimberley, Earl of, an English statesman, born January 7, 1826, succeeded his father as third Baron Wodehouse, May 29, 1846. He was Under Foreign Secretary, 1852-56; Envoy at St. Petersburg, 1856-58; Under Foreign Secretary, 1859-61; Lord-Lieutenant of Ireland, 1864-66; Lord Privy Seal, 1868-70; and Colonial Secretary, 1870-74. His administration of Ireland during a critical period was firm and able. He was created Earl of Kimberley, June 1, 1866.

Kim'chi, **R. David ben Joseph**, born at Narbonne in 1160 (died about 1235), was a celebrated Jewish commentator, grammarian, and lexicographer. He was the first to discover the distinction between the long and short vowels, and defended a natural and grammatical exegesis at a time when his brethren were almost all enamoured of Haggadic, Cabalistic, and astrological interpretations. His principal work was *Michlol* ('perfection'), which consisted of a Hebrew grammar and a lexicon. Besides which he wrote commentaries on the Pentateuch, the earlier Prophets (Joshua to Kings), the later Prophets (Isaiah, &c.), the Psalms, Ruth, Chronicles, and Job, and a Refutation of Christianity.

Kimm'ridge Clay, the lowest member of the Portland or Upper Oolites (see OOLITIC SERIES), consisting chiefly of blue slaty clays with intermediate bands of sand or calcareous grit. It yields a bituminous clay known as *K. coal*, which burns with a yellowish smoky flame. Fossil remains of the various invertebrate groups and of fishes and reptiles are found—the most characteristic being the lamellibranch species *Gryphaea virgula* and *Otreta delioidea*.

Kimm'ridge Coal Money, a name given to the circular discs of Kimmridge shale found abundantly in Dorsetshire by antiquaries, who were long puzzled as to the origin and use of the discs. They are now believed to be the refuse parts of the solid pieces of shale from which the Britons and Romans turned bracelets and amulets.

Kim'polung, a town of Wallachia, Roumania, 79 miles N.W. of Bucharest, and 18 S.E. of the Törzburg Pass, in the Carpathians, by which it carries on an active trade with Transylvania. Pop. 10,970.

Kinburn, a Russian fort at the confluence of the Bug and Dnieper, which was captured by Suwarow from the Turks, 28th June 1788, and again from the Russians by the French and English fleets, 17th October 1855.

Kincardineshire, or **The Mearns**, a county on the E. coast of Scotland, of triangular form, bounded N. and W. by Aberdeen, S. by Forfar, and E. by the North Sea. Area 388 sq. miles; pop. (1871) 34,630. It has a rocky coast line of 30 miles, and extends inland 22 miles. On the coast between Bervie and Stonehaven, the two principal towns, are cliffs of 150-300 feet. The E. portion of the Grampians (with Mount Battock, at the W. extremity of K., 2505 feet) occupies the greater part of the county, and terminates in the promontory of Girdle Ness at the mouth of the Dee. To the S. lies the E. part of Strathmore (q. v.), called the 'How o' the Mearns,' a fertile and well-tilled valley of 50,000 acres, and there is also good land in the Dee valley and on the coast. About half of the surface, chiefly consisting of a rich loam, is under cultivation. The prevailing rocks are gneiss and conglomerate on the coast, and granite in the N. In 1876 45,255 acres were under corn, 22,433 in green crops, 46,142 under various grasses, and 6126 in permanent pasture; there were 4748 horses, 28,504 cattle, 32,176 sheep, and 2523 pigs. The cod, ling, haddock, skate, and turbot fisheries are brisk, but the manufactures, confined to coarse linens, are unimportant. K. sends one member to Parliament. Stone circles, cairns, and memorial stones abound. Roman coins and arms, as well as traces of Roman camps, have been found, and there are several ruined towers of the feudal period, the chief being Dunnottar Castle (q. v.).

Kinematics (Gr. *kinēma*, 'a motion') is the science of pure motion. It combines the fundamental conceptions of algebra and geometry, and differs from Kinetics (q. v.) in leaving out of account the nature of the bodies used and the forces producing or called into action by the motion. The description of a surface by the motion of a line, and of a curve by the motion of a point, are familiar instances of kinematical conceptions. The most interesting cases of the K. of a point are considered under

such headings as Curvature, Cycloid, Epicycloid, Fluxions, Harmonic Motion, &c., and need not here be particularly adverted to. The great importance of K. lies not, however, in its purely geometrical applications, but in its bearing upon physical phenomena. It forms, indeed, the simplest introduction to mathematical physics, and has recently been applied with singular success to the more practical departments of science, such as the theory of machines and engineering generally. The motion of a rigid body or of any relatively fixed system of points is completely determined if the motion of any three points not in the same straight line be so. If any plane figure suffer displacement in its plane, the displacement may be accomplished by a rotation round a fixed point in the plane, which is determined by the initial and final positions of any arbitrary line in the figure. A succession of rotations may then be represented by a succession of rotations round a series of points, each of which corresponds to one displacement. By joining these points a polygon is obtained, which is definitely fixed for the given motion. Now, it can be shown that there can be drawn in the figure a second polygon which has its sides equal, each to each, to those of the fixed polygon, and which by rolling upon this fixed polygon gives the complete motion to the figure. By supposing the successive displacements small enough, the sides of these polygons may be diminished indefinitely, and the polygons become ultimately for a continuous finite displacement continuous curves. Hence any displacement of a rigid solid in directions wholly perpendicular to a fixed line may be produced by the rolling of one cylinder fixed in the solid upon another fixed in space—the axes of the cylinders being parallel to the fixed line. The point about which the figure at any instant is rotating is called the *instantaneous centre* of rotation. (See ROTATION.) The application of these and other purely kinematical theorems to the theory of machines has been given in an admirable treatise on *Theoretische Kinematik* (1874-5) by Professor Reuleaux of Berlin, translated by Professor Kennedy of University College, London (1876). See also Professor Kennedy's *Kinematical Models*, one of the science lectures delivered at the South Kensington Loan Exhibition in 1876. Another very important class of kinematical problems will be considered under the article STRAIN. K., with many of its applications to the theory of curves and surfaces, forms the first preliminary chapter of Thomson and Tait's *Natural Philosophy*.

Kinetics is the branch of Dynamics (q. v.) which investigates the motions of a material system resulting from the action of given forces, or discovers the combination of forces necessary to produce a given motion. The simplest problems are those which relate to the motion of a single particle under the action of a single force, and for problems of this nature Newton's first and second laws of motion (see MOTION, LAWS OF) are necessary and sufficient. The introduction of conditions of restraint, such as that the motion takes place in a resisting medium or along a definite path, results only in increasing the difficulties of the mathematical analysis. When, however, the motion of two or more particles in physical connection is to be investigated, a further principle is necessary, which is fully supplied by Newton's third law. In the scholium to this law Newton reckons the forces of resistance against acceleration as reactions equal and opposite to the actions which produce the acceleration. In other words, all the forces acting upon a system form with the reactions against acceleration an equilibrating set of forces; and this is the explicit statement of the principle enunciated by D'Alembert in 1742, and still known by his name. Its symbolic representation enables us to write down at once the equations of motion for any system for which the equations of equilibrium have been investigated. This principle Lagrange made the basis of his *Mécanique Analytique* (1788), a work which contains theorems of extraordinary beauty and generality, and is to be ranked along with Newton's *Principia* (1687) and Laplace's *Mécanique Céleste* (1798-1825). To Laplace we owe the first use in the theory of attraction of that function which is now known as the *Potential* (q. v.); while Lagrange developed in his remarkable system of generalised co-ordinates a general method for the solution of any dynamic problem. The whole investigation turns upon the mathematical treatment of a certain quadratic function of the rates at which the generalised co-ordinates vary. This function is now recognised as the kinetic energy (see ENERGY) of the system, and is the characteristic

element in Maupertius' principle of least action (see ACTION, PRINCIPLE OF LEAST), the importance of which in dynamical science was first fully appreciated by Lagrange. The principle of *Varying Action*, an extension of the above by Sir W. R. Hamilton of Dublin, is by far the most valuable development since the time of the French physicists. This principle led, in the hands of its inventor, to a general dynamic theory, by which the whole motion of any conservative system is determined by means of a single function known as Hamilton's *Characteristic Function*. It is the so-called action, and is a function of the co-ordinates and of a constant which is the sum of the kinetic and potential energies of the system. There are several special departments of K. which have not here been touched upon, and will be mentioned merely for reference, such as hydrokinetics and electrokinetics, which are discussed under HYDRODYNAMICS and ELECTRICITY. See Thomson and Tait's *Natural Philosophy*; Tait and Steele's *Dynamics of a Particle*; Clerk Maxwell's *Electricity and Magnetism*; and the numerous elementary textbooks upon mechanics and dynamics.

King, the chief of a nation, first in rank and power, holding a permanent life office, and, at least in the modern conception, personally irresponsible for his actions. He may be either hereditary or elective, his power absolute or limited; while the office itself may be open to both sexes, or confined to males alone, and religious consecration may or may not be essential to its due investiture. Still the germ of all kingship lies involved in the word *king*, which is identical with the Sansk. *janaka*, 'father,' both springing from the same root as the Eng. *kin*, the Gr. *genos*, and the Lat. *gigno*. From the head of a household the title passed to the head of a clan, a tribe, a nation, the power of its holders always increasing proportionately to the decrease in their number. The further we go back in the history of a people, the greater we find to have been the number of petty kingdoms, the smallest of which was formed, probably, by the absorption of states, similar in nature to, but smaller than itself. In this process of natural selection, two leading principles were at work—those of election and hereditary succession. By the one the people had a voice in the appointing of their leader; by the other he must come of a chosen and divine stock, he must be able to claim founder's kin with Zeus or Woden. Thus only would he be the noblest of a noble line. At first the K. was the chieftain of his people, not the holder of a territorial dignity. We meet early with a K. of the English, an Emperor of the Romans, a Duke of the Normans, but such titles as K. of England or France are comparatively modern; they belong to a later age when kingship had passed from chieftainship of a people to lordship of the soil. Only as lands, originally held in trust for the nation, came to be looked on as the K.'s personal estate, did men begin to ask why those lands should not pass, like any other territorial possession, by a fixed law of succession, and Primogeniture (q. v.) became the rule of their transmission. Again, the conceptions of an Emperor (q. v.) were blended with those of a K., and the modern theory grew up by which the Crown is regarded as the fountain of justice, the original grantor of all landed property, the source of the national assembly itself. In England, however, isolated from Roman influences, the primitive institution remained least altered. The eldest son of a deceased sovereign obtained a preference, but no more. We often speak of Harold, Stephen, and John as usurpers, but if they were such, then Ælfred, Eadward the Confessor, and, in more recent times, William III. and his successors were usurpers likewise. And as the English nation retained its elective rights, so too it retained its power of deposition. Thrice before and twice since the Conquest has a K. been deprived of his kingly office, whilst in three instances, though not formally deposed, he has been removed from all authority. Elsewhere, on the Continent, hereditary descent triumphed over election, and the more firmly established it became, the greater were the convulsions and alterings of old landmarks when from any cause it was once broken through. Hence, nowhere plainer than in England can modern kingship be traced to its primeval source. Here its stream may have widened and changed much of its early character, but it remains essentially the same waters, hemmed in by the same banks—Victoria is the descendant of Cerdic and Cymric, as her Parliament is the continuation of the West Saxon Witenagemot. See Freeman's *Comparative Politics* (Lond. 1873), and vol. i. of his *Norman Conquest* (Oxf. 1870).

• **King-bird** (*Tyrannus intrepidus*), or **Tyrant Flycatcher**, a species of *Inessorial* birds belonging to the section *Dentirostris*, and to the family *Muscicapidae* or Flycatchers. The K. arrives in the United States in April, and leaves on its southward journey at the close of autumn. It derives its popular name from its tyrannical and active habits. The plumage is ashen-grey above; the head black, and provided with an erectile crest of feathers of an orange hue at their bases. The tail is black, tipped with white; the under parts, of a greyish-white hue. The average length is 8 inches.

King-chu, a walled city of China, province of Hu-pe, on the left bank of the Yang-tsi-Kiang. It lies 150 miles W. of Hankow, and is of some military importance. Pop. 500,000.

King Crab (*Limulus*), or **Molucca Crab**, the popular name of a peculiar genus of *Crustaceans*, forming the type of a special order, that of the *Xiphosura* ('sword-tailed'), whilst the curious extinct forms included in the order *Eurypterida*—such as the *Pterygotus*—are nearly related to the living K. C. In these crustaceans the head and chest form a large convex buckler of horse-shoe shape, bearing unstalked, compound eyes on its upper surface. The mouth has a small labium or upper lip, and six pairs of appendages in the form of legs provided with nipping-claws, the bases of these legs being spinous, and serving as jaws. The first pair of appendages represents the *antennae* or feelers. The abdominal segments—six in number—bear the gills and reproductive organs, covered by an *operculum*, on their under surface; and the *telson* or last joint of the body is prolonged to form a long spinous tail, from which the name *Xiphosura* has been derived. This tail is used by these crabs as a lever in enabling them to alter their position in the water. The *Limulus polyphemus* is the common species. The K. Crabs occur in the Indian and Japanese Seas, and are also found on the N. American coasts. Their eggs are considered delicacies by the Malays, who use the spinous tails to form spear-heads.

King-fisher, the name given to various *Inessorial* birds belonging to the section *Fissirostris* (q. v.). The genus *Alcedo*, to which the common K. (*A. ispida*) belongs, is distinguished by a long bill, the nostrils being of oblique form, and covered by a plumed scale. The second and third quills are the longest. The tail is short, and the hinder toe stout and broad. This bird is of common occurrence in Britain, and has varying hues of dark green and glossy blue on the upper parts, the under parts being chestnut, and the throat and breast white. The average length is 7 inches. The K. is usually of solitary habits, and may be known by its quick rapid flight on the banks of rivers, in which its characteristic food is found. It is extremely deft in catching fish, and will sit motionless for long periods watching the water from the branch of a tree. Small fishes are swallowed at once, prey of larger bulk being dashed against stones so as to soften it prior to its being swallowed. The nest is made in the banks of rivers, and is usually found in a deserted rabbit or rat hole. The eggs number from six to eight, and are of a pinkish colour. Within the nest the rejected scales and bones of fishes may be found. The tiny K. (*Alcyon pusilla*) inhabits N. Australia and New Guinea, and resembles the common K. in habits. Its colour is blue. The azure K. (*A. azurea*) inhabits New S. Wales. Of other species, one of the best-known is the belted K. (*Ceryle Alcyon*) of N. America,

American Kingfisher.

which has a head-crest of feathers, and is blue on the upper parts, a belt of blue crossing the chest. Its length is about 12 inches. The tridactylous K. (*Ceryx tridactyla*) inhabits Java and the E. Archipelago generally; a well-known Australian form being the *Halcyon Sancta*. The great African K. (*Ceryle maxima*) is found in W. Africa, and attains a length of 15 inches. Its colour is an ashen grey mottled with brown. By the ancients the K. was credited with marvellous

powers of stilling the tempestuous sea, and of bringing forth its young upon a floating nest. Hence has arisen the metaphor 'halcyon-days,' &c. See HALCYON DAYS.

King George's Sound, an inlet on the S. coast of Western Australia, containing a good roadstead and two sheltered harbours. The entrance is in 35° 6' S. lat., 118° E. long. The only present importance of K. G. S. is as a coaling station for the mail steamers running between Ceylon and Melbourne.

Kinglake, Alexander William, the historian of the Crimean War, was born in 1811, and educated at Eton and Cambridge. He practised at the Chancery bar from 1837 to 1856, and was member for Bridgewater from 1857 to 1868. His first work, *Eothen*, a graceful and popular account of Eastern travel, appeared in 1844. He published the first two volumes of his *Invasion of the Crimea* in 1863, the fifth, which deals with the battle of Inkerman, in 1875. A cabinet edition, in 6 vols., is in course of publication; the fifth vol. appeared in June 1877. Both in literature and Parliament he has been a bitter opponent of French imperialism.

King's Bench. See QUEEN'S BENCH.

King's Book. By 36 Henry III. c. 3, it is enacted that commissioners shall be appointed in every diocese to certify the value of every ecclesiastical benefice and preferment, and according to this valuation the first-fruits and tenths were in future to be collected and paid. This *valor ecclesiasticus* is what is called the K. B. A transcript of it is given in Ecton's *Thesaurus* and Bacon's *Liber Regis*. But the whole of this document has been printed by the commissioners appointed to examine into the state of the public records, and copies distributed to many public institutions.

Kings, Books of, which are reckoned as one book in the MSS. of the Hebrew Scriptures, the division into two having been introduced from the LXX. and Vulgate in the 16th c., are a continuation of the narrative of the Books of Samuel (q. v.). They contain the annals of the Israelites from the accession of Solomon (B. C. 1016) to the destruction of Jerusalem by Nebuchadnezzar (587). See JEWS. Regarding the author of the Books of Kings, tradition—in the Talmud, Rabbis, and Christian Fathers—points to Jeremiah, and the prophetic-didactic character of the books favours the opinion, besides the similarity of 2 Kings xxiv 18, xxv. 30 to Jeremiah lii. Some find a difficulty, however, in the age of Jeremiah, who began to prophesy in the 13th year of Josiah, from which time till the carrying away of Jehoiachin was sixty-six years, and think it more probable that the author was Baruch, who edited the Book of Jeremiah (q. v.).

King's College, Cambridge, was founded in 1441 by Henry VI. as an appendage to his earlier foundation of Eton College (q. v.), and reconstituted in 1443 on a much larger scale. Under the new statutes of 1861, it consists of a provost, at least forty-six fellows, and at least forty-eight scholars. The fellowships are open to all members of the college who have taken their B.A., and whose standing after such degree does not exceed three years. Of the scholarships, twenty-four of £80 value, with rooms, commons, and tuition free, are appropriated to the scholars of Eton; whilst the others, of £80, with free tuition, are open. The college gives away eight exhibitions and fourteen prizes, and presents to thirty-eight livings. In 1876 it had thirty-six undergraduates. Its chapel, the glory of Cambridge, was commenced in 1446 and completed in 1532, and is in the Late Perpendicular style. Its internal dimensions are—length, 209 feet; breadth, 45½; height, 76. The fan tracery of its unsupported stone roof, the fifteen ancient stained-glass windows, and the richness of the carvings, render this one of the finest pieces of architecture in England. The remaining buildings are mostly of a later date.

King's Counsel or **Queen's Counsel** is a rank given to certain barristers in England and Ireland, and to certain advocates in Scotland. The office is honorary, but it gives a right of precedence in all the law courts.

King's County, an inland county in the province of Leinster, Ireland, lies between Kildare on the E. and Roscommon and Galway on the W., and is separated from the latter by the Shannon. Area, 772 sq. miles; pop. (1871) 75,900. It is bordered on the S. by the Slieve-Bloom Mountains, watered by the Brosna and the head streams of the Boyne and Barrow, occupied in great part by the Bog of Allen (q. v.), and traversed by

the Grand Canal and the Dublin and Galway Railway. Exclusively an agricultural county it has a good loamy soil in many parts, and is distributed (1871) as follows:—130,583 acres under tillage; 222,680 in pasture; 8129 in plantation; 1733 under rivers and lakes; and 130,860 in waste, bog, mountain, &c. There is better farming here than in many other parts of the country; and the holdings are on an average of about 39 acres. Grazing is carried on extensively along the valley of the Shannon, and sheep-farming in the uplands in the N. bordering on W. Meath. The county sends two members to Parliament, and its chief town is Tullamore. There are many Danish raths, ruined castles, and ecclesiastical remains, such as the Abbey of Clonmacnoise (Irish Gael. *Clain-mic-Nois*, 'the retreat of the sons of the noble,' or more probably, 'the meadow of the son of Nos'), of date 548. The great tribe of the O'Connors were the former possessors of the country, which was assigned to English settlers and made shirelands in 1557 under the names of King's and Queen's County in honour of Philip and Mary.

King's Evil. See SCROFULA.

King's or Queen's Evidence. A criminal allowed to become a witness against an accomplice is so called. In England the admission is held to infer a promise of recommendation to mercy. In Scotland, by the mere act of calling an accomplice as a witness, the prosecutor forfeits his title to proceed against him for the crime in question.

Kingsley, Charles, was born at Holne Vicarage, Devonshire, 12th June 1819, entered Magdalen College, Cambridge, 1840, was appointed curate of Eversley, Hampshire, 1842, and rector, 1844, and married at the same time a daughter of Mr. Grenfell, M.P. His first publication was *Village Sermons*. In 1848 appeared the *Saint's Tragedy*, of which Bunsen remarked that it proved the author capable of continuing Shakespeare's great series of historic dramas. Though wanting in definiteness, it is a powerful delineation in the person of Elizabeth of Hungary of the natural struggle of the pure affection against the repressions and mortifications inculcated by a medieval priesthood. *Alton Locke* was published in 1849, and is perhaps his most powerful work. It earned him the title of the 'Chartist parson,' and contains vigorous descriptions of London life among the working classes, with sociological views suited to the author's sympathies. *Yeast* followed in 1851, and developed the same problems in reference to the agricultural labourers. It abounds with passages of the most intense and indignant realism. *Hyppatia* in 1853 and *Westward Ho!* in 1858 are historical novels, the former handling with much brilliance and some inaccuracy the advance of early Christianity in the face of paganism, the latter, with fiery emphasis and intense realisation of the circumstances, painting the opening of the New World to the Elizabethan voyagers. In 1859 K. was appointed Professor of Modern History at Cambridge, Canon of Chester (1869); and Canon of Westminster (1873). He died at Eversley, January 23, 1875. After 1858 his natural force began to abate, but throughout the whole of his works there may be found an admirable wholeness of tone, an incisive honesty of expression, and an ardent, exalting, yet practical enthusiasm. Among the best known of his other works are *Sermons on National Subjects*, *Phaethon*, *Alexandria and her Schools*, *Glaucus*, *The Heroes*, *Two Years Ago*, *The Water-Babies*, *Hereward*, *Madam How and Lady Why*; *At Last: a Christmas in the West Indies*. K. was a poet as well as a novelist and social reformer. Some of his lyrics are among the truest and tenderest written in modern times. *O Mary, go and call the Cattle Home*; *Three Fishers went Sailing out into the West*, &c., will long be remembered and sung. See *Charles Kingsley*; *His Letters and Memoirs of His Life*, edited by his wife (Lond. 1876).—**Henry K.**, brother of the above, born at Holne Vicarage, Devon, in 1830, was educated at Worcester College, Oxford, and lived in Australia from 1853 to 1858. He earned great popularity as a novelist, his chief works being *Geoffrey Hamlyn* (1859), *Kavenshoe* (1861), *Austin Elliot* (1863), *The Hillyars and Burtons* (1865), *Old Margaret* (1871), and *Number Seventeen* (1875). From 1869 to 1871 he edited the *Edinburgh Daily Review*. K. died May 24, 1876.

King's Lynn, or **Lynn Regis**, a port of England, in the county of Norfolk, on the right bank of the Great Ouse, 4 miles above its entrance into the Wash, and 90 N.N.E. of London by

rail. It has several good churches, the W. Norfolk Hospital, and a grammar school. There is a considerable export of agricultural produce, and the chief imports are coal, timber, wine, spirits, tobacco, hemp, and oilcake. In 1875 there entered and cleared the port 1587 vessels, of 207,821 tons. Pop. (1871) 17,266. The town returns two members to Parliament.

Kings-of-Arms, the chief officers of the Heralds' College (q. v.), are three in number—Garter, Norroy, and Clarenceux. Of these Garter (instituted 1417) is head, while Norroy and Clarenceux are provincial kings of the country N. and S. of the Trent respectively. A fourth king-of-arms—Bath or Gloucester—attached (1725) to the Order of the Bath (q. v.), and whose jurisdiction extends to the Principality of Wales, has no place in the Heraldic Chapter. Scotland and Ireland have each their king-of-arms—Lyon (q. v.) in the former, and Ulster (q. v.) in the latter country.

King's-ton, the capital and chief commercial town of Jamaica, lies on a splendid landlocked harbour in the S.W. of the island, 12 miles S.W. of Spanish Town by rail, and in a plain at the base of the Blue Mountains. It is supplied with good drinking water by a magnificent aqueduct, has no important buildings, but is surrounded by rich sugar-plantations and numerous villas and gardens. The harbour is enclosed on the S. by a tongue of land, and is defended by several strong forts. In 1870 the value of the exports, mainly rum, sugar, tobacco, and dye-woods, was £1,263,162, and of the imports £1,320,030. In spite of the land and sea breezes the climate is very hot, and there is much yellow fever. Pop. 35,000. K. was founded after Port Royal had been destroyed by the great earthquake of 1692, and named in honour of William III. It was in great part destroyed by fire in 1782, and again in 1843. A bishopric was established here in 1856.

Kingston, a town of Canada, in the province of Ontario, on the lower extremity of the lake of that name, 95 miles S.W. of Ottawa, and 172 W.S.W. of Montreal by rail, is next to Quebec the most strongly fortified place in the Dominion. In 1870 it had seventeen churches of various denominations (including a Catholic and an Anglican cathedral), three banks, three newspapers, and numerous benevolent and educational institutions. There are fine wharves, well adapted for the large grain-shipping trade, and extensive ship-yards, besides foundries, machine and piano factories, breweries, tanneries, &c. With Queen's University (founded in 1841) was incorporated (1866) the Royal College of Physicians and Surgeons, the former with eight, the latter with twelve professors. K. occupies the site of the old French fort of Frontenac (1673-1758), the present city having been founded in 1784 and incorporated in 1838. Pop. (1871) 12,407, who return two members—one to the House of Commons and one to the Provincial Parliament.

Kingston-upon-Thames, a market-town of England, in the county of Surrey, 12 miles S.W. of London by rail, stands on the right bank of the Thames, which is here spanned by a five-arched stone bridge and an iron railway viaduct. Besides the fine cruciform parish church, there are six district churches, a grammar-school, town-hall, &c. Malting is the leading industry. The parish includes several important suburbs, consisting mainly of villas, which have sprung up of late years. From antiquities discovered near the town, it has been identified with the Roman *Tamesa*; the first English name *Moreford* was changed to *Cyningstun*, from its being the coronation-place of the early English kings, the stone on which the monarch sat during the ceremony now standing near the Assize Court. Pop. of municipal borough (1871) 15,263.

Kingstown, a seaport of Ireland, on Dublin Bay, 6 miles S.E. of Dublin by rail, is a place of growing importance, being the station for the Liverpool and Holyhead mails. Its harbour, constructed in 1816 at a cost of upwards of £700,000, has an area of 251 acres, and is protected by two piers, 3500 and 4050 feet in length. K. is also a fashionable watering-place, and has fine hotels, baths, villas, and racecourse, &c. The older name, *Dunleary* (Irish Gael. *Laeghaire's Dun*, 'the hill of Laeghaire,' king of Ireland in the time of St. Patrick), was changed to K. in honour of a visit of George IV. in 1821, at which time it was a mere fishing village and collier haven. Pop. (1871) 16,378.

Kingstown, the capital of the British island of St. Vincent, West Indies, on an inlet which forms a good harbour. It is well built and fortified, and has fine botanical gardens. Pop. 5000.

King's Yellow, a pigment formed of a mixture of the sesqui-oxide and the golden yellow sesqui-sulphide of arsenic. See ORPIMENT.

King-te Ching, a town in the province of Kiang-Si, China, on the Tchang-Kiang, 56 miles from its entrance into Lake Pojang. It is the chief seat of the porcelain industry in the empire, and has a pop. of 200,000.

Kingwood, a scarce and beautiful Brazilian wood believed to be derived from a species of *Dalbergia* (*Triptolemia*).

Kinkel, Johann Gottfried, born 11th August 1815 at Oberkassel in Rhenish Prussia, became (1838) a pastor at Bonn and 'Docent' in Church History, but after his marriage (1843), chiefly studied the history of art, of which he was made professor in 1846, having published (1845) *Die Altchristliche Kunst*, the first part of a great work never completed. K. was an active socialist in 1848, but was seized (June 1849), and sentenced to perpetual imprisonment, from which he escaped November 1850. For some years he taught in England German and the history of art, of which last he became professor at Zürich in 1866. A collection of *Gedichte* by K. has passed through nine editions (1843-73), and a longer poem, *Otto der Schütz*, reached its 34th in 1875.

Kin, Next of. See NEXT OF KIN.

Kinnaird's Head, a high promontory near Fraserburgh, on the N.E. coast of Aberdeen, 20 miles E. of Banff, with a lighthouse 120 feet high.

Ki'no, the name of various astringent gums. The Indian K. is derived from *Pterocarpus marsupium*, and the African from *P. erinaceus*, both large trees belonging to *Leguminosae*. It is extracted by making incisions in the bark from which the juice exudes, and hardening into a brittle mass by exposure to the air, is easily broken into little angular shining fragments of a bright ruby colour, in which state it comes to market. Several species of the Australian genus *Eucalyptus*, also yield a red resinous juice which consolidates into a substance resembling K., and the dhak (*Butea frondosa*) supplies largely Bengal K., used by the natives for tanning leather. The K. of Mateira Medica is the Indian import obtained from *P. marsupium*, and is employed in diarrhoea, dysentery, &c., much as *catechu*. It contains about 75 per cent. of tannic acid.

Kinross-shire, after Clackmannan the smallest county of Scotland, bounded on the N. and W. by Perthshire, S. and E. by Fife, is 12 miles from N. to S., and 13 from E. to W. Area, 78 sq. miles; pop. (1871) 7198. K. is mainly an undulating tract of low hills surrounding Loch Leven (q. v.), and drained by it. The Ochils skirt the N., and the Cleish Hills the S., while the Lomond Hills occupy the E. The soil is in general gravelly, but becomes richer N. and W. of the lake, and the chief formation is Old Red Sandstone, with coal measures in the S. In 1876, 7630 acres were under corn, 4021 in green crops, 11,208 under various grasses, and 8518 in permanent pasture; while horses numbered 1011, cattle 6133, sheep 23,155, and pigs 597. K. unites with Clackmannan in sending a member to Parliament. Kinross, the county town, 14 miles by rail from Dunfermline, had (1871) 1926, and Milnathort, 2 miles by rail to the N.E., 1312 inhabitants, chiefly occupied in the manufacture of tartan shawls.

Kinsale (Irish Gael. *Craunsaile*, 'head of the brine'), a seaport of Ireland, in the county of Cork, on the left bank of the estuary of the Bandon, which forms K. Harbour, and 14 miles S.S.W. of Cork by rail. The sheltered harbour affords anchorage for 300 vessels, but its foreign commerce has been wholly absorbed by Cork, while the fishing-craft, which in 1850 numbered 798, had in 1875 fallen to barely half that number. K. is, however, a much-frequented bathing-place, and has a town-hall, barracks, assembly-rooms, &c. It returns one member to Parliament. Pop. (1871) 5530; of parliamentary borough (including part of Ringecoran) 7050. K. is an ancient place, having given title to the De Courcy family since 1181. It was burnt in 1594, seized by the Spaniards in 1601, and was the place where James II. landed from France in 1689.

Kintyre. See CANTIRE.

Kiosk, an eastern garden pavilion, open on all sides, and surmounted by a dome supported on pillars; also, a latticed

chamber, projecting from the upper story of a building, common in Turkish and Persian palaces.

Kip'tshak, or **Deshti-K** (i.e., 'Steppe of K.'), the name given by Eastern writers in the Middle Ages to the wide district watered by the lower Ural, Volga, Don, and Dnieper, and inhabited by rude nomads, chiefly of Turkish stock, but better known as the name of the western quarter of the empire of Genghis Khan, which fell to his eldest son Juyi, and which stretched from the interior of European Russia and the Caucasus eastwards to Dzungaria, and from Siberia southwards to the Caspian, the Ural, and the Sir. Juyi died early, but his successor Batu conquered all the rest of Russia, and made his way to Silesia. The K. empire or territory of the 'Golden Horde' (from Mongol *ordo*, 'a tent'), was broken up in the 15th c. into the khanates of Kasan, Astrakhan, and Krim, which passed into Russia respectively in 1552, 1554, 1783.

Kirby, Rev. William, was born at Winesham, Suffolk, 19th September 1759, educated at Caius College, Cambridge, and took holy orders in 1782. From his mother he received the first initiative towards zoological study. In 1788 K. became a member of the Linnean Society, which was newly started, contributed (1793) *A Description of Three New Species of Hirudo*, and other papers during the next few years. *A Monograph Concerning English Bees* appeared (1802); *The Introduction to Entomology*, written along with Spence (1826); *Habits and Instincts of Animals* (1830), a Bridgewater treatise. K. was honorary president of the Entomological Society, Fellow of the Royal and Geographical Societies, and corresponding member of many foreign societies. He died 14th July 1850. K. was a good observer, but his contributions to science were made chiefly from the picturesque and anecdotal point of view. See Freeman's *Life of the Rev. W. K.* (Lond. 1852).

Kirchheim ('Kirkhöme'), a town in the Danube district of the kingdom of Wurtemberg, on the Neckar, 15 miles S.E. of Stuttgart, with which it is connected by railway, has the largest wool-market in S. Germany, and manufactures woollens, linens, and machinery. The ancestral castle of the Dukes of Teck is 6 miles distant. Pop. (1875) 6197.

Kirghis, a nomadic people of Turkish race who occupy a vast region of Central Asia known as the K. steppes, stretching from the Caspian to the Altai Mountains, and from the Sea of Aral to the rivers Tobol and Irishi. The K. are akin in language and race to the Uzbeks, and are divided into the two great branches of the K.-Kazaks or Kaizaks, and the Kara-K. ('Black K.'). The Kara-K., called Buruk by the Chinese, and Dikokamanniye by the Russian, dwell partly in Dzungaria and Turkestan, and partly in the E. portion of the Altai Mountains. They form the two distinct tribes of the *Or* and the *Sol*, which again are split into many minor divisions, and which are not held together by the slightest bond of union. The K.-Kazaks, about 450,000 in number, are for the most part subject to Russia, and are divided into the three hordes—the Great Horde (*Chü-djús*), dwelling on the S. of the lake of Balkash, toward the Lake of Issik-kül; the Middle Horde (*Orta-djús*), between Balkash and Omsk in Siberia, and the Little Horde (*Küchuk-djús*), scattered as far W. as Tashkend and the river Chüi. The K. are wandering herdsmen or shepherds, and live in *yurts* and *kubitzas*, or felt tents; they are excellent breeders of cattle, and their food is mostly prepared from milk. The various tribes, especially those of the Kazaks, are much given to robbing and fighting with each other. The men are usually below middle size, but are strong and hardy, and have high cheek-bones, and eyes deep-set, and slightly oblique. The women, who do most of the work, are frequently handsome. An intoxicating beverage is made from sour mare's milk. Mohammedanism is the nominal religion, but there are no priests or mosques, and the faith only shows itself in a few rites and ceremonies. In the beginning of the present century the K. were deservedly known as 'the slave-hunters of the steppes,' as they regularly attacked caravans and sold their captives in the markets of Khiva and Bokhara. See Zaleskij's *La Vie des Steppes-Kirghizes*, *Descriptions, Récits, et Contes* (Paris, 1865); Atkinson's *Travels*, &c. (Lond. 1860); Herr Wagner's *Reisen in den Steppen* (Leips. 1864), and Hellwald's *Russen in Central-Asien* (Eng. transl. Lond. 1874).

Kirkcaldy, a town of Scotland, in Fifeshire, on the N. shore

of the Firth of Forth, and a station on the North British Railway. With its suburbs, it is about three miles in length, and is hence known as the 'Lang Toun.' Its chief manufactures are linen, spun flax, and jute, wax-cloth, iron-ware, and pottery. The harbour, which is commodious, was entered in 1875 by 1175 vessels of 78,392 tons, and cleared by 2611, of 242,402 tons. The exports are linen and yarns, coals, &c., and the imports, flax, grain, and timber. Together with Dysart, Kinghorn, and Burntisland, K. sends one member to Parliament. Pop. (1871) 12,422. K. belonged to the abbots of Dunfermline from 1334 to 1450, and shortly after the latter date was made a royal burgh, having its charter ratified by Charles I. in 1644. Adam Smith was born here.

Kirkcudbrightshire, or The Stewartry of Kirkcudbright, a county in the S. of Scotland, bounded N. and N.W. by Ayrshire; S.W. by Wigtownshire and Wigtown Bay; S. and S.E. by the Solway; and E. and N.E. by Dumfriesshire. Area, 954 sq. miles; pop. (1871) 41,859. K. stretches 44 miles from E. to W., and from N. to S. 40 miles. The surface is in general hilly and even mountainous, especially in the N.W. and N., where Merrick rises to 2764 feet, the Rhums of Kells to 2688 feet, Cairnmuir of Deugh to 2612 feet, and Blacklary to 1950 feet. In the S.W. Cairnmuir of Fleet reaches 2331 feet, and in the S.E. Criffel 1800 feet. The principal rivers are the Cree, between K. and Wigtownshire, the Ken (with its affluent the Dee), widening into Loch Ken, on its way to the Solway at Kirkcudbright, the Urr, and the Nith, separating the S.E. of K. from Dumfriesshire. There are numerous small lakes. Most of the rocks belong to the Lower Silurian; but many of the mountains are granite. One-fourth of the surface is arable, but the upland districts afford good pasturage. In 1876, 32,618 acres were under corn, 17,610 in green crops, 47,444 under various grasses, and 75,062 in permanent pasture. Horses numbered 5366; cattle 41,229; sheep 369,334; pigs 7444. K. is traversed from Dumfries to Newton-Stewart by the Caledonian Railway. The towns are Kirkcudbright, the county town, on the Dee estuary, with a pop. of (1871) 2464, Maxwelltown, a portion of Dumfries, with (1871) 4198, and Castle-Douglas, with (1871) 2210 inhabitants. The county sends one member to Parliament.

Kirkdale Cave, a remarkable cavern in the Oolitic limestone in the vale of Pickering, Yorkshire. It was discovered in 1821, is about 250 feet long, and contains the remains of extinct species of mammals, which were first described by Buckland in his *Reliquiæ Diluvianæ*. Amongst them are the bones of elephants, hippopotamuses, rhinoceroses, cave-bears, hyænas, tigers, horses, &c.

Kirkham, a market-town in Lancashire, England, 2 miles N. of the Ribble estuary and 24 miles N.W. of Manchester, makes cottons, sailcloth, and sacking. Pop. (1871) 3593.

Kirkintilloch (a corruption of the Celtic *Caerpentulach*, 'the fort at the end of the ridge'), a market-town in Dumbartonshire, Scotland, 6 miles by rail N.E. of Glasgow on the Forth and Clyde Canal, with calico-works, mines of ironstone and coal, and stone quarries.

Kirk Kilissia, or **Sarınta-Ekklesiâs** ('forty churches'), a town of Turkey, in the vilayet of Edirne, 32 miles E. of Adrianople. It carries on an active trade in wine, corn, cheese, and butter, and is famed for its sweetmeats prepared from grapes and walnuts. Pop. 14,000.

Kirk-Road means in Scotland a path used by the inhabitants of rural districts for going to church. Such use, if ancient, prevents the proprietor of the land through which the K.-R. runs from shutting it against the public.

Kirk-Session is an ecclesiastical court in Scotland composed of the ministers and elders of a parish. It can suspend any one from the privileges of the church, to which it can also restore him. The K.-S. sometimes exacts fines from persons convicted of breach of church discipline, by threat of church censure or other spiritual punishment; but they have no legal power to impose a fine. An appeal from its decision lies to the Presbytery, thence to the superior ecclesiastical courts of Scotland, the provincial synod and General Assembly.

Kirkwall, the largest town in the Orkneys (q. v.), lies on the N. shore of Pomona or Mainland, 35 miles N.E. of Thurso, and 24 from Duncansby Head. Its trade is increasing. In

1871, 1316 vessels of 95,706 tons entered the port; cleared, 1212, of 88,080 tons. The cathedral of St. Magnus, said to have been founded by Jarl Hakon in 1138, is a cruciform building in the Norman and early English styles, 226 feet long and 56 feet wide. Kirkevaag (Kirkjuvaag, 'Kirk Bay'), as K. was called in the middle ages, when the Orkneys were under Norway, was the residence of the jarls of Orkney. Ruins still exist of their palace, and of the bishop's residence. Pop. (1871) 2265.

Kirschwasser ('cherry water'), a liqueur prepared in Germany, Holland, and Denmark, from the juice of cherries mixed in equal proportion with strong spirit and sweetened with sugar. The liqueur is often flavoured with essential oil of bitter almonds and other aromatics; but in some cases the ripe cherries are ground up with their stones, the kernels of which communicate to the juice the same flavour as bitter almonds. See MARASCHINO.

Kischenev, the capital of the government of Bessarabia, Russia, on the malarious Ilyk, an affluent of the Dniester, 95 miles N.W. of Odessa by rail. It lies in a hilly and finely wooded district, and has fourteen churches, a government library, many fountains, a theatre, and a large trade in wheat, linseed, tallow, cattle, tobacco, &c. Its wine is famous. Pop. (1870) 102,427, extremely mixed, and in great part consisting of Jews. K. was little more than a village when it passed to Russia in 1812. It was the rendezvous of the Russian army, and the place where the declaration of war against Turkey was proclaimed, April 1877.

Kisfaludy, Sándor, a Magyar poet, was born at Sümegh in Hungary, 22d September 1772, studied at Raab and Presburg, entered the Austrian army, and saw some active service, after which he retired to an estate in 1801, and devoted himself to the cultivation of poetry. *Ketergá Szerelem, Roldog Szeretlem*, two volumes of lyrical poetry, first established his reputation, which was afterwards sustained in *Regekt-d Magyar Előidőből* ('Tales of the Old Hungarian Times'), and perpetuated in certain historical dramas, e.g., *János Hunyadi*, and *Ladislaus the Cumanian*, still represented upon the stage of his native country. K. died at Sümegh, 30th October 1844. His works were published in 8 vols. 1833-38.—**Károly K.**, brother of the preceding, was born March 19, 1790, and died at Pesth November 21, 1830. He is the founder of the national drama, and an admirable writer of comedy. His best pieces may be studied in a German translation by Gaal (*Theater der Magyaren*, Bonn, 1820). K.'s collected works were published in 10 vols. in 1831. The chief Hungarian literary society has been named after the brothers K.

Kishengurh (Krishnagarh, 'fort of Krishna'), the chief town of the native state of the same name in Rajputana, India, 21 miles N.E. of Nusserabad. It is a walled town, strongly situated on a range of granite hills.—The state of K. has an area of 724 sq. miles; pop. 105,000; revenue, £30,000. In consideration of losses in transit dues sustained owing to the opening of the Rajputana Railway, the British pay annually £2000. The ruling family branched off from that of Jodhpore in 1594.

Kishm, an island in the Persian Gulf, near the entrance, separated from the coast of Laristan by Clarence Strait, 3 to 8 miles broad. It is 55 miles long, and from 9 to 32 miles broad, is sterile and broken by sandstone hills, except in the N., where a black loam yields corn, vegetables, and fruit (especially dates) in large quantities. Jackals and antelopes abound, and in the S. of the island are extensive salt caves. K. formerly had seventy small towns and villages, and a pop. of 20,000, but owing to the depredations of pirates, the towns have now dwindled to three—K., Laft, and Basidohe—and the pop. to about 5000, mostly Arabs.

Kishnuggur (Krishna-nagar) the chief town of the district of Nuddea, Bengal, British India, on the left bank of the navigable river Jellinghi, 64 miles N. of Calcutta: pop. (1872) 26,750. It is famous for the manufacture of muslin, and of human figures moulded in clay. There is a Government college here with English professors, teaching up to the standard of the B.A. examination. It is attended by 150 pupils, and costs about £3000 a year. The Rajah of K. ranks as one of the leading Hindius and purest Brahmins in Bengal.

Kialjar, a fortified town of Russia, in the government of Stavropol, Cis-Caucasia, 45 miles from the mouth of the Terek,

weaves cotton and silk, and has a brisk trade in fish, wine, and brandy. Pop. (1870) 10,000.

Kiss, August, a Prussian sculptor, born 11th October 1802, at Paprotan, near Pless in Upper Silesia, was a pupil of Rauch and afterwards of Tieck. He had already modelled a number of designs for churches and other public buildings after the designs of Schinkel, when in 1839 he exhibited the model of his famous Amazon group. This was received with enthusiasm; the 40,000 thalers necessary for its completion was subscribed, and the work placed on the stairs of the Museum in Berlin, 22d June 1843. K. sent a model of it to the English Exhibition of 1851, which excited great attention and was bought by America. His other chief works are an equestrian statue of Friedrich the Great at Breslau, statues of Friedrich Wilhelm III. at Potsdam and at Königsberg, of St. Georg in the Schlosshof at Berlin, and of St. Michael at Babelsberg. K. died 24th March 1865.

Kiss'ingen, the most frequented bathing-place in Bavaria, lies picturesquely in the valley of the Franconian Saale, 30 miles N.N.E. of Würzburg by rail, and is surrounded by wooded mountains. Its three springs are the Rakoczy, of which 300,000 bottles are exported annually; the Pandur, a powerful salt-water impregnated with salt, used both for baths and drinking; and the Narbrunnen, resembling the selters water. The healing properties of the waters were known in the 16th c., when the place came under the protection of the Prince and Bishops of Würzburg. At the beginning of the present century K. was a mere valley, and it is now visited annually by 10,000 persons, and has a resident pop. (1875) of 3176. The Prussians here defeated the Bavarians, 10th July 1866.

Kist'na, an important river in S. India, which properly receives this name after the junction of the Tungabudra and Bhima with the Krishna (*sic*), a short distance below the town of Kurnool. These three rivers drain the S. Mahratta country and the Deccan. The K. rises in the W. Ghauts, N.E. of Bombay, only 40 miles from the Arabian Sea, and after a S.E. course of 800 miles falls into the Bay of Bengal by three mouths S. of Masulipatam. The area of its basin is 94,500 sq. miles. In its upper course, and on the banks of its tributaries, many minor irrigation works have been constructed; and the great scheme, formed by an anicut or weir at the head of the delta, is intended to supply 430,000 acres. The whole K. valley, however, has been the scene of the greatest suffering during the famine of 1877. The stream is useless for navigation.—**K. district**, which has been formed out of the old districts of Masulipatam and Guntoor, at the mouth of the K. River, has an area of 8036 sq. miles; pop. (1872) 1,452,374. The land is swampy and exposed to cyclones; the staple crop is rice. The chief town is Masulipatam.

Kit, a general term for all regimental necessities except arms, uniform, and accoutrements. All approved recruits receive a free K., the articles of which they are bound to replace if injured or lost. Before 1855 soldiers had to pay for their K. from the high bounty then given.

Kit, a small pocket violin.

Kitchen-Garden is the garden ground appointed for the cultivation of culinary vegetables, fruit-shrubs, and fruit-trees. It should be so placed with regard to the kitchen departments of a house as to admit of intercommunication without bringing the operators or operations into view of the family. Size is regulated by the family wants, and a rectangular form is recommended, the area being enclosed by walls, with, if necessary, plantations forming an outer belt to break the force of high winds. The most desirable surface is one that is level, open, and airy. A forcing department, a frame ground, and a reserve ground, are accompaniments to every complete K.-G. The more delicate fruit-trees are always placed and trained against the walls, and the hardier descriptions and fruit-shrubs are planted in the open garden—as standards, dwarfs, or espaliers. The herbaceous vegetables are of two kinds; (1) perennials which remain several years in the ground, such as asparagus, rhubarb, horseradish, strawberries; (2) the more numerous crop of annuals or biennials, many of which only occupy the soil a part of the year. The important object to be attended to in arranging the system of crops is to procure the greatest quantity and the best quality of the desired kinds of produce at the least possible expense of labour, time, and manure. See HORTICULTURE.

Kite (*Milvus*), a well-known genus of *Raptorial* birds, the common species of which—*Milvus regalis*—may be readily distinguished by the long, forked, or divided tail. The K. was formerly much more common than at the present time, the advance of civilisation and the culture of land having caused this bird to become comparatively rare. In the genus *Milvus*, the bill is straight at its base, and curved towards its tip. The wings are long, their third and fourth quills being longest. The tarsi are short and scaly. The common K. attains a length of 20 inches, the general colour being reddish-brown. The food consists of mice, rabbits, hares, and the smaller birds, whilst this bird is also known to be an expert fisher. The eggs, numbering two or three, are white, tinted with brown; and the nest is generally built in high trees. The Arabian K. (*M. Aegyptus*) closely resembles its European neighbour. The swallow-tailed K. (*Elanoides furcatus*) inhabits America, but has been occasionally found in Britain. It is nearly allied to the falcons, and is coloured white and black. Another American species is the *Ictinia Mississippensis*, or Mississippi K.; whilst the Govinda K. (*Milvus Govinda*) is common in India.

Kite.

Kit-Kat Club, an association founded about 1688, which took its name from its meeting at Christopher or Kit Kat's, a pastry-cook in King Street, Westminster. From a purely convivial meeting it came in the reign of Anne to be associated with Whig principles and the upholding of the Protestant succession, its forty-three members at that period including Marlborough, Walpole, Addison, Steele, Garth, &c. Kneller painted the portraits of his brother members in three-quarters length—whence the title *kit-kat* applied to that species of portrait—and engravings of his paintings, with memoirs of the club, were published in 1821. See the *Quarterly Review*, vol. xxvi.

Kitt'iwake Gull (*Larus tridactylus*), a species of *Laridae* or Gull (q. v.) named from the sound of its cry, is common round the British coasts. It is white on the head and neck, and silvery grey on the back, the wings being variegated with black and white. The average length is 16 inches. The hinder toe is represented by a mere horny tubercle—hence the specific name *tridactylus* or 'three-toed.' The eggs number three, and are of a brownish olive colour. The K. G. is found in the Mediterranean and Caspian Seas, but is a typical northern bird.

Kitt'o, John, D.D., a Biblical writer, the son of a jobbing mason, was born at Plymouth, December 4, 1804. Having become deaf at the age of twelve, his youth was spent in great misery in a workhouse. Mr. Groves, a dentist of Exeter, took him as assistant in 1824, and subsequently sent him to a missionary college. After a residence as a missionary at Malta he spent four years (1829–33) with Mr. Groves in Eastern travel. From his return till his death, 25th November 1854, he worked incessantly (usually fourteen hours a day) at Biblical Literature. Many of his works are standard authorities. Among the best are the *Pictorial Bible* (1838; new ed. 1855); the *Cyclopædia of Biblical Literature* (1850; 3d ed. by Dr. W. L. Alexander, 3 vols., Edin. 1870), and *Daily Bible Illustrations* (1849–53). See *Memoirs* by J. E. Ryland, with *Critical Estimate* by Professor Eadie (1856).

Kiwi-Kiwi. See *APTERYX*.

Kiz'il-Irmak' ('red river'), the ancient *Halys*, a river of Turkey in Asia, rises on the Kösse Dag, 97 miles W. by N. of Erzingan, flows first S.W., then N.W., and finally N.E. to the Black Sea, 40 miles E. of Sinope. It has a length of 450 miles.

Kizil-Kum' (Turk. 'red sand'), the desert of Turkestan, between the Sir-Daria and Amu-Daria, is a plain of reddish-brown sand which is here and there heaped up in hills by storms. It is over 40 miles broad, and its only vegetation is one kind of grass, and a scanty bush that sometimes reaches a height of 10 feet. The margin, called Ak-Kamish, is good grazing land, on which the Kirghiz feed their herds.

Kjölen (Norse, 'The Keel'), the watershed stretching between Sweden and Norway from the Finmark to Röras, with numerous peaks 6000 feet high.

Klagenfurt (*Claudia Forum*), the capital of Carinthia, Austria, 160 miles S.W. of Vienna by rail, on the Glau, and 2 miles E. of the lovely Wörther See, with which it is connected by a canal. The town is nearly square, and promenades occupy the site of the fortifications, destroyed by the French in 1809. The chief buildings are the parish church, with a tower 288 feet high, the archiepiscopal palace, and the 14th c. Ständehaus ('house of the estates'). There are two gymnasia, a theological college, a seminary, school of engineering, and a deaf and dumb asylum. K. has the largest white-lead manufactory in Austria, besides leather, cloth, and tobacco industries. Pop. (1869) 12,285.

Klapka, Gyorgy (George), a Hungarian general, was born April 7, 1820, at Temesvar, entered the army and became (1842) sub-lieutenant in a Hungarian regiment of guards, rose (1847) to the rank of lieutenant-colonel, and (1848) on the outbreak of the Hungarian revolution acted as general in the struggle against Austria. During the provisional government K. became Minister of War; but the most brilliant point in his career was the heroic defence of Komorn (1849) after Vilagos had capitulated, a defence which was varied by the famous sortie of August 3, in which he cut in twain the Austrian lines, and which he only ceased to sustain upon honourable terms being granted him by General Haynau. In 1850 were published the *Memoirs* of K. and (1851) *The National War in Hungary and Transylvania*. K. unsuccessfully attempted to stir up a revolution in Hungary in 1866, undertook the reorganisation of the Turkish army in 1873, and in 1877 sided with the Turks in their struggle with Russia.

Klaproth, Heinrich Julius, the son of a celebrated German chemist, was born October 11, 1783, at Berlin, taught himself Chinese before he was sixteen, studied at Halle (1800-2), started the *Asiatisches Magazin* at Dresden, and attracted the attention of scholars. In 1804 K. went to St. Petersburg, where he laboured in behalf of the Academy of Sciences at Oriental language and literature. He travelled as far as the Chinese frontier (1806), and on his return was nominated extraordinary academician, granted a pension, and admitted into the ranks of the Russian nobility. K. then explored the Caucasian range, but being prohibited from publishing the results of his travels, he left Russia in 1812, having been previously deprived of his honours. At the Isle of Elba he offered his services to Napoleon, and for some time lived upon his pen at Paris, until Humboldt in 1816 procured him the professorship of Asiatic languages and literature at the University of Berlin. K. died at Paris, August 20, 1835. His extraordinary sagacity, penetration, and erudition make him one of the greatest linguists of this century. He wrote with the same clearness and facility in French as in German, and has left important works in both tongues. *Reise in den Kaukasus und Georgien in den Jahren 1807-8*; *Archiv für die Asiatische Literatur, Geschichte und Sprach-Kunde* (1810); *Abhandlung über die Sprache und Schrift der Uiguren* (1820); *Asia Polyglotta* (1823-29), are among his German contributions. *Tableaux Historiques de l'Asie depuis la Monarchie de Cyrus jusqu'à nos jours* (1824); *Mémoires relatifs à l'Asie* (1827-28); *Magasin Asiatique* (1827); *Histoire du Kachmir* (1825); *Lettre à M. Champollion le Jeune*, are some of his contributions in French. See Landres's, *Notice Historique et Littéraire sur K.*; Fischer, *Denkschrift auf K.*; Merlin, *Catalogue de la Bibliothèque de M. K.* (Par. 1839).

Klattau (Czech, *Klatov*), a town of Bohemia, on the Bradlenka, 25 miles S. of Pilsen, carries on a cloth-weaving industry. Pop. (1869) 7734.

Klausenburg (Magyar, *Kolozsvár*, 'the enclosed fortress'), a town of Transylvania, on the Szamos, 106 miles E.S.E. of Grosswardein by rail, consists of a walled inner town, surrounded by five suburbs. The cathedral, built by Sigismund (1414), was restored by Matthias Corvinus, and there are three gymnasia, a university (founded 1872), a Hungarian theatre, &c. The chief manufactures are tobacco, cloth, paper, and faience pottery, and in the neighbourhood are important rock-salt works. Pop. (1869) 26,382. K. is the *Claudiopolis* of the Romans.

Klausthal, a town of Hanover, in the Ober-Harz, 25 miles N.E. of Göttingen, and 1792 feet above the level of the sea. In the vicinity are several silver, lead, zinc, copper, and iron mines (the Georg Wilhelm mine is 2135 feet deep), giving employment to most of the inhabitants. K. is the seat of the Government mining administration, and its Berg-schule contains a large collection of models and minerals. Most of the houses are of wood, and the surrounding country is bleak and sterile. Along with Zellerfeld, from which it is separated by the Zellbach, K. has a pop. (1875) of 8548.

Kleber, Jean Baptiste, French republican general, was born at Strassburg, 6th March 1753, entered a military school at Munich, and while there attracted the attention of Kaunitz, who appointed him to a lieutenancy in his own regiment. Finding promotion in the Austrian army too slow for penniless soldiers, K. soon resigned his commission, and lived for a time in obscurity as inspector of public buildings at Belfort in Elsass. But in 1792 he was again induced to take arms, this time as a private, and in the French army. Soon he became adjutant-major. At the defence of Mainz his bravery gained him the rank of adjutant-commander, and ultimately of brigade-general. Twice defeating the Vendéans, once at Mans, and once at Savenay in 1795, he was placed at the head of three divisions of the army of the North, and again proved victorious at Fleurus, Marciennes, Mons, Louvain, and Maastricht. Jealous intrigue then compelled him to retire from active service, and he quietly passed the leisure thus gained in writing his memoirs. Ere long, however, he hastened at the call of Bonaparte to Egypt, accompanying his chief on the Syrian expedition, capturing El-Arish, and gaining the brilliant victory of Mount Tabor. At the battle of Aboukir he also distinguished himself. Left by Bonaparte in command of the army in Egypt, K. at the convention of El-Arish consented to evacuate the country with his troops. Admiral Keith was unable to fulfil certain promises made to the French by Sir Sidney Smith; and K., indignant at what he accounted a breach of honour, called upon his men to fight once more. The Turks were routed with great slaughter at Heliopolis, and the French were in hopes of again conquering Egypt. But K. fell by the hand of a Turkish assassin on the 14th of June 1800. See Pajol's *K.*, *sa Vie*, *sa Correspondance* (Par. 1877).

Klenze, Leo von, a German architect, born 29th February 1784, in the principality of Hildesheim in Hanover, after an education in Paris and Italy, became in 1808 architect to Jerome Bonaparte, King of Westphalia, and in 1815 entered the service of Maximilian I. of Bavaria, for whom and his successor Ludwig I. he built in Munich the Glyptothek (1816-30), Odeon, Kriegsministerium, Duke Max's Palace, the Bazar, Old Pinakothek (1826-36), Royal Palace, Rahmshalle (1853), Wallhalla (1830-42), and Propylæa (1862). During a visit to Greece in 1834, K. devised the plans for the rebuilding of Athens, and in 1839 he was invited to St. Petersburg to superintend the construction of St. Isaac's Church and the Czar's Palace. K. died at Munich, 27th January 1864.

Kleptomania (Gr. *kleptō*, 'I steal,' and *mania*, 'insanity'), is an irresistible impulse to steal, connected with, or dependent upon, disease of the cerebro-spinal system. Kleptomania is not to be confounded with notorious habit-and-repute thieves; for K. may affect individuals who are not covetous, and whose circumstances are such that there is no obvious motive for theft. Many insane people appropriate the property of others under the impression that everything they see belongs to them, while others do so out of mere stupidity, and some simply from the desire to possess, knowing, at the same time, that the articles do not belong to them; but such cases are not examples of pure K., for the morbid impulse to steal is associated with other cerebro-mental lesions. There are many instances on record of K., in which there was no other apparent mental disorder; but in most instances there will probably be found distinct symptoms of cerebro-spinal disease, or a hereditary predisposition thereto. Gall mentions that the first king of Sweden was always stealing trifles, so that K. is not invariably associated with a miserly, avaricious disposition, nor with a strong desire to possess where there are no means of purchasing. Sometimes articles, thus appropriated, are entirely worthless, and are never turned to any account; and in some instances, when they are of value, they are freely given to others. Generally there is some attempt

at concealment, but articles are often stolen ostentatiously, and when the theft is detected, there is no attempt at denial or explanation. In all cases of genuine K. there is an absence of all appearance of remorse, and the individual, however respectable his position in society may be, does not appear to realise the degradation of his position, and when the event has passed the act is soon repeated. K. is very frequently an early symptom of *general paralysis*, or softening of the brain, and the first indication of a general break-down of the mental faculties.

Kle'vo (Fr. *Cleves*), a town of Rhenish Prussia, 3 miles from the Rhine, with which it is connected by a canal, and 48 miles N.W. of Düsseldorf by rail. Its chief buildings are the Stittskirche (1345) and the Schloss, with the lofty Schwanenthurm, erected by Adolf I. (1439) on the site of a Roman watch-tower. Spinning and weaving are the staple industries. Pop. (1875) 9248. The former *duchy* of K. extended along both banks of the Rhine, and had an area of 185 sq. miles. United by the marriage of Johann III. to Jülich, Berg, and Ravenstein (1511), it passed, on the death of Johann Wilhelm without issue (1609), to Brandenburg, from whom it was twice wrested by France, 1757-63 and 1794-1815.

Klink'et, in fortification, a small gate in the stockade, through which sallies may be made.

Klipp'springer (literally 'cliff springer or leaper'), the name given by the Dutch colonists to a species of antelope (*Oreotragus saltatrix*). The colour is a dark brown mottled with yellow. The average height is 21 inches. The male alone has horns. The K. antelope is among the most active of its kind. It lives in precipitous situations, and in places in which most other animals would fail to obtain a foothold. The K. is also known by the name of 'Kainisi.' In general appearance it is one of the most elegant of the antelope family.

Klopstock, Friedrich Gottlieb, a great German poet, was born July 2, 1724, at Quedlinburg. When only a schoolboy of sixteen at Schulpforte, he formed the plan of his great epic *Messias*, of which he composed the first cantos in prose while studying theology at Jena (1745-46). At Leipzig he was introduced to the editors of *Bremische Beiträge*, in which the first three cantos of the *Messias* were printed anonymously in 1748. K. then became a private tutor at Langensalza, where he made the acquaintance of Sophie Schmidt, the 'Fanny' of his odes. In 1750 Bodmer invited him to Zurich, where he stayed half a year, afterwards accepting an invitation to Copenhagen from Fredrik V. He there received a pension of 600 daler to complete his poem. His influence was soon shown in Denmark, as in Germany, by the rise of a K. and anti-K. party in literature. In 1770 he accompanied Count Bernstorff to Holstein, and in 1771 settled in Hamburg. The *Messias* was finished in 1773. K. died at Hamburg, March 14, 1803. By his epic and his lyrics K. marked a new epoch in German literature, delivering it from the slavish imitation of the French displayed in Göttsched's school. His fancy was free, if often wild and clouded, and his feeling, though sometimes exaggerated, was generally true. To the spiritless cosmopolitanism and free-thinking then in vogue, he opposed a patriotic enthusiasm and an æsthetic Christianity equally aloof from the stiff orthodoxy of the day and from narrow-minded pietism. In his *Burdete*, a sort of national-heroic dramas, the Cheruscan Hermann is the representative of German freedom, and the Scandinavian mythology fills the place previously given to old classical legends. To the prevalent abuse of rhyme he opposed unrhymed verses in antique rhythms often scarcely intelligible to a German ear. K. was, in short, a gifted poet, but wanting in clearness and the power to limit and command himself. Novalis remarks of his works, with equal wit and truth, that 'they appear, for the most part, free translations of an unknown poet, by a talented but unpoetical philologist.' K.'s collected works appeared at Leipzig in 12 vols. (1798-1817); other editions are dated 1823-30, 1839, 1844, 1855. See K. F. Cramer, *K., er und über ihn* (2d ed. 5 vols. Leips. 1782-93); Klammer Schmidt, *Briefwechsel der Familie K.* (2 vols. Haffnerst. 1810); the biographies of K. by Döring (Weimar, 1825) and Gruber (Leips. 1831), and Mörikofer, *K. in Zürich* (Zür. 1851).

Knap'sack (Ger. *Knappsack*, from Low Ger. and Dutch *knappen*, 'to bite, to eat,' and synonymous with Fr. *havre-sac*, 'a soldier's provision bag'), a portable case of painted canvas, leather, or goat-skin, borne on the back by soldiers on service

and in which is packed all the immediate necessities in the shape of clothing, &c., for a campaign.

Knap'-weed, or **Knob'-weed**. See CENTAUREA.

Knaresborough, a town of England in the W. Riding of Yorkshire, on the Nidd, 18 miles W.N.W. of York by rail. Its fine cruciform parish church of St. John was restored and enlarged in 1861; there is also a modern church of the Holy Trinity, with a tower 160 feet high. The chief manufactures are woollen rugs and mats. K. has also flour-mills and an extensive corn trade. It sends one member to Parliament. Pop. (1871) 5205.

Knee (Old Eng. *cneow*, *cneo*; comp. Ger. *knie*; Lat. *genu*; Gr. *gonu*; Sans. *jānu*), the articulation between the femur and the tibia. In birds the fibula also enters directly into the joint, but in mammals it is only indirectly, by means of the ligaments connected with the femur. In man it forms a huge joint, but in certain positions of the limb rotation of the tibia outwards and inwards can take place to a limited extent. Between the femur and the tibia there intervene two *inter-articular cartilages*, which vary in shape. Each has a convex and rounded border and a concave and thin border, a portion of the articular surface of the tibia situated within the concave border being left free. They are nearly semicircular in shape, the external forming a more complete circle than the internal. They are attached to the margins of the tibia by their convex borders, and their extremities are attached in front of and behind the *tibial spine*, the two cartilages are united together by a few fibres passing between them anteriorly, the *transverse ligament*. The tibia, fibula, and femur are connected together by strong ligaments which are divided into internal and external, the former of which cannot be seen without opening the synovial cavity of the joint. *Within* the joint there are two *crucial ligaments*. These pass obliquely between the sides of the intercondyloid notch of the femur, and pass downwards to be attached to depressions situated in front of and behind the spine of the tibia. The anterior of the two ligaments is directed downwards, forwards, and slightly inwards; the posterior, downwards and backwards. They cross each other like the letter x. The posterior crucial ligament is connected with the external semilunar cartilage by an *accessory ligament*. *Outside* the joint there is, in front, the *anterior or patellar ligament*. This may be regarded as the tendon of insertion of the extensor muscles of the thigh. In this tendon there is a sesamoid bone, the patella or knee-cap. This ligament is attached below to the tubercle of the tibia. Between the ligament and the tibia we have a bursa, and between the ligament and the fascia of the upper part of the leg a bursa. The latter bursa is distended with fluid in the affection called *housemaids' knee*.

Behind the joint there is a *posterior or Winslow's ligament*, consisting of fibres passing obliquely between the tibia and fibula, and strengthened by fibres which are continuous with the insertion of the semi-membranous muscle. On the inner side of the joint there is a broad and flat band of fibres passing between the tibia and fibula, the *internal lateral ligament*. On the outer side of the joint is a rounded cord, the *long external lateral ligament*, passing

Section through knee joint. 1, Synovial cavity; 2, ligamentum mucosum; 3, ligamentum patellae; 4, fatty cushion; 5, anterior crucial ligament; 6, posterior ditto; 7, spine of tibia.

from the outer tuberosity of the femur to the upper part of the head of the fibula; and a *short external lateral* ligament situated behind the last, not having a constant arrangement. Besides these ligaments the joint is closed in by fascia derived from the muscles in the neighbourhood of the joint, and by lateral slips from the *patellar* ligament.

Placed between the semilunar cartilages and the tibia and femur there are processes of the *synovial membrane* of the joint. It lines the internal surfaces of the ligaments of the joint, and is prolonged upwards in front of the femur for a distance of three inches. Between this synovial membrane and the portion of the anterior ligament below the patella there is a collection of fat which forms a padding to fill up certain gaps which are produced in movements of flexion and extension. In some animals this synovial membrane consists of two or three parts, and an indication of this separation remains in man in the form of a fold of synovial membrane which passes from this cushion of fat to the intercondyloid notch of the femur. To this fold the name *ligamentum mucosum* has been given.

When the knee is flexed all the ligaments of the joint are relaxed except the *patellar* and *posterior crucial* ligaments. In extension the *posterior* and *lateral* and the *anterior crucial* ligaments are stretched. In semiflexion a considerable amount of rotation can be produced. The crucial ligaments are the chief agents in preventing too much flexion and extension. The cartilages help to adapt the shape of the tibia to the different surfaces of the femur with which it is in contact in certain positions. They lessen the shock given to the leg in jumping and other movements. The *patellar* changes its position with regard to the femur and tibia in the movements of flexion and extension, distributes any pressure which may be made upon the joint in front over a large and even surface, and enables extension of the leg upon the thigh to take place more rapidly by acting as a fulcrum.

Knell'er, Sir Godfrey, a famous portrait-painter, was born at Lübeck, a free town of N. Germany, in 1648. He studied under Rembrandt, and after living in various German towns, settled in England in 1674. In 1688 he succeeded Sir Peter Lely as court-painter, and retained that office under James II., William III., and Anne. He was knighted by William in 1692, and made a baronet by George I. in 1715. He died October 27, 1723. K.'s most notable works are the 'Beauties of Hampton Court,' and the portraits of the Kit-Kat Club; but many royal and other distinguished personages sat to him for their portraits. K. was a wit as well as an artist, but his vanity was egregious. He is said to have given Pope £500 to write an extravagant epitaph on his tombstone in Westminster Abbey.

Knight, Charles, publisher and author, son of a bookseller, was born at Windsor, 15th March 1791. He edited several publications at Windsor, the *Etonian*, *Plain Englishman*, &c. In 1823 he started *Knight's Quarterly Magazine*, and continued it on removing to London in 1824. He became connected with the Society for the Diffusion of Useful Knowledge in 1827, for which he published among other works the *Penny Magazine* (1832-45); the *British Almanac* and its *Companion*, published annually since 1823, and the *Penny Cyclopædia* (1833-56) of which the *English Encyclopædia* (1854-61) is an improved development. Mr. Knight won a high place as a Shakespearian commentator by his *Pictorial Shakespeare and Biography of Shakespeare* (1839-41); and has edited or written a multitude of tracts and papers, *Half Hours with the Best Authors* (1848); *Knowledge is Power*, on the vexed question of capital and labour (1855); *Half Hours with the Best Letter Writers* (1866-68), &c. His *Popular History of England* (1856-62) is his most elaborate and able work. He published an autobiography, *Passages of a Working Life during Half a Century* (1863-65). In 1860 he was appointed publisher of the *London Gazette*, a sinecure of £1200 a year, not too great a reward for a life of unwearied labour for the development of pure and instructive literature. He died, March 9, 1873.

Knighthood. The right to confer K. was not originally a prerogative of royalty, nor was the order a part of the municipal constitution of any state. It was partly a military and partly a religious institution existing throughout Christendom, and the order might be conferred by any one who was himself a knight, whether in his own or in a foreign country. Accordingly a

foreign knight is a knight in England by our law, though a foreign duke is only an esquire. See CHIVALRY.

Knights Bann'ers were created on the field of battle by the king under the royal banner. The custom is now in desuetude, and the order obsolete.

Knights' Fee, in England, was so much inheritance as was sufficient to maintain a knight with sufficient revenue.

Knights of the Shire are the members returned to Parliament from the counties of England. Anciently they were required to be knights girt with the sword.

Knights Templars. See **TEMPLARS**.

Knipp'erdolling. See **ANABAPTISTS**.

Knitting (from Old Eng. *cnytan*; Low Ger. *knutten*, 'to make a knot'). The art of producing articles of hosiery, &c., with one continuous thread. In net-making, which has been practised from a remote period, a kind of K. is performed, the thread or twine being knotted into meshes with a needle. Plain K. is commonly pursued in making stockings by hand, and consists in forming with yarn or thread by the aid of K.-needles successive rows of loops, the loops in each row being drawn through those immediately preceding. Stocking K. is believed to have been invented in the 16th c., but in what country is uncertain. Fancy K. in cotton and coloured wools is followed by ladies in the production of many useful and ornamental household articles. Shawls, mits, &c., of great beauty and fineness are knitted by the natives of Shetland from the fine soft wool of the Shetland sheep. The greater part of the hosiery of the Midland district of England is made on the Stocking-frame (q. v.), but K.-machines will eventually supplant it. One of American origin, called the 'crane knitter,' is becoming popular in Great Britain; with it, a pair of men's woollen socks can be made in twenty-five minutes. The self-acting power K.-machine, invented by A. Paget, will be found described in *Transactions of Mechanical Engineers Institute* for 1870.

Knives (Old Eng. *cniſas*; Ger. *kneife*), a well-known general name for a variety of cutting-instruments of diverse forms and uses. K. are usually made of steel or iron, unless for special use, as cutting fruit, paper, &c., when silver, ivory, or other material may be employed. In remote antiquity cutting instruments were made of flint chips; subsequently copper and bronze were used. Table-K. and forks were unknown to the nations of antiquity. Among the Greeks and Romans only one knife, which was often richly ornamented, lay at table, and it was used by a carver to cut the meat into small pieces, which were lifted with the fingers. In *Athenæus* it is stated that the Gauls tore meat with their teeth, occasionally assisting themselves with a knife which each one carried in a sheath by his side. The Old English carried about with them a *met-sax*, or food-knife, and it is recorded that King Æthelstan left his knife on the altar of Beverley as a pledge for his redemption of a vow of benefaction. Chaucer refers to the common practice of his day in the line—'A Scheffeld thwitel bar he in his hose,' and at the same time bears testimony that Sheffield, still the foremost centre of the cutlery manufacture, was then famous for its K. The custom of carrying meat-K. about the person, is still perpetuated by wearers of the Highland costume, in which the dirk, with its small knife and fork in one sheath, is a prominent and admired feature. According to Stow, Richard Mathews, on Fleet-Bridge, was the first Englishman who made 'fine K. and knife-halts,' and in 1563 he obtained a prohibition against all K. of foreign manufacture. Clasp or spring-K. of Sheffield make were common in the second half of the 17th c.; they came originally from Flanders. The flaying-knife is the emblem of St. Bartholomew, and in the *History of Croyland Abbey* it is stated that the monks there distributed little K. to all and sundry on St. Bartholomew's Day in commemoration of the saint's horrible death. The operations in the manufacture of a steel table-knife are similar to those described under **CUTLERY** for a razor and fork.

Knot, a name given to a species of wading or gallatorial birds—the *Tringa Canutus* of the naturalist. This bird occurs in flocks in many parts of the British coasts, and feeds on the sea-grass (*Zostera marina*). It migrates southwards on the approach of

winter, and does not breed in England. The eggs appear to fumber five. The colour is a bright chestnut, variegated with brown and black, the plumage assuming an ashen grey tint after the breeding season. The average length is 10 inches.

Knot.

Knot, the nautical name for a geographical mile. The name arises from the method by which a ship's rate of sailing is ordinarily estimated. The log-line (see LOG) is divided into equal lengths by knots, and each length is $\frac{1}{10}$ th of a geographical mile, so that the number of knots on the line which run out in half a minute gives at once the rate per hour at which the vessel is going.

Knot, a mode of joining or fastening ropes. There are numerous kinds of knots having different capabilities, and on shipboard and in industrial pursuits they are of constant service. A few of the more common and useful knots are here shown.

Knots.

(1) Thumb or overhand K. tied at the end of a rope to prevent it slipping; (2) running K. used to bind or draw anything close; (3) reef or sailor's K., (4) draw K., and (5) common bend or weaver's K., are very useful for joining two ropes securely; the draw K. has also the advantage of being easily undone; (6) clove hitch binds firmly, and will support a weight on a smooth vertical pole; (7) sheepshank, for shortening a rope without unloosing the ends; (8) double bowline hitch, serviceable for slinging a cask; the single bowline hitch takes a tight grip of a post or other rope to haul on; (9) Carrick bend, a strong interweaving of two doubled ropes; (10) timber hitch for hauling on to move a weight. The knots used by mariners are described in Dana's *Seaman's Manual*. See also *Book of Knots* (Lond. Hardwicke & Bogue).

Knot-Grass, or **Knot-Wort**. See POLYGONUM.

Knout, the Russian scourge, consists of leather thongs braided with wire. It was formerly used in punishing all kinds of criminals, but is now only inflicted on incendiaries, assassins, and such like. Some 120 lashes are considered equivalent to a sentence of death.

Knowles, **James Sheridan**, an English dramatist, was born at Cork, Ireland, May 12, 1784, studied at London under his father, and composed while yet a boy the *Welsh Harper*. He early became acquainted with Lamb, Coleridge, and Hazlitt, was seized with histrionic ambition, tried his fortune at Dublin and failed (1806), tried again at Waterford (1807) in a company of Edmund Kean's, where he published his *Fugitive Pieces*. In 1815 his *Caius Gracchus* was played at Belfast; in 1820 *Virginus* appeared; in 1825 *William Tell*; in 1832 the *Hunchback*; in 1836 *Love Chase*; two of which from their adaptability to the modern stage will probably keep their ground for some time. K. wrote more than a dozen plays besides, none of them, except that they have an imitative favour of the Elizabethan dramatists and an accurate knowledge

of stage effect, rising beyond mediocrity. *The Idol Demolished by its own Priest* is a controversial treatise written by him after he had forsworn the stage and turned Baptist. K. died at Torquay, Devonshire, December 1862. A collection of his 'Dramatic Works' was published at London in 1863.

Knox, John, descended from a Renfrewshire family of some consequence (the Knoxes of Ranfurly), was born in 1505 at Gifford, East Lothian, educated at the grammar school, Haddington, and at St. Salvador College, St. Andrews (1524), where, along with George Buchanan, he studied under John Major. After diligent research among the schoolmen, and, as it is supposed upon doubtful evidence, having taken orders as a priest about 1530, K. devoted himself to the study of Jerome, Augustine, and others of the Christian fathers with the result that (about 1543) he embraced reformed doctrines and entered the family of Hugh Douglas of Longniddrie to act as tutor to a son of his and John Cockburn's of Ormiston. During 1546-47 K. preached to the Protestants who had gathered within the castle of St. Andrews until a French force, under Leo Strozzi, took it in August. K. was sent to the galleys in France for two years, from which he was released in 1549. 'He abode,' says Burton, 'in the S of England until the death of Edward VI., when he found refuge and congenial duty in Geneva. Thus, for some years after the capture of St. Andrews he and his cause disappear from the face of Scottish history.' In 1550 K. was preaching in Berwick and the adjoining country, and (April 4th) had to answer to the Bishop of Durham for heresies. At Berwick he paid his addresses to Marjory Bowes, to whom he was afterwards married. When in London in 1553, K. refused an English bishopric, and by his advice influenced to a considerable extent the Prayer Book of the Church of England. Next year K. was at Dieppe on his road to Geneva, where he became acquainted with Calvin, and about which time he wrote his *Admonition to the Professors of God's Faith in England*. At Frankfurt he became pastor of a Protestant church, but on the arrival of Dr. Cox, who had been preceptor to Edward VI., a dispute which arose as to the use of a church service sent K. back to Geneva. His 'cause' reappeared in Scotland (1555), but K. remained in Geneva (1556-7-8), along with his wife and mother-in-law. During this period he assisted in making a new translation of the Bible into English, and published a dogmatic treatise, *The First Blast of the Trumpet against the Monstrous Regiment of Women*, in which he impugned the right of females to govern. 'On the 2d of May 1557,' according to his *History of the Reformation*, 'arrived John K. from France,' after which began the most important period of his life as Scotch Reformer. He preached at Perth, and the religious houses were wrecked, the same course being adopted by the 'rascal multitude' at Crail, Cupar, Linlithgow, Stirling, and Lindores. It was then determined by the 'Lords of the Congregation' to set up the Protestant worship throughout Scotland, but, held in check by the French troops under the Queen Regent, negotiations had to be opened with the English court. These were conducted with great zeal and success by K. and ended in an English army being sent to Scotland to aid the cause of the Reformation. On the 20th December 1560 K. sat in 'the first General Assembly of the Reformed Church of Scotland, having, during the previous autumn, assisted in the compilation of the *Protestant Confession of Faith* and the *First Book of Discipline*. In August 1561, Queen Mary arrived in Scotland, and had many interviews with K., whom she endeavoured to talk over. The Reformer never desisted from denouncing with unflinching directness before her Antichrist and Popish idolatry. A reaction against the Reformation took place, which made K. all the more inexorable. He condemned Mary's proposed marriage with Darnley, and broke off for a year and a half his friendship with Murray and Maitland because he thought they temporised. K. married, for the second time (March 1564), Margaret Stewart, a daughter of Lord Ochiltree. An inhibition was laid upon him (1565) for the personal offensiveness to the court of his preaching, and he took the opportunity of visiting England, charged from the Assembly with a letter to the English bishops asking lenity for the brethren who scrupled to use the sacerdotal dress. The murder of Rizzio took place March 9th, 1566, and K. justified it. The murder of Darnley followed, February 9th, 1567, and K. publicly maintained that the estates of the kingdom ought to bring Mary to a trial, and if she were found guilty, that she

ought to be put to death. K. was a prominent party to the coronation of James VI. (24th July), and he preached (December 15th) at the opening of the Parliament which ratified all the acts previously passed in favour of Protestantism. In 1570 Regent Murray was assassinated, and K., who regarded the deed as a grave national misfortune, preached his funeral sermon. Against Kirkcaldy of Grange, his former friend, K. thundered denunciations, and his situation in Edinburgh became dangerous when the Hamiltons, who refused to pledge their word for his safety, were received into the castle. Accordingly K. sought and found a safe retreat in St. Andrews, where, though his health was shattered owing to an attack of apoplexy (1570), he wrote a *Vindication of the Reformed Religion*. 'Thirsting to depart' though he was, K. returned to Edinburgh in August, wrote (1572) a letter of sorrowful farewell to the Assembly, and at the arrival of the news of the Massacre of St. Bartholomew, was still able to execrate in public 'that murderer, the King of France.' K. died November 24, 1572, and left behind him two sons by his first wife, and three daughters by his second. It was said over his grave by the Earl of Morton that 'he neither feared nor flattered any flesh.' K.'s claims to historical consideration are many. The Scotch Reformation was largely due, in the different aspects it assumed, to his personality. Like Calvin and Luther, he not only reformed religion, but improved the language of his country. His *History of the Reformation of Religion within the Realm of Scotland* is written with strength, vigour, and simplicity. K.'s character has been variously estimated. That he was arrogant and egotistic is certain, but 'his impersonation of self, his "I, John Knox,"' says Mr. J. H. Burton, 'and his assumption of authority come from a source deeper than idle parade.' Never was man more disinterestedly earnest, never did a life shape itself more consistently in accordance with its ethical and religious theory. 'This man of God,' his secretary Bannatyne wrote in his diary when K. died, 'the light of Scotland, the comfort of the kirk within the same, the mirror of godliness, and patron and example to all the true ministers in purity of life, soundness in doctrine, and in boldness of reproof of wickedness.' See Burton's *History of Scotland*, vols. iii., iv., v.; McCrie's *Life of Knox*; *Scots Worthies*, by J. Howie.

Knowltonia, a S. African genus of *Ranunculaceae*, having very rigid ternate or bi-ternate leaves, umbellate green flowers and juicy fruits. The bruised leaves produce blisters. It was named by Salisbury after Thomas Knowlton, a useful gardener and botanist of the last century.

Knoxville, a city of Tennessee, U.S., at the head of the navigation on the Tennessee River, and on the new railway from Charleston to Cincinnati. It is the third city in the state in point of size, and lies in one of the most fertile and beautiful regions of the U.S.; has 17 churches, a marble court-house, erected at a cost of \$400,000, the E. Tennessee University, the State Agricultural College, with an endowment of \$500,000, a free library, an opera, &c. The manufactures are iron, paper, railroad-cars, carriages, &c. Pop. (1870) 8682.

Knutsford (Knut's Ford?), a market-town of England, in Cheshire, on the Bollin, 23 mile E.N.E. of Cheshire by rail. It has several quaint old half-timber, gable-fronted buildings, and a racecourse. Pop. (1871) 3597.

Koala, or **Kangaroo Bear** (*Phascolarctos cinereus*), a genus of *Marsupial* mammals, occupying a position somewhat intermediate between the kangaroos and phalangers. The K. is the native 'sloth' and 'bear' of the Australian colonists. It attains a length of 2 feet. The body is stout, and covered with a fur of a bluish-grey colour. The tail is absent. All the feet have strong curved claws, adapting the animal for climbing trees, while the great toe can be opposed to the other toes, and the fore-feet become handlike in function from the division of its fingers into two opposable sets. The food consists of vegetable matters.

Kobeljaki, a town in the government of Poltava, Russia, on the Vorskla, 140 miles by rail S.W. of Kharkov. Pop. (1870) 12,989.

Koblentz. See COBLENZ.

Kobolds. See GIANTS AND DWARFS.

Koch, Karl Heinrich Emmanuel, a German naturalist was born at Weimar in 1809. He studied at Würzburg and Jena, and in 1836 undertook a scientific journey through southern Russia, the results of which were published in his *Reise durch Russland nach dem Kaukasischen Isthmus* (2 vols. 1842-43). On his return he became Professor of Botany at Jena, but in 1843 again set out and explored the neighbouring lands of Turkey, Armenia, and the basin of the Caspian. From materials then collected, he has published several works, of which the chief are *Wanderungen im Orient* (3 vols. 1846-47), *Beiträge zu einer Flora des Orients* (1848-54), *Die Kaukasische Militärstrasse* (1851), besides an excellent map of the Caucasian Isthmus, published at Berlin in 1851.

Kock, Charles Paul de, the posthumous son of a Dutch banker, was born at Passy-lès-Paris, May 21, 1794. As a boy K. was dreamy and timid, and numbers of romances were put into his hands by his mother for his amusement. On his fifteenth year he became a banker's clerk, and in that situation wrote his first novel. Besides novels he wrote vaudevilles, comedies, and melodramas in incredible profusion. The profligacy of his writings has often been commented on by English writers. By French critics, though the fluent vulgarity of his style is condemned, he is accepted as a truthful painter of the manners of the bourgeoisie, and an accurate investigator in *affaires du cœur*. The best of his theatrical pieces were published in Paris (2 vols. 1840), and his novels (1845, in 56 vols.). Among his characteristic novels may be mentioned *Mon Voisin Raymond*, *Seur Anne*, *Le Barbier de Paris*, *Un Jeune Homme Charmant*, *Mœurs Parisiennes*. *Le Troubadour Portugais*, *M. Mouton*, *Une Nuit au Château*, represent perhaps about his best specimens of melodrama, vaudeville, and opera-comique. K. died at Paris, 28th August 1871. There are three collections of his works, that of 1834-35, in 30 vols.; of 1841-43, in 26 vols.; of 1844-45, in 56 vols.

Kohat, the chief town of the district of the same name in the Punjab, India, 37 miles from Peshawar; pop. (1868) 6064. The cantonment, which lies to the E., containing 3000 men of all arms, is much overcrowded. To the N. is a strong mud fort, which cost £31,000. K. is an important frontier station, to overawe the wild tribes of the neighbouring hills.—The district of K., which is bounded on the E. by the Indus, contains an area of 2839 sq. miles; pop. (1868) 145,419. The staple crops are wheat, millet, Indian corn, and barley. Alum, sulphur, and coal are found, and salt is mined to the amount of 14,000 tons a year, yielding to Government a revenue of £8500. Sword-blades and rifle barrels of great excellence are manufactured entirely by hand. The K. pass, 9 miles in length, which separates K. from Peshawar, was long in the possession of the Afreedees—warlike mountaineers, who came to terms with the British in the beginning of 1877.

Kohl, Johann Georg, a German traveller, was born at Bremen, April 28, 1808, and studied law at the universities of Göttingen, Heidelberg, and Munich; and after acting for some years as private tutor in the families of the baron of Manteuffel and Count Meden, settled in 1838 at Dresden. Since then he has travelled over almost the whole of Europe, besides spending four years (1854-58) in America, and has published numerous works descriptive and scientific. Among these are *Der Verkehr der Menschen in seiner Abhängigkeit zu der Erdoberfläche* (1841); *Skizzen aus Natur und Volkerleben* (1851); *Aus meinen Hütten* (1852); *Geschichte der Entdeckung Americas* (1862); *Nordwest-Deutsche Skizzen* (1864); *Am Wege. Blicke in Gemüth und Welt* (1866); *Geschichte der Erforschung des Golfstroms* (1868).

Kohl-Rabi ('Kale Turnip'), the German name for a dwarf variety of the cabbage (*Brassica oleracea*, var. *gongylodes*) with stem swollen so as to resemble a turnip above ground, but of a delicate green colour. This abnormal growth is used like turnip or potato as a vegetable to meat, or is dressed whole, and eaten with sauce. It is more appreciated, and more cultivated in Central and N. Europe than in Britain.

Kokra Wood is a very hard wood obtained from *Scepa Roxburghii*, a tree with simple laurel-like leaves, now placed in the Spurge family, but having a curious affinity to the genus *Alnus* (alder) of *Amentifera*. It is used in India for various purposes, and imported into Europe chiefly for manufacturers of musical instruments, such as flutes.

Kol'aba, the chief town of the district of the same name, Bombay, British India, and also of an island on the Concan coast, due S. of Bombay. K. town is a military convalescent station. K. island was formerly the headquarters of the Angria family of Mahratta pirates, but the dynasty failed in 1841. The district of K. has an area of 1482 sq. miles; pop. (1872) 350,405.

Kolapore, the chief town of the native state of the same name, India, in connection with the Bombay Government, 185 miles S.E. from Bombay. Pop. (1872) 39,621. The state of K., which lies within the Deccan, has an area of 3184 sq. miles; pop. (1872) 802,691; revenue, including that of its dependencies, £304,000. The products are rice, millet, sugar-cane, and coarse cotton; the manufactures are pottery and hardware. The ruling dynasty is Mahratta, and traces its descent from a younger branch of the family of the great Sivajee. The present (1877) Rajah is a minor, and the state is administered by the Political Agent. Public works, education, and sanitary improvements are receiving special attention. Since 1822, internal mismanagement has frequently required the intervention of the English; the last treaty dates from 1864. There are eleven recognised feudatory chiefs. The Bombay Sepoys mutinied here in 1857.

Kolar, the chief town of the district of the same name, in the state of Mysore, India, 43 miles E.N.E. from Bangalore, and 10 miles N. of the Madras Railway. Pop. (1871) 9924. Silk and blankets are manufactured, and turkeys are reared in great numbers. Here is the tomb of Hyder Ali's father. The district of K., in the extreme E. of Mysore, has an area of 2577 sq. miles; pop. (1871) 618,954. The crops are *jagger*, rice, gram, oilseeds, betel leaf, tamarind and turmeric. The exports are silk and sugar. It contains the rock fort of Nundidrug.

Kol'berg, a fortified seaport of Prussia, in Pommern, on the river Persanté, near its entrance into the Baltic, 143 miles N.E. of Berlin, with which it is connected by rail. It has an old cathedral, a handsome town-house, important salmon and lamprey fisheries, salt-works, and 37 vessels of 6586 tons. Standing among low swamps it can easily be surrounded by water. Pop. (1875) 13,550, of whom 1687 are soldiers. K. has sustained several protracted sieges. Before the town lies the fortified work called the *Maikuhle*.

Kolgujev, a rocky and swampy island of 1350 sq. miles, lying N.E. of Tsheskaja Bay, 124 miles from Kanin Noss, inhabited by a few Samoeds, but visited annually by Russian fowling and fishers.

Kollar, Janos, a Slavic poet, born 29th July 1793 at Mossocz in the N. of Hungary, after an education at Kienmütz and Neusohl, studied theology at the universities of Presburg and Jena. Appointed pastor of the Slavic evangelical church at Pesth (1819), he held that post until the outbreak of the revolution of 1848, when he was called to Vienna as confidential agent of the government. The year following he was made Professor of Archaeology in the University of Vienna, where he died January 29, 1852. K.'s first and finest production, *Bánsé* ('Poems,' 1821), became famous in it; second edition, under the new title *Slávy Deera* ('Daughter of Glory,' 1824), and marks an epoch in Czech literature. It consists of 622 sonnets, of which Panslavism is the connecting sentiment. His later writings were mainly on linguistic subjects. Kober published a selection from his writings entitled *Spisy* (4 vols. Prag, 1862-63).

Kölliker, Rudolf Albrecht, a German physiologist, was born at Zurich, July 6, 1817. Since 1847 he has been Professor of Physiology at Würzburg. His chief works are his *Mikroskopische Anatomie* (2 vols. 1850-54), the materials of which he had published as memoirs during his earlier career; his *Handbuch der Gewebelehre* (1852, 4th ed. 1863); the *Entwickelungsgeschichte des Menschen* (1861); and the *Icones Histologicae* (1864).

Kollin, a town of Bohemia, Austria, on the left bank of the Elbe, 35 miles E. of Prag, with a pop. of 7727. It is the scene of a victory gained by the Austrians under Marshal Daun over Friedrich the Great, 18th June 1757.

Köln (Fr. *Cologne*, Lat. *Colonia*), a fortified city of Prussia and capital of the Rhineland province, on the left bank of the Rhine, 24 miles S.E. of Düsseldorf by rail. A fortress of the first rank and one of the chief commercial centres of Germany,

it is semicircular in shape, girt by a ring of twenty-two forts, and has narrow, gloomy streets. A bridge of boats and an iron bridge 1352 feet long, connect it with Deutz on the right bank of the river. The great architectural feature of K. is the cathedral, which was founded in 1248, and is one of the most magnificent specimens of Gothic in Europe. A cruciform structure, it is 510 feet long and 231 broad, and the central tower rising over the transept is 357 feet high. The choir, completed in 1322, and flanked by seven chapels, exhibits in its lowest parts the simple, dignified forms of early Gothic, while from the massive pillars of the substructure rises a florid system of splendid arches and flying buttresses. The work of building which had lingered was abandoned in the 16th c., and the edifice was converted into a hay magazine by the French in 1795. In the beginning of the 19th c. it was rescued from destruction; first Friedrich Wilhelm III. and then the German people contributed funds for its restoration, the cost of which is estimated at £700,000; Zwirner was appointed architect, and, excepting the towers, the building was completed in 1863. Other notable churches are those of St. Peter, containing a picture of the crucifixion of St. Peter, painted and presented by Rubens; St. Ursula, where are preserved the bones of the 11,000 virgins, who, according to the legend, were massacred here by the Huns on their refusal to break the vow of chastity; St. Marie im Capitol, the oldest church in K., built in the 11th c.; church of the Minorites, of the 13th c., with the tomb of Duns Scotus; and that of St. Gereon (1219-1227) dedicated to the 408 martyrs of the Theban legion and their captains Gereon and Gregory (afterwards the patron saints of K.), who are traditionally recorded to have perished here during the persecutions of Diocletian in 286. The Gürzenich, so named from its founder, was originally a 'Merchants' Hall,' and was built 1441-74; it is now used as a music hall, and is the finest secular building in K., being adorned with pinnacles and six slender watch-towers. (See Raschdorff, *Das Kaufhaus Gürzenich in K.* Berl. 1864, with twenty-one plates.) K. has also an archbishop's palace, a town-house of the 13th c., a museum (1855-61), an observatory, a public library, a botanic and zoological garden, an arsenal, a seminary for the education of priests, several gymnasia and a theatre. Outside the walls are beautiful gardens and promenades. K. was famed for its cloth industries as early as the 13th c., and had warehouses at Bergen and Bruges. It is now noted for its manufacture of eau-de-cologne, of which some 1,500,000 bottles are exported yearly. The factories of the perfume are twenty-four in number, and of these the Klosterfrau Maria Clementine Martin, produced 26,400 gallons (value £48,855) in 1871. The other industrial products of K. are silks, woollens, laces, cotton yarns, velvets, cloaks, and metal wares. There is good dock accommodation and an extensive river-trade in wine, grain, oil, &c. K. is a great railway centre. Pop. (1875) 135,371 (including Deutz with a pop. of 14,513), of whom 10,746 are Protestants, 2685 Jews, and 5240 soldiers. K. was originally called *Ubiarum Oppidum*, but when a Roman colony was planted here by Julia Agrippina in A.D. 50, the name was changed to *Colonia Agrippina*. Remains of the Roman period—sculptures, mosaics, tombstones, &c., are continually being discovered. K. subsequently became a free city of the empire, and one of the richest of the Hanse towns, and was the seat of a university from 1388 to 1798. Its bishop was raised into an archbishop in the 8th c., and for several centuries the holders of the see took their place as princes and electors of the empire. The archbishopric was secularised in 1801, and the city with its territory was ceded to Prussia in 1814. See Ennen and Eckertz, *Quellen zur Geschichte der Stadt K.* (vol. i. 1860), and Ennen, *Geschichte der Stadt K.* (3 vols. 1862-68).

Kolom'na, one of the oldest towns of Russia, in the Government of Moscow, on the Moskva and Kolomenka, 63 miles S.E. of Moscow by rail. It has twelve churches, two convents, an old kremlin, manufactures of silks, cottons, leather, &c., and some cotton-printing, and tallow-melting. Pop. (1870) 20,000.

Kolome'a, or properly **Kolomyja**, an old town of Austria, in Galicia, at the foot of the Carpathians. It is noted for its pottery, and had formerly an important trade. Pop. (1869) 17,679, of whom nearly half are Jews.

Koltsch, Alexis Vasiljevitch, a popular Russian lyrical, born in Voronezh, 14th October 1809. His father, a cattle-

dealer, gave him only the merest rudiments of education; but a few books bought at fairs awoke his imagination, and in his wandering life as a herdsman it was roused to an enthusiasm for the steppe that reflects itself in all his songs. After imitating for a time the verse of such poets as Derzawin and Pushkin, K. went in 1831 to Moscow on business, and there found friends who inserted some of his poems in the journals. A visit to St. Petersburg in 1838 introduced him to Pushkin, Joukovsky, and a wide circle of appreciative friends. He longed more and more to be rid of trade, and was just about to settle in St. Petersburg for a literary life, when he sickened and died, 31st October 1842. In 1846 appeared a complete edition of his poems, with a biography by Bjelinsky. They are marked by deep poetic feeling, force of conception, and a charming naïveté of expression.

Koldivan', a town of Asiatic Russia, in the government of Tomsk, on the left bank of the Obi, 100 miles S.W. of Tomsk, and at the base of an offset of the Altai Mountains, in which there are large jasper quarries. Pop. 3000.

Kolyma', the most easterly of the great rivers of Siberia, rises in the Stanovoi Mountains, flows N., receiving the Omolon and the Anyui, and enters the Arctic Ocean by the K. Bay, after a course of nearly 1000 miles. At its mouth lies the little town of Nishnii Kolymisk.

Komorn' (Hungar. *Komárom*), a town in the comitat of K., Hungary, lies on the E. extremity of the Greater Schütt, an island at the junction of the Danube and Waag, 87 miles E.S.E. of Vienna, with which it is connected by railway. Its fortifications, founded by Matthias Corvinus, and restored since 1805, extending 7 miles along the rivers' banks, are among the strongest in Europe, and can shelter as many as 50,000 men. During the Hungarian War under Klapka (q. v.), the insurgents here resisted the Austrian forces from October 1848 to September 1849. K. has considerable trade in wine, grain, wood, and fish.

Kond, or **Khand**, an aboriginal hill tribe of India, chiefly found in Orissa, where they number 77,000, and also in the N.E. of Madras. They are supposed to be of Dravidian origin, akin to the Gonds. Until the last few years they were notorious for human sacrifice, which they used to carry out in the most systematic and horrible manner. This practice demanded a military force for its suppression in 1847, when more than 1500 victims were rescued. It is said that all inclination to it has now died out. See Dr. W. W. Hunter's *Orissa*, and Colonel Dalton's *Descriptive Ethnology of Bengal* (Calcutta 1872).

Kong Mountains, a range in the W. of Africa, forming the N. boundary of A-hanti and Dahomey, and extending W. from the Niger, in a line almost parallel to the coast (from which it is distant some 200 miles), as far as the tableland of Senegambia. The greatest known summits are not over 2500 feet.—**K.** is also the name of the capital of a district to the N.W. of Ashanti, which has some cotton industries, and a trade in gold dust, and is the converging point of several caravan routes.

Konieh, a town of Asia Minor, capital of the vilayet of the same name, 129 miles W.S.W. of Newschehr, is a decayed place, though its numerous mosques and other public buildings still give it an imposing aspect. There is a bazaar for the sale of English cottons, Nürnberg wares, &c., but of native industries there are none. Pop. estimated at from 22,500 to 30,000. K. is the ancient *Icomium*, the capital of Lycaonia, which was a populous city, inhabited by Greeks and Jews, at the time of the visit of Paul and Barnabas. It was the scene of a synod (235), fell under the Arabs (708), became the residence of the Seljuk sultans (1097), and was captured by Friedrich Barbarossa (18th May 1190). On December 20, 1832, it witnessed the defeat of the Turks under Redshid Pasha by Ibrahim Pasha, the Egyptian viceroy.

König, Friedrich, the inventor of the steam-press, was born at Eisleben, April 17, 1775, and first began business as a printer and bookseller. In 1807 he went to London, and with the aid of Thomas Bensley and others was enabled in 1810 to patent his first steam-machine, which printed by two flat plates. In 1811 he patented his cylinder press, and after various improvements, which he patented, he returned to Germany in 1817, where in the succeeding year he established, along with

Andreas Friedrich Bauer, a firm for making steam printing-presses at Oberzell near Würzburg in Bavaria. K. died January 17, 1833.

Königgrätz, a fortified town of Bohemia, on the left bank of the Elbe, at the mouth of the Adler, 64 miles E.N.E. of Prag by rail. It is the seat of a bishop and has a cathedral and some cloth industries. Pop. (1869) 5061. The Austro-Saxons, under Benedek, suffered a severe defeat here at the hands of the Prussians under Moltke, 2d July 1866.

Königinhof, an industrial town of Bohemia on the Elbe, 18 miles N. of Königgrätz by rail. It has manufactures of linen, leather, hats, &c., and some sugar refining. Pop. (1869) 5370.

Königsberg, the capital of the province of E. Prussia, and a fortress of the first rank, on undulating ground at the confluence of the Old and New Pregel, and 4½ miles from the entrance of the united stream into the Frisches Haff, 78 miles E.N.E. of Danzig. It is the seat of a university (old building founded in 1544, new one completed in 1862) and has a royal palace of date 1532-54, enclosing a large quadrangle, and having a lofty Gothic tower, a schlosskirche adjoining the palace, where Friedrich I. was crowned in 1701 and Wilhelm in 1861; a museum with a collection of 300 chiefly modern pictures, a Gothic cathedral, begun in 1835, situated on an island in the Pregel, and containing the tomb of Kant, an observatory, royal library, botanical garden, several public gardens, and a theatre. The Pregel is crossed by seven bridges, and on the N. sides of the town are two extensive sheets of water. K. is connected by rail with its port of Pillau, at the mouth of the Frisches Haff. A new quay on the river at K., with rails, was being constructed in 1876. There are large manufactures of machinery, chemicals, beer, soap, leather, tobacco, paper-hangings, &c. K. has an immense trade in grain, drawing its supply chiefly from Russia (export in 1875, 8,262,161 cwts., value £3,485,916). Its other exports are timber, wool, iron, and iron wares, and petroleum (1875, 110,588 barrels). In 1875 there entered the port of Pillau 2424 vessels of 541,080 tons, and cleared 2316 of 1,250,773 tons. K. is connected by rail with the S. of Russia. In 1875 there was imported 3,022,000 cwts. of coal and coke, and 217,000 barrels of herrings. Pop. (1875) 122,636. K. was originally a castle (1255) of the Teutonic order, and was named after King Ottokar of Bohemia. After the fall of Marienburg (1457) K. became the residence of the Grand Master of the Order, and subsequently (1525-1618) that of the Dukes of Prussia. The Elector Friedrich III. of Brandenburg here assumed the title of King of Prussia in 1701, and after the disasters of 1806 Friedrich Wilhelm III. retired hither with his court, including Baron v. Stein, W. v. Humboldt, York, &c. K. is also noted as the birthplace of Kant, and the scene of his life-work. Hamann, Herder, and others are also associated with the city.—**K.** is also the name of a town in the Neumark, Brandenburg, on the Röke, with some tanning and distilling. Pop. (1875) 6353.

Königswart, a town of Bohemia, in the valley of the Beraum, a tributary of the Elbe, 79 miles W.S.W. of Prag. It is the seat of a castle built by Metternich in 1618, and in the vicinity are iron and tin mines, and mineral springs. Pop. (1869) 7494.

Konotop, a town in the Russian government of Tshernigov, Russia, 440 miles S.W. of Moscow by rail, has several factories. Pop. (1870) 9946.

Konrad is the name of several German poets of the middle ages. (1) **K.**, probably Castellan to Heinrich the Lion (1139-95), who translated the *Song of Roland* into German verse (mod. ed. W. Grimm, Augsb. 1838). (2) **K. Fleck**, a native of Swabia, born about 1220, author of the exquisite *Flöre und Blancheleur* (ed. by Sommer, 1846; mod. version by Wehrle, 1856). (3) **K. Von Würzburg**, represents at its best the last epoch of romantic poetry as it flourished under the fostering hand of the Hohenstaufen. Little is known as to the details of his life beyond the meagre facts that having dwelt for long at Würzburg, he died at Basel, 31st August 1287. He was one of the most prolific of the Minnesänger, and though prolix at times, is marked by the spontaneity, freshness, and naïveté of his order. His chief works are the legends, *Heil. Alexius* (Massmann,

843); *Silvester* (Grimm, 1841); *Das Herte* (Roth, 1846); *En, elhart und Engeltrut* (Haupt, 1844); *Kaiser Otto* (Hahn, 1838); *Die Goldene Schmiede* (Grimm, 1840); *Lieder* (Pfeiffer, 1870), &c.

Konrad I., the nephew of Emperor Arnulf and Count of Franconia, was elected King of the Germans, October 9, 911. K. carried on wars with his vassals, the Dukes of Saxony and Bavaria, in order to establish the royal authority. He was mortally wounded in an engagement with the latter, and before his death he asked his brother to hand over the crown to the eminently competent Heinrich of Saxony. The chief internal change during his reign was the making of duchies for the first time into hereditary fiefs. K. died December 23, 918.—**K. II.**, son of Heinrich, Duke of Franconia, was elected at Mainz, September 8, 1024, King of the Germans. He was speedily engaged in war with his cousin, the Duke of Carinthia, part of his policy being to lessen the power of the territorial aristocracy. Then he crossed the Alps (1026), was crowned King of Italy at Milan, and (1027) Emperor at Rome. Upon the death of Rudolf of Burgundy (1032), K. succeeded to that duchy, though he had to contest with Eudes of Champagne for five years before obtaining absolute possession. At different points he carried on war with the Bohemians, Poles, Slavs, and Hungarians. In 1037 K. revisited Italy, and issued his Edict, making all fiefs hereditary. He died at Utrecht, June 4, 1039, and leaves the reputation of having been one of the most sagacious and brave German kings. K. was the first of the Franconian line of emperors.—**K. IV.**, the last of the Hohenstaufen dynasty, was born, April 1228, at Andria, received the title of Duke of Swabia and Elsass, and was crowned King of the Romans in 1237. K.'s reign was marked by a struggle with Heinrich of Thuringia, who, at the advice of Innocent IV., assumed the title of royalty at Hochheim. He became Emperor upon the death of Friedrich II. (1250), but was excommunicated by the Pope, against whom he fought with success. He died of a fever at La Vallo, May 21, 1254.—**Konradin of Swabia**, son of the preceding and Elizabeth of Bavaria, was born in 1252. In his infancy K. was stripped of the crown of Germany, Naples, Sicily, and Jerusalem, through the influence of Innocent IV., who, notwithstanding the opposition of Manfred, K.'s uncle, enlisted the services of Charles of Anjou by promising him royal honours. Manfred was conquered in the plains of Graondella, and (1268) K. being defeated at Scurcola, was taken prisoner, conducted to Naples, and executed in November of the same year. A fragment of poetry among a collection of the Minnesänger is attributed to the unfortunate youth, who suffered the severest penalties for his father's excommunication.

Koo'doo (*Strepsiceros Koodoo*), a species of Antelope (q. v.), attaining a height of 4 feet at the shoulder. Its distinctive feature is the curious spiral conformation of the horns, which attain a length of 3 feet, and are provided with a keel. So regular in their conformation are these structures, that a straight pole may be passed down and through the spirals, without interruption. The K. is hunted for the sake of the skin and flesh, a strong durable leather being made from the former. The colour is a reddish grey, marked on the sides with several prominent white streaks. The female is hornless. The K. is usually found in bands of four or five.

Koom'rah, the name given to a species of *Equida* somewhat intermediate in form between the horse and ass, found in N. Africa, where it inhabits woody districts. Very little is known regarding its exact nature or habits. The colour is a very dark bay. The tail is slightly tufted, but the general bearing of the animal suggests an alliance with the horse.

Ko'pek (*kopeika*), a Russian copper coin, one-hundredth part of a Rouble (q. v.).

Ko'ran (Arab. 'the reading,' or 'that which ought to be read,' from *kara*, 'to read'), is the collection of revelations which Mohammed (q. v.) professed to receive from time to time either directly from God or through the angel Gabriel; the name being applied to the whole book and also to any particular chapter or section. It was composed in the dialect of the Koreish, the most noble of all the Arab tribes, with some slight mixture of other dialects. It is the standard of the Arabic language, and is universally acknowledged to be written with the utmost elegance and purity; it claims, indeed, to be inimitable by human pen,

and therefore to be a standing miracle, greater than that of raising the dead. To this miracle Mohammed himself chiefly appealed for the confirmation of his mission, publicly challenging all the scholars of Arabia to produce a single chapter that could be compared with it. That Mohammed was the author of the K. is undisputed, although it is probable that, as was said by some of his countrymen at the time (cf. K. 16, 25), he got assistance from others. The account given of the matter by himself was that the divine original was written from everlasting on a vast table beside the throne of God, and that a copy from this was sent down to the lowest heaven, from which Gabriel revealed it to Mohammed in fragments as circumstances required, showing the whole copy, a volume bound in silk and ornamented with gold and gems, to the prophet once a year. The revelations were taken down from the lips of the prophet by his secretaries, and published to his followers, the original copies being thrown promiscuously into a chest. The work of editing these various fragments was entrusted by his successor Abu Bekr to Zeid ibn Thabet, one of his secretaries, who collected them from the palm leaves and skins on which they had been written, and from the mouths of such as had gotten them by heart. In the thirteenth year of the Hegira, owing to the numerous variations of the copies used in the different provinces, the Calif Othman ordered a large number of copies to be transcribed from that of Abu Bekr, and to be put in circulation in place of the old ones, which were burned.

The general design of the K. seems to be this: to unite the professors of the three different religions then followed in the populous country of Arabia, who, for the most part, lived promiscuously, and wandered without guides, the far greater number being idolaters, and the rest Jews and Christians mostly of erroneous and heterodox belief, in the knowledge and worship of one eternal, invisible God, by whose power all things were made, and those which are not may be, the supreme governor, judge, and absolute Lord of the creation; established under the sanction of certain laws, and the outward signs of certain ceremonies, partly of ancient and partly of novel institutions, and enforced by setting before them rewards and punishments, both temporal and eternal: and to bring them all to the obedience of Mohammed, as the prophet and ambassador of God, who after the repeated admonitions, promises, and threats of former ages, was at last to establish and propagate God's religion on earth by force of arms, and to be acknowledged chief pontiff in spiritual matters as well as supreme prince in temporal' (Goliis, quoted by Sale). The great doctrine of the K., then, is the unity of God, to re-establish which truth Mohammed declared to be the chief and of his mission, as it had been the mission of Moses and Jesus, the great prophets before Mohammed, but after whom no great prophet need be expected. Accordingly the greater part of the K. is filled with examples of punishment inflicted by God on 'those who rejected and abused his messengers, many of them taken from the Old and New Testaments, and the Jewish and Christian apocryphal books. Another part is occupied with laws and admonitions to various virtues, especially reverencing and worshipping the only true God, and resignation to his will. The rest consists of passages relating to particular emergencies.

The K. is not only the Bible of Mohammedans, but also their code of law and jurisprudence, and Book of Common Prayer. It contains explicitly or implicitly all knowledge. The various discrepancies and contradictions in it are explained by the doctrine of abrogation: that God commanded several things in the K. which were for good reasons afterwards revoked. Of the present text 225 verses have been abrogated in this way. See MOHAMMEDANISM.

Kordofan ('the white land'), a province in the Egyptian territories of the Sudan, formerly an independent state, but conquered by an Egyptian force in 1821. Its area is about 12,000 sq. miles, and its pop. is estimated at 500,000. The chief town is El Obeid (q. v.). See NUBIA and SUDAN.

Körner, Karl Theodor, a German poet, born at Dresden, 23d September 1791, studied for two years at the school of mines at Freiburg, and went in 1810 to Leipsic, but owing to imprudence was forced to leave the university. At Vienna he brought upon the stage some comedies of high value; his serious dramas were less striking, but their pathos, most marked in *Zriny* and *Rosamunde*, captivated the young. On the breaking

out of the War of Freedom, K. entered the army, after his *Leier und Schwerdt* ('Lyre and Sword') had shown that his special field lay in the patriotic lyric. Weber's melodies made his fresh, bold songs all the more popular. On the 26th August 1813 K. fell in an action between Schwerin and Gadebusch, where there is a monument to his memory. His *Sämmtliche Werke* were published by Streckfuss (1 vol. Berl. 1834, 1863; 4 vols. Berl. 1838, 1863), and by Wolff (with letters, &c., 4 vols. Berl. 1858). Biographies of K. have been written by Erhard (1821) and Hadernann (1848).

Kosciuszko, Tadeusz, a Polish patriot, was born of noble parents in the government of Minsk, 12th February 1746. Educated at Warsaw, he entered the army and obtained the rank of captain. In the American War he distinguished himself by the side of La Fayette, and on his return to Poland became major-general. When Catherine II. declared war he served under Poniatowski; but the base intrigues of Stanislas rendered all patriotic movement useless, and he retired in disgust to Germany. In 1794 K. returned to Poland, assumed the dictatorship, marched upon the Russians and defeated them at Racławice. By a series of skilful movements he kept the ill-disciplined armies of the enemy at bay; but on the appointment of Suwaroff to the Russian command Poland's hopes fell. Overpowered by numbers, K. sustained an irretrievable defeat on the 10th of October 1794 at Maciejewice. Falling from his horse, covered with wounds, he cried, 'Finis Poloniae!' Within a month Poland was completely subdued. K. was kept in confinement at St. Petersburg during Catherine's reign, but regained liberty on Paul's accession, and passed into France. He died of fever 15th October 1817. There are biographies of K. by Falkenstein (Leips. 1825, 2d ed. 1834); and Chodzko (Par. 1837).

Köslin (Slav. 'the goat town'), a town in the province of Pommern, Prussia, 75 miles N.E. of Stettin by rail, and 5 miles from the Baltic, with a great sheep-market, and manufactures of paper. Pop. (1875) 14,816.

Koslov, a town in the Russian government of Tambov, on the river Voronezh, 42 miles W. by N. of the town of Tambov by rail, with a large trade in corn and tallow. Pop. (1870) 25,522.

Kossuth, Lajos (Louis), chief actor in the Hungarian Revolution of 1848, was born at Monok, in the county of Zemplin, April 27, 1806. Educated for the profession of his father, a lawyer, but too early a republican to hope for legal preferment, he quitted his studies, and entered on his political career as a representative at the diet of Presburg, in 1832. Here his only attempt at oratory covered him with mortification, and he determined to gain influence by establishing a journal. This journal, first circulated in MS., afterwards in lithograph, did not long escape government suppression; and its editor was condemned to four years' imprisonment. In 1840 the result of the elections compelled the release of all political prisoners, and K. was again at liberty, more a republican than ever. The *Pesth Journal*, which he then established, with a circulation of sixty copies, in two months numbered six thousand subscribers. After nearly four years of journalistic work, K. devoted his energies to the formation of national societies, several of which did most important reformation work. In 1847, K., in his prime, was by an overwhelming majority returned to parliament as member for Pesth. At once making a bold stroke for freedom, he demanded the formation of a Hungarian ministry. The demand was granted. Hitherto K. had sought the political reform, rather than the independence of his country; but Austria's deceptions urged his party to extremes. K. forced the Emperor to ratify decrees giving equality of civil rights to all classes, and franchise to every citizen possessing £10 of income, or £40 in heritable property, to every university graduate, and to every workman employing an apprentice. The Vienna cabinet was not slow to revenge itself. Imperial decrees were passed practically nullifying any independence Hungary had gained; the Croats were instigated to desertion, and open rupture quickly ensued. Still K., in his new journal, *K.'s Gazette*, maintained the attitude of a dutiful subject. Only when Austria openly espoused the cause of the Croats did he, in despair, appeal to the nation with these words, 'I demand two hundred thousand men, and forty-two millions of florins.' They were granted. Volunteers flocked to the standard, and a severe battle was fought with Jellachich.

Marching on Vienna, K. sustained a defeat at Schwechat, and retired. Still patriots volunteered. The diet removed from Pesth to Debreczin, formally declared the country in danger, and appointed K. Governor of Hungary. Austria, aided by Russia, spread destruction pitilessly, and in 1849 K., convinced that the cause was lost, resigned his post, escaping to Turkey, and thence to England. Seldom has the British nation accorded to any foreigner a welcome warmer than that which K. received. His eloquence won for Hungary the most intense sympathy. K. was but coldly heard, however, in America, whence he returned to England in 1852. His *Select Speeches*, delivered in this country during the Russian war, have been edited by F. W. Newman. On the outbreak of the Italian revolt, K. addressed the soldiers of his country, but failed to effect any movement. In 1867 he was elected deputy for Waitzen, but declined the office. He has latterly resided at Turin, devoting much of his time to science. In 1877 K. broke the silence of years to advocate an anti-Russian policy on the part of Hungary and England.

Kostroma, a central government of Russia, is watered by the navigable Volga, with its tributaries. Area 32,701 sq. miles; pop. (1870) 1,101,099. The forests, which belong mainly to the peasants, and cover three-fourths of the surface, are the chief source of wealth, shipbuilding, tar-making, and the manufacture of mats of linden bark being important industries. Linen, paper, and Russia leather are also largely manufactured. In all there are 411 factories, with 8132 workmen. Among the inhabitants are 4000 Cheremissians, and 300 Karakalpaks. —**K.**, the capital of the government, 191 miles N.E. of Moscow, on the rivers Volga and K., which are frozen for six months of the year. It has a fine cathedral, forty churches, leather and linen industries, a thriving trade, and celebrated shipbuilding yards. It was founded in 1152, and suffered much from Tartar and Polish invasions. Pop. (1870) 27,178.

Kotah, the chief town of a native state of the same name in Rajputana, India, on the right bank of the river Chumbul, 195 miles S.W. from Agra. It is a well-built place, with some trade. In 1857 the British resident, with his two sons, was murdered by the native troops of the K. contingent.—*The state of K.* has an area of about 5000 sq. miles; pop. about 450,000; net income, £200,000. Much of the country is well watered; the hilly tracts are carefully preserved for large game. The dynasty, whose title is Maharao, dates from 1620. In 1874 it was found necessary for the British to assume the direct administration of affairs, which is conducted through an able Mohammedan minister. K. is the headquarters of the Harrow Political Agency.

Köthen (Ger. 'the place of huts'), an old and well-built town in the duchy of Anhalt, S. Germany, 12½ miles W.S.W. of Dessau. It has a handsome railway station, and is at the junction of lines from Magdeburg, Bernburg, Halle, and Dessau. The old castle has a valuable zoological museum. Pop. (1875) 14,408.

Kotri, a town in the district of Kurrachi, Scinde, British India, on the right bank of the Indus, opposite Hyderabad, and 105 miles N.E. by rail from Kurrachee; pop. (1872) 7949. K. occupies, at present, an important position, as the terminus of the Scinde railway, where goods and passengers are transhipped into the Indus steamers. It happens to be situated on a permanent bank of the river. There is a floating-dock here, and a steam ferry to Gidu Bundar, the port of Hyderabad.

Kottbus, a town of Prussia, in the province of Brandenburg, on the Spree, 70 miles S.E. of Berlin, at the junction of lines of railway from Berlin, Halle, Leipsic, Breslau, and Posen. It has an old royal castle, and large manufactories of cloths, woollens, and linens. Pop. (1875) 22,650.

Kotzebue, August Friedrich Ferdinand, a German poet and playwright, was born at Weimar, May 3, 1761, and after a varied career in Russia and Germany, was assassinated at Mannheim, March 23, 1819, by K. Sand, on account of his hostility to liberalism. His works are numerous, and marked by skilful stage-effects. The chief are *Menschenhass und Reue* (1789), known on the English boards as *The Stranger*; *Die Indianer in England* (1789); *Die Verwandtschaften* (1798); *Das Epigramm*, and *Die beiden Klingsberg* (1801); *Das Intermezzo* (1809); *Die Verkleidungen* (1818), &c. There is a collected edition (1840-42) in 40 vols.; a select edition (1868) in 10 vols. See Döring's *Biographie Von K.* (1840).

Kou'miss, or **Ku'miss**, an alcoholic beverage made by the Tartars and Kalnucks from mare's milk, which is caused to undergo vinous fermentation. A spirit, called *rack* or *racki*, possessing a most disagreeable taste, is distilled from it. K. is supposed to possess therapeutic virtues, and its manufacture in England has recently been entered on.

Kouss'o. See **CUSO**.

Kov'no, a government of Russia, made up (1843) of the N. districts of the former government of Vilna, is bounded N. by Courland and S. by Vilna, Suwalki, and E. Prussen. Area 15,775 sq. miles; pop. (1870) 1,156,041. K. is undulating and wooded, with numerous streams, which run S. to the Niemen, or N. to the Baltic and the Gulf of Riga. The chief industries are agriculture and wood-cutting; the principal crop is rye, while flax and hops are also largely cultivated. K., the chief town, at the confluence of the Vilna and Niemen, 415 miles S.W. of St. Petersburg by rail, has considerable trade, and is noted for its mead (*Lippits*). Pop. (1870) 33,050.

Krajo'va, the chief town of Little Wallachia, near the E. bank of the Schyl, 120 miles W. of Bucharest, with which it is connected by rail. It is very irregularly built, has a large public park, and is inhabited by many wealthy bojars. Pop. 22,767.

Krasnoiarsk' (Slav. 'the beautiful city'), 1. A town of Russia, in the government of Astrakhan, on the Achtuba mouth of the Volga, and 23 miles N.E. of Astrakhan, has important fisheries, and is noted for its fruit. Pop. (1870) 8246.—2. K., capital of the government of Yenescisk, in E. Siberia, in a fruitful district on the river Yenesei. Gold washing is carried on, and there is a museum for Siberian antiquities. Pop. (1870) 9997.

Krazin'ski, **Count Valerian**, born about 1780, is chiefly known by the use to which he turned a wide knowledge of Slavonic language and literature during the period succeeding the rebellion of the Poles in 1830, when he resided in England. *The Rise, Progress, and Decline of the Reformation in Poland* (2 vols. Lond. 1839-40); and *Montenegro and the Slavonians in Turkey* (1853) are among the most instructive of a host of miscellaneous works published by him in this country. K. died in Edinburgh, 22d December 1855.

Kre'atine. See **CREATINE**.

Kre'feld, a town of Rhenish Prussia, 5 miles from the E. bank of the Rhine, and 12 N.W. of Dusseldorf by rail. It is the chief German seat of the silk and velvet industries—the manufactures vying with those of Lyons, and amounting in value yearly to over three millions sterling. Other products are machinery, chemicals, and cottons. Pop. (1875) 62,905, of whom 13,000 are Protestants (1000 Anabaptists), whose ancestors, settled here under the protection of the Princes of Orange (1600-1702). K. with the county of Meurs fell by inheritance to the crown of Prussia in 1702. The French under the Prince of Bourbon-Condé were here defeated by Ferdinand of Brunswick in 1758.

Kremenchug', a town of Russia, in the government of Poltava, on the Dnieper, 58 miles S.W. of Poltava by rail, has seven churches, numerous charitable institutions, tallow and rope factories, manufactures of liqueurs, &c., and is the trade-centre of the government. Pop. with the suburb Krinkow (1870) 30,472.

Kremenetz' (Slav. 'a fortress'), a town of Russia, in the government of Volhynia, on the Ikva, 115 miles W. of Jitomir, in a ravine surrounded with high mountains. It has an observatory and a botanic garden; and on a high hill near is the famous monastery of Pocheyof. Pop. (1870) 10,449.

Krem'nitz (Slav. 'a fortress,' Magy. *Körmöcs Bánya*), a town of Hungary, between the Gran and Neutra, 80 miles N. of Pesth, with which it is connected by rail. Its gold and silver mines are among the richest in Europe, and it has five churches, a castle, and a famous mint that issues yearly over 130,000 ducats and 2,000,000 silver florins. There are also vitriol and paper industries. Pop. (1869) 8442, who are mostly of Saxon origin, and still speak a corrupted Saxon dialect.

Krems, a town of Austria, 37 miles W.N.W. of Vienna, by rail at the confluence of the K. with the Danube, is a walled place with fine churches and numerous educational institutions.

Market gardening is an active industry, and there is a thriving trade in flax, soap, wine, &c. A rich alum bed was discovered here in 1760. Pop. (1869) 8155.

Kremsier, a town of Austria, in the markgratdom of Mähren, on the river March, 40 miles E. by N. of Brünn. The Archbishop Olmütz has here a beautiful summer residence, with fine art collections and a large library. During the Vienna rising the Austrian diet met at K. from 22d November 1848 to 7th March 1849. (Pop. 1869) 9910.

Kre'osote. See **CREOSOTE**.

Kreuz'er, a German coin, equal to $\frac{1}{4}$ gulden, or $\frac{1}{4}$ d. in S. Germany, but in Austria called *neu-K.*, and equal to $\frac{1}{10}$ gulden, or $\frac{1}{10}$ d. The K. was first coined in the Tyrol in the 13th c., and was marked with a cross (*kreuz*).

Kreuz'nach, a town of Rhenish Prussia, on the Nahe, where it joins the Rhine, 40 miles S.S.E. of Koblenz by rail. It is chiefly celebrated for its medicinal salt springs, which of late years have attracted many visitors. There are some manufactures of brandy, champagne, chocolate, and tobacco. A quaint stone bridge, on which are built several houses, unites the *Altstadt*, the *Neustadt*, and *Bade-Inscl*. Pop. (1875) 13,787.

Kril'of, **Alexis Andrejevich**, a Russian poet and fabulist, born at Moscow, February 14, 1768, obtained in 1812 a post in the imperial library at St. Petersburg, and in 1830 a seat in the cabinet. He stood in high favour with the Czars Alexander I. and Nicholas, who loaded the closing years of his life with wealth and honour. K. died at Vassily-Ostrov, on the 21st November 1844. When a young man, K. wrote prose comedies; but his fame rests on his fables (published in 1808, 1811, and 1816), which are truly national poems, full of native thought and humour, and wholly free from the imitation of French models universally found in earlier Russian literature. They are familiarly known by all classes of society in Russia, and have been translated into German by Torney (Mitau, 1842). See W. R. S. Raiston's *K. and his Fables* (1871).

Krimmitschau', a town of Prussia, in the province of Saxony, 40 miles S. of Leipsic by rail. It has manufactures of woollens, cottons, needles, and buttons. Pop. (1875) 17,649.

Kris, or **Creese**, the name for a dagger with wavy blade and curved wood hilt carried by the Javanese, and worn throughout the Malayan Archipelago generally. It is with this weapon that fanatical Bugis or Malays run *amok*, that is, under some sudden impulse, rush wildly through a village, wounding every person in their path.

Krish'na ('the black or blue one'), the eighth *avatar* or incarnation of Vishnu, and the most popular god of the Hindu cosmogony. In the Mahabharata he appears as a prince, whose valour greatly contributed to the successful issue of the war. In the Ramayana he becomes a god, and the 18th Purana or Bhagavata is devoted to the description of his life. The legends all centre round the upper valley of the Jumna, in the neighbourhood of Muttra and Brindabun, where K. sported with the milkmaids. His love scenes with Radha are beautifully described in the Gita Govinda of the poet Jayadeva (see translation by Arnold, Lond. 1876). In many respects, K. recalls the Apollo of the Greeks, and some episodes in his early life are even thought to be borrowed from the New Testament.

Kro'nenberg, a town of Rhenish Prussia, on the Wipper, has manufactures of silks, and iron and steel wares. Pop. (1875) 8165.

Kron'stadt (Germ. 'crown city'), a strongly-fortified and regularly built seaport town of Russia, on the island of Kotlin, in the Gulf of Finland, 20 miles W. of St. Petersburg. It is the chief commercial seaport of Russia, the seat of the admiralty, and main station of the Russian Baltic fleet. The fortifications of K., founded in 1710 by Peter the Great (who took the island from Sweden in 1703), have been gradually strengthened with ramparts of massive granite, defended with many batteries of large cannon. In 1854-55 Sir Charles Napier blockaded K. without effect. It has three large harbours: the inner for merchant ships, the outer for ships of war, and a third for ship-building and repairs. K. is the port of St. Petersburg. In 1874 it was entered by 1773 sailing vessels and 1084 steamers, of which 945 (including 510 steamers) were English. On an

island near lies the fort of Kronsloot ('crown castle'). Pop. (1870) 47,166.

Kronstadt, or **Krūnen** (Magy. *Brassó*), a town of Austria, in Transylvania, 70 miles E. of Hermannstadt, is the terminus of the principal railway, and the chief centre of the trade and manufactures of Transylvania. It consists of a lower quarter, surrounded with walls, and three suburbs, and has an old fortified castle, a fine Gothic church, and a town-house with a high tower. K. has several paper-mills, and extensive manufactures of linens, woollens, and cottons. Pop. (1869) 27,766, of whom three-fifths are Germans.

Krossen, a town of Prussia, province of Brandenburg, at the confluence of the Bober and Oder, 32 miles S.E. of Frankfurt, has two churches, an ancient *schloss*, and manufactures of cloth and leather. Pop. (1875) 6789.

Krüdener, Barbara Juliane von, grand-daughter of the Russian Field-Marshal Münnich, born 21st November 1764 at Riga, married in her sixteenth year Baron von K., whom she accompanied to Venice and Copenhagen as Russian ambassador, but was divorced, and returned to Riga in 1791. To this time belongs her well-known sentimental novel, *Valérie ou Lettres de Gustave de Sinar à Ernestine de G.* (2 vols. Paris, 1804, new ed. 1855), in which she sketches the romance of her own life. Becoming penitent she joined the Herrnhuters, and travelled through great part of Europe, drawing crowds of unfortunates of all classes to her preaching of repentance, visiting the distressed in prisons, and fearlessly rebuking kings and princes. In *Le Camp des Vertus* (Paris, 1815) she published her views on the Second Advent. The Czar Alexander I. was deeply influenced by her. Though honoured by some as a heroine and a prophetess, she was by many regarded as mad, and was driven from one country after another, till her death at Karasu-Basar in the Crimea, 25th December 1824. See Brescius and Seiler, *Beiträge zu einer Charakteristik der Frau von K.* (Berl. 1818); Eynard, *Vie de Madame de K.* (2 vols. Paris, 1849); and *Frau von K., eine Zeitgemälde* (1868).

Kru' mau, a town of Bohemia, on the Moldau, 15 miles S.W. of Budweis. It has an immense castle, built on a rock and enclosing five courtyards. There are large breweries and a famous beer-vault is cut in the solid rock. Pop. (1869) 6600.

Krumm'acher, Friedrich Adolf, a religious writer of Germany, born July 13, 1768, at Tecklenburg in Westphalia, died a preacher at Bremen, 4th April 1845. He is widely known as a writer of moral parables (*Parabeln*, 1805, 8th ed. 1850; *Apologien und Paromythien*, 1810) much imitated in his own time. See Möller, *F. A. K. und seine Freunde* (Bonn, 1849). — **Friedrich Wilhelm K.**, son of the above, born at Duisburg in Rhenish Prussia, January 28, 1796, an eloquent preacher and earnest opponent of rationalism, was from 1853 to his death (December 10, 1868) Court Chaplain at Potsdam. His *Elias der Thibiter* (3 vols. 5th ed. Elberfeld, 1860), *Elisa* (2 vols. 2d ed. *ib.* 1845), and *Salomo und Sulamith* (7th ed. *ib.* 1855) have been translated into English.

Krumm'horn, a very old wind instrument of wood; also an organ stop, called in England (by corruption) *cremona*.

Krupp, Friedrich, a celebrated German metal-founder, was born at Essen, in Rhenish Prussia, April 11, 1812. There, in 1827, his father established a foundry, which under the proprietorship of the son has grown to one of the most extensive manufactories in the world. (See **ESSEN**.) In 1851 he exhibited in London at the Great Exhibition a block of steel, weighing 45 hundredweights, and cast after a method invented by him. The steel manufactured by this process is called Krupp's steel, and can now be cast in 100-ton blocks. His great fame, however, rests upon his steel guns, which were used so successfully by the Prussians at the siege of Paris during the late war (1870-71). Recently he has cast an 80-ton breech-loading gun in steel, which is nearly 30 feet long, and will throw a projectile $\frac{1}{3}$ of a ton in weight, and has designed besides a 124-ton gun, to be made upon the same plan, whose projectile will weigh 1 ton.

Kru'senstern, Adam John Chevalier von, a Russian voyager, born 8th November 1770 at Haggud in Esthonia, served (1793-1799) in the English navy, and after his return to Russia, commanded (1803-6) a Russian expedition to the N. Pacific in the interests of science and trade, described by himself

in *Reise um die Welt* (3 vols. 1810-12; Eng. trans. by Hoppner, 1813). Other works of his are *Atlas de l'Océan Pacifique* (2 vols. St. Petersburg, 1824-27), and *Beiträge zur Hydrographie der grösseren Océane* (Leips. 1819). K. became a vice-admiral in 1829, and an admiral in 1841, and died August 24, 1846.

Kahatt'riya, or **Chetri**, the second or warrior caste of the primitive Hindu system. How they became extinct is uncertain. They are said to have been exterminated by an angry god, Parasuram. Among those who claim to be their modern representatives are the Rajputs (q. v.) and the Khetris, the great trading caste of the N.W., who are now to be found all over the peninsula, and even visit Central Asia in pursuit of commercial profit. The chiefs of the aboriginal hill tribes also generally claim to belong to the K. caste.

Ku'ba, a town of Asiatic Russia, in the government of Baku, 47 miles S.S.E. of Derbend, was the seat of a khan, but was abandoned by the Russians on their annexation of 1816, on account of its unhealthiness, and **New K.** founded in its stead, 18 miles to the westward. The latter is well built, and strongly fortified, and carries on a lively trade with Persia and Astrakhan. Pop. 9405.

Kuban', a river of Russia, rises in the Caucasus, at the N.W. base of Mount Elbruz, flows N., and then W. receives the Labu, passes the forts Nikolaja, Protschimo-Okop, and Jekaterinodar, and enters Lake Kesiltash, near the Strait of Kertch on the Black Sea, after a course of over 450 miles.

Kub'lai Khan, a great Mongol conqueror, grandson of Genghis Khan (q. v.), flourished in the 13th c. He expelled the Manchu Tartars from China, subdued the native Sing dynasty, and by 1280 was ruler of the most extensive empire on the face of the earth. It reached from the Arctic Ocean to the Straits of Malacca, and from Asia Minor to the Sea of Okhotsk. Every Mongol prince acknowledged his paramount authority; the Grand Dukes of Russia paid him tribute, and scholars came to his court from India, Persia, and Europe. K. died at Pekin in 1294.

Kuch, or **Cooch Behar**, the chief town of a native state of the same name in Bengal, India, situated between two channels of the river Torsha, a tributary of the Brahmaputra, 348 miles by road N. from Calcutta; pop. (1872) 7132. — The state of **K. B.**, which is surrounded by British territory, has an area of 1292 sq. miles; pop. (1872) 532,565; revenue, £116,000, of which some part is derived from estates within British districts. The staple crop is rice; the exports, jute, tobacco, and oilseeds. By a treaty dated 1773, the state pays a tribute of £6770, which was then estimated to be half the revenue. The present rajah is a minor, and the state has been under British management since 1864, by which it has greatly advanced in prosperity. It is the home of the tribe of Koch, or Rajbansi, who are probably of Indo-Chinese origin, and number one and a half millions throughout Bengal.

Kue'nen, Abraham, a famous Dutch theologian, was born at Haarlem, 16th September 1828, and, after attending the gymnasium there, was enrolled a student of theology at Leiden, 4th September 1846. On the 21st of June 1851 he was made a doctor of theology, after having defended as his thesis a *Specimen theologicum, continens Genesios Libri Capita triginta quatuor priora ex Arabica Pentateuchi Samaritani Versione nunc primum edita cum Prolegomenis* (Leiden, F. J. Brill). After passing the ecclesiastical examinations (which give access to the office of a preacher in the Reformed Church), he was appointed on the 1st October 1851 *Adjutor Interpretis Legati Warneriani*, and as such charged under Professor F. W. J. Juynboll, *Interpres Legati Warneriani*, with the care of the Oriental MSS. of the University Library of Leiden. On the 30th December 1852 he was appointed Professor Extraordinary of Theology in Leiden. At his entrance on this office (12th March 1853) he delivered a discourse, *De accurato Antiquitatis Hebraicae Studio Theologo Christiano magnopere commendando* (Leiden, P. Engels). On the 1st October 1855 he was appointed Ordinary Professor. In the academical year 1861-62 he was Rector of the University of Leiden, and on laying down office (8th February 1862) he delivered a discourse, *De Religione Christiana, per continuas Theologiae Commutationes sibi constanti et ineluctabili* (Leiden, Van Doesburgh). Before entering on the office of

professor, K. was made Doctor of Literature *honoris causa* by the senate of the University of Leiden (2d February 1853). K.'s writings are *Liber Geneseos secundum Arabicam Pentateuchi Samaritanis Versionem* (Leid. E. J. Brill, 1851); *Libri Exodus et Levitici secundum Arab. Pent. Versionem* (ibid. 1854); in the *Bijbelsch Woordenboek voor het Christelijk Gezin* (Biblical Dictionary for the Christian Family), published in three vols. (Amst. P. N. van Kampen, 1852-59), the articles *Jerusalem*, *Samaritanen* (Samaritans), and a number of others on the books of the Old Testament; in the *Godgeleerde Bydragen* (Theological Contributions), published at Amsterdam, for 1855-66, a number of dissertations, and sometimes extensive reviews of books, and among other things, a number of essays under the common title, *Het O. Testament in het N. Testament* (The Old Testament in the New Testament); in the periodical, *De Bijbelvriend, Nieuw en Oud, ter verklaring van den Inhoud en den Geest des Bijbels* (The Bible-friend, New and Old, for the explanation of the contents and the spirit of the Bible (Nymegen, H. C. A. Thieme, 1860-1872), a number of essays and articles, among which there is a series of sixteen *Schetsen uit de Geschiedenis van Israël* (Sketches from the History of Israel); *Historisch-kritisch Onderzoek naar het Ontstaan en de Versameling van de Boeken des Ouden Verbonds* (Historico-critical Inquiry into the Origin and Collection of the Books of the Old Covenant) (3 vols. Leid. 1861-65); [French transl. of part I, by A. Pierson, with an introduction by M. Renan (Par. M. Lévy, frères, 1866); Eng. transl. of chaps. i. and ii., *Pentateuch and Joshua*, by Bp. Colenso (Longmans, Lond. 1865).] In the *Theologische Tijdschrift* (Theological Journal; Amst. and Leid. Loman and Van Doesburgh; later, Leid. Van Doesburgh) for 1867 and following years, K. wrote a great number of essays, articles, shorter and larger reviews and notices, among other things, a series of ten *Critische Bydragen tot de Geschiedenis van den Israëlitischen Godsdienst* (Critical Contributions to the History of the Religion of the Israelites); *De Godsdienst van Israël tot den Ondergang van den Joodschen Staat* (The Religion of Israel to the Fall of the Jewish State, 2 vols. Haarl. 1868-70); *De vijf Boeken van Mozes; eine Voorlezing* (The Five Books of Moses, a lecture, Leid. 1872); *De Profeten en de Profetie onder Israël: Historisch-dogmatische Studie* (The Prophets and Prophecy in Israel, an historical and dogmatic inquiry, 2 vols. Leid. 1875). There are English translations of the three last-mentioned works. Smaller brochures—published separately, or in collections of sermons—are not mentioned here. In the *Theological Review*, No. liv. (July 1876) appeared *Yahveh and the 'other Gods'*, and in the reports and communications of the Royal Academy of Sciences (Section of Literature), *De Samenstelling van het Sanhedrim* (The Composition of the Sanhedrim) (1st ser. vol. x.); *De Stamboom van den Masoretischen Tekst der O. Testament* (The Pedigree of the Masoretic text of the Old Testament, 2d ser. vol. iii.), translated into French by A. Carrière (Paris, E. Leroux, 1875); *De Mannen der Grooten Synagoge* (The Men of the Great Synagogue, 2d ser. vol. vi.).

Whatever may be thought of the results at which he has arrived, it cannot be denied that K. is eminent alike as a critic of the Old Testament and as an historian of its religion. He exercises a growing influence both here and on the Continent, particularly on the younger and fresher students of the Hebrew Scriptures. As a critic he has developed, qualified, and applied the positions of Graf, maintains the priority of the Jahvist fragments in the Pentateuch, and finds the origin of the Levitical legislation in and after the Babylonian captivity. He holds that the prophecies of the 8th c. B.C. are authentic documents, written by contemporaries of the events described, and constitute the firm and luminous point from which the constructive, literary, and historical criticism of the Old Testament can best start. As an historian he denies the supernatural, regards the religion of Israel as a phenomenon to be explained like the other religions of the world by the operation of strictly natural causes, with a development that was alike in history, thought, prophecy, and legislation throughout organic. K. is a thinker of remarkable power, an historian of subtle insight and great constructive ability, an accurate and laborious scholar, and a writer of singular lucidity, terseness, and force.

Kuenlun' Mountains, a range of Central Asia, stretching from the Bolor-Tagh E. to the mountain-system of China, and forming the N. boundary of Thibet. The western part, which

is all that is yet known, is generally called Karakorum, and towers to a height of 21,000 feet, sending down tremendous glaciers, and opening in wild romantic valleys.

Ku'fo Writing, a form of Arabic characters, somewhat older than the age of Mohammed, and used throughout Northern Arabia. It was modelled on the Old Syriac, and was named after the town of Kufa on the Euphrates, because that place, as the first seat of the Califs, outside Arabia, contained the most accomplished Arabic scribes. From Kufa the writing spread over the other lands of the Caliphate, but fell into disuse in the 10th c. It is found on coins and inscriptions. Stockholm has one of the best collections of Kufic coins in Europe. Among the writers who have paid special attention to this subject are Adler (*Museum Cuficum Borgianum*), the two Tychsens, Hallenberg, Castiglioni, Marsden, De Sacy, Frähn, and more recently Dorn, Stickel, De Sauley, Olshausen, and Sorel.

Kugler, Franz Theodor, a German author, born at Stettin, January 19, 1808, early devoted himself to artistic pursuits, trying in turn music, painting, and poetry. In 1831 he became Doctor of Philosophy, and in 1835 was nominated Professor to the Academy of Fine Arts, being appointed a member of the Berlin Academy in 1849. He died March 18, 1858. It is said of K. that, 'along with Waagen and Schnaase, he opened out a new path in artistic history, and originated a national art in Prussia.' Among his chief contributions are *Handbuch der Geschichte der Malerei von Constantin bis auf die neuere Zeit* (1837-47); *Handbuch der Kunstgeschichte* (1841-47); *Geschichte der Baukunst* (1856). His history of Friedrich the Great reached a 7th ed. in 1870.

Kuh'-horn ('Cow Horn') or **Alp-horn**, the long horn of the German mountainous regions, having usually five notes, and capable of producing melodious phrases.

Kuikajou, or **Potto** (*Cerculeptes caudivolutus*), a peculiar species of carnivorous mammalia found in S. America, and attaining the size of a large cat. Its colour is light brown, variously marked with bands of a darker colour. The tongue is very long, is used in taking in honey, a partiality for which has procured for the K. the name of 'honey bear.' The tail is prehensile, and assists the animal to climb trees. The K. is readily domesticated, and appears to be of inoffensive habits.

Kuil'enburg, a walled town of Holland, in the province of Gelderland, on the S. bank of the Lek, 10 miles S. by E. of Utrecht by rail. It has several places of worship, including a Jansenist church and a synagogue, also a fine orphanage. There are manufactures of stoves, furniture, &c., and a steamboat trade with Rotterdam, chiefly in grain, butter, and tobacco. Pop. (1870) 6162.

Ku'ka, or **Ku'kana**, a town of Central Africa, the capital of Bornu, lies 10 miles W. of Lake T. had, and consists of two distinct towns, Billa-Gedibe and Billa-Futebe, the former of which is the royal residence. There is a large weekly market of mats, horses, slaves, pearls, &c. Estimated pop. 8000.

Kulm (Czech. *Chlumer*, 'a hill;' cognate with the Lat. *culmen*), a village of Bohemia, Austria, 8 miles N.E. of Teplice, is celebrated as the place where a French corps under Vandamme was surrounded by the allied Austro-Russian army, and, after a fierce resistance, forced to surrender with eighty pieces and 10,000 men, August 29-30, 1813.—**K.** (Pol. *Chelmo*) is also the name of a town in the province of West Prussia, near the Vistula, 25 miles N. by W. of Thorn. It has linen industries and a corn trade. Pop. (1875) 9615. K. was a Polish Hanse town from 1466 to 1772. The *Kulmischer Recht* was a collection of all the statutes of the Teutonic knights for the Kulmisch land.

Kuma'on, a large district in the N.W. Provinces, British India, which lies on the S. slopes of the Himalayas. Area, 6000 sq. miles; pop. (1872) 433,314. It reaches up to Thibet, and contains some of the highest peaks in the world, as well as the sacred sources of the Ganges. K. was annexed after the Nepál war of 1815. The lower regions include the terai, or long fringe of malarious jungle which skirts the base of the mountains. The forests are now preserved, and the low land has been brought under an immigration scheme. Potatoes are largely grown, and in 1872 there were 1395 acres under tea

cultivation, yielding 285,700 lbs. Gold and lead are found, copper mines are also worked, and the iron is of sufficiently good quality to attract European capital. The chief towns are Almorah (pop. 6260), Mandi, and the sanatorium of Nyni Tal. J. P. Minnaert, one of the professors in the University of St. Petersburg, who visited India for the purpose of collecting Oriental MSS., published *Indyjskiya skazki i legendy*, &c. (Indian Tales and Legends collected in K. in 1875; St. Petersburg, 1877).

Kumbuk, a large and handsome tree of the Myrobalan family (*Combretaceae*) called *Pentaptera glabra*. It is a native of various parts of India, and the hard and durable wood is employed in shipbuilding. By calcining the bark and wood a kind of lime is obtained for chewing with the betel nut.

Kümm'el. See CARAWAY.

Kumquat of Japan, a shrub belonging to the orange family, namely, the *Citrus Japonica* of Thunberg. It bears a fruit about the size of a gooseberry, from which an excellent preserve is prepared. In Chusan the K. occupies extensive slopes of the hills, bearing abundance of its yellow fruit, which is collected for home use and for export.

Ku'nersdorf, a village of Brandenburg, $4\frac{1}{2}$ miles N.E. of Frankfurt, is the scene of a disastrous defeat of Friedrich the Great by the Russian and Austrian allies, August 12, 1759.

Kungur, a town of Russia, in the government of Perm, on the Sylwa, 49 miles S.E. of Perm, has six churches, tanning and other industries, and in the neighbourhood a large anchor factory. Pop. (1870) 10,804.

Kunigunde, St., whose life is written in the *Acta Sanctorum*, was the wife of Heinrich of Bavaria, who became emperor in 1014. As the story goes, K. being childless, her husband lent his ear to calumnies affecting her chastity, and permitted her to suffer a trial by ordeal. Having walked barefoot over ploughshares at a white heat unscathed, K. vindicated her virtue, and after Heinrich's death she took the veil, and founded the convent of Kaufungen, where she died March 3, 1040. In 1200 K. was canonised by Innocent III.

Kunnoj (*Kanauj*; Sansk. *Kanyakubja*, 'round-shouldered girl'), a town in the district of Furruckabad, N.W. Provinces, British India, on the Kali stream, 52 miles N.W. of Cawnpore. Pop. (1872) 17,093. At present little more than 'an expanse of ruins, where the cultivated fields are composed of brick-dust and mortar.' K. was for many centuries the capital of Hindustan, being second in antiquity only to Oude, and it has given its name to the most honoured sept of Brahmins. The Hindu dynasty was overthrown by Mohammed of Ghur in 1194; but the city owes its ruin chiefly to a change in the course of the Ganges, which now flows 2 miles to the E. In 1540 K. was the scene of the decisive defeat of the Mogul Emperor Humayun by his Afghan rival, Shere Shah.

Kupferschiefer, the name given to a series of beds of dark shale, rich in copper ore, which occurs in the Harz and Hessen, and seems to be contemporaneous with the lower strata of the Magnesian Limestone of the Permian Period (q. v.).

Kupurthulla (*Kapurthala*), the capital of a native state of the same name, in N.W. India, in political connection with the Punjab Government, 8 miles from the left bank of the river Beas, 75 miles S.E. from Lahore.—The state of K. lies half in the Punjab, and half in Oude, the latter territory having been granted for services during the Mutiny of 1857. Area, 1650 sq. miles; pop. 470,000; revenue, £170,000, of which £13,100 is paid to the British as commutation for military service; army, 15 guns, 198 horse, and 1014 foot. The products are sugar-cane, cotton, wheat, maize, and tobacco. The present Rajah, descended from the warlike Sikh stock, was most liberal in support of education. He is now insane, and the state is under British administration. See Griffin's *Rajahs of the Punjab* (Lahore, 1870).

Kur (Gr. *Kuros*, Lat. *Cyrus*), or **Mtkwari**, a river of Armenia, rises in the Soghan-lü Mountains to the S.W. of Kars, enters Caucasia, and after a winding south-easterly course of about 600 miles, only 70 of which are navigable, enters the Caspian by several mouths between Baku and Senkoran. Its

principal tributaries are, on the right the Aras (q. v.), and on the left the Alasun.

Kurdistan ('land of the Kurds'), the geographical expression for a loosely-defined region of south-western Asia, which is included in the Turkish vilayets of Van, Diarbekr, and Bagdad, and in the Persian province of Azerbaijan. Its area is variously estimated at from 28,000 to 100,000 sq. miles (three-fourths of the whole being nominally subject to Turkey), and the pop. at from one to three millions. The Kurds (anc. *Carduchi*) are a nomadic Aryan race, much given to plundering, and little changed from what they were in the time of Xenophon. They are stout, dark-complexioned, and savage in appearance. A few have settled down to agriculture, and the cattle, goats, and horses of their rearing are widely famed. The Kurdish language, a sister of the Persian, is divided into two main dialects—the Kurmanchi and Zaza. A branch of the race occurs in the Persian province of Khorasan, whither it was transported by Shah Ismail to guard his eastern frontier. These number some 25,000, live mostly in tents, and are still notorious for their thievish propensities. See Rich's *Narrative of a Residence in K.* (2 vols. Lond. 1836), and Lerch's *Forschungen über die Kurden* (2 vols. St. Petersburg, 1857–58).

Kuria Mu'ria Islands belong to Britain (since 1854), and are situated in a bay of the same name on the S.W. coast of Arabia. They are six in number, have a total area of 21 sq. miles, and are inhabited by some thirty fishermen. There is a slight export of inferior guano.

Kurile Islands, a chain of twenty-six Japanese islands in the N. Pacific Ocean, stretching from the island of Yesso, N.N.E., to Kamtschatka, across the entrance to the Sea of Okhotsk, a distance of 700 miles. Area estimated at 3000 sq. miles; pop. probably not over 300. They are irregular and mountainous, containing some ten active volcanoes, one of which is 12,000 feet high. They derive importance from their iron and copper mines, seal-fishery, and fur trapping. They are divided into the Great and Little Kuriles; the latter belonged to the Russians till they gave them up, in exchange for territory in Saghalien, to the Japanese by treaty of June 1875.

Kurisches Haff, a lagoon on the N. coast of Prussia, separated from the Baltic by a narrow tongue of land called *K.-Nehrung*, and communicating with it by the Memel Deep, some 1000 feet wide, and 12 feet deep. It is 60 miles long, and on an average 15 broad; its waters are fresh, and for the most part shallow.

Kurnal (*Karnal*), the chief town of the district of the same name in the Punjab, British India, on the Grand Trunk Road, 74 miles N. of Delhi. Pop. (1868) 27,022. It is a walled city of great antiquity, and has manufactures of country cloth and blankets. It is the site of a stud-farm, but the military cantonments were removed in 1841, on account of unhealthiness, supposed to have been engendered by the interference with drainage caused by the Western Jumna Canal. K. was the scene of a decisive battle (1739), when Nadir Shah, the Persian invader, defeated the Mogul emperor.—The district of K., which is bounded on the E. by the Jumna River and irrigated by the canal, has an area of 2351 sq. miles; pop. (1868) 610,927. The staple crops are wheat, millet, rice, cotton, and sugar-cane. The manufactures are sal-ammoniac, made out of the salt that effloresces from the soil, glass, and cotton goods. The towns are K., Paniput, and Kythul.

Kurnul, the chief town of the district of the same name in Madras, British India, on the right bank of the Tungabudra River, not far above its junction with the Kistna, 320 miles N.W. of Madras; pop. (1871) 25,579. The district of K., which is bounded N. by the Nizam's dominions, has an area of 7151 sq. miles; pop. (1871) 914,432. This tract was only acquired by the British in 1834, when the Nawab or Mohammedan chief was forcibly dethroned for treason. It is the scene of the operations of the Madras Irrigation Company, guaranteed by Government, which were commenced in 1864, and have not proved a success, despite a total expenditure of more than a million sterling. The district is at present (1877) the centre of suffering from famine.

Kurrachi (*Karachi*), the capital city and the seaport of the province of Scinde, British India, at the extreme N. of the delta

of the Indus. Pop. (1872) 53,526, with an additional 3297 in the cantonments which lie N.E. of the city. K. occupies a most important position both for trade and for military purposes. The harbour is the best along the seaboard for 500 miles in either direction. It lies between Manora Head and the island of Kiamari. Up to 1874, £450,000 had been spent on its improvement, and is now dredged to a uniform depth of 20 feet. In 1871-72 it was visited by 1021 ships, with a tonnage of 129,508. The total value of sea-borne imports and exports is about four million sterling. The chief imports are cotton piece goods (£850,000), metals (£200,000), grain and sugar (£100,000 each), liquors (£90,000). The exports are raw cotton (£800,000), wool (£400,000), oil-seeds, dyes, and provisions (£150,000 each). These figures include the interportal trade with Bombay. There is besides a large inland trade with Beluchistan and Afghanistan. The railway at present (1877) only runs to Kotri, 105 miles up the Indus, but the connection with the Punjab is being proceeded with. K. has no important manufactures. The town is well built, and cared for by the municipality. There are several churches, schools, and hospitals; a handsome public building, called the Fiere Hall (in honour of Sir B. Frere, for eight years commissioner of Scinde), which cost £20,000; three steam cotton-presses, which can turn out daily 1000 pressed bales; and the head offices of the Indo-European Telegraph Company. The city is said to have had no existence prior to 1729. It was occupied by the British in 1839, four years previous to the conquest of the province by Sir Charles Napier.—K. *district*, which extends between the Hubb River and the Indus and across the delta of the latter river, has an area of 14,091 sq. miles; pop. (1872) 423,459. It is covered to a great extent with barren hills and sandy deserts, and is very thinly peopled. See *Gazetteer of Scinde* (Lond. 1874).

Kursk, a government in S. Russia, surrounded by the governments Orel, Voronezh, Kharkov, Poltava, and Tchernigov. Area, 17,937 sq. miles; pop. (1870) 1,866,859. It is an undulating plain, intersected by the rivers Sem, Psiol, and Vorskla, which belong to the river system of the Dnieper, and by the Donetz with its affluent the Oskol, belonging to that of the Don. Agriculture is the principal industry; hemp, flax, hops, and tobacco are much cultivated.—K., the capital, 285 miles S. by W. of Moscow, has twenty-two churches, and a great church seminary with 2000 students. Pop. (1870) 31,754.

Kusnezsk, a town of Russia, in the government of Saratov, and on the Trussava, 300 miles W. of the Volga. It has large tanneries and an active trade in timber. Pop. (1870) 14,185.

Kusten'djie, a fortified seaport in Bulgaria, Turkey, on the Black Sea, at the E. end of Trajan's Wall. A railway, opened in 1860, connects it with Tchernavoda on the Danube. The estimated value of exports for 1872, in transit and otherwise, consisting of cereals, cattle, wool, cheese, &c., was £400,000; and of imports, chiefly manufactured goods, hardware, coal, &c., £220,000. The same year there entered and cleared 395 steamers and sailing ships, for the most part British, Turkish, Austrian, and French, with a total tonnage of 177,185 tons register. Pop. 1800.

Küstenland (i.e., 'coast land'), a crown land of Austria, lying between Carniola and the Gulf of Venice. Area, 3084 sq. miles; pop. (1869) 600,525. It is part of the former kingdom of Illyria, and is sometimes called by that name. Including the peninsula of Istria (q. v.) it is traversed in a south-easterly direction by lateral ranges of the Julian Alps, which in Monte Maggiore attain a height of 4400 feet. The only considerable rivers are the Isonzo and Queto, and the chief ports are Trieste (the capital), Capo d'Istria, Pirano, and Rovigno. The K. produces oil, wine, figs, and other fruits, and there is much cattle-breeding in the uplands. The country is crossed by a railway line connected with the systems of Austria and Italy.

Küst'rin, a fortified town in the Neumark district of the province of Brandenburg, Prussia, is 53 miles E. of Berlin by rail, at the confluence of the Warthe with the Oder. It has three suburbs and a royal castle. Pop. (1875) 11,202.

Kutai'eh (anc. *Cotianum*), a town of Asia Minor, in the vilayet of Brusa, on the Pursak, a tributary of the Sakaria, 72 miles

S.E. of Brusa. It carries on a considerable trade, is protected by a fortress, and has an estimated pop. of 60,000.

Kutais', a Russian government, bounded N. by the Caucasus, W. by the Black Sea, S. by Asiatic Turkey, and E. by Tiflis. It is mountainous, and is watered by the Rion and its tributaries. Area, 8000 sq. miles; pop. (1870) 591,590.—K., the chief town of the above, lies on the right bank of the Rion near the Tiflis railway, and 60 miles W.N.W. of the port of Poti on the Black Sea. It occupies the site of the ancient *Cutatisium* or *Cyläa*, capital of Colchis, is fortified, and has a trade in grain, wine, cattle, &c. Pop. 8263.

Kutch, or **Cutch** (*Kach*) a native state of W. India, in political connection with the Bombay Government, occupying a peninsula which becomes an island at certain seasons of the year, bounded N. by the Runn of K. separating it from Scinde, W. by the Indian Ocean, S. by the Gulf of K. separating it from Kattywar, and on the E. by the native states of Gujerat. Area, excluding the Runn, 6500 sq. miles; pop. (1872) 487,305. The products are grain, cotton, and oilseeds; but K. is best known as a centre of active trade and a nursery of seamen. The greater part of the commerce of the E. coast of Africa is in the hands of Mohammedans and Hindus from British India, of whom many are emigrants from K. In 1871 the trade of K. direct with Zanzibar was valued at \$281,660, chiefly cotton cloth. In 1872-73 the coasting trade of K. with Indian ports was thus returned:—Exports, £72,000, chiefly cocoa nuts, spices, wood, grain, and pulse; imports, £2100, chiefly salt. The ruling chief, whose title is Rao, is of the Thareja clan of Rajputs, which dates back to the 15th c. The first treaty with the British was in 1809, and there have been several later agreements to suppress piracy, restore internal order, and check female infanticide. The present (1877) Rao, who is fifty-five years of age, has much improved the administration, and has co-operated to put down the Zanzibar slave-trade. Revenue, £130,000; tribute, £18,000. The capital is Bhuj, but the port of Mandvi is the most populous town.

Kutt'enberg (Czech. *Hora-Kútina*) is a town of Bohemia, Austria, 45 miles E. by S. of Prag by rail. A vein of silver here discovered in 1237, after being worked to a depth of 2000 feet, became exhausted at the close of the 16th c. There are still mines of copper and lead. K. manufactures cottons and beet-sugar, and has several Gothic churches, that of St. Barbara being much admired. Pop. (1869) 12,747.

Kutub Minar (the 'pillar of Kutub-ul-din,' the first Mohammedan emperor of Delhi), the name of the celebrated column or tower at Delhi, which is unique in the world. It is now 238 feet high, but was once higher. The base, which is of red sandstone, is a polygon of twenty-four sides. The shaft is circular, and tapers gradually to the summit. There are five stories, each with a balcony; the two upper ones are of white marble. It can easily be ascended by a spiral staircase inside. It was struck by lightning in 1368, and again in 1803 it required to be thoroughly repaired by the British Government. After much controversy, it has been decided that it was built in honour of Mahommed of Ghur (1200-20), and that Hindu artificers were probably employed.

Kutusoff, **Michael Laurionovich Golenitscheff**, Prince of Smolensk, was born in 1745, studied at Strassburg, became an officer of artillery in his seventeenth year, and rose to the rank of lieutenant-colonel during the war of Polish Confederation. At Chouma (1774), and again at Otchakoff (1788) he was severely wounded; he contributed greatly to the victory of Matchin, acted as ambassador at Constantinople and Governor of Finland, commanded (1805) the first Russian *corps d'armée* against the French, and overcame Marshal Mortier at Dürenstein. K. was second in command at Austerlitz, and commander-in-chief (1811-12) in the Turkish and French wars. He died at Bunzlau in Silesia, May 10th, 1813.

Kyaboo'ca. See AMBOYNA WOOD.

Kyanising, a process of preserving wood from Dry-rot invented by Mr. Kyan of New York. It consists in immersing the timber in a solution of corrosive sublimate, which unites with the albumen, and prevents the germination of fungi. K. has to a great extent been superseded by other methods, as

creosoting, which protect wood from insects and worms as well as from dry-rot.

Kyanite (Gr. *kuanos*, 'sky-blue'), a triclinic mineral, usually light-blue or white in colour. It is a silicate of alumina, and is found in gneiss and mica slate, often accompanied by garnet. It somewhat resembles sapphire, and is used as a gem.

Kymograph (Gr. *kuma*, 'a wave,' and *graphê*, 'a mark'), an instrument by means of which variations in blood pressure can be measured. There are two kinds, the *mercurial* and the *spring* K. The *mercurial* consists of three parts—1st, a U-shaped tube, into the bend of which mercury is placed; 2d, an arrangement by which the blood in the vessels can be brought in contact with the mercury; and, 3d, an arrangement by which any movement of the column of mercury can be registered upon a revolving cylinder. The U-shaped tube, called the *manometer*, is made of glass, the internal surface of which must be free from inequalities and must be of uniform calibre throughout. To one end of this glass tube is attached by means of a ring of india-rubber a bent leaden tube. The last is attached, by means of another ring of india-rubber, to the stem of a T-shaped piece of glass tubing, the *canula*. One of the limbs of this *canula* is in connection with a length of india-rubber tubing, and the other (which is for introduction into the interior of the blood-vessel) is bevelled off so that it may be more easily introduced. When in use, the tubing leading from the *canula* to the *manometer*, and that portion of the limb of the *manometer* with which it is connected, down to the level of the mercury, is filled with a saturated solution of carbonate of soda, the object being to have a fluid, first, which will conduct movements of the blood to the column of mercury; and, secondly, which will prevent coagulation of the blood in the tubing. Resting upon the surface of the mercury on the other

limb of the *manometer* we have a floating rod, which has at its lower end a cap which is concave in shape on its lower surface, so as to fit accurately upon the surface of the mercury at its upper end. A pencil of vulcanite is fixed so as to be at right angles to the rod. Any increase or diminution in the blood-pressure in the vessel will be communicated to the mercury, and will cause a corresponding rise and fall of the column, and this movement will in turn affect the floating rod and pen. When the pencil in connection with this stem is brought in contact with a revolving cylinder, the surface of which is covered with paper, there is produced a mark in the form of a curve, showing the mean blood-pressure which has occurred during the experiment. This instrument was introduced by Ludwig.

The *spring* K. consists of a C-shaped hollow spring, which communicates with the blood-vessel by means of tubing and a *canula*. When in use the spring is filled with spirits of wine, and the tubing with carbonate of soda. Any alteration in pressure in the blood-vessel will cause an alteration of the amount of pressure in the spring, and will result in a straightening or increased curving of the spring. To exaggerate this change of form, there is connected with one end of the spring a lever made of light wood, to the end of which a pen or point is attached. This point can then be brought into contact with the revolving cylinder as in the *mercurial* K. This instrument was introduced by Fick, and the tracing obtained by it represents accurately the variations in blood pressure during a pulsation of the heart.

Kyrie Eleison (Gr. 'Lord have mercy') is a phrase which occurred in the ancient Greek liturgies, and has been freely adopted into later ones. In particular it was incorporated into the Latin Mass, forming the introduction to the *Gloria in Excelsis*.

L.

the twelfth letter of the alphabet, corresponding both in position and in modified shape to the Greek *Lambda* and Hebrew *Lamed* ('ox-goad'). It is a liquid, with a peculiar soft sound, which is uniformly constant in all languages, except in the Welsh and Spanish, where L is doubled and pronounced with a lisp as a sort of aspirate, indifferently represented by H L, and F L. L interchanges with R, D, and N; 'apostle' becomes, in French, *apôtre*; 'St. Giles' is properly Saint *Ægidius*; Bologna or Boulogne, is the Latin *Bononia*. L sometimes disappears altogether, as *piano*, from *planus* = level; Firenze, the modern Italian name of Florence. When preceding another consonant, it sometimes becomes mute, as 'palm, could.'

In English words of one syllable, the final L is doubled, as 'bell.' As a numeral L stands for 50; as an abbreviation for *libra*, the Latin for 'pound' (hence £. for a pound sterling, and lb. for a pound avoirdupois), and also for Law, as LL.D. = Legum Doctor, or Doctor of Laws.

Laa'land. See LOLLAND.

Lab'arum, the standard of Constantine the Great, in which the Roman eagle was replaced by a golden crown, inclosing the monogram XP, while on the purple banner below the figure of Christ was substituted for that of the Emperor. Its adoption was due to Constantine's well-known vision of a cross in the heavens, which preceded his victory over Maxentius, and led him to embrace Christianity.

Labédoyère, Charles Angelique François Huchet, Comte de, a French general of an old Breton family, was born at Paris, April 17, 1786. At the age of twenty he joined the army, became aide-de-camp to Marshal Lannes, subsequently to Prince Eugene; was placed, in 1811, at the head of a battalion, and next year was made colonel by Napoleon. During the retreat from Moscow, and at Lützen, Bautzen, and Kolberg, his bravery won for him further distinction, and he soon became general of brigade. L. was one of the last of Napoleon's officers to leave the field of Waterloo. He subsequently supported the claims of Napoleon II., but after the capitulation of Paris, delaying too long his flight, was arrested, tried by court-martial, and shot on the plain of Grenelle, August 19, 1815.

La'bel, or **File**, in Heraldry, a three-pointed figure, used to distinguish the eldest son during the lifetime of the father.

Labia'tæ is a large natural order of dicotyledonous herbs and shrubs, numbering about 120 genera and 2500 species—abundant in warm and temperate regions, rare in Arctic and Alpine districts. Some sixty species are natives of Britain. The properties are stimulant, fragrant, aromatic. Many are used as culinary vegetables, more particularly for flavouring purposes—such as the mints, sage, thyme, and others; others yield volatile oils, which are used in medicine, perfumery, &c., as peppermint, lavender, rosemary, patchouli.

La'bium, the term applied to the lower lip in insects and other Arthropoda. The L. in insects is composed of a confluent pair of maxillæ or lesser jaws. The term is used in contradistinction to the *labrum* or upper lip, a segment developed apparently in the middle line of the body of Arthropoda.

Lablache, Luigi, a famous operatic singer of French origin, was born at Naples, December 6, 1794, studied under Gentile and Valente, and at the age of seventeen was engaged as

buffo Napoletano at the San Carlino Theatre in Naples. Thence with ever increasing success he passed to Palermo, Milan, Turin, and Vienna, in the last of which cities he created quite a furor, and had a medal struck in his honour. L. made his *débüt* at Paris in 1830, and sang there every winter till 1852. He also visited England, Russia, and Germany, and was everywhere received with enthusiasm. He died at Naples, January 23, 1858. L. was a splendid artist, powerful, passionate, and majestic; he was also a man of exquisite taste, and amassed a precious collection of antiquities. See Castel Blaze, *Biographie de L.*, and Fétis, *Biogr. Univ. des Musiciens*.

Laboratories are establishments where scientific experiments are systematically carried on. The name has long been familiar in reference to chemistry, and till comparatively recently was solely used in this connection. Now, however, L. are recognised as essential to the complete study of every natural and physical science. The laboratory system has been especially developed in Germany, where every university has its chemical, physical, physiological, botanical, zoological, anatomical, L., in buildings totally distinct in many cases from the rest of the university. The example set by Germany is being assiduously followed by all civilised nations; and it is very much owing to this rapid development of opportunities for investigation and for training in the method of research, that science in all its branches has made such progress during the last quarter of a century.

Laborde, Alexandre Louis Joseph, Comte de, born at Paris, 15th September 1774, was the youngest son of an eminent financier (guillotined 18th April 1794). Entering the Austrian service, he served through five campaigns against the French Republic, but returned to France after the Peace of Campo Formio, and having won the confidence of Napoleon, attended him in 1808 on his Spanish, and in 1809 on his Austrian invasion. On the fall of the empire, L. retired for a while from politics and devoted himself to the cause of education, visiting England in 1815 to study the Lancaster system, but in 1823 he entered the Chamber of Deputies as a member of the extreme Left, signed the Protestation of 1830, and after the July Revolution received the prefecture of the Seine. He died at Paris, 24th October 1842. L. was the author of many valuable works on travel and antiquarian research, of which may be mentioned *Voyage en Espagne* (4 vols. Par. 1807-18); *Itinéraire de l'Espagne* (5 vols. Par. 1806-27; 3d ed. with additions by Humboldt and St. Vincent, 6 vols. 1827-28); and *Les Monuments de la France* (2 vols. Par. 1832-36).—His son, **Léon Emanuel, Comte de L.**, born at Paris, 15th June 1807, studied at Göttingen, travelled in the East, and was secretary to the French embassy at Rome (1829), London (1830), the Hague (1832), and Kassel (1834). Quitting diplomacy, he held the post of curator of modern sculpture in the Louvre (1848-51), and of director of the imperial archives from 1856 till his death, which took place at Paris, March 30, 1869. Like his father, he was a member of the Academy, and like him he published a multitude of works on travel, art, and archæology, as *Voyage de l'Arabie Pétrée* (Par. 1830-33); *Voyage en Orient* (Par. 1837-64); *Histoire de la Gravure* (Par. 1839); and *Archives de la France* (Par. 1866).

La'bour. See CAPITAL.

La Bourdonnais, Bertrand François Mahé de, one of the great Frenchmen in India in the 18th c., was born at St. Malo, February 11, 1699. Destined for the sea from his youth, he became a captain in the service of the French East India Company in 1723, and in 1725 took Mahé, on the Malabar coast, which was called after him. In 1746, as governor of the Isles of France and Bourbon, he led a fleet to Pondicherry and put the

British squadron to flight. In conjunction with Dupleix, he then attacked Madras, which surrendered; but he quarrelled with Dupleix about the terms of the capitulation, and forthwith sailed away. On his return to France he was thrown into the Bastille; though acquitted on his trial, he died of a broken heart, September 9, 1753. See Colonel Malleison's *French in India*.

La'bourers and Artificers. By 5 Eliz. c. 4, single men between twelve years of age and sixty, married men under thirty years of age, and all single women between twelve and forty years of age not having any means of livelihood, may be compelled by two justices to go out to serve in husbandry or in certain specific trades. Differences between masters and servants in husbandry and in handicrafts may be determined by a justice of the peace, who is to examine upon oath and make order for payment, provided the question does not involve a value above £10. Police magistrates of the metropolis have power to settle disputes between masters and bargemen, ballast men, coal porters, sailors, and other labourers for hire on the river Thames, docks, and wharves, provided the sum in dispute does not exceed £5. They have also authority within the metropolis district summarily to compel any one detaining the property of another to deliver it to the owner, if the value does not exceed £15.

Labrador, the name applied to an undefined part in the N.E. of the great Canadian peninsula, between Hudson's Bay and the Atlantic. *L.* proper, or the country stretching from Cape St. Louis, at the entrance to Belle Isle Strait to Cape Chudleigh in the N.W., is under the jurisdiction of Newfoundland. Area 70,000 sq. miles; pop. (1869) 2479, exclusive of the natives, who have of late years been greatly reduced by famine and disease. The interior has a sandy, rocky, and swampy surface, and the coast is precipitous, greatly indented, and fringed with islands. The coasts abound in valuable harped and hooded seals, and the sea is well-stocked with codfish and herring of the best quality. Near the settlements are cultivated some potatoes and vegetables. The climate is severe, the temperature in winter ranging lower than that of Greenland, and the scanty flora is limited to stunted birch, willow, juniper, and poplar trees. The inhabitants are mostly Esquimaux, and have been converted to Christianity by Moravian missionaries, whose chief stations are Nain (the first, founded in 1771), Okkak, Hebron, Zoar, and Rama. There are other Protestant and Roman Catholic missions, the latter among the scanty Indian tribes of the interior. In the brief summer the coast is visited by many vessels from Newfoundland, England, Jersey, and the United States. The revenues are in the care of a collector, whose headquarters are at Blanc Sablon. *L.* is governed by a summary court, the judge of which is both magistrate and coroner. See Hind's *Explorations of the Interior of the L. Peninsula* (1863). The part of the peninsula to the W. of *L.* proper, that drains into Hudson's Bay and Strait, was for two centuries the property of the Hudson's Bay Company (q. v.), and was sold to the Dominion of Canada in 1871. The tract of country to the S. of *L.* proper, and stretching along the St. Lawrence, also belonged formerly to the Company, and is now the *district of L.*, in Saguenay county, Quebec. It is inhabited chiefly by French Canadians and Indians, who are mainly employed in the seal, fish, and fur industries. At Moisie there are considerable iron-works. The position of the Indians has been greatly improved by Roman Catholic missionaries. Pop. (1871) 3597, exclusive of Anticosti (q. v.), with its 702 inhabitants.

Labradorite, the typical member of the lime felspar group, is of common occurrence in greenstone, gabbro, hypersthene rock, and certain granites. It is usually dark grey or brown in colour, but is often relieved by a play of brilliant colours due to internal reflections. It is capable of taking a fine polish, and has consequently been employed in jewellery.

Lab'ridæ, a family of Teleostean fishes, represented by the genera *Labrus*, *Scarus*, &c. In this group the mouth has thick fleshy lips. One dorsal fin spiny in front is developed. The ventral fins are beneath the pectorals, *i.e.*, are *jugal* in position. Cycloid scales form the body-covering, and there are soft teeth on the pharyngeal bones. The typical genus *Labrus* includes the Ballan and other wrasse. The Ballan wrasses (*Labrus bergylla*) is common round the coasts of Britain; the three-spotted wrasse (*L. trimaculatus*) being another familiar

species. The genus *Scarus* (q. v.) includes the Parrot fishes of tropical seas.

Lab'rum. See LABIUM.

La Bruyère. See BRUYÈRE.

Labuan' (Malay, 'an anchorage'), a British island in the Malay Archipelago, at the mouth of a bay on the N.W. coast of Borneo, from which it is separated by a channel 10 miles wide. Area 45 sq. miles; pop. (1871) 4898. It was ceded by the Sultan of Borneo in 1846, and a settlement called Victoria has been made at its S.E. extremity. There is a good harbour, an ample supply of water, and extensive coal mines, which are connected with the port by railway over 5 miles long. The exports are sago, camphor, birds' nests, and pearls. In 1874 the total value of exports was £99,105, and of imports £89,978. The public revenue (1874) was £7084. *L.* is a bishop's see. Its importance is mainly due to its central position with regard to Borneo, Annam, Cambodia, and the Philippines.

Laburnum, the *Cytisus Laburnum* of botanists, is a native of Switzerland and the adjoining mountain territory of France and Germany. It and the lilac are now the commonest trees in British suburban gardens, but the *L.*, with its 'golden rain,' is seen to greatest advantage when planted in front of loftier trees in a park or extensive shrubbery. The dark heart-wood is hard and heavy, for which qualities it is in request for turning. The seeds are poisonous. The purple *L.* is a hybrid between the above-named species and *C. purpureus*. Scotch *L.* is the variety *Alpinus* of *C. laburnum*.

Lab'yrinth (derived by some from Labaris, the name of one of the numerous princes to whom the construction of the famous Egyptian *L.* was attributed, by others deemed akin to the Gr. *lauros*, 'a passage') is the name applied by the ancients to vast structures, consisting of numerous intricate passages and halls, and situated wholly or partly under ground. The great Egyptian *L.* lay to the S. of Lake Mœris in Middle Egypt, at a short distance from the city of Crocodiles, since called Arsinoë. It is thus described by Herodotus—'The *L.* has twelve courts, all of them roofed, with gates exactly opposite one another, six looking to the N., and six to the S. A single wall surrounds the entire building. There are two different sorts of chambers throughout—half under ground, half above ground, the latter built upon the former; the whole number of these chambers is three thousand, fifteen hundred of each kind. The keepers could not be got to show the underground buildings; since they contain the sepulchres of the kings, who built the *L.*, and also those of the sacred crocodiles. The upper chambers excel all other human productions; for the passages through the houses, and the varied windings of the paths across the courts, excited in me infinite admiration. The roof was throughout of stone, like the walls; and the walls were carved all over with figures; every courtway surrounded with a colonnade, which was built of white stones, exquisitely fitted together.' Accounts of this wonderful building are also given by Strabo and other ancient writers. It was identified by Dr. Lepsius in June 1843. A second *L.*, on the model of the Egyptian, but only one hundredth part the size, is said to have been built by Dædalus, at the command of Minos, who shut up within it the monster Minotaurus. It is uniformly spoken of as situated near Cnossus, the royal city of Crete. It is now, however, generally believed never to have existed, and that its introduction into the works of later writers was suggested by the natural caverns, still to be seen in that neighbourhood. Similar structures were also erected in Lemnos and in Samos. The term *L.* was applied to an ornamental maze or wilderness in gardens, such as the Maze at Hampton Court. In anatomy, the *L.* is the part of the internal ear behind the tympanum; and in metallurgy, a series of troughs conveying water for washing pulverised ore in a stamping-mill.

Labyrinth'odon, the name given to a peculiar extinct genus of Amphibians for which a special order has been constructed, namely, that of the *Labyrinthodontia*. This group is defined by Huxley as including animals in which the 'body is of salamander form, with relatively weak limbs and a long tail. The dorsal vertebrae, when completely ossified, are biconcave, with double transverse processes. The ribs have distinct capitula and tubercula.' The points in which the *L.* differs most perceptibly from all living amphibians consist in the presence of three

hard, bony skin-plates in the thoracic region, occupying the place of the interclavicle and clavicle or collar-bone. Between these plates and the pelvis other skin-plates were developed, forming a kind of armour-plating on the abdominal surface. The skull has 'distinctly ossified epiotic bones,' and the cranial bones are sculptured, and 'exhibit peculiar smooth symmetrical grooves—the so-called "mucous canals." Another point in which the L. appear as exceptional animals when compared with their nearest living allies, is the possession of teeth of a very complicated pattern. The parietes or outer walls of the teeth were deeply folded and plaited, 'so as to give rise to a complicated "labyrinthine" pattern in the transverse section of the tooth.' Living amphibians possess at the most teeth of very rudimentary nature. The head in the L. was further defended by bony armour-plates. These animals became first known to geological science by the discovery of their footprints in sandstones of the Triassic age. These footprints resembled the shape of the human hand, each having five toes, and hence the unknown animal which made these traces received the name of *Cheirotherium*, literally 'hand-beast.' Further research resulted in the discovery of the L. remains, and in the demonstration that the hand-like impressions were formed by these animals. The L. occur as fossils in rocks ranging from the Carboniferous to the Triassic system. Numerous genera (*Anthracosaurus*, *Raniceps*, *Dendrerpeton*, *Hylerpelon*, *Archegosaurus*, &c.) are known.

Lac is a resinous substance elaborated on the twigs of various trees by the puncture of the female insect of *Coccus lacca*. The plants on which the substance is chiefly obtained are the banyan (*Ficus Indica*), and the peepul (*F. religiosa*), besides *Butea frondosa* and one or two others; and the countries whence it comes are India, Burmah, Siam, and Pegu. The twigs on which the deposit is formed are completely encrusted with the resinous material sometimes to the thickness of a quarter of an inch. L. in reality consists partly of an exudation from the tree, arising from the incision of the female insect in depositing her eggs, and partly of a secretion from her own body, in which the eggs are deposited during their development. The bodies of the female insects themselves, which remain adherent to the resinous mass they elaborate, and generally the undeveloped eggs, form part of the L. as gathered. The twigs covered with L. are gathered twice a year, and in that state without any preparation they constitute the stick L. of commerce. This is subsequently crushed to small pieces, the wooden cores are removed, and the residue washed with a weak solution of carbonate of soda. The washing separates the colouring matter contained in the crude L., and the remaining resin then constitutes seed L. A very valuable red dye-stuff is precipitated from the sodic solution by means of alum, and when dried and pressed into cakes it forms L. dye, very much used as a substitute for the more expensive cochineal for dyeing bright scarlets and pinks. Shell L.—the form in which the resin is most commonly found in British markets—is formed by melting seed L., straining it through a cotton bag, and while still viscous pressing it out between flat stones or leaves into thin plates or scales. Chemically, L. is a mixture of several resins, but as a whole it is soluble in a solution of borax. Dyed a golden yellow it is worked in the East into the form of chain bracelets and other ornamental articles. It constitutes the principal ingredient in ordinary sealing wax, a varnish is prepared from it, and it is also the principal substance used by hatters for preparing the stiff bodies of silk hats and for stiffening felt hats.

Lac (Sansk. *laksha*), the term universally used by natives and Europeans throughout India for 100,000. It is primarily applicable to money, but is also in use for other large quantities; at the exchange of 2s. for the rupee, a L. = £10,000. A hundred lacs is called a crore, or £1,000,000. In Indian notation it is important to recollect that the commas marking off the periods are placed, not after the thousands and millions, but after the lacs and crores. From this word is derived the name of the L. Insect (q. v.) on account of its numerous swarms.

Laccadives (Sansk. *lakke*, 'a hundred thousand,' and *dive*, 'an island'), a group of small islands in the Indian Ocean, 100 miles W. of the Malabar coast. They are of coral formation, and from a distance their cocoa-nut trees alone show above the water. The inhabitants, who may number 15,000, are inoffensive and poorly off. The L. are neglected by the British administration of India. They are liable to be devastated by cyclones,

and have caused the wreck of many ships. Exports to British India in 1874, including also those of the Maldives, £40,000; imports, £27,000. Since that year the trade has been included with British India.

Lace, a delicate textile fabric much used for ornamental purposes in the clothing of ladies and young children, though in the 16th and 17th centuries its use extended to articles of male attire, and even to the decoration of boot tops. L. and embroidery approach very near each other in character, although they may generally be distinguished readily enough from the fact that embroidery consists of needle-work ornamentation applied to a woven basis, whereas L. is wrought throughout as a distinct ornamental fabric by itself. The medieval 'cut-work' L., however, made chiefly in convents for the decoration of ecclesiastical vestments, altar cloths, &c., having been button-stitched on cloth, may be regarded as a species of embroidery. L. proper consists of two parts, the 'ground' and the pattern. The ground generally consists of a very fine net-work (*réseau*) of small hexagonal meshes which serve to hold the whole fabric together, and connect the various portions of the pattern; but in the case of guipure L. the patterns are connected by 'brides' or threads, strengthened and ornamented with button stitches, &c. Again, in some kinds of L. the ground is wanting, and the pattern so arranged that it either forms a continuous scroll, or so touches and joins edges as to hold the whole together. The fibres used in making L. are flax, cotton, and silk, gold and silver thread being also sometimes employed.

L. is divided into two distinct classes according to its method of manufacture, which are called respectively pillow and point or needle-made L. Two other distinctions may also be drawn classifying the fabric into real or hand-made, and imitation or machine-made L. Pillow L. is so called from its being manufactured with the aid of a large stuffed cushion into which pins are stuck according to the arrangement of the pattern, and around these the L. thread is plaited from a great number of small bobbins. The complexity and delicacy of some of the work may be estimated from the fact that in some instances as many as 1200 bobbins are required for one pillow, and an expert L.-maker working twelve hours a day will not finish more than a third of an inch in a week. For such extremely fine kinds of L. a thread of extraordinary tenacity, spun in damp cellars from specially grown flax, is employed. Such thread will sometimes cost as much as £240 per lb., but in recent times fine cotton yarn has been largely substituted for flax. The following description of the mode of making genuine point L. (*point d'Aleçon*) is given by Mrs. Palliser:—'The pattern is printed off on pieces of green parchment about 10 inches long, each segment numbered in its sides; the pattern is then pricked through upon the parchment, which is next stitched to a piece of coarse linen folded double. The outline of the pattern is traced out by two threads fixed by small stitches passed with another thread and needle through the parchment and its linen lining. When the outline is finished, the piece is given over to another worker to make the ground, which is worked backwards and forwards at right angles to the border. The flowers are next worked in; then follow the modes or fillings and other different operations. When completed the threads which unite L. parchment and linen together are cut by passing a razor between the folds of the linen, and there remains only the great work of uniting the different segments together. This process devolves upon the head of the fabric, and is effected by the stitch called "assemblage," by us "fine joining."

The principal variety of pure point L. manufactured in modern times is the *point d'Aleçon*, the preparation of which is described above. A portion also of Brussels L. is needle-made and distinguished as *point à l'aiguille*, although more commonly what is known as Brussels L. is a pillow-made fabric. The varieties of pillow L. are very numerous, and distinct classes of work being characteristic of special localities, the L. is generally distinguished by the name of the place of its production. Thus Valenciennes, Lille, Mechlin, Cluny, Maltese, Brussels, and Honiton laces, which are the principal varieties of pillow-made L., are all distinguished from each other, either by the nature of their grounds, the character of their flowers or fillings, the nature and mode of their joinings, the kind of thread from which they are made, or other characters. To convey an intelligible account of the distinctions between these varieties of L. would occupy much more space than can be devoted to the subject.

The manufacture of imitations of all these varieties of L. is an art which has attained its highest development at Nottingham, where the L. and hosiery trade are the staple manufactures. The machines for making L. are justly regarded as among the greatest triumphs of mechanical ingenuity, being, as remarked by Dr. Ure, 'as much beyond the most curious chronometer in multiplicity of mechanical device as that is beyond a common roasting jack.' The fundamental apparatus for machine-making of L. is the bobbin net frame (see BOBBIN NET), as by it the 'ground' of all common imitations of pillow L. is made. Machine-made L., however, embraces not only imitations of L. having net grounds, but all other classes, and even fine Brussels point, are successfully imitated by means of the machines now in operation. See Mrs. Bury Palliser's *History of L.* (Lond. 1865); Felkin's *Machine-made Hosiery and L. Manufactures* (Lond. 1867); J. Seguin's *La Dentelle* (Par. 1875); and Cole's *Ancient Needle-point and Pillow-Lace* (Arundel Society, 1875).

Lace-Bark Tree, or *Lagetta Intaria*, belonging to the Daphne family, is a native of the W. Indies. The inner bark after maceration can be separated into layers of a beautiful net-like appearance, whence the name is derived.

Lace-Leaf. See LATTICE-LEAF.

Lacépède, Bernard Germain Etienne de la Ville, Comte de, a French naturalist, was born at Agen, 26th December 1756. Among the authors who first influenced him most was Buffon, and his tastes on entering life were impartially distributed between music and natural science. Having composed music for the opera *Omphale*, besides several symphonies and a chorus, and published an *Essai sur l'Electricité*, none of which brought him distinction, Buffon offered him a demonstratorship in the private museum of the king, and asked him to continue a part of his *Histoire Naturelle*. In 1788 L. published the first volume of his *Histoire Naturelle des Reptiles*. On the outbreak of the revolution he became deputy-extraordinary for the town of Agen, and in 1791 deputy for Paris in the Legislative Assembly, advocating moderate opinions. *L'Histoire des Poissons* appeared 1798-1803, and *L'Histoire Naturelle des Cétacés* in 1804, the two works which give him his principal title to recognition as a natural historian. L. became president of the senate in 1801, and had the opportunity of refusing the office of Minister of the Interior. Providence, as he said, had endowed him with the faculty of obedience to the laws and established government, so that in 1815, under Louis XVIII., he retained his imperial honours. L. died at Épinay, 6th October 1825, after a long and successful career in science and politics. See *Œuvres de M. le Comte de Lacépède* (11 vols. Par. 1826-33), edited by Desmarests, and containing an *Éloge Historique* by Cuvier.

Lacerta and Lacertidæ. See LIZARD.

Lacertilia, an order of the class Reptilia, represented by the various families of Lizards (q. v.). The L. are commonly distinguished from other reptiles by the development of a pectoral and pelvic arch with fore and hind limbs—although some L., such as the blind or slow-worms (*Anguils*), want limbs altogether, while in others (*Chirotes*) the hind limbs may be wanting, and in some (*Bipes*) the fore limbs are undeveloped. The halves of the lower jaw are firmly united by bony union, and the articulation between the lower jaw and the skull does not permit of these bones being separated to the same extent as in the snakes. The body is covered with scales. The dorsal vertebrae are procelous or concave in part, or more rarely amphicelous or biconcave. The sacral vertebrae do not exceed two in number, and the sacrum in some cases is wanting. The capitula or heads of the ribs are simple and undivided. The teeth are not lodged in sockets, and the eyes are provided in the majority of cases with movable eyelids. The heart is three-chambered, consisting of two auricles (right and left) and one ventricle, and a urinary bladder is developed. As in all reptilia, the intestine, urinary, and genital organs of L. open into a cloaca or common receptacle, the outer aperture of the cloaca in L. being of transverse shape. The best known families of L. are the *Lacertidæ*, including the common lizards; the *Varanidæ*, or monitors; the *Scincidæ*, or skinks; the *Cerchidæ*, or Geckos; the *Iguanidæ*, or Iguanas; and the *Chamælonidæ* or chameleons. The chief genera of lizards are described in special articles—such as IGUANA (q. v.), GECKO (q. v.), &c.

Lace-Winged Flies, the name given to certain species of Neuropterous insects belonging to the family Hemerobidæ (Leach). The genus *Chrysopa* includes the best known species. *C. perla* is a familiar form, which is notable for the habit of its larvæ, which prey upon the aphides or plant-lice so destructive to plants. The wings are of a delicate, gauze-like texture; the body is green, the eyes golden. These flies emit a disagreeable odour when touched. The eggs are supported on pedicles or stalks; the pupa stage being attained late in summer, and the winter being passed within a cocoon generally hidden in the crevices of the bark of trees. *C. oculata* is a familiar American species.

La Chaise, or La Chaize d'Aix, François de, was born August 23, 1624, at the Château d'Aix in Forez, studied at the college of Roanne, became a member of the Society of Jesus and Professor of Philosophy at Lyons, where he published (1661) *Placita*, an abstract of his course. In 1675 he became confessor to Louis XIV., and against Madame de Montespan he directed all his influence, while it is understood that the secret marriage with Madame de Maintenon was the result of his advice. On the foundation of the House of St. Cyr, he revised its constitution. As guardian of the king's conscience he became very intimate with him, and, teaching him to take an interest in coins, was the means of originating l'Académie des Médailles. The cemetery of Père-la-Chaise to the E. of Paris occupies ground, part of which was granted to L. for the purpose of building a house where the Jesuits of Paris might find periodical recreation. L. is accused of having had the chief hand in the Revocation of the Edict of Nantes, and against the Jansenists he used with much perseverance and skill the opportunities afforded by his position. He was in fact a typical Jesuit, being rather an accomplished and acute man of the world than a person devoted to the exercises of religion. His writings, chiefly theological or ecclesiastical, are not important. He died 20th January 1709. See Sismondi, *Hist. des Français* (vols. xxv., xxvi., xxvii.); and Régis de Chatelauze, *La Père de la Chaize, Confesseur de Louis XIV.; Lettres et Documents inédits* (1. you, 1859).

Lachesis, a genus of Viperine snakes belonging to the *Crotalidæ* or rattlesnake family, and inhabiting tropical America. The tail ends in a spinous process, and the head is covered with small scales. A familiar species is the bushmaster (*L. unicolor*), which may attain a length of 14 feet. Its bite is greatly dreaded.

Lachlan, or Colaré, a river of N.S. Wales, after a W. and S.W. course of 700 miles, joins the Murrumbidgee (q. v.) in the middle of a vast swamp. The country along its course is by turns sandy and marshy, and only fit for sheep.

Lachmann, Karl, an eminent German philologist, born at Brunswick, 4th March 1793, studied at Leipsic and Göttingen, served as a volunteer chasseur through the Waterloo campaign, received a professorship in the Königsberg University (1818), but exchanged it for one at Berlin (1825), where he died 13th March 1851. L. published editions of Catullus (1829), Tibullus (1829), Lucretius (1850), and other Latin authors; two editions of the New Testament (1831 and 1846), in which he sought to present the authorised text of the 4th c.; and a number of valuable works on old German philology and literature—*Ueber Singen und Sagen* (1833); *Zu den Nibelungen und zur Klage* (1836), and editions of Walther von der Vogelweide (1827), Wolfram von Eschenbach (1833), &c. See Hertz, *Karl L. eine Biographie* (Berl. 1851). L.'s *Kleinere Schriften* were edited by K. Müllenhoff (Berl. 1876).

Lachrymæ Christi (Lat. 'Christ's tears'), a sweet but spirited muscatel wine, chiefly produced from the grapes of Monte Somma, near Naples. There are two kinds, red and white, and the former is generally counted inferior. Large quantities of spurious L. C. are sold from the Levant and S. Italy.

Lachrymal Apparatus consists of a gland and its ducts, the *lachrymal gland*, by which tears are formed and conveyed to the surface of the eyeball, and canals, *lachrymal canals*, by means of which the tears are carried away from the eye into the *lachrymal sac*. From this sac the tears pass through the *nasal duct* into the cavity of the nose. The lachrymal gland is about the size and shape of an almond; externally it is in con-

sact with the inner surface of the orbital plate of the frontal bone; internally it rests upon the upper and outer part of the eyeball. The gland is made up of a number of lobules, which are bound together by connective tissue. Each of these lobules has its duct, and these ducts terminate after passing obliquely through the conjunctiva in a series of openings, fourteen or fifteen in number, which are situated at the upper and outer part of the eyeball. In minute structure the lachrymal gland is a compound racemose gland (see GLAND).

FRONT of the LEFT EYELIDS, with the LACHRYMAL CANALS and NASAL DUCT exposed.

1. Upper and lower lachrymal canals, showing towards the eyelids the narrow bent portions, and the puncta lachrymalia; 2. lachrymal sac; 3. the lower part of the nasal duct; 4. plica semilunaris; 5. caruncula lachrymalis.

punctum lachrymale, situated at the summit of an elevation at the inner margin of the eyelids. The upper canal takes a course at first upwards from the *punctum*, then bends at a right angle, and passing inwards and downwards, opens into the lachrymal sac. The lower canal passes at first downwards and then inwards, and opens also the lachrymal sac close to, but below the opening of the upper canal. The lachrymal sac may be regarded as the upper dilated portion of the nasal duct. It is situated in a deep groove formed by the lachrymal bone and nasal process of the superior maxilla, and is further held in position by fibrous bands derived from the *tendo oculi*. Superiorly, the sac is closed. About its middle it receives the lachrymal canal—below, the sac narrows into and is continuous with the nasal duct. The nasal duct, about half an inch in length, is contained in a canal formed by the superior maxillary bone externally, and completed internally by the lachrymal and inferior turbinate bones. It opens into the inferior meatus of the nose. The lachrymal canals, sac, and the nasal duct, consist each of an external fibrous coat, and an internal lining of epithelium, but the character of this epithelium varies. In the canals it is composed of several layers of flattened cells. In the lachrymal sac and nasal duct the epithelium is of the ciliated variety, like that lining the nasal cavities. In the majority of cases, the orifice of the nasal duct is concealed by the mucous membrane of the nose, the object of this arrangement being to prevent the entrance of foreign matters from the nose on violent expiratory efforts. Other valvular arrangements of the mucous membrane lining this apparatus have been described, but their arrangement and presence is not constant. The function of the lachrymal gland is to secrete sufficient fluid to keep the surface of the eyeball moist, and to wash away foreign substances. In both these actions it is assisted by the action of the eyelids in winking. The use of the canals is to convey the tears into their proper excretory channel. If the orifice of the canal be not in its right position to receive the tears, as from the paralysis of muscles, the tears pass downwards over the face. The same results occur when, from any cause, more tears are secreted than can be carried away by the minute canals. This is seen in weeping and after severe injury to the eyes.

Diseases of the L. A.—The *secreting* and *excreting* L. A. are subject to various affections interfering with the functions of vision. *Xerophthalmia*, or *ophthalmia tarsi*, consists in dryness of the eye depending on a suppressed or imperfect secretion of tears, or on a deficiency of the mucous secretion which lubricates the surface of the eye. This may be owing to disease of the substance of the gland, enervation, obstruction of the ducts, or pressure from an abscess behind the upper lids. *Epiphora*, or excessive lachrymation, may be caused by the irritation of foreign substances, inflammation of

the eye or eyelids, and especially by scrofulous conjunctivitis. The glandulæ congregatæ, and the lachrymal gland, proper, are liable to *inflammation*, *suppuration*, *hypertrophy*, and they may become the seat of *fibro-plastic tumours*, *scirrhous*, and *medullary fungus*. *Encysted tumours* may appear within the lachrymal gland, or in the vicinity of the glandulæ congregatæ and lachrymal ducts, causing protrusion and ultimate disorganisation of the eyeball. *Lachrymal fistula* is usually the effect of abscess on the upper eyelid, or of suppuration of the lachrymal gland. *Sanguineous lachrymation* is of rare occurrence, but there are cases on record in which it was connected with a scorbutic diathesis. *Calculi* are occasionally formed in the ducts. The diseases of the *excreting* L. A. are *dacryocystitis* or acute or chronic inflammation, which, in neglected cases or reiterated attacks, frequently results in fistula of the sac. *Obstruction of the nasal duct* is generally caused by a thickening of the mucous membrane, and this affection often leads to inflammation of the sac, and the formation of a fistulous opening. The introduction of a *style* is a useful method of treating chronic dacryocystitis in every stage of the complaint except the first, when there is merely weakness of the eye, and a gathering of tears at the inner canthus. The style is a nail-headed piece of silver about $1\frac{1}{2}$ inch long, and $\frac{1}{16}$ inch thick. The head should be plano-convex, with its edge rounded off, and the neck should form an angle of about 130° with the body. The style may be worn for an unlimited time with comfort to the patient. D. of the L. A. are numerous, and important from their intimate connection with the organs of vision, and their treatment is too complicated to admit of brief description. See *Manual of the Diseases of the Eye*, by Dr. Macnamara (Lond. 1876); *Leçons Sur les Affections de l'Appareil Lacrymal*, par F. Panas (Par. 1877); *Traité des Maladies des Yeux*, par le Docteur Ch. Abadie (Par. 1877).

Lac Insects (*Coccus*), a genus of *Hemipterous* insects notable as affording the commercial product known as Lac (q. v.). The general name of 'bark lice' is frequently given to the group of which the genus *Coccus* is a familiar example. The characters of the family are the possession of at least six joints in the antennæ; the two-jointed tarsi; the absence of a beak and hinder wings in the males, and the wingless, scale-like nature of the adult females. The rings of the body and legs become abortive in the female Coccidæ; the males resembling some flies in outward appearance. The genus *Coccus* itself has males in which the antennæ are ten-jointed, and which have two very long bristles attached to the posterior joints of the body. The antennæ of the females are nine-jointed. The cochineal insect (*Coccus cacti*) secretes masses of cochineal from its body. The males are of a carmine hue, with light-brown wings. The average length of the males is three-fourths of a line; of the females one line in length. These insects inhabit Mexico, and live on the *Cactus coccinellifer*, but they have been acclimatised in Spain, Algiers, and Madeira.

Lackawanna, a small river of Pennsylvania, U.S., flows for some 30 miles of its lower course through, and gives name to the largest and richest anthracite coal-basin in America. The bed has an area of 198 sq. miles, and a thickness of 5-14 feet, at a depth of 100-400 feet below the surface. The annual out-put is over ten thousand tons.

Lacordaire, Jean Baptiste Henri, was born March 12th, 1802, at Recey-sur-Orce, in the Côte d'Or, studied from 1810 to 1819 at the Lyceum of Dijon, went to Paris in 1821, where he began his career as an advocate with marked success. Dissatisfied with his life, and burning with zeal to consecrate himself to some great achievement, L. forsook his profession (May 1823), and was ordained a priest in 1827. He joined Lamennais and Montalembert in the editorship of *L'Avenir*, a journal which, whilst it advocated with radical vehemence such questions as liberty of the press and of the human conscience and universal suffrage, preached ultramontanist religion. In September 1832, Gregory XVI. denounced it officially, perceiving the inconvenience of the opinions it supported. The editors went to Rome, and L. on his return published a form of submission which announced that their partnership was broken up, and that they knew no other guide than the Church. L. began to lecture at the Collège Stanislas (1834), attracting numerous audiences, and (1835) the Archbishop of Paris opened to him the pulpit of Notre Dame. Here immense crowds, composed chiefly of young men, artists, littérateurs, and politicians, were attracted by his

oratory. Having passed through the stage of Voltairean scepticism, being profoundly read in literature, history, and philosophy, and discarding the language of the theological schools, he was able to make himself agreeably articulate to the cultivated ear of Paris, while his intense and passionate earnestness seemed a guarantee for practical fruits. After preaching for two years L. went to Rome, became a Dominican friar, returned and sought to revive the order in France, publishing (1840) *Memoire pour le Rétablissement en France de l'Ordre des Frères Prêcheurs*, and in the same year his *Vie de Saint Dominique*. Again he sought Notre Dame, where among many famous orations he delivered the funeral sermon of Daniel O'Connell (1847). In 1848 he was returned to Parliament, but shortly resigned; in 1854 he took the direction of the College of Sorrèze; in 1858 were published his *Lettres à un jeune homme sur la vie Chrétienne*. L., one of the most spirited and inspired of the sons of modern France, died at Sorrèze, 21st November 1861. The best edition of his *Œuvres* appeared at Paris (9 vols. 1872). See Sainte Beuve, *Causeries du Lundi* (vol. i.), and Foisset's *Biographie de L.* (1870).

Lacquer and **Lacquering**, a kind of varnish, and the art of applying it to articles of metal, wood, &c. L. is closely allied to japanning. Brass work is commonly lacquered to preserve it from atmospheric and other deleterious influences. The L. used for this purpose is composed of seed-lac dissolved in spirits of wine, turmeric, dragon's blood, or other material being added to give the desired tint. The brass object is first coated cold, and receives a second coat of L. after being heated in a stove. The Japanese excel all other nations in L. wood, an art which originated with them in the 8th c. of our era. Their L. is made with the sap of the 'urushi' or L. varnish tree, which also yields the vegetable wax of Japan; pigments, and powdered silver and gold are most carefully mixed with it, and the most elaborate and tedious processes are pursued in perfecting the ware. Old Kioto and Tokio (Yedo) L.-ware are most esteemed.

Lacroix, Sylvestre François, a French mathematician, was born at Paris in 1765. For some years he taught mathematics in a naval school at Rochefort, and then went to Paris, where he became professor successively in the School of Artillery, l'École Normale, the central schools, l'École Polytechnique, the Sorbonne, and the Collège de France. L. was not a great original mathematician like his contemporaries Laplace and Lagrange, but he was one of the most successful of teachers, and his *Traité du Calcul Différentiel et Intégral* (2 vols. 1797; 2d ed. 3 vols. 1818) supplied a long-felt want, and supplied it well. His other important works are *Traité des Différences et des Séries* (1800; 2d ed. 1810-19), and *Cours des Mathématiques* (9 vols. 1797-1816), besides which he was the author of numerous *Mémoires* and of valuable elementary treatises on various branches of mathematics. L. died at Paris, May 25, 1843.

La Crosse, a ball-game of growing interest, which has been introduced within the last few years into Britain from Canada. It is a development or modification of the ball-play of the N. American Indians, and since 1867 has been recognised as the national sport of Canada. A properly constituted game consists of twelve players on each side—twenty-four in all. Each player is paired with an opponent, and the pairs are set at a particular part of the field. This guards against crowding, and makes the game more open and fair, since as a rule no player has more than one opponent at a time. Each player is provided with a *crosse*,—a light, strong stick, of any suitable length, turned round at the extremity like a shepherd's crook. The tip of the turn is connected by a stretched piece of catgut string with the *collar*, which is near the other extremity of the *crosse* just below the handle. Between the string and the stick is fastened a triangular-shaped netting, on which the ball is caught and carried, or from which it may be thrown. The object of the game is much the same as in Football (q. v.). Each side endeavours to drive the ball through its opponent's goal, one game being finished every time a goal is scored. The ball must not be *handled*, and no player can seize another or check him in any way except by taking the ball from him. Unless the disposal of the players in definite places be particularly attended to, the game, which when properly played requires all the resources which skill, presence of mind, and *physique* can supply, is apt to degenerate into something like the rough schoolboy sport known as 'shinty.'

La Crosse, a city of Wisconsin, U. S., on the E. bank of the Mississippi, and at the embouchure of the La Crosse and Black River, 275 miles N.W. of Chicago by rail. It has fifteen churches, two daily and five weekly newspapers (one German, one Norwegian), nine steam saw-mills, large machine shops, saw-mills, and breweries, and a vast trade in timber and grain. The assessed valuation is 3,000,000 dollars. Pop. (1870), 7785; (State census 1875) 11,012.

Lactantius, commonly called *Lucius Calius Firmianus*, a Christian father of high repute for learning and eloquence, was born probably in Italy, not later than the middle of the 3d c. He studied in Africa under Arnobius. About 301 A.D., on the invitation of Diocletian, he settled in Nicomedia as a teacher of Latin rhetoric, and at this period he became a Christian. About 312-18 A.D. he was appointed tutor to Crispus, son of Constantine, and ten years or so thereafter is believed to have died at Treves. His chief work is his *Divine Institutions*, a manual of Christianity, in seven books, bearing the following titles:—False Religion, the Origin of Error, False Wisdom, True Wisdom, Justice, the True Worship, the Happy or Blessed Life. His other works include an *Epitome of the Institutions*, *De Ira Dei*, *De Opificio Dei*, *De Mortibus Persecutorum*; and several poetical pieces have been, though erroneously, attributed to him. As a theologian, L. displays grave defects; but the grace and purity of his style won him the name of the Christian Cicero. L. enjoyed great popularity, and the *editio princeps* of his works (1465) is one of the earliest extant specimens of the art of printing. The chief modern editions of L. are those of Bünnemann (Leips. 1739), Dufresnoy (Par. 1748), Xavier (13 vols. Rome, 1754-59), Migne (Par. 1844), and Fritzsche (Leips. 1842-44). There is an English translation by Dr. Fletcher in the *Ante-Nicene Library* (Edinb. T. & T. Clark, 1871).

Lactation, the time during which the mammary glands are actively engaged in the secretion of milk. This usually begins two or three days after child-birth, its commencement being marked by the presence of more or less fever, *milk fever*. The glands from this time continue to secrete milk actively for a period of about twelve months; after this time, the milk lessens in quantity and quality, until a few drops only are secreted upon the application of a stimulus to the breasts.

Lacteals. This name is applied to the lymphatic vessels of the small intestine. In minute structure these small vessels resemble the lymphatic vessels elsewhere. When digestion is not taking place, they contain lymph. During digestion the L., however, are filled by a milky fluid, the *chyle*, which contains, in addition to the lymph corpuscles or globules, numerous molecules and oil globules. These molecules and oil globules are absorbed from the small intestines, the former being composed of oil surrounded by a thin layer of albumen (see *CHYLE*). The L. are arranged in two sets—a superficial, consisting of vessels which ramify between the peritoneal and muscular coats of the small intestine, and situated in greatest numbers near the mesenteric attachment of the bowel; and a deep set, which ramify in the mucous membrane and sub-mucous coat of the intestine, and pass outwards through the muscular coat to communicate with the superficial layer. From the deep set, loops are given off which are contained in the *villi*. In the lower animals this loop breaks up into a plexus of smaller vessels which frequently communicate with each other in the villus, but in man there is only a loop, with perhaps one or two

INJECTED LACTEAL VESSELS in the VILLI of the HUMAN INTESTINE.

Two villi in which the L. are represented as filled with white substance and the blood-vessels with dark: *zoo* diameters (Teichmann); *a*, *b*, the lacteal vessels, single in one villus and double in the other; *c*, the horizontal lacteal vessels with which those of the villi communicate; *d*, the blood-vessels, consisting of small arteries and veins with capillary network between.

Intercommunicating branches. The lacteal within the villus is, according to recent observations, connected by minute processes with the flattened cells which make up the basement membrane supporting the epithelial cells which surround the villus. They are also connected with the branched cells of the retiform tissue which surrounds and holds together the constituent parts of the villus. The exact mode by which the molecules and oil globules pass from the small intestine into the lacteal is not known. It is known that fatty matters, taken with the food, are acted upon by certain digestive fluids and converted into a milky fluid; that the fluid disappears from the intestinal canal when passed along the small intestine; that during digestion the L. become filled with this milky fluid, and lastly, that the branched cells of the retiform tissue mentioned above are found filled with oil granules during digestion. It was supposed at one time that the lacteal communicated directly with the surface of the villus; but at the present time, the view most in favour is that these cells of the retiform tissue play an important part in the absorption, and probably act as carriers of fatty granules from the small intestine to the lacteal. The L. of the muscular coat, after receiving the contents of the L. of the mucous membrane, pass from the intestine between the layer of the mesentery and accompany the blood-vessels. They next enter into the lymphatic glands, and after leaving these, they are collected into a few large vessels, which finally pour their contents into the *receptaculum chyli*, the commencement of the *thoracic duct*.

Lactic Acid ($C_3H_5O_3$), when pure, is a colourless uncrystallisable liquid of a syrupy consistency, and very soluble in water, alcohol, and ether. It may be prepared in a variety of ways, but the ordinary L. A. is the result of the fermentation of various sugars in the presence of certain albuminous substances (see **FERMENTATION**.) A convenient method is by mixing together two gallons of milk, six lbs. of raw flesh, twelve pints of water, eight ounces of putrid cheese, and four lbs. of chalk, and subjecting the mixture to a temperature of about $30^{\circ} C$. After a few weeks, a quantity of calcium lactate is formed, which is purified by crystallisation and decomposed by zinc carbonate. The zinc lactate so formed is treated with sulphuretted hydrogen, and L. A. results. The acid may also be extracted from a great variety of liquids containing decomposing vegetable matter, such as *sauer kraut*, a preparation of white cabbage, the sour liquor of the starch-maker, &c. It is also formed in the spontaneous souring of milk—hence the name. It forms *lactates* with barium, calcium, zinc, iron, &c.; and these salts are all insoluble in ether, and sparingly soluble in cold water. When heated in excess of sulphuric acid, they give off pure carbonic oxide.

Lactuca (in medicine). The leaves and flowering tops of the wild indigenous plant, *Lactuca virosa*, and the inspissated juice, evaporated to a pulpy consistence, are used in medicine as a sedative and narcotic, and sometimes as a diuretic and diaphoretic in cases of dropsy and visceral obstruction. The preparations of L. are highly prized by some practitioners for their sedative qualities, and for allaying cough in phthisis and other pulmonary diseases. Dose—of the *extract*, five to ten grains; of the *succus*, one to two drachms; of the *tincture*, thirty to sixty minims.

Ladakh', or Middle Thibet, a province of the State of Cashmere, in feudatory connection with the British Government of India. It is bounded by Cashmere proper on the W., and by Thibet on the E. Area, estimated at 30,000 sq. miles; pop. about 300,000. It forms part of the upper valley of the Indus, averages 11,000 feet above the sea, and is shut in by snow-clad mountains. The crops are wheat and barley, but the most valuable products are borax, and the wool of the sheep, goat, and yak. The inhabitants are of Thibetan origin, and Buddhist in religion. Leh (q. v.) is the capital. L. was conquered by the Sikhs, under Golab Singh, the father of the present Rajah of Cashmere.

Ladies of the Queen's Household, the personal attendants of Her Majesty, consisted in 1877 of eight Ladies of the Bedchamber, four Extra Ladies of the Bedchamber, eight Bedchamber Women, two Extra Bedchamber Women, three Honorary Bedchamber Women, seven Maids of Honour, one Extra Maid of Honour, and the Mistress of the Robes, who has the superintendence of the others, the custody of the robes, and accompanies the Queen on all state occasions. On ordinary occasions Her Majesty is accompanied by a Maid of Honour.

Lading, Bill of. See under **BILL**—*Bill of Lading*.

Lad'islaus, the name of seven kings of Hungary and one of Naples (of the house of Anjou).—**L. I.**, the *Saint*, king of Hungary, 1077–95, surnamed from his care for the diffusion of Christianity, was conqueror of Croatia.—**L. V.**, the same as Vladislav III. of Poland.—**L. VI.**, *Postumus*, king of Hungary and Bohemia, son of Albrecht II., king of the Germans, of Hungary, and Bohemia, and grandson of the Emperor Sigismund, born 1440, and succeeded L. V. in Hungary in 1444 under the regency of János Hunyady, who defended the kingdom bravely against the Turks. After the death of the latter the young king suffered himself to be led by favourites, especially by Count Cilly; he died in 1457, only seventeen years old.—**L. VII.**, king both in Hungary and Bohemia, son of a brother of L. V. and a sister of L. VI., was of the house of Jagello (q. v.).

Lado'ga, Staraia ('old'), a Russian town in the government of St. Petersburg, on the E. bank of the Volkhof, 12 miles from its entrance into Lake L., is notable as the place which Rurik, the founder of the Russian monarchy, made his residence in 861.

Ladoga, the largest lake of Europe, lies between the Russian governments of St. Petersburg, Olonetz, and Viborg. Area, 6804 sq. miles. It is 120 miles long, 70 broad, and 1000 feet deep. In great part, however, it is rendered dangerous by shallows, sandbanks, and sunken rocks. It receives the waters of lakes Onega, Sarina, and Ilmen, through the rivers Volkhof, Sarim, and Svir, and is drained into the Gulf of Finland by the Neva. In the N. of the lake there is a group of islands, the chief of which are Valaam and Konevets, with their celebrated monasteries. The shores of the lake are mainly rocky. The L. Canal, skirting the S. shore, and linking the rivers Volkhof and Neva, enables vessels to avoid the dangers of a lake passage on their way from the Volga to the Baltic. Lake L. has also communication with the White Sea. See the work on L. by Colonel Andrief (1875).

Ladrones' (Span. 'thieves'), or **Marianne Islands**, a group in the N. Pacific, lying between 13° – 21° $35'$ N. lat., and 145° – 147° E. long. Area, 1254 sq. miles. They were discovered in 1521 by Magellan, who called them the L. on account of the thievish propensities of their inhabitants. Their second name was bestowed on them in 1668 by some Jesuit missionaries, in honour of Maria Anna of Austria, widow of Philip IV. The L. are of volcanic origin, mountainous, densely wooded, and fertile, producing cotton, indigo, rice, and sugar, but only five of the twenty islands composing the group are inhabited, and the population has fallen from 100,000 to 5000. The L. belong to Spain, and the seat of government is San Ignacio de Agaña in Gualan, the largest and most southerly island of the group.

Lady. See **LORD**.

Ladybird (*Coccinella*), a well-known genus of *Coleoptera* (q. v.) or beetles, the species of which have hemispherical bodies of yellow or red colour, variegated with black spots. Well-known species are the *C. ocellata*, the *C. bipunctata*, *C. trifasciata*, &c. The eggs are deposited in May, and are hatched during the succeeding month. The larvæ are black, and do good service to the gardener by the ravages they commit amongst the aphides or plant-lice.

Lady Chapels, dedicated to the Blessed Virgin, in churches prior to the 13th c. are generally a later addition, placed eastward of the high altar, and projecting from the main building. In churches of a subsequent date, as in the present Catholic usage, the Lady Chapel usually occupies the eastern extremity of the N. or S. aisle.

Lady-Day, 25th March, an English and Irish term, on which rent is usually payable. Ecclesiastically, it is the Feast of the Annunciation of the Virgin Mary, hence its name.

Lady Fern (*Asplenium Filix-femina*), a beautiful and variable British fern of world-wide distribution, Australia excepted.

Lady of Mercy, Our, an order of knights founded by Jacobo I. of Aragon in 1218, whose object was to redeem Christians taken prisoners by the infidel. The knights were of great service in the struggles before the expulsion of the Moors.

Lady of Monte'sa, Our, an order of knights founded in 1317 by Jacobo II. of Aragon, who, after the suppression of the Knights Templar, was permitted by Pope John XXII. to appropriate the estates previously held by them in his dominions to the maintenance of the new order, whose headquarters were fixed at Montessa.

Lady's Mantle, the popular name for the genus *Alchemilla*, is specially applied to the common representative species *A. vulgaris*, on account of the shape and vandyked edge of the leaf. The genus belongs to the tribe *Poterieae* of the Rose family, and consists of thirty species, chiefly natives of the Andes region. *A. Alpina*, with divided leaves, silvery below, is a striking ornament on damp rocks and by streams in the Scotch Highlands.

Lady's Slipper, *i.e.*, slipper of our Lady—the Virgin Mary—is the name given to the Orchidaceous genus *Cypripedium*, from the shape of the lip of the flower. The species number about fifty, and are widespread in temperate and tropical regions. *C. calceolus* is one of the rarest British plants.

Lænnec, René Théodore Hyacinthe, a famous French physician, was born 17th February 1781, at Quimper, in Bretagne, studied medicine at Paris, and devoted himself with particular enthusiasm to pathological anatomy, following the lead of Corvisart. From 1808 to 1816 the best fruits of his investigations into the organic causes of disease were contributed to the *Dictionnaire des Sciences Médicales*. In 1819 L. published the treatise upon which his celebrity rests, *Traité de l'Auscultation médiate et des Maladies des Poumons et du Cœur*. In it he developed the scheme of diagnosis practised by means of the stethoscope. He was appointed Professor of the College of France in 1822, but, overcome by mental exertions, he retired to Bretagne, where he died, 13th August 1826. See Pariset's *Éloge de L.*

Lætare Sunday, or **Mid-Lent**, was the fourth Sunday of Lent, and was so called from the first word of the Introit of the Mass or Holy Communion-service for that day—*Isa. lxvi. 10*; as the second was called Reminiscere (*cf. Ps. xxiv. 6, Vulg.*); and the third Oculi (*cf. Ps. xxiv. 15*).

La Farina, Giuseppe, an Italian author and politician, was born at Messina, Sicily, in 1815, graduated at the University of Catania, became an advocate, and in 1837 had to leave the island owing to the propagation of revolutionary views. Returning in 1839, L. started the *Spectator* and *Beacon*, but both being suppressed he retired to Florence, where the reforming spirit was strongly at work, and published the *Dawn*, in which he attacked the papal system and preached democracy. In 1848 he again returned to Sicily, the Provisional Government appointing him on a mission to Rome, Tuscany, and Piedmont, for the purpose of enlisting sympathy in their cause. L. was unsuccessful, but joining the Ministry he held the portfolios for the Interior, Instruction, and Public Works. His last appearance in Sicily was made along with Garibaldi, with whom, however, he quarrelled (1861). L. died in September 1863. His chief works are *Studies in the Thirteenth Century*, *History of the Sicilian Revolution in 1848-49*, and *History of Italy from 1815-50*; *L'Epistolario di La F.* appeared at Milan in 2 vols., 1869.

Lafayette, a city of Indiana, U.S., and a great railway centre, on the river Wabash, and the Wabash and Erie Canal, 60 miles N.W. of Indianapolis. It formerly derived its importance from being at the head of navigation on the Wabash, now abandoned by commerce. In 1875 it had twenty-five churches, three daily newspapers, street railroads, an opera-house, a State agricultural college (Purdue University), and a large trade in groceries, boots and shoes, &c. Pop. (1871) 13,500.

Lafayette, Marie Jean Paul Roch Yves Gilbert Motier, Marquis de, was born 6th September 1757, of an ancient French family, at the Château de Chavagnac, in Auvergne, educated at the *Collège du Plessis*, married Mlle. de Noailles 11th April 1774, became enthusiastically attached to the idea of political liberty, and on the outbreak of the American Revolution was tempted across the Atlantic, landing at Georgetown in Carolina in the summer of 1777. L. fought at Brandywine and in Canada, but went back to France in 1778, on hearing that war had broken out between his country and England. Returning to America in February 1779, he defended

Virginia with prudence and skill, compelled Cornwallis to capitulate at Yorktown, and again returned to France. In 1784-85 he once more revisited America, being received with the strongest manifestations of enthusiasm. For some years L. devoted himself to the cause of constitutional freedom in France, and in the Assembly of Notables (1787) demanded a convocation of the States-General. In the National Assembly (1789) L. spoke with great ardour, was appointed vice-president, and became commandant over the armed citizens, whom he named the National Guard. With this appointment began the most difficult part of his career, that of restraining the unruly multitude. By his endeavour to obtain for the king the courtesies due to his position, L., even at the moment he was advocating the abolition of aristocratic titles, and acting upon the principle that 'insurrection is the most sacred of duties,' fell under the suspicion of the Jacobins. He therefore retired to Auvergne (October 1791), but was called to take the command of one of the armies organised after the coalition of Pillnitz. From the camp of Maubeuge (1792) he denounced the clubs and advocated the upholding of a constitutional throne in a letter addressed to the Assembly, and even appeared there in person to enforce his demand. This course was regarded with coldness by the court and with indignation by the Jacobins. His effigy was even burnt at the Palais-Royal. He sought a neutral country, but being captured by the Austrians (19th August 1792) was sent to Wesel. It was not till September 1797 that he regained his freedom. L. voted both against the consulate and the empire, and hailed with pleasure the return of the Bourbons, believing in 'a popular throne surrounded by republican institutions.' From 1818 to 1824 he sat in the Chamber of Deputies for the department of Sarthe. In the latter year he revisited America, and was voted 200,000 dollars and an estate in gratitude for his services. He was prominent in the revolution of 1830, and died 20th May 1834. See Jules Cloquet, *Souvenirs de la Vie Privée du Général la F.* (1836); La Bédollière, *Vie Politique du Marquis de la F.* (1833); *Mémoires, Correspondance et Manuscrits du Général la F.* (6 vols., Par. 1837-38), edited by his family.

Lafayette College, at Easton, Pennsylvania, U.S., was chartered in 1826, and has now classical, scientific, and law (since 1875) schools, and technical ones of mining, civil engineering, and chemistry. It grants degrees, and the number of resident professors and tutors is 28, of non-resident lecturers 4, and of students 319.

Laffitte, Jacques, the son of a carpenter, was born at Bayonne, 24th October 1767, went to Paris in 1788, entered the bank of Periegaux, and after going through the different grades of the office with rapidity, succeeded to the business in 1809. In turn L. was elected president of the Chamber of Commerce, judge of the Tribunal of Commerce (1813), and governor of the Bank of France (1814). He conducted a financial operation for Louis XVIII. to the amount of several millions of francs after Napoleon escaped from Elba, and took charge of five millions for Napoleon after the defeat of Waterloo. When Blücher demanded 600,000 francs from the town of Paris, L. became guarantee for the amount. In 1816 he was chosen deputy for Paris, and spoke with great authority upon questions of finance, combating the system of forced loans, and advocating the freedom of the press. For the next few years he was one of the most prominent men in the capital, and earned for himself an enviable repute for actions of the most generous kind and on the most magnificent scale. He held the portfolio for finance, and was president of the Council in the first Ministry of Louis-Philippe, but retired in 1831, being too conservative for the majority of the assembly. The financial panic of the same year bore hard upon his house, and he was compelled to sell off the whole of his private property, by which he retained a surplus of 8,000,000 francs. L. died at Paris, 26th May 1844. Some of his publications are *Opinion sur le Projet de Loi de Finances de 1818* (1818), *Réflexions sur la Réduction de la Rente et sur l'État du Crédit* (1824), *Dix millions de Profits à garder*. See Louis Blanc, *Histoire de Dix Ans*. See Marchal's *Souvenirs de J. L.* (Par. 1844), *Vie de M. J. L.* (Par. 1844), and the work of Büdinger (1870).

La Flèche. See **FLÈCHE**, LA.

La Fontaine, Jean de, a French poet and fabulist of exquisite talent, was born at Château-Thierry, in Champagne, 8th

July 1621, received a slender education in his native village, was sent to Reims (1641) with the view of adopting a religious life, gave up the idea in a year and a half, after which he plunged into a course of dissipation. Having commenced the study of the old French poets, L. in his twenty-second year felt the impulse of his own genius for the first time. After his marriage, which took place in his twenty-sixth year, he widened his reading to the fields of Latin and Italian literature, and in 1654 appeared his translation of the *Eunuchus* of Terence. In the same year he made the friendship of Fouquet, who offered him a pension on the condition that he should produce something poetical every quarter. Until the fall of his patron in 1661, L. wrote *Le Songe de Vaux*, *L'Adonis*, besides numerous epistles and ballads. Other patrons were forthcoming in the Duchess of Bouillon and Marguerite of Lorraine, but, though he was on intimate terms not only with them, but with Molière, Racine, and Boileau, he made no effort to appear at court. Before the fall of the Duchess of Bouillon in 1680, he published his *Contes et Nouvelles en Vers* (1665), *Fables Choisies mises en Vers* (1668), *Les Amours de Psyché et de Cupidon* (1669). In the *Vers de Circonstance*, written under the roof of his first patron, he showed a marked capacity for the production of light and graceful trifles. His *Contes* took higher artistic ground. They were based upon the material supplied in the old *fabliaux* and in the tales of Boccaccio and Ariosto, which he handled with dexterous simplicity, penetrating them with the spirit of vivacity and movement, enlivening them with piquant reflections, but at the same time preserving them in a state of ingenious immorality. L. is at his best in the *Fables*. Their purity is irreproachable, their style is a perfection as any French writer has attained, their good sense is conspicuous, and their sympathy for all vital creation, proper to the Frenchman. In France they are known and admired; in other countries they are almost unknown. In 1680 L. was pensioned by the Duke of Orleans, and in 1683 to a vacant chair in the Académie, which, to the king's displeasure, whom he offended by his attacks with ballads. The last years of L.'s life are but a record of attempts and attempted amendments. His ideal of a state was never reached, the moral law did not exist for him. He was long overthrown with a serious malady, he determined to devote himself to expiate his follies by writing hymns. He died at Paris, 13th April 1695. The best edition of L.'s works is that by Wackenaer (18 vols. Par. 1819-20; new ed. 6 vols. Par. 1834-35, 1857-60). See Sainte Beuve's *Portraits Littéraires et Critiques du XVIIIe*, Taine's *Essai sur les Fables de L.* (Par. 1870), and Paul Lacroix's *Bibliographie La Fontaine* (Par. 1874).

Lagomys, a genus of Rodent *Mammalia*, belonging to the *Leporida*, of hare and rabbit family. The legs in L. are better proportioned than in *lepus*. Complete collar bones are developed, but the skeleton is very rudimentary. *L. alpinus*, found in Siberia, is a familiar species. It is hunted for the sake of its skin.

Lagoon, an Italian form of the Latin *lacuna*, 'a pool,' from *lacus*, 'a lake.' See *AROTI*.

Lagopus, a genus of Raptorial birds, represented by the Grouse (q. v.) (*L. Scoticus*), ptarmigan (*L. vulgaris*), and allied forms. The tarsi and toes are provided with hair-like feathers, giving to the legs rather a clumsy appearance. The bill is short and broad, and the nostrils are feathered.

Lagos, a British colony on the W. coast of Africa, and on the Right of Benin, comprises a strip of coast-land 12 miles broad, stretching from the river Yerewa to Ode, and the island of L. in a deep inlet at the mouth of the river L. or Soa. Area, 5000 sq. miles; pop. (1871) 62,021, of whom, however, only a small number are whites. The town of L., at the W. end of the island, is the seat of Catholic and Wesleyan missions, and has a port of 36,000. Badagry, Palma, and Leckie are trading ports, and export palm-oil, cotton, indigo, and ground nuts. Formerly a great centre of the slave trade, L. was seized by the British in 1851, and was formally made a settlement in 1861.

Lagos ('the town on the bay,' anc. *Lacophriga*), a seaport of Portugal, in the province of Algarve, 19 miles E.N.E. of Cape St. Vincent, is a fortified place with a sand-choked harbour, which in 1875 had only three ships of 233 tons burden. Pop. 7500. In L. Bay Admiral Boscawen defeated the French Toulon fleet under De la Clue, August 18, 1759.

Lagrange, Joseph Louis, Comte, one of the most celebrated of mathematicians, was born at Turin, January 25, 1736. His father was of French birth, but had taken service with the Duke of Savoy. In 1753 L. began the study of modern mathematics with such extraordinary zeal and success that within the next three years he had established a world-wide reputation as a mathematician of marked originality. In 1755 he had made researches which laid the foundation of the calculus of variations, and elicited the high encomium of Euler, who had long been working in the same direction. In 1766 he succeeded this famous mathematician (who had gone to St. Petersburg) as director of the mathematical division of the Berlin Academy, of which he had been a member since 1759. During his stay here he contributed some sixty papers to the *Mémoires* of the Academy, the most remarkable of which is the demonstration of the periodicity of the variations of the major axes of the planetary orbits (1776). In 1787 he removed to Paris, and the same year appeared his immortal work, the *Mécanique Analytique*. In this treatise the whole of dynamical science is based upon one principle, which L. calls the principle of *virtual velocities*. From this, aided by D'Alembert's analytical expression, which reduces all kinetical problems to pure statical ones, L. developed by mathematical processes of rare beauty generalised formulæ which apply to every dynamical problem. On the foundation of l'Ecole Polytechnique in 1794, L. became Professor of Mathematics, and in this capacity published his *Théorie des Fonctions Analytiques* (1797), and *Résolution des Equations Numériques* (1798). The former aims at establishing the differential and integral calculus by means of ordinary algebra without making use of the doctrine of limits. His method, however, cannot logically exclude this doctrine, and is in itself defective, but it is most powerful in its applications to algebraic developments. Napoleon made L. a grand officer of the Legion of Honour and a member of the imperial senate, in recognition of his scientific eminence. L. died at Paris, April 10, 1813. Besides his great works above mentioned, he wrote numerous valuable papers and memoirs upon the propagation of sound, the theory of probabilities, the dynamics of fluids, the libration of the moon, the planetary theory, &c., &c. His *Œuvres* were published by Serret (new ed. 1867). See MM. Virey and Potel, *Précis Historique sur la Vie et la Mort de L.* (Par. 1813).

La Guayra. See *GUAYRA*, LA.

La Guéronnière, Arthur, Vicomte de, was born in 1816, started a journalistic connection with *L'Avenir National* (1840), and has remained a publicist throughout life. Along with Lamartine he founded *Le Bien Public*, and after writing for Emile de Girardin in *La Presse*, he joined *Le Pays*, and defended the *coup-d'état* of 2d December. His notoriety is chiefly founded upon the influence he now obtained as the literary mouthpiece of Napoleonic ideas. Besides conducting the *Pays* and *Constitutionnel*, he was elected a State Councillor. Some of his brochures, especially *L'Empereur Napoléon III. et l'Angleterre*, created a profound sensation throughout Europe. In 1868 L. was sent to Brussels as ambassador, and thence to Constantinople. After the establishment of the Republic, he edited the *Presse* for a time, but resigned, owing to a difference with the proprietors, October 1873.

La Harpe. See *HARPE*.

Lahijan, a town of Persia, in the province of Ghilan, on the Langrud, 25 miles S.E. of Resht, is an ancient place, with extensive bazaars, a college, and good caravanserais. Silk, which is largely manufactured here, is the staple commodity. Estimated pop. 15,000.

Lahore, the capital of the province of the Punjab, British India, and the chief town of the district of the same name, one mile S. of the Ravi river, 1080 N.W. of Calcutta, with which it is connected by railway, and 270 S.E. of Peshawar, to which place the railway is now (1877) being continued. Pop. (1868) 125,363, including 12,682 in the suburbs, and 13,757 in the cantonment of Mean-Meer. L. has always been one of the greatest cities of the East, and as such is included by Milton in his sounding roll of Oriental monarchies. Situated on the high road from the N.W. frontier, it was the capital of the first dynasty of Mahomedan invaders, and subsequently of the great Sikh ruler. It is surrounded by a brick wall 16 feet high, 3 miles in circumference, with 13 gates, but a large space outside is covered by ruins of its former grandeur. The historical build-

ings include the tomb of Jehangir, the palaces of successive Mogul emperors, the Badshahi mosque of Aurungzebe, and the mausoleum of Runjeet Sing. Many of these have great architectural beauty. The chief structures of English origin are the Punjab University College, the Mayo Hospital, the Museum, the Lawrence and Montgomery Halls, and the offices of government. There are trifling manufactures of silk scarfs, and gold and silver lace. The trade is mostly confined to local wants, the imports (grain, &c.), being valued at £330,000, the exports at only £18,000. The situation is not healthy. On this account the troops were removed in 1852. The previous annual death-rate had been 84 per 1000. L. was the capital of an early Hindu dynasty; it was taken by the Moslem Afghans in 1022, and attained its chief prosperity under the early Mogul emperors, 1524-1660. It was ravaged by Sikhs, Turcomans, and Maharrattas. Runjeet Sing established himself here in 1799, when the city was almost in ruins. On March 29, 1849, as the result of the second Sikh war, L. was finally proclaimed the capital of a British province. During the Mutiny the city remained tranquil. Immediately on the news of the outbreak at Meerut, the five regiments of sepoy at Meerut were disarmed by the European force, one-fourth their strength, and the native garrison in the fort of L. was also quietly removed. The *district* of L. is bounded S.E. by the river Sutlej, and traversed by the Ravi. Area, 3659 sq. miles; pop. (1868) 789,666. The crops are wheat, pulse, millet, and cotton. It contains the town of Kasur (pop. 15,209), which carries on manufactures of leather.

Lahr (Old Ger. a 'site,' or 'field'), a town in Germany, in the Grand-Duchy of Baden, on the Schutter, a tributary of the Rhine, 50 miles S.S.W. of Karlsruhe, with important manufactures of tobacco, wool, cotton, silk, linen, chicory, and leather. Pop. (1875) 8490.

Laibach (Ger. 'the warm or leafy brook'; Slav. *Liubliana*; Lat. *Labacum*, or *Æmona*), the chief town of Carniola in Austria, on the Laibach, an affluent of the Save, 170 miles S.S.W. of Vienna by rail. The town itself is close and old-fashioned, but the suburbs have fine streets and squares. It has a cathedral, an Ursuline church with a magnificent altar, and several educational institutions. There is an extensive commission-trade, besides manufactures of cotton, sugar, leather goods, machinery, and chemical preparations. Pop. with suburbs (1869) 22,593. Here met (January 26-May 12, 1821) a congress, composed of the Russian and Austrian Emperors and their ministers, with envoys from the other great powers, and from the Italian princes, which agreed to restore the old order of things in Naples and Sardinia, in spite of England's protest.

Laing, Malcolm, a Scottish historian, born 1762 at Strynzia, in Orkney, was educated at Kirkwall. He passed advocate at the Scottish bar in 1785, but was little employed as a lawyer, and devoted several years to historical study, after which he spent the later portion of his life in agriculture on his paternal estate in Orkney, and died there in 1818. His chief works were a *History of Scotland from the Union of the Crowns* (1603) to the *Union of the Kingdoms* (1707); with *Two Dissertations, Historical and Critical, on the Gowrie Conspiracy, and on the Supposed Authenticity of Ossian's Poems* (1800), an able, though prejudiced work, in which he is equally severe on Macpherson and on Mary; *The Poems of Ossian, &c., Containing the Poetical Works of James Macpherson, Esq., in Prose and Rhyme, with Notes and Illustrations*; and a second edition of his history in 1804, with a *Preliminary Dissertation on the Participation of Mary Queen of Scots in the Murder of Darnley*. L.'s works have few graces of style, but have gained him the character of an acute and judicious historian.—**David L.**, a distinguished Scottish antiquary and man of letters, the son of a well-known Edinburgh bookseller, was born in that city about 1796. From his earliest years he was a close student of the national literature. His long career of learned authorship commenced about 1821, when he published the poems of Alexander Montgomery in connection with Irving. This was followed in 1822 by an edition of the *Early Popular Poetry of Scotland*, and the publication of Sir David Lyndsay's *Heralds Manuscript*, a magnificent *œuvre de luxe*, containing 133 coloured plates. Since then he has edited *Fugitive Scottish Poetry* (2 vols. 1825-53); *Golgarrus and Gawane, and other Ancient Poems* (1827), the first work printed in Scotland (1508); *Early Metrical Tales* (1826); *Dunbar's Poems* (1834, with Suppl. 1865); *Works of John*

[illegible]

Laïs was the name of two celebrated Greek prostitutes. The elder was born in Corinth, lived in the times due to his part in the Peloponnesian War, and was equally notorious for his avarice, and caprice. The younger was a native of that 'insurrectionary' city, brought to Corinth in early life. She was a companion of the rival of the Athenian courtesan Phryne, and is said to have been stoned to death by some Thessalian women, jealous of her success.

La'ity (from the Gr. *laos*, 'the people'), a term of Maubeuge the 2d c. to denote all persons not belonging to the upholding of

Lake (Lat. *Lacus*), a land-locked sheet of water. The Assembly, great kinds of lakes are (1) those through which rivers remand. Those those which have inlets but no outlets; and (3), and with indig rivers rise. Lakes of the second kind—of which the Caspian and Aral Seas—being captured water by evaporation. Their waters are of the West. It was Asia is the great land of salt lakes. In Europe, the most noted (Ladoga and Onega) and most numerous are found in Finland, and in Sweden, but the most famous is in 'a popular of Switzerland, N. Italy, and Scotland. From 1818 to *Law Regarding Lakes in Britain*.—The Department of not only to the water of a lake surrounds a city, and was voted to the *solum*, which he may make any use for his services. He which are the permanent sources of rivers, and died 20th May the owner of the ground in which they are *Vie Privée du Général* navigable, are not usually *inter regalia* du Marquis de la F.

Lake, Viscount, a distinguished *Manuscripts du Général de la*
in 1744, was appointed commander-in-^{his family.}
ing the administration of Lord Welles-
ley in Hindustan Proper during the
1803-4; took Aligarh, Delhi, and Agra,
and the family of the late
Coel and Laswari, by which the power
was broken and that of England estab-
lished. In two months he destroyed three
by Frenchmen, and took 426 guns.

found all over Switzerland, those of the bronze age chiefly in the central and western lakes, and those of the iron age in the lakes of Neuchâtel and Bienné alone.

The large quantities of remains obtained on the sites of these ancient settlements throw considerable light on the manner in which their inhabitants lived. In the most remote times the lake dwellers appear to have subsisted almost entirely by hunting and fishing, but subsequently they domesticated cattle, which were herded on the platforms, as the deposits of manure testify. Still later, pigs, dogs, and sheep were domesticated, but no remains of the domestic cat or fowl have been found, and those of the horse are few and comparatively recent. Dr. Rüttemeyer gives a list of thirty-seven species of mammalia, twenty-four of birds, four of amphibians, and nine of fishes, bones of which have been found in the lake settlements. The lake dwellers cultivated wheat, barley, and flax, and oats also, during the bronze age, but neither rye nor hemp. They made cakes (some of which still exist) of corn rudely crushed in stone hand-mills. Wild fruits and berries were also largely consumed by them, and a cake made of the seeds of the opium poppy was found at Robenhausen. In all 115 species of plants have been determined as having been known to them. They had manufactures of linen, nets and cordage, leather, and pottery. In the few settlements of the iron age, coins and glass have been found, in addition to the implements and weapons of stone, horn, bone, and bronze, found generally distributed in the older dwellings. The religion of the inhabitants is still unknown, and their mode of sepulture was also a mystery till 1876, when a discovery was made in the Canton of Vaud of what is believed to have been a family grave of a date transitional between the stone and bronze ages. It consisted of an underground chamber supported by stones, and contained fifteen human skeletons, two stone hatchets, a smooth bone disc, a copper ring, and a needle and four small bracelets of bronze.

Prehistoric remains of L. D. similar to those of Switzerland have been discovered in Bavaria, Saxony (near Leipsic), Mecklenburg, Pomerania, and insular Denmark. Similar dwellings are mentioned by Herodotus as having been constructed by the Pæonians, and the Saracen geographer Abulfeda (q. v.) records their existence in Syria in the beginning of the 14th c. They were also common along the shores of the Lake of Mexico at the time of the Spanish conquest, and Bancroft states that one of the towns there situated 'was founded entirely on piles, and had canals instead of streets.' Commander Cameron reports the existence of a settlement of the same kind in Lake Mohrya, a small lake to the W. of Lake Tanganyika, Central Africa. The houses are 6 feet above the water, and can only be reached in canoes. Habitations built on piles are common in the rivers and sheltered inlets of New Guinea, being so erected to protect their inhabitants from alligators. See also CRANNOGES.

See M. Frédéric Troyon's *Habitations Lacustres de la Suisse* (1857); Dr. F. Keller's *Lake Dwellings of Switzerland and other Parts of Europe*, translated and arranged by J. E. Lee (1866); Sir J. Lubbock's *Prehistoric Times* (1869); Bancroft's *Native Races of the Pacific States of N. America* (vol. ii., 1875); Cameron's *Across Africa* (1877).

Lake of the Woods, a lake of N. America, on the border line of Canada and Minnesota, U.S., is connected by the Winnipeg with Lake Winnipeg on the N.W., and by the Rainy River with Rainy Lake on the S.E. It is 977 feet above sea-level, has a circuit of about 300 miles (much indented by bays and inlets), and is studded by numerous small wooded islands. A roadway of 90 miles was constructed (1870) from its shores direct into the heart of the Red River Settlement.

Lakes (colours) are pigments prepared by mixing colouring matters or dyestuffs with earthy ingredients, such as alumina, oxide of tin, powdered chalk, baryta, or with starch. The most common lake colours are red, the finest of which—Carmine (q. v.)—is composed of the colouring matter of cochineal and alumina. Madder lake is a compound of madder with alumina and oxide of tin, and Brazil wood similarly compounded also yields a much-used red lake. Aniline colours are also prepared as L., and more rarely yellow L. are made with Persian berries and flavine.

Lakshmi, the Hindu goddess of fortune and beauty, and the consort of Vishnu. It is in her honour that the Kayet or writer caste of Bengal celebrate their great annual festival in February. Pen and ink, the emblems of their craft, are scrupulously put

aside, and no writing may be done. See Wilson's Works, vol. ii., *Religious Festivals of the Hindus* (Lond. 1864).

Lalande, Joseph Jérôme le Français de, a celebrated French astronomer, was born at Bourg (Ain), July 11, 1732. At Paris he applied himself to mathematics and astronomy with such success that when only eighteen years of age he was deputed by the Academy of Sciences to go to Berlin to make observations for determining the parallax of the moon. In 1760 he became director or editor of the *Connaissance des Temps*, the method of which he completely changed. The following year he succeeded De Lisle as Professor of Astronomy in the Collège de France, and in 1764 published his *Traité d'Astronomie*, whose peculiar value lies in its practical character. L. died at Paris, April 4, 1807. He wrote many other works, geographical and astronomical, of which the chief are *Voyage en Italie* (1769), *Traité des Canaux* (1778), *Bibliographie Astronomique* (1803), and numerous memoirs on the theories of various planets. See Delambre's *Éloge de L.* in the *Mém. de l'Institut*, t. viii. (1807).

Lally, Thomas Arthur, Baron de Tollendal, Comte de, the last of the great Frenchmen in India in the 18th c., was born at Romans in Dauphiné, January 1702. His family was of Irish extraction, and emigrated in the train of the Stuarts. L. received a thorough military training, was a soldier at eighteen, took part in the sieges of Kehl (1733) and Philipbourg, and when war broke out between England and France in 1741 greatly distinguished himself at Dettingen, Menin, Ypres, and Furnes. His Irish regiment captured Tournay, and decided the battle of Fontenoy. He joined Prince Charles Stuart in Scotland, was present at the skirmish of Falkirk, and after the disaster of Culloden re-entered the French army. In 1755 L. proposed to contest with England the possession of India. In 1758, the year after the battle of Plassey, he landed at Pondicherry. He took Fort St. David from the British, but failed in an attack upon Madras. In 1759, along with Bussy, he was signally defeated by Sir Eyre Coote at Wandewash, a blow from which the French power in India never recovered. In 1761 Pondicherry was taken by the British, and L. sent a prisoner to Madras, and thence to London. Learning that he was accused of betraying the interests of France, he quitted England on his parole, and appeared before the French Court demanding justice. The result was his imprisonment in the Bastille. His trial commenced in January 1764. He was condemned, and beheaded at Paris 9th May 1766. Three years afterwards the French East India Company ceased to exist. See Colonel Mallet's *Essays and Lectures on Indian Historical Subjects* (2d issue, Lond. 1876).

La'ma. See LLAMA.

La'maism, the religion of Thibet and the surrounding countries, presents a singular medley of Shamanism, Sivaism, and Buddhism, which last faith was introduced into Thibet in the 7th c. A.D., suppressed in the 10th, but revived in the 11th c. In 1357 was born, in the province of Amdo, T'oung-Kaps, of whom it is related that he was distinguished from his birth by a long white beard and by powers of gifted utterance, and that at the age of three he professed the religious life. After a careful study of the Buddhistic classics, he created an eclectic system of his own, whose followers he distinguished from the red-capped professors of the established faith by a revival of the original yellow cap of Buddhism, whence their nickname 'Yellow Caps.' He also founded (1409) the lamaserics or 'monasteries' of Galdan, Sera, and Braipung in the neighbourhood of H'Lassa, and of Tas-chi Lumpo. L., as established by him, centres in a spiritual and (since 1640) territorial sovereignty, residing at Potala near H'Lassa, on whom towards the close of the 15th c. was conferred the title *Dalai Lama* ('sea-priest'). He is regarded as the incarnate Buddha, who may only attain *nirvana*, when by the world-wide promulgation of his doctrines he has freed humanity from all its sorrows. Hence the *Dalai Lama* never dies, his soul merely passing from one body to another, that generally of a child, who must be discovered by such tests as the recognition of a bell or answers relating to the *Dalai's* former stage of existence. His duties are simple—to sit cross-legged in his temple, and from time to time extend his hand in benediction to his worshippers. There are many other grand lamas, of nominally equal dignity, the chief of whom reside at Kras-his-lun-po in Further Thibet, at Great Kouran, and at Pekin. Subordinate to these are the *khutuks*, incarnate Buddhist saints; the *khubilghans*, incarnate founders of lamaserics;

charmanas, or 'monk' lamas who act as scribes, physicians, sorcerers, &c., and make up one-third of the entire population; and *gufpos*, hermits. From the first Jesuit missionaries down to the Abbé Huc (who starts with the theory that Tsong-Kapa must have derived his system from a Christian missionary), travellers have delighted to trace a resemblance between L. and Catholicism. They speak of the Lamaistic sacraments of baptism, confirmation, and penance, of popes, cardinals, and archbishops, of monasteries and nunneries, abbots, priors, and so forth. That these analogies are either forced or depend on purely external accidents, not on derived ideas, is shown in the wide difference between a Western monastery and a lamaseri, which, if it answers to anything, is more like an Egyptian *laura*, having neither common dwelling-house nor refectory, but permitting its 'monks' to live each according to his means; while no case of identity of doctrine is adduced that is not explainable by the common impulses of all natural religion. The canonical books of L., comprising 333 volumes, consist mainly of translations from the Sanskrit, but also include original treatises by Tibetan writers. See Huc's *Voyage dans la Tartarie, le Tibet, et la Chine* (Par. 1852); Köppen's *Lamaische Hierarchie und Kirche* (Berl. 1859); and Markham's *Narrative of the Mission of G. Bogle to Tibet and of the Journey of Th. Manning to H' Lassa* (Lond. 1876).

La'mantin, or **Lamantine**. See MANATEE.

Lamarok', Jean Baptiste Pierre Antoine de Monet de, a French naturalist, was born at Bazentin in Picardy, August 1, 1744, and educated at the Jesuits' College at Amiens with a view to entering the Church; but after his father's death in 1760 he joined the army. An accident obliged him to retire in 1762. He then entered the service of a banker, devoting his ample leisure time to the study of meteorology and botany. His *Flore Française* (1778) led to his being elected a member of the Academy of Sciences; and in 1792 he was appointed one of the Professors of Natural History in the Jardin des Plantes. Geoffrey Saint-Hilaire had charge of the *vertebrata*, L. of the *invertebrata*—a branch of science which he had hardly as yet studied. He speedily mastered the details, however, and in 1815–22 published his *Histoire des Animaux sans Vertèbres* (7 vols.; 2d ed., edited by Deshayes and Milne Edwards, 11 vols., 1836–45), one of the truly classical works on zoology. His other chief work is *Philosophie Zoologique* (2 vols. 1809), in which he speculates on the variability of species, forestalling in some measure Darwin's theory of the origin of species. L. died at Paris, December 18, 1829. See Cuvier's *Éloge de L.*

La Marmora, Alfonso Ferrero Marchese di, an Italian general and politician, was born of a good Piedmontese family, November 17, 1804, early distinguished himself in the War of Independence, became General of Brigade in 1843, and was appointed Minister of War by Victor Emmanuel in 1849, in which office he showed great activity in the cause of military reform. During the Crimean War L. was despatched from Sardinia with an army of 17,000 men, which did good service on the banks of the Tchernaya. In the ministry of Cavour he took the portfolio for war, and (1861) succeeded General Cialdini as commander-in-chief of the troops of the king of Italy, served as Premier (1864–65), and in the Austro-Prussian War (1866) met with a reverse at Custozza, which brought him into great unpopularity. Accused by Cialdini of a secret understanding with Napoleon, L. met the charge by laying before the Italian Parliament (July 21, 1868) a despatch of the Prussian ambassador, dated June 17, 1866, which clearly proved the understanding to have been rather with Prussia. From 9th October 1870 to 25th January 1871, L. stood at the head of the Roman Government, as Governor-General and Viceroy, and is now (1877) commander-in-chief of the Italian army.

Lamartine', Alphonse de, an illustrious French poet and politician, was born at Mâcon, 21st October 1792. At the village of Milly L. received the rudiments of his education, and about 1805 was sent to the Collège de Lyon, from which he was speedily withdrawn, and lodged at a Jesuit house at Belley. Returning to Milly (1809) he plunged into a course of Italian, English, and French poetry, fell in love, and was despatched to Paris *pour se distraire*. The winter of 1811–12 he spent at Rome; in 1813 he was dreaming away his time in a courtship at Naples; in 1814 he took military service under Louis XVIII.,

but during the Hundred Days retired to Switzerland; in 1816 he was at Aix nourishing his esteem for the young wife of an old man; in 1820 appeared his *Méditations Poétiques*, a volume which at once established his reputation, and drew upon him the attention of the king and the aristocratic salons, while its religious aspiration, its dreamy enthusiasm for nature, and its passionate warmth of expression rendered it peculiarly acceptable to the youth of France. L. was immediately appointed secretary of the embassy at Naples, and on his way thither married Miss Birch, a beautiful and wealthy young Englishwoman. In 1823 were published *Nouvelles Méditations*, in 1824 he became secretary to the embassy at Florence, in 1825 appeared *Le Dernier Chant de Child Harold*, a couplet of which so offended Colonel Pepe, the Italian patriot, that a duel was fought between them. L. returned to Paris (1829), and was elected a member of the Académie Française. After the Revolution of July, L. declined to serve the new monarchy, and renounced his diplomatic career. In 1831 he published his *Politique Rationnelle*, which ushered him into the more stormy life of the statesman. Failing to obtain a place in the Assembly, L. travelled in the East for nineteen months, but was elected deputy for Bergues (Nord). In 1835 he gave to the world *Souvenirs, Impressions, Pensées et Paysages pendant un Voyage en Orient*, full of magnificent descriptive passages, which sometimes, however, tend towards verbosity; in 1836 appeared *Jocelyn*, and in 1838 *La Chute d'un Ange*. During this year he made steady progress in Parliamentary esteem, began to lead the Progressive Conservative party, made vigorous speeches on 'the Eastern question,' and (1845) denounced the government of Louis-Philippe. In 1847 came forth the *Histoire des Girondins*, in which the great revolutionary epoch of France was pictured with rhapsodical enthusiasm. This book is commonly supposed to have exercised immense influence in producing the Revolution of 1848, during which L. became a member of the Provisional Government and Foreign Minister of the Republic. His influence was widely exercised in restraining the vehemence of the more extreme members of the party, but his popularity soon declined, and when he competed against Louis Napoleon and Cavaignac for the office of President he obtained the lowest number of votes. After the *coup-d'état* of 1851, L. retired from politics, but having fallen into straitened circumstances, was compelled to write for his living. Among his later works are *Confidences* (1849); *Nouvelles Confidences* (1851); *L'Histoire de la Restauration* (8 vols. 1851–53); *Histoire de Turquie* (6 vols. 1854); *Histoire de Russie* (2 vols. 1855), *Cours familier de Littérature* (1856, et seq.), and *Toussaint l'Ouvreur*. In 1867 he received a pension, and died March 1, 1869. His *Œuvres Complètes*, in 40 vols., were published in 1860–63. See the *Biographies of L.* by Pelletan (1869), Janin (1869), *L.'s Own Mémoires* (1871), and the *Correspondance de L.* (6 vols. 1875), published by Mme. Valentine de Lamartine.

Lamb, Charles, born in Crown Office Row, London, 18th February 1775, was a schoolfellow of Coleridge at Christ's Hospital, obtained a clerkship in the South Sea House, and afterwards served the East India Company for thirty-three years, retiring on an allowance of £400 per annum. L. first appeared in the literary world along with Coleridge and Charles Lloyd, as joint author of an unpretending and unsuccessful volume of poems. Next, in 1798, he wrote *Rosamond Gray*, a daintily-told story with slender plot. His tragedy of *John Woodvil*, printed in 1801, was rejected at the theatres, while his only other dramatic attempt, a farce entitled *Mr. H.*, was damned on the first night of representation, its author himself hissing from the pit most lustily. The well-known *Tales from Shakespeare* (partly written by his sister Mary) appeared in 1806; the *Specimens from Dramatic Poets contemporary with Shakespeare*, and *Adventures of Ulysses* (culled from Chapman's Homer), in 1807. In the following year L. and his sister worked together at two charming little books, *Mrs. Leicester's School* and *Poetry for Children*, the latter of which, published in 1809, was thought to have totally disappeared till a copy was discovered in S. Australia in 1877. Meanwhile his pen was busy in the service of the magazines, one or two of his best essays—those, for instance, on Hogarth and Shakespeare—being contributed to the *Reflector*, edited by Leigh Hunt. The *Elia Essays* were first collected from the *London Magazine* in 1823; the *Last Essays of Elia* and *Popular Fallacies* were published by Moxon in 1833. L. died at Edmonton, 27th December

1734, and his sister on the 20th May 1847. L. was not a voluminous writer, yet some of his earlier prose efforts have passed into oblivion; while of his poems, the *Farewell to Tobacco*, *Familiar Faces*, and *Hester* alone continue to be read. His fame rests on the *Elia Essays*—a sufficient foundation. In these, all moods are reflected, all chords touched, and by a master's hand. L.'s style is at once easy and inimitable, witty and tender, sometimes giving a picture in a single word, or sounding the depths of pathos with the simplest phrase. The old English dramatists, humorists, and moralists—such men as Massinger, Browne, Wither, Jeremy Taylor—these were his friends more than any living associates. With these he delighted to company, writing, as he whimsically said, not for posterity, but for antiquity; and with these in imagination by his side, he penned his immortal *Essays*—ripe, rich, and fragrant, like old wine. His letters to Coleridge, Southey, Leigh Hunt, Hazlitt, Talfourd, &c., are now included in his *Collected Writings*, the best edition of which is in six volumes (Moxon, 1876).

Lamballe, Maria Theresa Louisa, of Savoy-Carignan, Princess of, was born at Turin, September 8, 1748, and was married in 1767 to Louis Alexandre Joseph Stanislas de Bourbon, Prince of Lamballe. The Prince died in 1768, leaving his young widow to deplore the career of debauchery by which he was cut short. Louis XV., who had neither wife nor mistress, seemed at one time likely to share with her the honour of the crown, but L. attached herself to the Dauphin and Marie Antoinette. When they ascended the throne, L. was appointed superintendent of the household, and became the Queen's most attached friend. Urged by her to take refuge in England, L. set out, but returned to share the royal captivity, was dragged (August 12, 1792) to the prison of La Force, and on the 3d September put to death under circumstances of frightful brutality. See Mme. Guénard's *Mémoires de la Princesse de L.* (Par. 1801), and Lescure's *La Princesse de L.* (Par. 1864).

Lambayeque, a town of Peru, in Libertad, on the river L., 15 miles from the Pacific, and 425 miles N.W. of Lima. It has manufactures of woollens and cottons. Pop. 10,000.

Lambert, Johann Heinrich, a German philosopher and mathematician, born August 29, 1728, at Mühlhausen, in Alsace. The last fourteen years of his life were spent at Berlin, where he died, September 25, 1777. As a mathematician he was among the first of his time, and in the universality and depth of his knowledge, philological and metaphysical, he rivalled his great predecessor Leibnitz. Of his many works, the most important are *Photometria* (1760), *Neues Organon* (2 vols. 1764), *Anlage zur Architektonik* (2 vols. 1771), and *Logische und Philosophische Abhandlungen* (2 vols. 1782). He was, besides, the author of valuable memoirs upon the planetary theory, the velocity of sound, the mathematics of music, the motions of fluids, and various meteorological and other physical and astronomical phenomena. See Huber, *L. nach seinem Leben und Wirken* (Basel, 1829).

Lambert, John, an English general, was born at Kirkby-Malhamdale in Yorkshire, 7th September 1619. He was a colonel in the Parliamentary army at Marston Moor, became major-general 1648, reduced Pomfret in 1649, and fought at Worcester in 1651. He took a leading part in the deposition of Richard Cromwell, when he virtually became Dictator. He quelled the Royalist insurrection of Sir G. Booth, but on the opposition of Monk his army deserted, and he was committed to the Tower in January 1660. He was banished to Guernsey in 1662, where he died, March 1694.

Lambeth, formerly *Lomehithe* ('clayey haven'), the western portion of the metropolis, in the county of Surrey, a parliamentary borough; pop. (1871) 379,112. It contains many churches and charitable institutions, notably St. Thomas's Hospital, facing the Houses of Parliament, and abounds in manufactories. Lambeth Palace, the residence of the Archbishop of Canterbury, dates from 1197. It has a magnificent library, and records of the archiepiscopal see since 1278.

Lambeth, Degrees of. See DEGREES OF LAMBERTH.

Lambrequin. See MANTLING.

Lamb's Lettuce. See CORN SALAD.

Lamb's-Wool, a beverage of strong ale and pulped roasted apples, formerly much esteemed in Britain. In some parts of Scotland anything very delicious is said to 'gang down like lam'-oo.' The name is a corruption of the Cymric *la maes abhal* (pronounced *lamasool*), 'the feast or ingathering of apples.'

Lamego, a town of Portugal, province of Beira, near the left bank of the Douro, and 46 miles E. by N. of Oporto, with trade in wine and hams. Pop. 8000. Here was held in 1143 the first *Cortes*, which gave Portugal a constitution.

Lamellibranchia'ta ('plate-gilled'), a class of Mollusca represented by the oysters, cockles, mussels, and by all our common bivalve shellfish. In this class the shell is always bivalve. It is in the great majority of cases *inequilateral*, or more developed to one side of the middle line than to the other, and is usually *equivocal*, or composed of equal halves. The shell is formed by the *pallium* or *mantle* which lines each half of that structure. It is shut by special (*adductor*) muscles, but is opened by the action of an *elastic ligament* which comes into play when the muscles relax. One or two adductor muscles may be developed; the oyster illustrating the former condition. The mouth is not provided with any teeth, and a perfect digestive system exists. The heart is two or three chambered, and is *systemic* in its nature. The gills consist of two plate-like organs existing on each side of the body. Water is admitted to the gills either by the simple unclosing of the shell, or by special tubes named *siphons*. Hence the class is divided into the *Asiphonata* (oysters, mussels, pinnæ, scallops, &c.), and *Siphonata* (clams, cockles, razor-shells, pholas, teredo, &c.). The *foot* may be well developed or rudimentary (as in the oyster). It may be used for leaping (cockle), for burrowing (razor-shell), or for forming a *byssus* or *beard* (mussel and pinnia). The organs of sense consist of tentacles developed around the mouth, of hearing organs, and of rudimentary eyes—well seen in the scallops (pecten).

Lamell'icornes, a group of Coleoptera or Beetles, including forms in which the tarsi are five-jointed (*Pentamera*). They are so named from the peculiar conformation of the terminal joints of the antennæ or feelers, these joints being lamellar or plate-like, and disposed like the joints of a fan. To this group belong the cockchafers, dung-beetles, stag-beetles, &c.

Lamell'irostres, a division of the *Natatorial* birds or Swimmers, represented by ducks, geese, flamingoes, &c. The bill is flat, and covered with a soft membrane. Its edges are further provided with a series of horny plates or *lamella*, serving as a kind of straining apparatus, whereby the solid parts of the food are strained off from the liquid portions. Four toes are developed; the fourth or hinder toe being unconnected by the web with the others.

Lamennais, Hugues-Félicité-Robert, Abbé de, a celebrated French religious and political writer, was born at St. Malo, 19th June 1782. Educated by an eccentric uncle, he quickly developed into premature manhood, having for companions at the age of ten Livy and Rousseau, and at twelve fighting with his *curé* over the truths of religion. In 1809 was published his *Réflexions sur l'État de l'Église*, a work which Government suppressed. Three years passed, and with the help of his brother he produced the *Tradition sur l'Institution des Evêques*; but the hostility of the moderate political party drove him to England, where he supported himself by teaching. Returning to France, L. at once rose to the pinnacle of fame by publishing the first part of the *Essai sur l'Indifférence en Matière de Religion*. Its author at this time upheld the ruling of the Church as the only and absolute law for society. In the *Conservateur*, *Défenseur*, and *Drapeau Blanc*, ephemeral party journals, he continued the crusade against secular power. When the last two volumes of the *Essai* appeared, L. was offered a cardinal's hat, but declined it. His next work, in which his theory of government was propounded in its most extreme form, was entitled *De la Religion, considérée dans ses Rapports avec l'Ordre Civil et Politique* (1825). After the July Revolution he founded *L'Avenir*, a journal whose pages, as revolutionary tendency, were soon laid under ban by Gregory XVI. The natural reaction of sentiment had set in: from this time L. became less and less a churchman. The *Paroles d'un Croquant*, written in a week, made his changed opinions public. In the

columns of journals and by means of pamphlets he continued to exercise an influence; but enthusiasm was gone. His last utterances of importance are to be found in his *Esquisse d'une Philosophie* (4 vols. 1841-46). He died a sceptic, 27th February 1854, and was buried, according to his request, without the observance of any religious rites. His *Œuvres Complètes*, in 12 vols., were published in 1844, and his *Œuvres Posthumes* in 5 vols. in 1855-58. See Renan, *L. et ses Écrits* in the *Revue des Deux Mondes* (August 1857), and Blaize, *Essai Biographique sur L.* (Par. 1858).

Lamenta'tions (Heb. *K'inoth*, 'songs of mourning') are not in the Hebrew canon ascribed to Jeremiah, nor placed alongside of his prophecies. In the LXX. and Vulgate they are placed next to the prophecies of Jeremiah, and called the L. of Jeremiah over Jerusalem. In the Talmud and by Josephus, Jeremiah is regarded as the author, and only very few have called in question this traditional view. The reasons for holding it are the agreement of the L. with Jeremiah's prophecies in their spirit, purport, tone, and language, especially what the author says about his own fortunes (iii. 1-21, cf. Jer. xxxviii.). The time of composition was doubtless after the capture of the city, in the eleventh year of the reign of Zedekiah (B.C. 587), and perhaps, although not certainly, after the burning of the city and temple.

Lamination is the deposition of stratified rocks in thin laminae or layers, which are not so distinctly marked as true strata. The laminae rarely exceed an inch in thickness, and may be as thin as the finest paper, while strata may vary from half an inch in thickness to many feet. L. is met with mostly in sandstones and shales.

Lamm's Day, the 1st of August. It is one of the four *cross quarters* of the year, the other three being Whitsuntide, Martinmas, and Candlemas. Some rents are still payable on these days in England, and they are the terms generally in force in Scotland. The name is a corruption of the Old Eng. *hlaf-mæsse*, 'the loaf mass,' a festival held at the beginning of the harvest.

Lammergeier, or **Lammergeyer** (*Gypfetus barbatus*), a large species of Vulture (q. v.), inhabiting S. Europe and W. Asia, and attaining a length of 4 feet, while the wings may reach an expanse of 10 feet. This bird is also known by the name of the bearded vulture, from a tuft of bristles rising from beneath the bill. Its colour is a greyish-brown marked with white above, each feather having a white streak in its centre. The head and neck are dark brown. The under parts are white tinted with brown. The head and neck are feathered, and the bill is long and sharply curved at its tip. The second and third quills are the longest, and the tail is long and wedge-shaped. The L. feeds on carrion, but also picks up lambs, rabbits, kids, and other small animals, bearing them to its nest, which is constructed on the summit of a cliff. The eggs number two, and are of a dirty white colour mottled with brown.

Lammermoors, a range of hills in Scotland, forming in part the boundary between the counties of Haddington and Berwick, and extending from the Moorfoot Hills to the rugged coast S. of Dunbar. The L. reach a height of 1534 feet in Sparleton, and of 1732 feet in Lammer Law.

Lamorcière, **Christophe Léon Louis Juchault de**, a French general, was born at Nantes, 6th February 1806, educated at the Polytechnic School (1824-26), became lieutenant (1830), and, after serving with distinction in the African war, rose to the rank of colonel (1837). In 1844 L. was appointed commander of the Legion of Honour, and temporary governor of Algeria, with the military rank of general. Owing to his energy and skill, the African war was brought to a conclusion in 1847. During the revolution of 1848 L. proclaimed the abdication of Louis-Philippe, was wounded at the barricades when commanding against the mob, and took office in the Cavaignac Ministry. After the *coup d'état* of Louis Napoleon, he was imprisoned, then sent into exile. In 1860 L. appeared in Italy as commander of the Papal troops during the War of Independence, but was compelled to surrender to Cialdini at Ancona. He died 11th September 1865, at his château of Prouzel near Amiens. See Pongesia, *Le Général de L.* (Par. 1866).

Lamp (Gr. *lampas*, 'a torch,' from *lampō*, 'I shine'), a well-known apparatus for producing artificial light, by burning oil or other inflammable liquid saturating a wick of twisted or plaited cotton. Lamps are of two kinds—(1) *Suction* lamps, in which the oil is raised from a reservoir to the top of the wick by capillary attraction; and (2) *mechanical* or *pressure* lamps, which have a contrivance for forcing the oil to the burning wick in constant proportions with unvarying regularity. The improvements in the construction of modern lamps date from the invention, in 1784, of the Argand oil-lamp, the distinguishing feature of which was the burner. In it a cylindrical wick was used, occupying the space between two metallic tubes, through the inner of which a constant stream of air passed, securing a more complete combustion of the oil; a glass chimney also was placed over the burner to increase the draught. The flame of the Argand L. varied with the change of level of the oil in the reservoir, and to remedy this defect the Carcel L. was invented in 1798, in which the burner is supplied with a superabundant quantity of oil by clockwork, ensuring a brilliant, steady flame. The Carcel L., though still retained by Parisians as the standard in photometric investigation, is not adapted for ordinary use. On it the moderator lamps, invented since 1825, are based. The oil is stored in the body of these lamps, and is forced, by the pressure exerted by a spiral spring on a disc floating in the oil, up through a tube in the piston to the burner; and in the ascending tube is placed a 'moderator,' consisting of a tapering rod, to control and regulate the flow of oil according to the pressure of the spring. The principle of raising a superabundance of oil to the burner in the foregoing lamps, which were designed to burn animal or vegetable oils, is inapplicable in lamps for consuming mineral oils, as petroleum, paraffin, naphtha, &c. These liquid hydro-carbons are so largely composed of carbon, that to prevent smoke, only as much oil as the wick can suck up should reach the flame; and to consume the carbon present, a plentiful and regular supply of air must be afforded. These conditions have been fairly met in numerous varieties of mineral oil-lamps. The brass burner of the most common household form is shown in section in the annexed diagram. The upper portion of the oil reservoir, which may be either of glass, porcelain, or metal, is seen at A. Fixed to it is a metal cylinder B, perforated with numerous small holes for the inlet of air, and closed at the foot by a disc C, to prevent the escape of oil from below. D is a flat tube to support the wick, and having a hole in it to allow of the wick being raised or lowered by a notched wheel E. A perforated partition F is placed across the air chamber to hold any fragments of wick that may fall, and to steady the currents of air. B is capped with a dome G which deflects the air currents on the flame as it passes through a slit on the crown of the dome. Around the dome is a gallery for supporting a glass chimney (partly seen at H), to increase the draught through the air chamber, and to shield the flame from wind. In the 'Paragon L.' recently patented by M. Dietz, for burning petroleum, there are two air chambers, from which an abundant and well-regulated supply of heated air is directed on the lower as well as the upper part of the flame. The 'Anucapnic' (Gr. 'without smoke') L., invented in 1866 by Messrs. Rowatt & Son, of Edinburgh, is noteworthy on account of the glass chimney being dispensed with. The burner in this L. is provided with an inner and an outer dome, which cause a powerful draught, and the air in circulating between them becomes so hot that on impinging on the flame the oil is completely burned without smoke. Mr. A. M. Silber has lately introduced a L. for burning purified petroleum, which gives remarkable results, and is well adapted for most of the purposes of illumination for which gas is now used. The Silber lamps are provided with modified Argand burners with circular wicks of varying diameter, and the petroleum is consumed, to a great extent, in a vaporised condition, owing to the lowering of the oil level in the wick case, with the effect of greatly increasing the illuminating power. The supply of oil to the wick is regulated according to the consuming power. Where a large number of lights are used, the oil is distributed from a tank in the upper part of the building to a series of

Lamp.

little cisterns placed on a level with the lamps to be fed, and provided with automatic mechanism for equalising the flow of the oil to the lamps. A saving of 20 to 40 per cent. of cost is effected by the Silber L. over that of gas, reckoned at 3s. 9d. per cubic foot. See SAFETY LAMP.

Lampblack is an intensely black pigment formed of the soot deposited from the smoke which results from imperfect combustion of various substances. The finest and most lustrous qualities are obtained from the combustion of camphor or of various oils, but common L. is generally made from refuse resinous substances, pine-tree roots and knots, &c., by burning in furnaces specially constructed for impeding combustion and favouring the deposition of soot. L. of fine quality is the basis of Indian Ink (q. v.).

Lamprey (*Petromyzon*), a genus of fishes forming one of the two genera included in the order *Marsipobranchii* (q. v.). In this group the skeleton is very imperfect, and is represented chiefly by a persistent *notochord*. The skull is cartilaginous, no distinct cranial bones are perceptible, and no lower jaw is developed. The gills exist in the form of a series of sacs or pouches borne on the sides of the neck, and opening externally by seven apertures along the side of the neck. No limbs (or paired fins) are represented, although a medium dorsal fin continued backwards to form a tail-fin, is developed. The mouth has the form of a circular opening, with a number of horny processes developed in its margin. The round form of the mouth gave origin to the term *Cyclostomata* ('circular mouth') by which the L. order was formerly known. The best-known species is the great L. (*P. marinus*), which attains a length of from 16 to 20 inches or more. The colour of this species is olive-brown, spotted with dark brown and black. The L. adheres to fixed objects by means of its rounded mouth; respiration being conducted by the gills. The lampern (*P.* or *Lampetra fluviatilis*) is common in many English rivers, and attains a length of from 12 to 15 inches. Its colour is a bluish-grey above, and white beneath. The pouched L. (*Geotria Australis*) of Australia has a large dilatable pouch on each side of the head. The mud L. or sand pride (*Ammocetes branchialis*) is a doubtful species of L.

Lampshells, a familiar name given to many *Brachiopodous* molluscs, from the shape of their shell. The species of the genus *Terebratula* have in particular received this name; one of the valves being deep and bowl-shaped, while the beak is prominent, and pierced by a hole for the protrusion of a ligament. Many fossil species of *Terebratulæ* are known—the existing species being found in warm seas.

Lamp-tridee. See GLOW-WORM.

Lan'ark (Cymric, *Llanerch*, 'a separate piece of ground'), a market-town beautifully situated near the Clyde, 29 miles S.E. of Glasgow by rail. Handloom weaving is its chief industry. The Falls of Clyde in the neighbourhood attract numerous visitors. L. unites with Hamilton, Airdrie, Linlithgow, and Falkirk in sending a member to Parliament. Pop. (1871) 5099. —**New L.** (pop. 973), a village one mile S. of L., founded in 1784 by the father-in-law of Robert Owen, was from 1815 to 1827 the scene of that socialist's philanthropic labours.

Lan'arkshire, or **Olydesdale**, a county in the W. of Scotland, occupies the whole basin of the Clyde (q. v.), and is surrounded by the counties of Dumfries, Stirling, Midlothian, Linlithgow, Peebles, Dumfries, Ayr, and Renfrew. Area, 889 sq. miles; pop. (1871) 765,339. L. stretches 52 miles from N. to S., and from E. to W. 34 miles. It is judiciously divided into three districts or *wards*, the upper (one-half of L.), of which two-thirds are moorland or mountain, producing lead, and the middle and lower wards, which are very rich in coal and iron. L. is mountainous in the S., where the Lowther Hills rise to 2403 feet, Tinto Hill to 2335 feet, Rodger Law to 2257 feet, Culter Fell to 1801 feet, and White Craig to 1425 feet, undulating in the middle, and flat in the N. The soil of the arable parts of the county is clay with an admixture of sand. In 1876 there were 52,151 acres under corn crops, 18,441 in green crops, 72,016 under various grasses, and in permanent pasture 100,217. Horses numbered 7522; cattle, 65,147; sheep, 213,535, and pigs, 8268. Pasturage and dairy-farming are thus more general than the rearing of grain. L. has from the earliest times been

famous for its fruit. Its breed of draught horses is highly valued. L. is the greatest manufacturing and mining county of Scotland. Its chief industries are clustered round Glasgow (q. v.), and include cotton-weaving, ironworking, shipbuilding, and the manufacture of sugar, woollens, silk, and chemical preparations. The county sends two members to Parliament.

Lan'cashire, a north-western county of England, is bounded W. by the Irish Sea, E. by Yorkshire, N. by Cumberland and Northumberland, and S. by Cheshire. Area, including the outlying portion of Furness, 1884 sq. miles; pop. (1871) 2,819,495. It is entered in the N. and traversed along the E. by the Pennine range, but is flat towards the coast, which is indented by Morecambe Bay, and the estuaries of the Ribble and Mersey. The chief rivers, besides the two last-named, are the Lune, Leven, Duddon, and Winster. The district of Furness, detached by Morecambe Bay, and stretching N. to Lake Windermere, is mountainous and picturesque. Throughout L. the chief formation is carboniferous, but new red-sandstone prevails in the W., and is lined with post-tertiary deposits. The soil is for the most part a fertile loam, and in 1875 there were 102,353 acres under corn crops, and 50,126 under green crops, while 73,336 were in clover, sanfoin, and grasses in rotation, and 532,955 in permanent pasture, exclusive of mountain or heath. In 1875 L. had 231,057 head of cattle, 314,664 sheep, 34,348 horses, and 38,443 pigs. The chief crops are oats, wheat, barley, potatoes, and turnips. L., however, derives its great importance from its vast textile and mineral industries. It is the greatest seat of the cotton manufacture in the world, having some 2000 factories, employing between three and four hundred thousand persons. Since 1770 the cotton industry has developed with a rapidity that may be judged by the eightfold increase of the inhabitants. Manchester is perhaps the greatest seat of manufactures in the world; other leading 'cotton towns' are Preston, Blackburn, Burnley, Wigan, Chorley, &c. (See COTTON.) In L. there are also large flax and silk mills, smelting-works (see BARROW-IN-FURNESS), coal-mines, &c. Liverpool (q. v.) is the principal port, and shipbuilding is carried on extensively on the Mersey. In 1871 the annual value of all property in L. on which direct taxes were paid was £27,923,057. Eight members of Parliament are returned for the county, and twenty-four for the boroughs. The county town is Lancaster, and the principal remains are the beautiful Furness Abbey, date 1127, and an abbey of the same period in the E. of L., township of Whalley. Near Whalley is the Roman Catholic College of Stonyhurst. See *The L. Library*, a critical catalogue of works on L. topography and local history, by Lieut.-Colonel H. Fishwick (Lond. 1876), and a *Glossary of the L. Dialect*, by Nodal and Milner (Lond. 1875).

Lan'caster ('the town on the Lune'), the county town of Lancashire, on the left bank of the Lune, 6 miles N.E. of its entrance in L. Bay, and 60 N.N.W. of Manchester by rail. It is a picturesque town, and the hill on which it is built is boldly crowned by the castle, now used as a jail, parts of which date from the reign of Edward III. The other noteworthy buildings are the parish church of St. Mary, with a lofty tower, and many old monuments and brasses; Christ Church, in the Second Pointed style, built in 1857; a Roman Catholic church, convent, and schools, covering an area of two acres; Ripley Hospital, for the maintenance and education of 150 boys, endowed and erected in 1864; the Town-hall on the market-place, the Custom-house on St. George's Quay, &c. There are large manufactures of cotton, silk, and oilcloth, besides iron-foundries, iron shipbuilding yards, furniture factories, railway-carriage works, and steam marble-mills. In 1875 there entered and cleared 519 vessels of 80,924 tons. The Lune is here crossed by an aqueduct and by a bridge of five arches. A dock at Glasson, 5 miles down the river, enables large vessels to discharge their cargo into lighters. Pop. (1871) 17,245. L. was disfranchised for corrupt election practices in 1867. It is supposed to occupy the site of a Roman station. In *Domesday* it appears as *Lancastre*. The town received its first charter from King John, and was made a county palatine by Richard III. It suffered much during the Wars of the Roses and the Parliamentary War.

Lancaster, a city of Pennsylvania, U.S., 68 miles W. of Philadelphia by rail, has thirty-three churches, a theatre, eight banks, the Franklin and Marshall College of the German Reformed Church, three daily and seven weekly (two German)

papers, &c. Its chief manufactures are cotton (employing 1700 hands), tobacco (20,000,000 cigars), and lager beer (25,000 barrels annually). There are also large foundries and iron manufactures of every description. In the War of Independence, L. was the meeting-place of the 'Continental Congress,' and it was the seat of the State government from 1799 to 1812. Pop. (1870) 20,233.

Lancaster Gun. See RIFLED ARMS.

Lancaster Herald, the second in point of seniority of the six English heralds, whose office, instituted by Edward III. in 1362, on the occasion of his son, John of Gaunt, succeeding to the dukedom of Lancaster, was raised by Henry IV. to the rank of a king-at-arms, abolished by Edward IV., and finally revived by Henry VII.

Lancaster, Joseph, born in Southwark in 1778, is well known for his enthusiastic application of the principles of the monitorial system to the practical work of teaching in London, and for his connection with the bitter controversy which issued in the formation of the National and of the British and Foreign School Societies. (See ANDREW BELL.) In 1805 L. was summoned to an interview with George III., who is reported to have said to him, 'I highly approve of your system, and it is my wish that every poor child in my dominions should be taught to read the Bible.' The subsequent career of L. was sadly chequered. In 1812 he became insolvent, and in 1818 went to America. He died in poverty, 24th October 1838, from the effects of an accident in the streets of New York.

Lancaster, Sir James, an English navigator, born about 1550. He had command of the first expedition sent out by the East India Company (1600-3), when he established commercial relations with Java and Sumatra. L. was knighted by Queen Elizabeth, and died in 1620. He was a sanguine believer in the N. W. Passage. Baffin named the sound at the extremity of Baffin's Bay after him. See Purchas's *Pilgrims*, vol. iii., and Hakluyt's *Voyages*, vol. i.

Lancaster Sound, an inlet, 250 miles long, stretching W. from Baffin's Bay to Barrow Strait, and so forming part of the N. W. Passage. It is enclosed by North Devon Island on the N., and the minor islands of Cockburn Land on the S. Discovered by Baffin in 1616, it was first navigated by Parry in 1819.

Lance (Lat. *lancea*), a weapon of offence consisting of a pointed or spear-head fixed to a long, smooth, wooden shaft. It was in use among the Assyrians and Egyptians, and in the hands of the Macedonian and Roman soldiers proved a most effective weapon. Several European cavalry regiments are armed with the L.; in the British army such horsemen are termed lancers, and their L. is 9 feet long, with a triangular spear-head adorned with a red and white pennon.

Lancelet (*Amphioxus*), the lowest fish and Vertebrate, forming the only representative of the order *Pharyngobranchii* (q. v.). It has no distinct skeleton, the spine being a mere cellular notochord. No skull, lower jaw, or limbs are developed. No brain or organs of hearing are present, and a distinct heart is wanting, its place being supplied by contractile dilatations existing on many of the blood-vessels. The blood differs from that of all other vertebrates in being colourless. The breathing organs of the L. consist of a greatly distended pharynx, the walls of which contain cartilaginous filaments and are perforated, whilst its interior is covered by a delicate ciliated membrane. Water taken in by the mouth passes through the slits in the pharyngeal sac, aerating the blood contained in its lining membrane; whilst it ultimately passes into the abdominal cavity, from which it escapes by an opening situated in front of the anus, and known as the *abdominal pore*. The digestive system is simple, and the liver is represented by a long sac-like organ. The mouth is a longitudinal slit. It is surrounded by a horny ring, to which filaments or *cirri* are attached—hence the origin of the name *Cirrostromi*, sometimes applied to this group. No kidneys exist, and no lymphatic or absorbent system has been discovered. The L. attains a length of about 2 inches. It inhabits sandy coasts and sandbanks, and has a tapering body, provided with a lancet-shaped tail-fin. The L. has of late years been regarded with great interest by biologists, from the use which has been made of its structure and affinities in supporting the doctrine of evolu-

tion. It is presumed to present the starting-point of vertebrate organisation.

Lancelot of the Lake does not figure in the earliest legends of Arthur (q. v.). He is not mentioned by the Welsh bards, by Nennius, or by Geoffrey of Monmouth. He is therefore a creation of the later romance trouvères, and his adventures form part of that vast superstructure of chivalric fantasy which has effectually hidden from view the historic Arthur of Nennius. According to the romances, L. was the son of Bar. King of Brittany, and received his name from the circumstance of his being carried off by the witch-nymph Vivien, the mistress of Merlin, and brought up in her magic home within the bosom of a lake. At the age of eighteen he proceeded to the court of Arthur, and signalises himself by unequalled prowess in a thousand adventures. His amour with Guinevere is presented in a much coarser light by the older poets than by Tennyson. The first trouvère that handled the story was Chrétien of Troyes in his *La Charette*, but there are numerous old versions in French, German, and English.

Lancers, a branch of the English cavalry service, armed with pennon-decked lances, swords, and pistols, and answering to the German Uhlans and the French Lanciers. The first regiment of the latter was raised in 1742 by Marshal Saxe, on whose death, however, it lost its distinguishing weapon. In 1801 the Third Hussars armed one of their squadrons with lances, and Napoleon in 1807 incorporated a regiment of Polish Uhlans into his body-guard. He also formed four regiments of L. in 1807, which in 1812 were increased to nine, with a total force of 10,000 men. All these were suppressed in 1815, with the exception of the royal guard, but were shortly after reorganised, and at present the French cavalry includes eight regiments of L. During the American Civil War a lancer regiment was raised at Philadelphia, but soon discarded its lances as ill-suited for the thick woods of Virginia. The L. were introduced into the English service to correspond to the French Polish L., and compose five regiments. See CAVALRY.

Lancet Window, a tall narrow window, the arch of which is formed on an acute-angled triangle, common in the first half of the Early English period of architecture, or from 1190 to 1245. Originally used singly, lancet windows came to be grouped in combinations of from two to seven, and when thus combined were sometimes surmounted by a large arch, the space between which and the tops of the windows was often pierced with circles, trefoils, &c.

Lance-Wood, a strong, light, and elastic wood believed to be the produce of a W. Indian species of two genera (*Guatteria* and *Duguetia*), belonging to the natural order *Anonaceæ*. L.-W. is principally used by coach-builders for shafts and carriage poles, also for making archery bows.

Lancia'no, a town in the province of Chieti, Italy, lies on three hills 6 miles from the Adriatic, and 100 miles E.N.E. of Rome. It has a beautiful cathedral and fine bridges, is the see of an archbishop, and has active trade with Greece and Dalmatia. Its muscatel is famous. L., the ancient *Auxanum*, the 'emporium of the Ferentini,' had in the middle ages great manufactures of linens, silk-stuffs, and needles. Pop. (1872) 8758.

Land, Transfer of, by Registration of Title. The Act of 1862 is intended to give certainty to the title to real estates, and to render dealings in land more simple and economical. A register is established of titles to estates of freehold tenure, and of leasehold estates in freehold. Upon request, the registrar is to deliver to the owner of an estate, or of any interest in land, a certificate, with a list and description of encumbrances, charges, and liens (see LIEN), whether or not registered as indefeasible title, with all other particulars requisite for showing the exact nature of the owner's estate or interest. Registered proprietors desirous of selling may obtain special land certificates. Lands may be conveyed by endorsement of certificate in a prescribed form. For creating a lien, deposit of estate certificate is made as effective as deposit of title-deeds. There is a relative Act for obtaining a declaration of title, by petition to the Court of Chancery. The petition must set forth particulars as to encumbrances or interests affecting title. A certificate is to be given to the party obtaining a final declaration. The Acts are limited to England.

***Lardau**, an old town of Rhenish Bavaria, on the Queich, 30 miles S.W. of Heidelberg by rail. It is beautifully situated, and has an important tobacco industry. Pop. (1875) 7579, of whom one-half are Protestants. L. was a stronghold from an early period, and during the 'Thirty Years' War it was besieged and taken seven times. It was captured by Louis XIV. in 1680, and fortified by Vauban in the form of an octagon in 1686. After repeatedly changing hands between 1702 and 1713, it remained with France till 1815. Its walls were levelled as no longer serviceable in 1867.

Land Crab, a general name applied to those species of *Decapodous* crustacea, which subsist in damp situations on land, and which may therefore be regarded as differing materially in habits from the ordinary members of the crustacean class. The genus *Gelasinus* (of which *G. masonis* and *G. bellator*, or the fighting crab, are good examples) contains familiar species of L. C., and the racer crabs (*Ocypoda*) are also well-known examples. The violet crab, or black crab of Jamaica (*Gecarcinus rubicola*), is perhaps the best known L. C. These creatures live in burrows, which may be distant at least a mile from the coast. They seldom visit the sea, save for the purpose of laying their eggs. In December and January they are at their best, but in May are poor and unfit to be eaten. When they proceed to the coast to deposit their eggs, they march in immense bodies, and usually in a straight line, their march being an event conspicuous in the calendar of the W. Indian Islands.

Landed Estates Court, the name of an Irish Court originally called the *Encumbered Estates Court*. It was created by Act of Parliament in 1848, its original function being to facilitate the sale of deeply encumbered estates in Ireland, by granting a fresh title to the purchaser, free from encumbrances. All having any interest in the property were cited to appear, and plead their claims before the court. Judgment was then given upon these, and the proceeds of the sale divided accordingly. The clear title brought a high price in the market; so that it was found advisable to extend the jurisdiction of the court to unencumbered land, and to make permanent that jurisdiction which had been originally meant to be only temporary.

Landed Men. In criminal trials in Scotland, when the panel (*i.e.*, the accused) is a proprietor of land he may insist on being tried by a jury of whom the majority are proprietors of land; that is, according to the law term, *Landed Men*.

Land'er, Richard, an African explorer, was born at Truro, Cornwall, in 1804, accompanied 'Clapperton,' as an attendant, to Sakkatu, and after the death of the latter, returned to England, and published a narrative of the expedition in 1829. Accompanied by his brother John, he discovered (1830) that the Niger entered the Bight of Benin by many mouths. After publishing his *Course and Termination of the Niger* (3 vols., Lond. 1832), he set out for the Upper Niger on a trading expedition with two steam-vessels. In a collision with the natives, L. was severely wounded, and died at Fernando Po, 27th February 1834.—**John L.** received an office in the customs, and died 16th November 1839.

Landerneau ('the enclosure on the water'), a seaport town in France, in the department of Finistère, on the florn, 12 miles N.E. of Brest, with a good harbour, and some manufactures of linen and leather. Pop. (1872) 6285.

Landes ('heaths') the third largest department of France, is bounded N. by the Gironde, S. by the Basses-Pyrénées, W. by the Bay of Biscay, and E. by Gers and Lot-et-Garonne. Area, 3599 sq. miles; pop. (1872) 300,528. In the S. and S.E. the surface is hilly and fertile, and is watered by the Adour, and its branches the Gave de Pau and Midouze. The rest is arid plateau land, dry and sandy, here and there dotted with sombre forests of pine and cork trees, and fringed along the coast with extensive *lans* or lagoons. From this desert tract, which is about the most thinly peopled in France, the department derives its name. The inhabitants, of Gascon race, are called *Parrens*, and subsist mainly in the L. proper by rearing sheep and swine, and by charcoal burning and cork cutting. The shepherds in the marshy districts are mounted on high wooden stilts. No less than 1270 sq. miles are covered with forest, and 77 with vines. The *Vins de Sable*, from the Maransin, are nearly equal in quality to those of Bordeaux, and the annual value of the

vintage is £140,000. In the S. and E. there is also considerable culture of wheat, maize, millet, rye, and oats. L. is traversed by the railway *Bordeaux-à-Bayonne*, and by branch lines. Mont-de-Marsan (pop. 1871, 6964) is the capital, and other towns Dax and St. Sever.

Landgraf. See **GRAF**.

Landlord and Tenant. By common law, any person may grant a lease for any term shorter than the term of his own interest. A lease for the whole term is rather an assignment than a lease. A lease may bear date as far back as the parties please, but its date must not be subsequent to its execution. In husbandry leases, a covenant is always implied, though not expressed, that the tenant will use the land demised to him in a husbandlike manner, and that he will not exhaust the soil by neglectful or improper tillage. With regard to *Fixtures*, see that article. An outgoing tenant should be careful not to leave any ground for an action for dilapidation, otherwise he may be dragged into an expensive lawsuit which he has no power to avert or stop. No outlay or improvements made by the tenant during his occupancy will be allowed to set off the landlord's claim; and any amount of damage awarded will carry costs (case of *Cooke v. Anderson*). In the absence of express stipulation in writing, the tenant cannot set off any debt due to him by the landlord against so much of his rent. But the occupier or sub-tenant may deduct the ground-rent, if he has paid it, from the first payment of rent due from him. *Notice to quit* is necessary where no time is fixed for the expiry of the tenant's term. If a tenant takes possession of a house, he is bound to retain it for a year; and though he may sublet it, the landlord—unless he accept the sub-tenant—may still hold him bound for the rent. The half-year's notice to quit should be given so as to expire on the *same quarter-day* as that on which the tenant took possession. So, if a person begin to hold at Christmas and wish to leave at the end of the first year, the notice must be served on or before Midsummer-day. If one day beyond Midsummer be allowed to elapse without notice being given, the tenant may be compelled to hold the house for *two years*, there being no intermediate quarter-day till the following Midsummer on which he can give notice, so as to end his holding on the same term as that on which it began. For legal method of enforcing payment of rent by the landlord, see **DISTRESS**, **EJECTMENT**, **REPLEVIN** AND **SALE**.

Lodgings.—The law between householders and lodgers is in almost every respect the same as between L. and T. What has been above stated applies to both kinds of tenure. It seems that if householders who let rooms with attendance do not keep them clean enough to be comfortable and wholesomely inhabitable, lodgers may leave them without notice or liability for rent. Thus, if bugs be found in a bed after entering into possession, a lodger is not obliged to stay in the house (12 M. and W. 52). A house-keeper has the same power to distrain the goods of his lodger for rent as a landlord has over those of his tenant. See **LODGING-HOUSES**. For Scottish law of L. and T. see **LEASE**, **CONTRACT** OF.

Landlord's Hypothec. See **HYPOTHEC**.

Land'on, Letitia Elizabeth, an English poetess, was born in Chelsea in 1802. At the age of nineteen she began to contribute verse under the initials L. E. L. to the *Literary Gazette*, which at once captivated the public fancy. *The Fate of Adelaide*, a Swiss tale, which appeared in 1821, was followed at intervals by *Improvisatrice*, *The Troubadour*, many poems and sketches, and three novels. In 1838 L. E. L. married Mr. M'Lean, Governor of Cape Coast Castle, but died October 15, 1839, from an accidental overdose of prussic acid. Her poems are instinct with a certain tender and romantic pathos, which betrays the influence of Byron. See Blanchard's *Life and Literary Remains of L. E. L.* (Lond. 1841).

Land'or, Walter Savage, was born at Ipsley Court, Warwick, 30th January 1775. At Rugby and Trinity College, Oxford, he attained the reputation of a fine classic, and at twenty published a volume of poems. On the death of his father he succeeded to large estates, mismanaged them, sold them, and went in 1808 to Spain, then invaded by Napoleon. There he equipped a body of troops at his own expense, and marched under Blake with the rank of colonel; but taking offence at a supposed insult from the British envoy he returned to England as hastily as he

left it. He married, and unhappily, in 1811; in 1812 unsuccessfully contested Monmouthshire for Parliament, and four years later took up residence in Italy, where the remainder of his life was chiefly spent. His chief works are:—*Gebir*, a poem (1798), translated into Latin (1802); *Count Julian*, a tragedy (1812); *Idyllia Heroica* (1820); *Latin Poems* (2 vols. 1824); *Imaginary Conversations of Literary Men and Statesmen* (5 vols. 1824–29); *Citation and Examination of Shakespeare* (1834); *Pericles and Aspasia*, and *A Satire on Satirists* (1836); *Pentameron and Pentologue* (1837); *Giovanna of Naples, Andrea of Hungary, and Fra Ruperto* (1840–41); *Poemata et Inscriptiones and Hellenics* (1847); *Last Fruits off an Old Tree* (1853); *Scenes for a Study, Dry Sticks* (1858); *Hellenics Enlarged* (1859); *Letters of an American* (1860). L. was of a passionate nature, and allowing his pen the utmost liberty was looked upon by many readers of his books as the incarnation of unreasonableness and extravagance. One or two of his fiercest pamphlets have dropped out of sight; the judgment of to-day upon his writings is calmer; while his friends have had opportunity of offering their unanimous testimony to his lovable and generous disposition. His works never were, and never will be, widely read; they must remain the delight of the cultured few. He is the poet of intellect rather than of fancy; indeed Coleridge declares him destitute of imagination in its highest form. But the *Imaginary Conversations*, written in the purest English, display an intensity of dramatic genius, an exquisite discrimination of character, a ripe scholarship, an abundance of wit and humour, and a wide sympathy which give them a place among the choicest treasures of our literature. L. died at Florence, 17th September 1864, aged ninety. His biography was written by John Foster (1869, new ed. 1874). A complete edition of his works is published by Chapman & Hall (7 vols. 1876).—**Rev. Robert Byres L.**, brother of the above, was also known in the literary world, chiefly as the author of four fine tragedies, *Count Aressi* (1824), *The Earl of Brecon*, *Faith's Fraud*, and *The Ferryman* (1841). He died at the rectory of Birlingham, Worcestershire, 26th January 1869, aged eighty-seven.

Landsberg on the Warthe, a town of Prussia, province of Brandenburg, on the river Warthe, 83 miles E. by N. of Berlin by rail, has great woollen markets and river traffic, and manufactures leather, woollens, tobacco, paper, and machinery. Pop. (1875) 21,444.

Land'scape Gardening, the art that grasps the varied characteristics and surroundings of ground intended to be devoted to gardens, public parks, or other similar uses, and so plans the arrangement and adornment as to bring the whole into harmonious combination. What Loudon remarks concerning the flower garden is equally applicable to the present subject, namely, that taste must be the principle that must serve as a guide. Embodied taste is style or character, and the art of the designer is, having fixed on a suitable style, to follow it out unmixed with other styles, or with any deviation which would interfere with the kind of impression which that style is calculated to produce. On the one hand, however, to bring everything to geometric precision is objectionable, as, on the other hand, is the introduction of extravagant attempts at wildness. The great object must be to exhibit to advantage the graceful forms and glorious hues of flowering plants, shrubs, and trees; to create pleasing effects by their judicious combination or by their disposal over varying levels, to use them in the enrichment of desirable views, and to utilize them in shutting out undesirable prospects, at the same time and in all cases taking full advantage of all the local peculiarities of the selected site for further artistic embellishment, by the introduction of rock-work, water, &c.

Lands Olausen Act. The statutes 8 Vic. c. 18, for England, and 8 Vic. c. 19, for Scotland, are so called. They prescribe the law applicable to taking compulsory possession of any one's land for public purposes.

Land'seer, Sir Edwin, the greatest of English animal painters, the son of John L., a well-known engraver and writer on art, was born in London in 1802. For more than half a century he was a constant exhibitor. His works include 'Low and High Life' (1831), 'Sir W. Scott and his Dogs' (1832), 'Comical Dogs' (1836), 'Peace and War' (1846), 'A Dialogue at Waterloo' (1855), 'Deer Stalking' (1858), and a legion of equally fine pictures, many of which are in the

National Gallery, London. His magic brush encircled his dumb subjects with a halo of almost human interest. He was elected A.R.A. in 1827, knighted in 1850, and appointed President of the Royal Academy in 1865, an honour he immediately resigned. His latest effort, the well-known lions in Trafalgar Square, attest his power as a sculptor. He died October 1, 1873. An exhibition of between four and five hundred of his works took place at Burlington House in the spring of 1874. The copyrights range from £100 for early works to £3000 for later ones. See the *Early Works of Sir E. L.*, by F. G. Stephens (Lond. 1868), *Memoirs* by the same (1874), and a series of elaborate papers in the *Art Journal* for 1876–77.—**Thomas L.**, the elder brother of the above, is a celebrated line engraver, and his finest works are reproductions of Sir Edwin's pictures, and of Rosa Bonheur's *Horse Fair*, published in 1861. He is the author of a *Life of Bewick* (2 vols. Lond. 1871).—**Charles L.**, another brother, born in 1799, is a painter of historical subjects, and held the office of Keeper to the Academy from 1851 to 1873.

Land's End, a bold rocky promontory, and the most south-westerly point of England, at the toe of Cornwall, 8 miles S.W. of Penzance. It is the *Penwith* of the Britons, and the *Belerium*, *Bolerium*, or *Antivestium Promontorium* of Ptolemy. Off the headland, which meets the full surge of the Atlantic, are three small islands, one of which supports a lighthouse. The foundation of a new rock lighthouse—the Longships—was laid 7th August 1871.

Landshut ('land's defence'), the chief town of the province of Nieder Bayern, S. Germany, on the river Isar, 37 miles N.E. of München by rail, has manufactures of paper, woollens, earthenware, and leather, great breweries, and trade in corn, cattle, and hops. There is a church of St. Martin (about 1450), with a tower 462 feet high. The university removed to L. from Ingolstadt in 1800, was again removed to München in 1826. Pop. (1875) 14,784.—**L.**, a town in Prussia, in the province of Schlesien, on the river Bober, 30 miles S. by W. of Liegnitz, with manufactures of linens, cottons, and woollens. Pop. (1875) 5815.

Landskro'na ('the crown of the land'), a town in Sweden, in the lan of Malmöhus, on a large harbour 30 feet deep on the E. shore of the Sound, 16 miles N.E. of Copenhagen, and connected by rail with the interior of Sweden. It has iron-foundries, and manufactures sugar and woollens. In 1870, 1189 vessels entered the port; cleared, 1175. Its fortifications were kept up till 1870, when its castle was made a prison.

Land'slips are dislodged portions of cliff or slope which have slid down from their original position. The undermining action of streams, and the disintegrating effect of freezing or of percolating water, are the usual agents in producing these dislocations. One of the most remarkable of L. occurred at Rossberg, behind the Righi, in 1806, when, after a rainy summer, thousands of tons of hard red sandstone and conglomerate slid over the sloping beds of the underlying sandy deposits and across the valley of Goldau, burying four villages and about 500 inhabitants.

Land'sturm. See LANDWEHR.

Land Surveying. See SURVEYING.

Land-Tax is a territorial impost introduced in its present form in the reign of William III. The method of raising it is by charging a sum on each county according to the valuation of 1692, and this sum is assessed on individuals by commissioners, being the principal landholders in the county, and their officers.

Land Transport Corps, a name formerly given to an army corps charged with the transport of provisions, war material, the wounded in battle, &c. It was dissolved after the Crimean War, and its place taken by the Military Train with similar functions. The Military Train was in turn disbanded in 1870, and its functions transferred to the Transport Section of the Army Service Corps, which is not a combatant force.

Land'wehr ('land-defence'), is that part of the German military force which does not strictly belong to the standing army, but is a sort of militia composed of those who have already served their time in that army. It was first organised in Prussia according to a plan of Scharnhorst in 1813. Every Prussian subject is enrolled as a soldier as soon as he has completed his twentieth year, and after seven years' service in the standing army he enters

the L. for five years longer, during which period he is liable to be called out twice a year for practice, and to be re-incorporated in the regular army in time of war. An exception is made, however, in the case of any one who can pass a certain examination, and maintain himself for one year. He is next enrolled in the 'Landsturm,' of which he remains a member till the age of fifty. The landsturm is only called out in case of invasion of the country. By the constitution of April 1871 the Prussian obligation of military service was extended to the whole German empire. In 1876 the German army numbered 293 battalions of L., comprising on the war-footing 250,244 men.

Lane, Edward William, an English Orientalist, who for life-long devotion to study worthily bears comparison with the great Germans. He was born at Hereford in 1801, and spent many years in Egypt, where he was induced by the fourth Duke of Northumberland, who bore the main share of the expense, to undertake his great work, the *Arabic Lexicon*. The first volume was published in 1863; four more appeared before his death at Worthing, 10th August 1876, and the remaining three are left completed in his own manuscript. He also wrote *Manners and Customs of the Modern Egyptians* (Lond. 1835), and translated *The Thousand and One Nights*.

Lan'franc, a famous Churchman and scholastic theologian, was born at Pavia about 1005, studied law at Bologna, and became a skilful advocate in the courts of his native city. Crossing the mountains to France, he established a school of law at Avranches, but in a journey which he made from that town to Rouen, he is supposed to have been waylaid near the Abbey of Bec by robbers, and to have been kindly succoured by Herlouin the knight-abbot. More probably, however, L. was drawn to the abbey through religious impulse. In 1042 he took the monk's robe, and in 1045 was appointed prior, and founded the most famous of the mediæval schools—pupils coming to sit at his feet from all parts of England, Germany, Italy, and France, the most famous being Anselm and Pope Alexander II. L. established for himself a reputation for orthodoxy (1050) by the exposure of the fallacies involved in a treatise of Berengar of Tours concerning the mysteries of the Eucharist, in which 'the real presence' was denied. L. was selected by William the Conqueror as his chief adviser, but having opposed the duke's marriage with Matilda of Flanders, he fell into temporary disgrace, and a sentence of banishment was passed upon him. His courageous *bonhomie* re-established him in favour, and 'from that time L. became his (William's) minister and counsellor, whether for the affairs of the Church, or the more daring schemes of foreign oppression which were opened up to him by the position of England.' As 'the fruit and seal of that reconciliation,' L. was appointed in 1066 Abbot of the house of St. Stephen at Caen, where he established a school which rivalled that of Bec. In 1067 he was nominated Archbishop of Rouen, but declined the office, being necessary to the Conqueror's schemes for organising the Church in England, as a check on the aggressive spirit of the feudal baronage. L. was raised to the see of Canterbury after the completion of the Norman Conquest, and he it was, says Mr. Freeman, who taught William 'to cloke a wrongful aggression under the guise of a holy war.' His policy was one with his master's, and the two men ruled together 'as no Pope and Cæsar ever ruled together in the imperial city itself.' The first act was that of compelling the Primate of York to make full submission to the new Primate of Canterbury, and after he had made professions of canonical obedience to L. they went to Rome for their pallia (1071). But it was not until the following year that a final decision was obtained before the Papal legate, the king settling the superior jurisdiction of Canterbury. After this began the undisputed ecclesiastical reign of L. Norman churchmen, men upon whom William could rely, were placed at the head of the religious houses. Ecclesiastical courts were originated, and the usage of holding a Convention was confirmed. A sterner discipline was established in the monasteries, a more vigorous impulse given to learning, whilst the local duties of L. were administered with diligence and detail. His reforms were, however, accompanied by much injustice to the English churchmen whom he found in office and numerously ejected. Though there was gain in ecclesiastical administration, there was a loss of sympathy in relation to the people. 'L. never,' says Mr. Freeman, 'became a naturalised Englishman. . . . Perhaps his character, hard if lofty,

his devotion to interests spread over a field far wider than the isle of Britain, hindered him from ever thoroughly throwing himself into any purely local or national position.' After the death of the Conqueror, L. secured the crown for William the Red, but his influence was misdirected, as the new king exhausted the royal hoard in profligacy and extravagance. L. died May 28, 1089. Several editions of L.'s collected works have been published, the latest at Oxford (1844), edited by Dr. Giles. See Freeman's *Norman Conquest*, vols. iii. iv. v.; Green's *Short History*; A. Charma, L., *Notice Biographique, Littéraire, et Philosophique* (1850).

Lang'eland ('long land'), called from the 15th c. to the 17th, **Lavind**, an island of Denmark, between the Great Belt, the Baltic, and the Little Belt, 33 miles long and 4 broad. Area 107 sq. miles; pop. (1870) 19,631. The surface is wooded and undulating, and the soil is a rich loam in the S. and middle.—Rudkjöbing, on the W. coast, is the market-town. Pop. (1870) 2785.

Lang'enbeck, Konrad Johann Martin, a German anatomist and surgeon, was born December 5, 1776, at Horneburg in Hanover. In 1804 he became professor in Göttingen, and in 1807 established there a surgical and ophthalmic hospital. He died January 24, 1851. His chief writings are *Nosologie und Therapie der Chirurgischen Krankheiten* (5 vols. 1822-40), *Icones Anatomicæ* (8 vols. 1826-39), *Handbuch der Anatomie* (4 vols. 1831-47).—**Maximilian Adolf L.**, son of the above, was born January 11, 1818, at Göttingen, where in 1845 he obtained a professorship. In 1851 he removed to Hanover, and has since remained there practising as a physician and oculist. His chief writings are *Klinische Beiträge* (1840-45), *Impfung der Arterienkörper* (1856), *Insolation des Menschlichen Auges* (1859).—**Bernard Rudolf Konrad von L.**, a cousin of the latter, has a wide reputation as a skilful surgeon. In 1847 he became professor at Berlin, and in 1866 was appointed general staff physician in the Prussian army.

Langenbie'lau, or **Bielau**, a cluster of villages in Prussia, in the province of Schlesien, 32 miles S.W. of Breslau, has important manufactures of linens, woollens, and beet-sugar. Pop. (1875) 13,360.

Langensalz'a, a town in Prussia, in the province of Sachsen, on the Salza, 11 miles N. by W. of Gotha by rail, has a medicinal sulphur spring, and manufactures woollens, cottons, and beer. Pop. (1875) 9484. L. was (27th June 1866) the scene of a conflict between a Hanoverian army of 20,000 men under King Georg V. and the Prussian advanced guard, 9000 strong. The Prussians, at first repulsed, were reinforced during the night, and the Hanoverians capitulated on the 28th.

Langholm ('the long meadow'), a town of Scotland in Dumfriesshire, on the Esk, 30 miles N.E. of Dumfries by rail. It has considerable weaving industries, dyeworks, and flour-mills. Pop. (1871) 3275. L. is an interesting old Border town, and its castle, now in ruins, was the stronghold of the freebooting Armstrongs.

Lang'horne, John, was born at Kirkby Steven, Westmoreland, in March 1735, and studied at Clare College, Cambridge. He spent the earlier years of his life teaching and writing for the press, but obtained preferment in the Church through the influence of his wife's relatives, who were rich. He was first preacher at Lincoln's Inn Chapel, and afterwards prebendary of Wells Cathedral. Of his prose works nothing remains but his well-known translation of Plutarch's *Lives* (1770), executed with the help of his brother. L. died 1st April 1779. His poems, with a biographical memoir, were published by his son in 1804.

Lang'land, William, the probable name of the author of a striking and powerful poem called *Piers the Plowman*. Of the author's Christian name at least we are sure; he repeatedly calls himself 'Will' in the course of his work. The authority for the surname is an entry in one of the Dublin MSS. in a handwriting of the 14th c., and a passage in Bale (16th c.). All that we really know of the poet is to be gathered from allusions occurring in his poem. Assuming the credibility of these, L. was born about 1332, probably at Cleobury Mortimer in Shropshire, received the education of a clerk or scholar, and in 1362 wrote the first draft of his great work. He then went to London, and lived in Cornhill for many years with his wife Kitte and his daughter Calote. About 1377 he began to recast and expand

his poem, introducing his varied experience of city life. A third version, of somewhat later date, shows him still in London 'earning a precarious living by singing the placebo, dirige, and the seven psalms' for the good of men's souls.' If the poem entitled *The Deposition of Richard II.* was written by him, as Mr. Skcat believes, L. was alive in 1399, and as this poem is unfinished, L. may have died soon after the accession of Henry IV. Forty-three MSS. of *Piers the Plowman* still exist, all of which exhibit the work in one of the three forms already indicated. The second of these, dating from 1377, is the richest, most graphic, and most original. It consists of an Introductory Prologue and Seven 'Passus' (= Books), which may again be subdivided into two portions: (1) The Prologue, or Vision of the Field full of Folk, of Holy Church, and of Lady Meed (Pass i.-iv.); (2) The Vision of the Seven Deadly Sins and of Piers the Plowman (Pass v.-vii). In terse, trenchant, alliterative verse he paints with satiric touch the motley array of mankind gathered before his vision in a field; but in the main his strictures and outcries are provoked by the corruptions of the church rather than of the world. Milman's words (*History of Latin Christianity*, vol. 6, p. 536, ed. 1855) are both eloquent and true. After noticing the academic revolt and defiance of Wiclif, he goes on to say: 'In the vision of Piers Plowman is heard a voice from the wild Malvern Hills, the voice, it should seem, of an humble parson or secular priest. He has passed some years in London, but his home, his heart is among the poor population of central Mercian England. . . . Whoever he was, he wrote in his provincial idiom, in a rhythm perhaps from Anglo-Saxon times familiar to the popular ear; if it strengthened and deepened that feeling, no doubt the poem was the expression of a strong and wide-spread feeling. It is popular in a broader and lower sense than the mass of vernacular poetry in Germany and England.' See the Rev. Walter W. Skeat's edition (1869) in the *Clarendon Press Series*—one of the most perfect specimens of editing to be found in the English tongue.

Langnau, a town in the canton of Bern, Switzerland, 16 miles E. of Bern by rail, on the Ilfis, an affluent of the Emmen, is the chief town of the Emmenthal. Weaving is the main industry; there is a market for cheese and linen yarn. Pop. (1870) 6214.

Langres, a town of France, in Haute-Marne, near the sources of the Marne, and 20 miles S.E. of Chaumont by rail. Among its historical monuments are the *Porte Gallo-Romaine*, a triumphal arch of the third c., the Roman church of St. Didier, with its rich collection of antiquities, and the cathedral of St. Mammès, dating from the 11th c. There are important manufactures of the finest cutlery, of woollens, leather, &c., and a trade in iron, cereals, timber, oils, and groceries. Pop. (1872) 6822. L., one of the oldest towns of France, was the capital of the ancient *Lingones* (of which name L. is a corruption), and became a centre of Christianity in the third century.

Langton, Stephen, a great English Churchman, was born some time in the middle of the 12th c. in the county of Sussex, studied philosophy and theology at Paris, became canon of Notre Dame, and chancellor of the university. In 1206 he was created a cardinal by Innocent III. About the same time the monks of Christ Church, Canterbury, claimed the right of filling up their recent archbishopric, and elected Reginald their sub-prior. The bishops and king were both angry, so an appeal was made to the Pope, who confirmed and consecrated L. (June 1207). John declined to receive the archbishop until May 1213, after having suffered the effects of the papal interdiction. In July, L. absolved the king at Winchester, exacting from him an oath to observe the promises made at his coronation to maintain good laws and abolish evil customs. He became the leader of the barons, and, says Mr. Green, 'through his life the charter was the first object of his care.' After the pope interfered to quash the charters, L. was suspended for some years, but in 1220 he was at Westminster, and crowned Henry III. with much ceremonial. During the remaining years of his life L. interested himself less in current politics than in the cultivation of letters and ecclesiastical reform. *De Benedictionibus* and *De Maledictionibus*, *Summa Theologie* and *Summa de Diversis* are treatises attributed to L. He died 9th July 1228, and takes rank as one of the most patriotic figures in the early contest for English liberty. See

Freeman's *History of the Norman Conquest* (vol. v. 1876), and Green's *Short History of the English People* (1875).

Language, the outward embodiment of thought, includes in its widest sense writing, telegraphy, speaking on the fingers, and all other modes by which man communicates his ideas. It is the one great barrier between him and the brute, for all cries of animals, manifold though they be, are expressions not of thought but sensation, analogous to our exclamations of pain or joy. Whence, then, did man obtain this pre-eminence? Is it innate, or merely acquired, like the use of fire or the arts of building, writing, &c. Is it a work of human art, a production of nature, or a divine gift? According to the leading philosophers of last century L. is an invention, arbitrary and conventional; words are artificial signs; and the varieties of human speech are due to different nations having fixed on different sounds as the fittest signs of their different ideas. This, the old *Thesauri* or Historical theory, is that which was held by Locke, advocated by Adam Smith, and adopted with slight modifications by Dugald Stewart. By it *daughter* might stand for 'father,' or *twenty* for 'thirty'—the father the 'milkier' for the family, or thirty the product of '10 x 2'! A second theory regards L. as a production of nature, dependent on, but not necessarily resulting from the powers of man; like the art of swimming, distinct on the one hand from the invention of a life-preserving apparatus, and on the other from such innate faculties as those of breathing or walking. Its advocates all hold man to have been originally in a state of mutism, but they differ as to the means by which he emerged from that condition, one party ascribing the constituent elements of human speech to the exercise of imitation, the other to a development of interjections. These two theories are known as the Onomatopœic and Interjectional, or as their opponents have irreverently dubbed them, the Bow-wow and Pooh-pooh theories. The former relies on such isolated words as *cuckoo* or *peewit*, but stumbles over *thunder* (root, *tan*, 'to stretch') or *squirrel* ('shade-tail'); the latter derives *foul*, *filth*, and *fiend* from the interjection *faugh*, but fails to account for the Sans. *phī*, 'to hate,' of which *fiend* is clearly a cognate. According to the last and now most generally accepted theory—the radical—there remains in every L., after we have explained all that can be explained, a certain inexplicable residuum of some 500 roots, each of which is the expression of a general and material concept. Thus the words *spy*, *spectacle*, *species*, *spice*, *scriptu*, and a host of others can all be traced back to the single root *spē*, 'to see.' Beyond this root it is impossible to go, nor is there any intelligible reason why it should convey the notion of seeing more than of hearing or speaking. We must simply accept it as a fact. Call them the gift of nature or of God, roots are the postulates of speech, and it is impossible to conceive that L. had a beginning without a pre-existing store of them to draw upon. And what their resources are, scanty though they may at first sight appear, is seen in the fact that the 42,718 words of Chinese are all reducible to 450 roots, the 94,464 of German to 250; while Hebrew is content with 300 radicals, and Sanskrit with 1706 according to the Sanskrit grammarians, but in reality with less than one-third that number. See PHONOLOGY; Max Müller's *Science of L.* (2 vols. Lond. 1862-64); Sayce's *Principles of Comparative Philology* (Lond. 1874); and Whitney's *Life and Growth of L.* (New York, 1875).

Langued (from Fr. *langue*, 'tongue'), or **Lampasse**, a heraldic term, meaning tongued.

Langue'doc, one of the old provinces of France, was bounded E. by the Rhone, W. by Gascony and Guienne, S. by Foix, Roussillon, and the Mediterranean, and N. by Lyonnais and Auvergne. It was the *Gallia Narbonensis* of the Romans, and in the middle ages received the name L. (*langue d'oc*) from its inhabitants using the word *oc* (an abbreviation of Lat. *hoc*) for *yes*, while the affirmative of the Romance dialect spoken N. of the Loire (the *langue d'oïl*) was *oil* (from Lat. *illud*) modified in the later *oui*. L. was finally annexed to the crown of France in 1361. It is now divided into nine departments.

Lani'adæ, or **Laniidæ**, a family of *Insectorial* birds belonging to the *Dentirostral* section of that order. The bill is long, straight, and frequently hooked at its tip; the wings are of moderate size, the tail long, the tarsi strong, and the hinder toe greatly developed. In the sub-family *Laniina* (including the

typical genus *Lanius*, to which the shrikes belong) the nostrils are on the sides of the bill, and the hind toe bears a broad pad on its sole.

Lann'er (*Falco Lanarius*), a species of falcon inhabiting N. Europe, and rarely visiting the British coasts. This bird is larger than the Peregrine falcon, and may equal the Jer- (or Gyr-) falcon in size. The male is smaller than the female, and is named a *Lanneret*. The name 'L.' is often, but erroneously, given to the young females of the Peregrine falcon.

Lannes, Jean, Duc de Montebello, a famous French marshal, born at Lectoure, 11th April 1769, was apprenticed to a dyer in his fifteenth year, joined the army in 1792, came under the notice of Napoleon in 1794, and having distinguished himself at the battles of Montenotte and Millesimo, was made a colonel in 1796. At the battle of Arcola he led as general of brigade, at Aboukir as general of division, and at Acre he was wounded. In 1799 L. was made commander of the consular guard, in 1800 he led the vanguard of the French army across the Great St. Bernard, and at Montebello he exhibited the highest qualities of personal bravery and generalship. He acted as plenipotentiary at Portugal for some time, and on his return was created Marshal of France and Duc de Montebello. L. fought with eminent coolness and ability at Austerlitz, Jena, Eylau, and Friedland; but in the battle of Aspern he was mortally wounded, and died at Vienna, May 31, 1809. Napoleon wrote of him at St. Helena, 'He was a man of extraordinary bravery; calm in the midst of fire, possessing a sure and penetrating glance, ever prompt to profit by eventualities, passionate and quick sometimes even in my presence. But he loved me. . . I found him a pigmy; I lost him a giant.' See René Perin, *Vie Militaire de J. L.* (Par. 1810).

Lann'ion (Celt. 'the little enclosure'), a town of France, department of Côtes-du-Nord, 35 miles W.N.W. of St. Brieu, and 42 miles from the mouth of the river Guer, has a harbour, with trade in hemp, grain, and animal charcoal. Pop. (1872) 5462.

Lansdowne, Henry Petty Fitzmaurice, Third Marquis of, was born 2d July 1780, and educated at Westminster, Edinburgh, and Cambridge. He graduated in 1801, in which year he was elected for Calne. He became Chancellor of the Exchequer under Fox (1806-7) at the age of twenty-five, and succeeded to the title in 1809. A staunch Whig, he was in opposition with his party for twenty years, but on their return to power in 1830 he became President of the Council. He filled the latter office in every Whig Administration till 1858, when he retired from public life. L. more than once refused the premiership. He died at Bowood, January 31, 1863.—**Henry**, fifth marquis, grandson of the above, born in 1845, was Lord of the Treasury (1868-72), and Under Secretary of State for War (1872-74) in the second Gladstone ministry.

Lansing, the capital of Michigan, U.S., 84 miles W.N.W. of Detroit, on Grand River, is the junction of six lines of railway. It was laid out in 1847 with fine wide avenues, and has sixteen churches, four banks, an opera house, a State library of 20,000 volumes, &c. A new capitol is in course of erection, at an estimated outlay of \$1,200,000. There are extensive iron-works, and a noted mineral spring. Pop. (1874) 7445.

Lansingburgh, a post village of New York, U.S., on the Hudson River, nearly opposite the mouth of the Mohawk, 200 miles N. of New York city by rail. It is perhaps the chief point in the United States for the manufacture of brushes, oil-cloth, and crackers, and communicates with Waterford by a bridge over the Hudson. L. is named after Abraham Lansing, who settled here in 1771. Pop. (1870) 6804.

Lantern (Fr. *lanterne*; Lat. *laterna*), a portable perforated case, with open or transparent sides for the emission of the light of a candle or lamp placed inside. Lanterns were known to the ancients, the frame being commonly formed of metal, and the sides of bladder, or thin plates of mica, or of horn. The streets of Roman cities, subsequent to the 2d c., are believed to have been lighted by lanterns. A mediæval brass L., having five rows of fine crystals set in perforations, is preserved at Oxford. On shipboard lanterns are named after their position, as the *poop* and *top* lanterns. In Christian art, a L. is the attribute of St.

Gudule and St. Hugh. *A la lanterne*, a cry of the Sans-Culottes during the French Revolution, preceded the hanging of their victim on a street lamp. L., in architecture, a drum-shaped erection, on the top of a building or dome to give light, or to crown the edifice.

Lantern-Fly (*Fulgora*), a genus of *Hemipterous* insects belonging to the family *Fulgoridae*. The antennæ have three joints, and two simple eyes or ocelli below the compound eyes. The head is very large, and the body convex. The hinder legs are long, and adapted for leaping. The vertex or front part of the head is enormously developed to form a long snout-like process, which in some species equals the body in length. The *Fulgora lanternaria* is found in Surinam; the *F. (or Hobinus) candelaria* in China. The average length of *F. lanternaria* is 2 or 2½ inches. Many entomologists doubt the luminosity of these insects; but there appears to be little doubt, from the observations of Madame Merian, that they occasionally exhibit this property.

Lanthanum (symbol, La; atomic weight, 93.6), a metal whose silicate occurs with the corresponding compounds of Cerium and Didymium in cerite, allanite, orthite, and other minerals. It was discovered in 1839 by Mosander, who named it L. from its having long escaped notice (Gr. *lanthanin*, 'to lie hid'). Its salts are colourless and unimportant.

Lan'yards (from Fr. *lanière*, 'a thong'), a nautical term for short ropes used for various purposes, but especially to stretch the shrouds and stays of the masts.

Lanzarote, the most north-easterly of the Canary Islands. Area 325 sq. miles; pop. 17,500. It is very fertile, producing the finest Canary wine. Droughts, however, are frequent and severe. Among the hills, which rise to a height of 2000 feet, are several active volcanoes. The capital is Tegüise, and the chief port Arrecife.

Lanz'i, Luigi, an Italian antiquary, born at Monte dell' Olmo in the province of Macerata, June 14, 1732, entered the Order of Jesus in 1749, and developed at Rome a taste for the remains of ancient art. On the suppression of his order, he received the sub-directorship of the gallery at Florence, where he died, March 30, 1810. His most important works were *Saggio di Lingua Etrusca* (3 vols. Rome, 1789) and *Storia Pittorica d'Italia* (Bassano, 1795; Eng. trans. by Roscoe, 6 vols. 1828). His *Opere Postume* appeared at Florence (2 vols. 1817), and a *Biografia* by A. Cappi (Forlì, 1840).

La'ocoön, a Trojan hero, priest of Apollo or Neptune, who strongly dissuaded his countrymen from drawing into their city the wooden horse left behind by the Greeks. While L. and his two sons were standing beside the altar, two fearful serpents swam to the Trojan coast, entwined the boys, and then the father, who went to their assistance, and all were killed. The Trojans believed that this death had befallen L. as a punishment for having thrust his lance into the side of the wooden horse. A magnificent group of statuary, representing the fearful death of L. and his children, was found in 1506, on the side of the Esquiline Hill, and is now in the Vatican. For details of the legends of L. see Heyne's *Excursus v., Æneid ii.*; and for an exposition of the beauties of the Vatican group see Lessing's *L. oder über die Grenzen der Malerei und Poesie*.

Laodicea, a city of Phrygia, built by Antiochus Theos in honour of his wife Laodice, was situated in the valley of the Meander, on the small river Lykos. It was a place of extensive trade and great wealth. It was completely destroyed by an earthquake in the reign of Tiberius, and at once rebuilt by the inhabitants. Soon thereafter Christianity was introduced into L., and it became a great Christian city, the see of a bishop, and in 363 and 476 the meeting-place of Christian councils. It was destroyed by the Mahomedan invaders, and is now in ruins, the extent of which, however, proves its former greatness.

La'on, the chief town of Aisne, France, 80 miles N.E. of Paris, on a bold eminence, at the foot of which is a branch station of the *Nord* Railway. It is still girt with remains of its old fortifications, and preserves one of its quaint, barbed-gateways. The chief buildings are the cathedral of Notre Dame, of mixed Roman and Gothic style, dating from 1115, an episcopal palace,

and a chapel of the *Templiers*, assigned to the 12th c. The library contains 20,000 vols., and MSS. ranging from the 7th to the 16th c.; the museum is rich in Gallo-Roman antiquities. L. has slight industries. Pop. (1872) 8600. The ancient *Bibras* of the Gauls and *Lugdunum* ('the fortress in the marshy land') of the Romans, L. was besieged by the Vandals in 407, and by Attila in 451. After the conquest of the Franks it became the seat of a bishop, and subsequently the residence of the last of the Karolings. Under its walls Napoleon was defeated by the allies, after a battle of four days, 10th March 1814.

Lao-tse ('ancient sage'), or **Lao-kiun** ('ancient prince'), a celebrated Chinese philosopher, the reputed founder of one of the great religions of China, Taoism, was born, according to the *Annals of Se-ma-Tsien* (70 B.C.), at Kuhien (mod. Luhien) in the kingdom of Tsou (Hu-nan), in the year 604, or, according to a later account, 565 B.C. He is said to have filled the post of archivist under the Emperors King-wang and Keng-wang (530-510), and to have been visited during this period by Confucius (q. v.), who marvelled at the wisdom of his answers, but compared him to a dragon, neither fish, beast, nor fowl. At length, appalled by the disorders of the Tschou dynasty, L. mounted a black ox and rode away towards Thibet. Coming to a pass in the mountains he was met by an officer, who begged him to leave behind him a volume of instruction. He accordingly composed his famous *Tao-te-king* ('Road to virtue'), and then departed to end his days in some unknown solitude. Unlike the active patriotism of Confucianism, the virtues of Taoism are strictly passive. Its followers are required to withdraw from the turmoil of the world to meditation and the contemplation of *Tau* ('road' or 'reason'), the one great cause of being, which takes the place of a supreme deity. So far the fundaments of Taoism show many points of contact with Buddhism, but in modern practice its whole system is so overgrown with magic and superstitions, many of which centre round the *elixir vita*, that it has lost almost all its original features, whilst becoming the most popular religion with the Chinese vulgar. The *Tao-te-king* has been translated into German by Victor von Strauss (Leips. 1870) and Plänckner (Leips. 1870), and into French by Stanislas Julien (Par. 1840), on whose work is based *The Speculations of L. on Metaphysics, Polity, and Morality*, by John Chalmers (Lond. 1868).

La Paz de Ayacucho, the chief commercial city of the republic of Bolivia, beautifully situated at the elevation of 12,226 feet, and on both sides of the Chuquapo. It has a fine cathedral, 14 other churches, a university, &c., and carries on a large foreign trade with the Peruvian ports of Arica and Islay, with the latter by means of the Arequipo Railway to Puno on Lake Titicaca. It was founded in 1548. Pop. 76,372.

Lapidary Work (from Lat. *lapis*, 'a stone') is the art of cutting, polishing, and mounting hard stones for ornamental purposes. The cutting of diamonds is regarded as a distinct art, not generally included under the term L. W., which deals chiefly with the cutting of agates, jaspers, carnelians, cairngorms, and other varieties of quartzose stones, to the exclusion of the rarer and more valuable precious stones. The art is also to be regarded as distinct from that of the seal or cameo engraver, although the materials employed are the same, and the processes followed are analogous. The sphere of the lapidary is thus very much confined to the preparation of that class of jewellery and ornament into which agates and the other ornamental quartzose stones largely enter, and which jewellery, though extensively manufactured in Birmingham and Germany, is distinctively known as Scotch jewellery. The opaque stones for this class of work are usually prepared in thin slices, shaped in accordance with the requirements of the design, and set in a backing and sides of silver or more rarely gold, while the transparent coloured quartzes, as cairngorm and amethyst, are cut and faceted like the more valuable precious stones. For the preparation of agate and similar stones, three processes, slicing, cutting, and polishing, are required. The slicing of these slabs from the rough agate is accomplished by means of a thin disc of soft iron made to revolve horizontally, the edge of which is charged with diamond dust mixed with oil. Emery powder may also be used for slicing quartzose stones, but its action is much slower than that of diamond dust. The cutting or shaping of the slices is effected also on a horizon-

tally revolving wheel or disc made of lead, and fed with emery powder and water; and finally the polishing is done with tripoli or with putty powder and water on wheels of tin or zinc. Cairngorms, &c., are cut and polished in a similar manner, but with special arrangements for holding the stone against the abrading and polishing surfaces, so as to produce regular and equal facets. When the pieces of stone operated on are too small to hold conveniently in the hand, as is usually the case, they are cemented on the end of short sticks or rods. See the works of King, Holtzapfel, Dr. Feuchtwanger, and Dr. A. Billing.

Lapis Lazuli, a rich blue mineral crystallising in dodecahedrons, and consisting principally of silicate and sulphate of alumina. It occurs in granite and granular limestone, and is used when richly coloured for making vases. The finer varieties come from Persia, China, Siberia, and Buchara. When powdered it constitutes a most beautiful and durable blue known as *ultramarine*. The ordinary ultramarine is prepared artificially, as that obtained from the native mineral is very costly.

Lapithæ, a Thessalian people, who inhabited the mountainous districts near Olympus and Pelion. They were descended from Lapithes, son of Apollo, and brother of Centaurus. In the war which broke out at the marriage of Perithous and Hippodameia, the L. defeated the Centaurs. See CENTAURS.

Laplace, Pierre Simon, Marquis de, a celebrated French mathematician and astronomer, was born March 23, 1749, at Beaumont-en-Auge, in Normandy. Carrying to Paris letters of introduction to D'Alembert, the latter soon obtained for him the mathematical chair at the military school at Paris. Henceforth he devoted as far as possible his whole attention to mathematical and physical science; but, like many other savans of this revolutionary period of European history, he became embroiled in politics, in which he evinced singular unfitness and deplorable lack of firm principle. He died at Paris 5th March 1827. L.'s fame rests solely on his attainments in science, in which he is to be ranked almost as the compeer of Newton. His great work, the *Mécanique Céleste* (5 vols. 1799-1825), is a systematic development from the first principles of dynamics of the whole theory of the solar system. The theory of the moon, the theory of the satellites of the larger planets, and the theory of the two great inequalities of Jupiter and Saturn, are handled with rare power; and attractions, rotations, and tidal phenomena are treated by methods as beautiful as they are original. The *Mécanique Céleste* is in great measure a republication of various memoirs published during the forty years succeeding 1772; and a popular (i.e., non-mathematical) exposition of his results is given in *L'Exposition du Système du Monde* (2 vols. 1796), the fifth and last book of which contains a brief, lucid, and accurate history of astronomy. His other chief works are *Théorie Analytique des Probabilités* (1812, 3d ed. 1820), and *Essai Philosophique sur les Probabilités* (1814, 5th ed. 1825). The best English translation of the *Mécanique Céleste*, with a valuable running commentary, is by Bowditch (4 vols. Boston, 1829-38). L.'s *Œuvres* were published in 7 vols. (1843-47). See Fourier's *Éloge historique de L.*

Lappland, the general name for the tracts of land inhabited by the Lapps in the N.W. of Russia, and the N. of Sweden and Norway. In Sweden the districts occupied by Lapps are the *Lappmarks* Tornæa, Lulea, Pitea, Umea, and Asele.—The Lapps are an Ugriic or Chudic race, with a language closely allied to that spoken by the Finns (q. v.). But the life of the Lappish nomads and fishermen contrasts unfavourably with that of the agricultural Finns. Their features are also of a lower type; though the common accounts of the low stature and Mongolian ugliness of the Lapps compared with the height and European beauty of the Finns are much exaggerated. The Lapps subject to Russia, called *Enare-Lapps*, also *Ter-Finns*, inhabit the peninsula of L. or Kola in the government of Archangel, and scarcely number 2000. They are nominally Christians, but believe in witchcraft and other superstitions. A form of serpent-worship still exists among them. In that part of Sweden which is called generally 'the Lappmark,' and which stretches as far as Kjölén (q. v.), dwell about 6000 Lapps. In Norway they number about 16,000. The Lapps are thus in all scarcely 24,000 people, scattered over wide deserts, and speaking three distinct dialects. In 1865 there were in Norway 1000 persons of Norwegian-Lappish descent, and 900 half Lapp half Finn. Of the Norwegian Lapps about 1600 keep flocks of

reindeer on the mountains; the rest, called *Sölapper* ('Sea Lapps'), have fixed abodes, and live much as the Norwegian fishers on the coasts. See Ihre, *Lexicon Laponicum* (Holm, 1780); Rask, *Lappisk Sprogloere* (Cop. 1832); Stockfleth, *Norsk-Lappisk Ordbog* (Christ. 1852); Thomsen, *Ueber den Einfluss der Germanischen Sprachen auf die Finnisch-Lappischen* (Halle, 1870).

La Pla'ta. See ARGENTINE CONFEDERATION.

La Porte, a city of Indiana, U.S., 12 miles S. of Lake Michigan, and 59 E. of Chicago by rail. It is the seat of Indiana Medical College, and has fifteen churches, three weekly newspapers, and a public library. A chain of seven beautiful lakelets in the vicinity attracts crowds of summer visitors. Pop. (1870) 6581.

Lappenberg, Johann Martin, born in Hamburg, 30th July 1794, studied at Edinburgh, London, Berlin and Göttingen, was made (1818) resident representative of his city at Berlin, took part in the Troppau Congress (1820), and became (1823) 'Archivar' to the Senate of Hamburg. In 1850 he shared in the movement for the restoration of the German federal diet, and died 28th November 1865. L. gained a high reputation for learning and research by his *Geschichte von England* (2 vols. Hamb. 1834-37). An English translation of vol. i. was published by B. Thorpe as *A History of England under the Anglo-Saxon Kings* (2 vols. Lond. 1845), and of vol. ii. as *A History of England under the Norman Kings* (Lond. 1857), and three supplementary volumes have been added by Professor Pauli (q. v.). He also published many texts and tracts relating to the history of Hamburg and the Hansa; *Hamburgisches Urkundenbuch* (i., 1842); *Zeitschrift für Hamburgische Geschichte* (6 vols. 1841-66); *Chronika der Stadt* (Hamb. 1852-61); also several on the philology of the German tongue; and later, *Quellensammlung der Schleswig-Holstein-Lauenburg Gesellschaft für Vaterländische Geschichte* (3 vols. 1862-65).

Lapsed' (Lat. *Lapsi*) were those Christians who, in the times of persecution of the early Church, complied to a greater or lesser extent with the demands of the authorities to take part in heathen worship. They were classified as (1) Libellatici, holders of a certificate from the magistrate that they were not Christians; (2) Sacrificati, who had sacrificed, and (3) Thurificati, who had offered incense to idols; (4) Idolatri or Blasphemati, who had formally denied Christ; (5) Mittentes, who had sacrificed by deputy, and (6) Traditores, who had surrendered church property.

Lap'wing (*Vanellus*), a genus of Grallatorial or wading birds, the common species of which—*V. cristatus*—is also popularly

Lapwing.

known as the 'peewit,' from its peculiar cry. The bill is straight, and its sides grooved for two-thirds of its length. The second and third quills are the longest; and the thighs are sometimes feathered to the knee. The hinder toe is short. The L. attains a length of 12 inches. The colour of the head and crest is black. The sides of the head are white; the chin, throat, and breast black. The back is a dark green, glossed with a metallic lustre, and the under parts are white. The food consists of worms, slugs, insects, &c. The nest is simply a hollow in the ground, and the eggs, numbering four, are of olive, spotted with dark brown. Curiously enough the eggs are placed with the smaller or pointed ends together, so that they assume a crossed appearance when viewed in the nest. The L. is readily tamed.

Lar, a town of Persia, capital of the province of Laristan, at the foot of a range of hills, 174 miles S.E. of Shiraz. It is a decayed place, but is still famed for the manufacture of cloth

and muskets and its bazaar is the finest in Persia. Pop. 12,000.

Larboard (*lo bordo*, contr. from Ital. *quello bordo*, 'that side'), a nautical term for that side of a ship which is on the left hand of one standing on the deck and looking to the head. *Port* is now substituted for L., as less likely to be confounded with *starboard*, the name given to the other side.

Larceny, or **Theft**. L., which is the legal term for stealing, is the felonious carrying away of personal property with intent to despoil the owner, without employing force or intimidation (see ROBBERY). When the abstraction of the property is without aggravating circumstances, the crime is *simple L.* When aggravated by circumstances, as by being committed on the person or in a dwelling-house (see BURGLARY), the crime is *compound L.* By *felonious* taking away is meant that the act is against the will of the owner. Mere removal of goods from the place in which they are deposited is sufficient to constitute L. When a person has lawfully obtained possession of goods under a charge of keeping them, he will be guilty of stealing if he apply them to his own use; but if money be entrusted to any one for a special purpose and he applies it to his own use, this would seem only to constitute the minor crime of Embezzlement (q. v.). The appropriation of money entrusted, but not for a special purpose, under ordinary circumstances is not criminal.

A wife is not guilty of L. in taking the goods of her husband, unless she commit adultery, in which case she forfeits her privileges as a wife. Wild animals cannot be stolen, but animals enclosed and domestic animals are subjects of theft. Regarding the human body, see GRAVES, ROBBERING. See also GARDENS, STEALING FROM.

Larch (*Larix*), a genus or sub-genus of Coniferae, closely related to the cedars and the spruce and silver firs. The common L. (*L. Europaea*), a native of Alpine districts up to 7000 feet in Europe and W. Asia, is now much cultivated as a forest tree in Britain, particularly in Scotland, and is available for many useful purposes, the wood possessing the advantages of being very durable, not liable to rot through moisture, nor subject to insect destruction. The tree, however, is a comparatively recent introduction, the two first plants grown in Scotland having been sent from London by the Duke of Athol, in 1727, along with some orange trees. All were treated alike as greenhouse exotics for several years until the hardy nature of the L. became known. The growth of this tree is rapid, and the height attained about 100 feet (exceptionally as much as 150 feet), whilst the pyramidal form, the pendent branches, the light-green leaves, and the purplish cones, render it a very ornamental object. The bark has tanning properties, and is the base of a tincture employed in medicine as an astringent and stimulant. Venice turpentine is also yielded by the L., as is also a sugary matter, an exudation from the leaves known as manna of Biançon, and a gum termed Orenburgh gum is collected in Siberia from the scorched stems after the not unfrequent forest fires in that country. Two American species of L. (*L. pendula* and *L. tensa*) constitute notable features in the scenery of Canada and the Northern States, growing to a large size and furnishing useful timber.

Lard is the fat of the common pig prepared by melting at a gentle heat, and preserved generally in bladders. It is now an article of commerce in very extensive use, the finer qualities being used in cookery as a substitute for butter, and as the basis of ointments in pharmacy, while the inferior and tainted qualities are employed as a source of L. oil. L. oil is a very pure and limpid fluid obtained from L. by submitting it in woollen bags to enormous hydraulic pressure. The supplies of L. come chiefly from the United States, whence in the year 1874-75, 160,859,168 lbs. were exported.

Lard'ner, Dionysius, LL.D., a well-known mathematician and scientific author, was born at Dublin, April 3, 1793. In 1828 he became Professor of Natural Philosophy and Astronomy in University College, London; and two years later projected the publication of a series of treatises on natural, physical, and economic science by the most eminent authors of the day. Several, on *Hydrostatics*, *Pneumatics*, *Heat*, &c., are from his own pen. There were 135 vols. published in all, under the name of

Lardner's Cabinet Cyclopædia (1830-44). L. died at Naples, April 29, 1859. He is the author of treatises on *Algebraical Geometry* (1823), *Differential and Integral Calculus* (1825), and of manuals (1851-56) of physics, optics, mechanics, electricity, &c. &c.—**Nathaniel L., D.D.**, a Presbyterian divine, was born in Kent, England, 6th June 1684. He published many valuable and learned theological works, the most famous being *The Credibility of the Gospel History* (5 vols. 1727-43), *Jewish and Heathen Testimonies* (1764-67), and *Letter on the Logos* (1759). He died July 24, 1768. L.'s views inclined towards Unitarianism. A complete edition of his works, in 5 vols., was published in 1815; another, in 10 vols., in 1828.

Laræ (from the Etruscan *lar*, 'hero') were the departed spirits of ancestors, who were worshipped among the Romans as tutelary deities. They were of two classes, *L. domesticæ* and *L. publicæ*. The images of the former, of whom the *Lar familiaris* was the head, were in great houses placed in a separate compartment. They were presented with some portion of each domestic meal, and were specially worshipped on the calends, nones, and ides of every month. Among the *L. publicæ* were the *L. præstitæ* and *L. compitales* (the guardian spirits of the city): the *L. rurales* and *arvales* (worshipped in the country): the *L. viales* (worshipped by travellers on the highways), &c.—The **Manes** ('the good ones') were the spirits of the departed who were raised as L. to the dignity of divine worship, and whose festival took place on the 19th of February.—The **Penates** were the whole household gods of the Romans, and thus included the L. They were so called (from *penus*), because they were worshipped in the *penetrælis* or centre of each dwelling, that is, at the *focus* or hearth. As in the case of L., we must distinguish between the public and the private penates.

Largesse (Lat. *largitio*), in the days of chivalry, was money thrown among the crowd by the heralds at tournaments, coronations, and on other great occasions. Thus we learn from the *Cerémonial de France*, vol. ii. p. 742, that at the Field of the Cloth of Gold 'during the festival L. was cried by the heralds, who bore a great and costly vessel of gold.' This is the last recorded instance of the practice, but an interesting survival of it lingers on in the eastern counties of England, where the entrance of a stranger into a harvest field is at once the sign for 'hallooing L.'

Largo (Ital.), a musical term indicating slowness of rate, and breadth of character.

Largs (Gael. *learg*, 'the slope of a hill'), a town of Scotland, in Ayrshire, agreeably situated on the Clyde, 14 miles S. by W. of Greenock. It has some fishing and weaving industries, and its fine beach attracts summer visitors in great number. Pop. (1871) 2760. Here Alexander III. of Scotland defeated Hakon of Norway in 1263.

Laridæ, the gull family, belonging to the order *Natales* or swimming birds. The bill is straight and compressed, and the wings long and pointed; the tail is also long, and the tarsi have transverse scales. The hinder toe is usually rudimentary. In the typical gulls (*Larina*, genus *Larus*) the bill is curved at its tip, and is not longer than the head. The nostrils are placed at the sides of the bill near the middle of its length. The tail is even, and the first quill is the longest. The chief genera, in addition to *Larus*, included in the family L., are *Stercorarius* (including the Skua gulls), and *Rissa* (including the kittiwake gull). The scissor-bill gulls form the genus *Rhyncops*.

Lariss'a (Turk. *Yenishehër*, 'new town'), a town of Turkey, in the vilayet of Janina, on the Salanvria (*Peneius*) 60 miles E. of Janina, stands in a sandy plain, has twenty-four mosques, and is the seat of a Greek archbishop, whose cathedral occupies the site of the ancient acropolis. Silk and cotton weaving form with vineyard cultivation the chief industries, and there is a lively transit trade. Pop. 30,000.

Laristan, a province of Persia, on the N. shore of the Persian Gulf, is 210 miles long by 120 broad. Its northern portion is traversed by a range of mountains, which enclose fertile tracts, yielding corn and fruits; but the lower country is a desert, only diversified by rocky hills and sandy valleys, and almost wholly destitute of water. The chief towns are Lar (q. v.), Tarom, and Kongun.

Lark, a name applied generally to many Insectorial or perching birds, but distinctively to birds of the section *Coniostreus*, and family *Fringillidæ*. The L. forms the sub-family *Alaudina*, in which the wings have their tertiary feathers nearly as long as the primaries. The claws are long and curved, that of the hinder toe being particularly developed. The bill is slightly arched above, and the nostrils are oval, and are hidden by feathers. The third quill is the longest. The tail is of moderate length, and may be slightly forked. Of the larks the skylark (*Alauda arvensis*) is the best known. Its colour is a brown, of varying shades, intermixed with white and yellow. The average length is 7 inches. The L. inhabits fields and open lands, and in its upward flight appears to ascend in a spiral manner; the spiral widening as it flies upwards. Larks pair in summer, but live in flocks during winter. They are much sought after in winter for the sake of their flesh. The food consists of insects, worms, &c., but the diet in spring appears to consist chiefly of vegetable matter. The eggs number four or five, and are of a greyish-yellow tinted with brown. The young leave the nest before they are fully fledged. The song of the skylark is perhaps the most celebrated among that of the bird-creation. The woodlark (*A. arborea*) is of smaller size than the preceding species, and the tail is shorter; a light streak existing over the eye. The breast is of redder tint than in the skylark, and the under parts are yellowish-brown. The average length is 6 inches. The *Otocoris* or eared L. is so named from the tufts of feathers borne on the head. Of this genus the pencilled L. (*O. pencillatus*) is a familiar example, and the shore L. (*O. alpestris*) is also included within its limits. The former occurs in Persia, the latter in N. America.

Lark.

Larkha'na, a town in the district of Shikarpur, Scinde, British India, on the S. bank of the Ghar Canal, 6 miles E. of the Indus river, and 150 miles N. of Hyderabad. Pop. (1872) 10,643. It is situated in the most fertile part of the province, and from its gardens and tree-lined roads, has been called the 'Eden of Scinde.' It has manufactures of silk, cotton, dyeing, and leather; and carries on a large transit trade with Kelat.

Lark'spur, is the genus *Delphinium*, the flower spurs, suggesting the name L. or lark's-toe or -claw. There are about forty species distributed through the N. temperate zone, and *D. Ajacis* as an alien or colonist is sometimes found in English corn-fields. Several species are common in gardens. The genus partakes largely of the acrid properties of the Ranunculaceæ, to which natural order it belongs.

Larn'aka (near anc. *Citium*), the chief seaport and trading town of Cyprus, near the S. coast, 25 miles S.E. of Levkosia, exports cotton, silk, wheat, salt, wine, opium, and fruit. It has a Greek church of St. Lazarus in the Byzantine style of the 10th or 11th c., a fine Roman Catholic church, and a Franciscan monastery, founded in 1848, but is a dirty, unhealthy town. In 1873, 918 vessels of 90,967 tons cleared the port. Pop. estimated (1875) at 6000. Marina or Alikai (i.e., 'the salt-pits'), on the shore, is inhabited by Europeans.

Laroche'foucauld, François Duc de, Prince de Marillac, was born 15th December 1613, received but a scanty education, as his father made him enter early into military service, and in his seventeenth year fought at the siege of Casal. In 1632 he was exiled to Blois, where he married Mademoiselle de Vivonne, and the next few years of his life were swallowed up in unsuccessful political intrigue, and in a protracted *liaison* with Madame de Chevreuse. Richelieu discovered his plots, and he was kept at a distance from the court. Returning thither after the Cardinal's death, he was still kept from preferment, and joined the army under the Duc d'Enghien to forget his disappointments. At the siege of Mardik he was seriously wounded. L. took the side of the Princes de Condé and Conti in the war of the Fronde, and occupied Bordeaux with troops (October 1650).

In July 1652 **L.** was again wounded, after which he settled into the calmer life of the court, and gave to the world as fruits of his literary leisure, *Mémoires* (in 1663-64), and *Réflexions ou Sentences et Maximes Morales, avec un Discours sur les Réflexions* (in 1665). The *Maximes* have secured for **L.** a conspicuous place in the roll of French ethical writers. 'He is,' says Prevost Paradol, 'the most profound of the moralists who have made war upon human pride.' His maxims bear the mark of the most incisive insight, and a pitiless capacity for emotional analysis. Viewed in the light of his career, it is not surprising that the results of his ethical observations, as embodied in brief paragraphs of concentrated sagacity, should be summed up in a doctrine of self-love. *L'amour propre, l'amour de soi*, is the key-note of his theory of human conduct, disinterested virtue he can nowhere recognise, positive and negative views which he has embodied with authoritative exactness and admirable clearness of language. **L.** died at Paris 17th March 1680. In *Les Grands Ecrivains de la France* there is an admirable edition of the works of **L.** by Regnier (2 vols. 1875). See Voltaire's *Siecle de Louis XIV.*; Sainte Beuve's *Études sur La Rochefoucauld*; and Madame du Sevigné's *Lettres*.

Larochejaquelein, Henri du Verger, Comte de, was born at the Château de la Durbellière, 3d August 1772, adopted a military career, and in 1791 was an officer in the constitutional guard of the king. He fought at Fontenay (1793), and preserved, by his daring, the Vendean troops from defeat at the battle of Luçon. **L.** led the Vendéans triumphantly against the Republicans, and took several towns. He was killed at Nouaillé, 4th March 1794. Though a dashing soldier and full of promise, **L.**'s fame among his countrymen is probably kept alive from the Cæsarean address attributed to him in entering battle, 'If I advance, follow me; if I withdraw, slay me; if I die, avenge me.' His brother, **Louis du Verger, Marquis de L.**, born 30th October 1777, was also a soldier, but was in the West Indies during the Revolution. He headed the royalists of La Vendée in 1813, but fell in battle at Pont des Mathias, 4th June 1815. His wife, **Marie Louise Victoire** (born 1772, died 1857), is the author of *Mémoires of the first Vendean war*, of which she was an eye-witness. See A. D. Nettement, *Vie de Madame de L.* (Par. 1859).

La Rochelle. See ROCHELLE, LA.

Larrea, a small genus of *Zygophyllaceæ*, of which *L. Mexicana* has obtained the name of Creosote plant, from its repulsive odour. It is very abundant in some parts of Mexico, forming a dense and almost impassable scrub, thereby constituting a barrier against drifting sands in the desert regions of that country. Three other species are found in Chili and Paraguay.

Larrey, Dominique Jean, Baron, was born near Bagneres de Bigorres, July 1766, studied surgery at Toulouse under his uncle, went to Paris in 1787, whence he departed for N. America as a naval surgeon. In 1792 he held an appointment in the French army of the Rhine, where his 'flying ambulances' brought him into notice. **L.** was elected Professor of the Military School in 1796, and two years later accompanied the French army to Egypt. The literary result of this was his *Relation Historique et Chirurgicale de l'Expédition de l'Armée d'Orient en Égypte et en Syrie*, published in 1803. After the battle of Wagram he received the title of Baron, and (March 1812) he was nominated chief surgeon of the grand army, with which he remained until Napoleon's abdication. At Waterloo he was wounded, and after the Restoration degraded; but before his death became surgeon-general of the Hôtel-des-Invalides, and inspector of military hospitals for Algeria. **L.** died at Lyons, 25th July 1842. He was the author of many treatises on the art of surgery.

Larva, the name applied in zoology especially to the first stage in the development of *Insects* (q. v.) after they leave the egg, but also given to the miniature forms of many other animals. Larval forms in modern zoology are accounted of the greatest importance, as affording a clue to the true relationship and descent of animals. Thus animals which exhibit true affinities will as a rule present a close resemblance in their larval state, whatever be the differences or distinctions between their adult forms. Of this the Crustacea furnish good examples. Thus the young of a barnacle, of a sacculina (a sac-like parasite

on crabs), of some prawns, and of many other crustacean groups, present a close resemblance, and appear as free-swimming bodies, each known as a *nauplius*.

Laryngoscope. The **L.** is a reflecting mirror so constructed and adapted as to enable the observer to explore the recesses of the larynx. It was not until 1857-58 that the importance of exploration by means of the **L.** was generally recognised through the influence of two German physiologists, Drs. Turck and Czermak. The small mirror, placed on a stalk attached to its margin at an angle of from 120° to 150°, is placed against the soft palate and uvula. The rays of the sun or of a good lamp are concentrated by means of a reflector on the laryngeal mirror, which throws the light downwards, and illuminates the parts to be examined, reflecting at the same time the images of the parts into the eye of the observer through the central opening of the reflector. By means of the **L.**, the trachea or windpipe can be explored through the larynx, and the condition of the parts examined with the greatest precision and accuracy.

Laryngotomy is performed by making a vertical incision in the mesial line, between the sterno-thyroid muscles, about an inch in length, and then a cross cut through the crico-thyroid membrane. A silver tube, curved on the flat, is then introduced into the air-passage and retained by tapes round the neck. The operation of **L.** is occasionally necessary, in order to save life, in cases of acute disease, more especially supervening on chronic laryngitis. In some cases the more difficult and dangerous operation of tracheotomy is necessary.

Larynx. *Anatomy of L.*—The **L.** is that portion of the respiratory passage which is situated between the pharynx and the trachea. It is composed of a number of cartilages, joined together by ligaments, and lined on the internal surface by a mucous membrane which covers in the ligaments and muscles. The cartilages are the *thyroid*, the *cricoid*, the *arytenoid* cartilages, and the *epiglottis*. These are present in all mammals, but present variations in shape and position in different animals.

In *man*, the *thyroid* cartilage consists of two lateral halves, continuing in front, but separated from each other behind. At the point of union of the two halves an angular projection, more prominent in the male than in the female, is formed. To this projection, in the male, the name *pomum Adami* is given. From the posterior or free borders of the cartilage there projects upwards and downwards two processes; the upper are connected with the *hyoid* bone by means of ligaments, the lower are directed downwards and forwards, and each presents at the tip a small smooth surface for articulation with the side of the *cricoid* cartilage.

The *cricoid* cartilage is in shape like a signet ring, the broad part of the ring being situated behind. It is placed between the thyroid cartilage above and the trachea below. Upon the upper border of this ring, posteriorly, there are two convex oral articular surfaces, upon which the arytenoid cartilages rest. Upon the posterior and lateral surfaces of the ring there are the surfaces for the articulation with the inferior processes or *cornua* of the thyroid cartilages.

The *arytenoid* cartilages, two in number, are three-sided pyramids about half an inch in height, the bases of which rest upon the oral surfaces on the *cricoid* cartilages. The surfaces are named, from their position, anterior, internal, and posterior. Upon the anterior surface there is a slight projection to which the *false vocal cord* is attached. The external margin of each is rounded and gives attachment to muscles; the anterior is pointed, and has extending from it, to the thyroid cartilage, a ligament, the *inferior thyro-arytenoid* ligaments. As these ligaments are the essential parts in the production of the voice, they are called the *true vocal cords*.

The *epiglottis* is a leaf-like cartilage which, during the act of swallowing, covers over the superior opening of the larynx. Ordinarily it projects upwards behind the base of the tongue. It is connected with the *thyroid* cartilage and with the tongue with fibrous tissue, covered by mucous membrane. Besides these cartilages, there are four other cartilages which are small and not so important. Two of these surmount the *arytenoid* cartilages, and are called the *cornicula laryngis*; the other two are placed between the arytenoid cartilages and the epiglottis, and situated in the fold of the mucous membrane which extends between these

parts. To these cartilages the name of cuneiform cartilages has been applied.

Ligaments and joints of L.—The thyroid cartilage is connected with the hyoid bone by a thin broad membrane, the *thyro-hyoid ligament*, situated in the middle line. The lateral *thyro-hyoid ligaments*, two rounded cords which frequently contain cartilage,

CARTILAGES of the LARYNX seen from behind and on the right. (Bishop.)

a, f, thyroid cartilage; the right ala is seen foreshortened; below *e*, the oblique line on its outer surface; *b*, superior, and *c*, inferior cornu of the right side; *d*, cricoid cartilage; to the left of *b*, anterior narrow part of the ring; *a, a*, arytenoid cartilages; *f, f*, epiglottis, the lines point to little pits (for glands) on its surface.

SIDE VIEW of the LARYNX after removal of the Left Ala of the Thyroid Cartilage. (Bishop.)

The upper thin part of the left thyro-arytenoid muscle has been removed to show the lower part, *d*, supporting the vocal cord; *e, a*, inner surface of right ala of thyroid; *b, b*, arytenoid cartilages; *d*, the small thyro-arytenoid muscle of Scæmmering sometimes present; *e*, posterior, and *f*, lateral crico-arytenoid muscles of the left side; *n*, cricoid cartilage; *h*, trachea.

unite the superior cornua of the thyroid cartilage with the greater cornua of the hyoid bone. The articulation between the cricoid and thyroid cartilages is lined by a synovial membrane, and protected by a capsular ligament. The movement allowed in this joint is of a rotatory character, the thyroid cartilage revolving upon its inferior cornua. A broad membrane, composed of elastic fibres, also connects the two cartilages. This is the *crico-thyroid membrane*. The joint between the cricoid and arytenoid cartilages is lined by a synovial membrane, and strengthened by fibres surrounding the joint. The movement allowed is considerable, and consists principally in such changes as result in the approximation and separation of the anterior angles of the arytenoid cartilages. The arytenoid cartilages are connected with the thyroid cartilage by the inferior and superior thyro-arytenoid ligaments already mentioned.

Muscles of L.—The muscles which move the cartilages of the L. upon each other are called intrinsic muscles. There are five pairs and one single muscle. Passing between the cricoid and thyroid cartilages on each side, there is the *crico-thyroid muscle*, which by its action will tend to depress the thyroid cartilage upon the cricoid, and in doing this will tighten the inferior thyro-arytenoid ligament or true vocal cord. Extending from the back part of the cricoid cartilage to the external angle of the arytenoid cartilage, there is on each side the *posterior crico-arytenoid muscle*. The direction of the fibres is upwards and outwards, and when in action the external angles of the arytenoid cartilages will be pulled towards each other, the arytenoid cartilages will perform the movement of rotation, and as a result of this the anterior angles, bearing the true vocal cords, will be separated from each other. Acting as antagonists to the last muscles, there is, on each side, a muscle passing, from the cricoid cartilage in front, backwards to be attached to the external angle of the arytenoid cartilage. By pulling forwards the external angles these muscles will approximate the anterior angles to each other. These are the *lateral crico-arytenoid muscles*. Passing between the arytenoid cartilages there is the single muscle, the *arytenoid muscle*. This muscle draws the arytenoid cartilage

together, and in doing so will approximate the vocal cords. Lastly, acting as antagonists to the *crico-thyroid muscles*, there are two muscles, the *thyro-arytenoid muscles*, which, passing from the thyroid cartilage in front to the anterior surface of the arytenoid cartilages, will draw the latter towards the former, and by doing so will slacken the vocal cords. The mucous membrane of the L. lines the whole of the interior of the L. It presents numerous folds, owing to its very loose attachment to the muscles. The portion covering the epiglottis and true vocal cords is, however, closely connected with these parts. It is also thinner in these situations, so that the white ligaments forming the vocal cords may be seen through the mucous membrane. At the point where the mucous membrane passes from the epiglottis to the tips of the arytenoid cartilages there is formed, on each side, a marked fold. This fold, which consists of two layers of mucous membrane, separated by a few fibrous bands, forms the lateral boundary of the *superior opening* of the L., or the opening by which the L. communicates with the pharynx. Between the *true and false vocal cords* the mucous membrane lines a recess called the *ventricle* of the L. The character of the epithelial lining of the mucous membrane varies. Situated beneath the mucous membrane, and opening, by their ducts, upon the surface of the mucous membrane, there are numerous glands whose function it is to secrete sufficient mucus to keep the parts moist. These glands are especially abundant in the *ventricles* of the L.

Nerves of L.—The L. derives its nerve supply from the pneumogastric and the sympathetic nerves. The mucous membrane of the L., the crico-thyroid and in part the arytenoid muscles are supplied by the superior laryngeal branch; the other muscles are supplied by the inferior laryngeal branch.

Diseases of the L.—The principal D. of the L. are acute, chronic, and cedematous laryngitis, aphonia, necrosis of the laryngeal cartilages, and polypi in the L. *Laryngitis*, or inflammation of the L., whether it be acute or chronic, is chiefly seated in the mucous membrane, and is an extremely dangerous affection, as the rima glottidis, the narrow chink through which respiration is effected, becomes readily occluded, and causes asphyxia. This occlusion may be caused by swelling of the lips of the glottis, effusion of plastic matter within or upon them, or by spasms in the L. In acute L. there are the usual symptoms of local inflammation—pain and tenderness on pressing, more especially about the pomum Adami; difficult and painful deglutition; dyspnoea, often of a spasmodic character, from interference with the proper admission of air into the lungs; and, when it proves fatal, the acute generally runs into the cedematous form of L. In *cedematous L.* the seat of the disease is in the submucous cellular tissue, and is generally the result of chronic D. of the L., but it is sometimes of an erysipelatous character, resulting from exposure to infection. The fauces are reddened, dusky, and swollen; the dyspnoea and hoarseness is early and excessive; there is great difficulty in swallowing, and the epiglottis is rigid and turgid, the infiltration being principally confined to the sub-mucous cellular tissue round the epiglottis, but never extending below the true vocal cords. In *acute L.* the treatment should be actively antiphlogistic, and free blood-letting should be practised by the application of leeches over the L. In *cedematous L.* the same plan should be followed, though it is less serviceable, and relief may be afforded by scarification about the root of the epiglottis, the sides of the glottis, and the back of the thyroid cartilage. The L. is liable to a variety of diseases, some of which are incurable, resulting in permanent impairment of the voice, or alteration in the use of the L., as *Aphonia* (q. v.), or *clergyman's sore throat*. The treatment of chronic L. is usually conducted by the topical application of a solution of the nitrate of silver, by means of a throat sponge firmly attached to a curved whalebone stick. In some cases, a few drops of the solution are introduced by means of a strong glass tube, bent nearly at right angles about an inch from one extremity, or the solution may be introduced by means of a laryngeal syringe. See *Diseases of the L.*, by Dr. Morell Mackenzie, in *Reynold's System of Medicine*, vol. iii., and *Traité Pratique des Maladies du L.*, par Ch. Fauvel (Par. 1876).

La Salle, a city of Illinois, U.S., on the N. bank of the Illinois river, and at the head of its navigation, 99 miles S.W. of Chicago by rail. It has four zinc-smelting works (one of which is the largest in the country), glass works, hydraulic cement factories, &c., and sends 200,000 tons of ice annually down the

iver to the southern markets. There is a good supply of bituminous coal in the vicinity. Pop. (1870) 5452.

Las'car, a name commonly applied to Oriental sailors on board British ships, more especially to Mohammedans from the neighbourhood of the Kutch and Gangetic delta. It is derived from a Persian word meaning 'army,' which, in Hindustani, came to be used of camp followers, and of the site of a stationary camp.

Lasca'ris, Constantine, a Greek grammarian, who, on the fall of Constantinople (1453), came to Italy, where he instructed Ippolita, daughter of Francesco Sforza, Duke of Milan, in the Greek language, composing for her his *Grammatica Græca* (Mil. 1476)—the first work printed in Greek. Quitting Milan, he lectured successively at Rome, Naples, and Messina, where he seems to have died at the close of the year 1493. To Messina he bequeathed a magnificent library, which was afterwards transferred to the Escurial.—**Andreas Johannes L.**, surnamed **Rhyndacenus**, because born on the banks of the Bithynian Rhyndacus (circa 1445), also came to Italy, and there found a patron in Lorenzo de' Medici, who twice despatched him to Greece to collect MSS. Returning from his second mission, L. found Lorenzo dead (1492), and thereupon betook himself to the court of Charles VIII. of France. Louis XII. sent him on two embassies to Venice (1503 and 1505), whence in 1513 Leo. X. called him to Rome to act as principal of a newly-founded Greek College, and as superintendent of the Greek press. In 1518 he revisited France, where François I. employed him, jointly with Budæus, in forming the Fontainebleau library, and in 1535 at the urgent request of Paul III. he returned to Rome, only to survive the toils of the journey by a few days. L.'s chief works are *Commentarii in septem Tragedias Sophoclis* (Rome, 1518); *Orationes* (Frank. 1575); *Anthologia Epigrammaticum Græcorum* (Flor. 1594), &c. See Villenain's *L., ou les Grecs du 15me Siècle* (Par. 1825).

Las Casas, Bartholomé de, the 'apostle of the Indians,' was born at Seville in 1474. He studied at Salamanca, and accompanied Columbus on his second, third, and fourth voyages to America. In 1502 he went to Hispaniola as a missionary, and was the first ordained priest in the New World. The shocking treatment by the colonists of the natives, induced him to sail to Spain in 1515 with an appeal to the crown. Cardinal Ximenes responded by sending out a commission of inquiry in 1517, which decided, however, in favour of the invaders. For many years, against much opposition, he continued to plead the cause of the Indians. He published in 1539 his celebrated *Brevissima Relacion de la Destruccion de las Indias*. In 1544 he was appointed Bishop of Chiapa, Mexico. He returned to Spain in 1551, and died in a convent at Madrid in July 1566. His MS. *Historia General de las Indias*, 3 vols., the fruit of forty years' labour, is in the royal archives at Madrid. Two vols. of his works, edited by Llorente, were published in Paris in 1822. His life was one of wonderful devotion. He was a heroic preacher of tolerance and Christian charity in a bigoted and persecuting age. See Arthur Helps' *Life of Las Casas* (Lond. 1868).

Las Cases, Emmanuel Augustin Dieudonné, Comte de, a French historian, was born at the Château of Las Cases, Languedoc, in 1766. In his youth he served in the navy, and being a royalist fled from France on the Revolution. After his return in 1809, when he gave his adherence to the empire, he filled several important offices of state under Napoleon. He was the companion of Napoleon during the first year of the latter's imprisonment at St. Helena, but was arrested on suspicion in November 1816, and confined at the Cape, and subsequently at Frankfurt. On Napoleon's death he was permitted to return to France, where he published his *Mémoires de St. Hélène* (8 vols. 1822-23), by which he is said to have gained £80,000. He also published an excellent *Atlas Historique* in 1803-4 (later ed. 1824-28), and an autobiography in 1819. He was elected to the Chamber of Deputies in 1831 and 1839. L. died at Passy-sur-Seine, May 15, 1842.

La Sere'na, the chief town of the province of Coquimbo, Chili, on the Coquimbo River, 6 miles from its mouth. It has a fine climate, and exports copper, gold, silver, &c. Pop. (1870) 7138. The port, at the river's mouth, is called Coquimbo.

Las Palmas, the chief town of the Canary Islands, is beautifully situated at the base of lofty hills on the N.E. coast of Gran Canaria. It is the seat of a bishop, and has a fine old cathedral, a supreme court, and industries in glass, leather, woollens, &c. Pop. 11,400.

Lassa. See **H'LISSA**.

Lassen, Christian, an eminent Orientalist, born at Bergen in Norway, 22d October 1800, after studying in Christiania, Heidelberg, Bonn, Paris, and London, settled at Bonn (1827), where he was Professor of Ancient Indian Languages and Literature from 1840 to his death, May 6, 1876. L. was first associated with A. W. Schlegel in his Sanskrit work, and afterwards with E. Burnouf in Pali. He has also thrown great light upon the cuneiform languages and the modern Iranian dialects. Among his numerous works, many of which were contributed to periodicals, the best-known is *Die Indische Alterthumskunde* (4 vols. Bonn, 1847-61; revised ed. of vols. i. and ii., 1861 and 1874), one of the best sources for early Indian history. Of his other important works the chief are his editions of the *Sāṅkhya-kārikā* (1832), *Gīta-govinda* (1836), also, in connection with A. W. Schlegel, of *Hilopadeca* (1829-31), and, after Schlegel's death (1845), of *Bhagavad-gītā anuv* (1846). With E. Burnouf he published *Essai sur le Pali* (1826), and in *Institutiones Lingue Pracritice* (1837), he produced a work which is still the standard authority on the Prakrit of the dramas.

Lass'o (Sp. *lazo*), or **Lariat** (Sp. *la riata*), a long rope of plaited hide, having at one end a running noose, used by horsemen in the Pampas of S. America in catching wild animals. One extremity is attached to the saddle, and the noose-end is swung with marvellous precision over the head of the pursued animal.

Last Heir, in Scotch law, is the sovereign, who is entitled to the property, heritable and movable, of every one dying intestate without legal heir. See **BASTARDY**, **DECLARATOR OF**.

Laswa'ri, a village in the Rajput state of Alwar, Central India, 128 miles S. of Delhi, famous for the battle in which Lord Lake, in 1803, defeated the army of Scindia. This victory, in conjunction with that of Wellington at Assaye, broke the Mahratta power, and established the British in the N.W. of India. A commemorative medal was presented to the survivors in 1851. See *Wellesley Despatches* (ed. Oxon. 1877).

Latakia, or **Ladikiyeh**, a seaport of Syria, 50 miles S. of Antioch. The small circular harbour of Scala or Marine, one mile distant, only admits vessels of 100 tons burden, and its entrance is contracted by the ruins of a fortress which was formerly connected with the mainland. 'L. tobacco' is largely cultivated in the neighbourhood, and the silk-culture and sponge-fisheries are also important industries. A triumphal arch of Septimius Severus and four Corinthian pillars are still standing. Pop. 6000, 1000 of whom are Christians. L. is the Phœnician *Ramatha*, the *Laodicea ad Mare* of Seleucus Nicator.

Lateen' Sail (Ital. *latina*, 'broad'), a triangular sail (chiefly used on Mediterranean small craft), with its upper edge fixed to a long spar at about an angle of 45° with the horizon.

Latent Fault. The rule of English law, extended to Scotland by 19 and 20 Vict. c. 60, is that in the contract of sale the buyer takes the risk of L. F.; that is, of defect unknown to the seller in the subject sold.

Lat'cran, Church of St. John (S. *Giovanni in Laterano*), the principal church in Rome, occupies the site of the palace of Plautius Lateranus, executed by Nero, A.D. 66. Constantine the Great granted this palace, in which he had fitted up a church, to Silvester I. It was overthrown by an earthquake (896), but rebuilt by Sergius III. (904-911); burned down (1308), but restored by Clement V., and decorated by Giotto; again destroyed by fire (1360), when the present edifice was erected by Urban IV. and Gregory XI. This has been altered or modernised by Martin V. (1430), Eugene V., Alexander VI., Pius IV. (1560), and the architects Borromini (1650) and Galilei (1734), the last of whom added the noble façade, from the central arcade of which the Pope, on Ascension Day, formerly blessed the entire world. Five œcumenical councils have been held in this church (see **COUNCILS**), which is known as

'Omnium Urbis et Orbis Ecclesiarum Mater et Caput.' On its N. side is the *Palazzo del Laterano*, the residence of the Popes from the time of Constantine down to the migration to Avignon.

La'tes, a genus of fishes belonging to the order *Teleostei*, and to the family *Percida* or *Perches* (q. v.). The *L. Niloticus* of the Nile is the best-known species. It attains a length of 2 or even 3 feet, and its flesh is highly esteemed. The *L. nobilis* of the Ganges is also held in favour.

La'tex is the sap of a plant after elaboration in the leaves. It may be limpid, mucilaginous, gummy, milky, or oily, and of various colours, from containing in solution or in suspense a variety of substances. It finds open course and rapid motion through the plant by a connecting system of channels termed lactiferous vessels.

La'tham, Robert Gordon, an English philologist, born at Billingborough, Lincolnshire, in 1812, passed from Eton to King's College, Cambridge, where he graduated in 1832, and was elected fellow of his college. At this time he was studying medicine, but a tour in Denmark and Norway (1832-33) turned his attention to a study of Scandinavian, the fruits of which appeared in translations of Tegner's *Axel* and *Frithjof*, and in *Norway and the Norwegians* (2 vols. Lond. 1840). Other works by him are *The English Language* (Lond. 1841; 5th ed. 1866); *Outlines of Logic, applied to Grammar and Etymology* (1847); *Descriptive Ethnology* (2 vols. 1859); *Nationalities of Europe* (2 vols. 1863), and editions of the *Germania* of Tacitus (1850), and Johnson's *Dictionary* (1857-70). As a philologist, L. is an able, if prejudiced, advocate of the original unity of the human race.

Latho. See TURNING.

Laths are long, thin, cleft pieces of wood, usually Baltic fir, nailed to rafters of the walls of dwellings to receive plaster, and also employed on roofs by slaters and tilers. *Lath floated and set fair* denotes plasterers' work of two coats, and when a third smooth coat is applied to receive wall-paper, the work is then called *lath pricked up, floated, and set fair*.

Lathy'rus, a genus of climbing, diffuse herbs, belonging to *Leguminosæ*, commonly represented in countries of the northern hemisphere, and occurring also in S. America. The species number about 100, of which nine or ten are natives of

Britain, the yellow vetchling (*L. pratensis*) and the tuberous bitter vetch (*L. macrorrhizus*) being the most frequent. The root of the last-named has been used for food in this country in the olden days of local scarcity, and so also has the seed of *L. maritimus*. On the Continent *L. tuberosus* was formerly sought after, and indeed cultivated for its esculent tubers. *L. sativus* is extensively grown in S. Europe for its seed, which is prepared for food in the same way as the chick pea. Well-known garden plants belonging to

Lathyrus odoratus.

the genus are the sweet pea (*L. odoratus*) and the everlasting pea (*L. latifolius*).

Lat'imer, Hugh, a notable English reformer, was born at Thurstone in Leicestershire, about 1490. 'My father,' he says, 'was a yeoman, and had no lands of his own, only he had a farm of £3 or £4 by the year at the uttermost, and hereupon he tilled as much as kept half-a-dozen men.' L. studied at Padua and the University of Cambridge, and took holy orders, throwing himself with so much zest into the pursuit of the 'New Learning' as to seriously injure his health. Becoming alive to the errors in the doctrine and discipline of the Church of Rome, he entered into a vigorous crusade for reform. His plain speaking drew upon him the enmity of the Cambridge theologians, who induced the Bishop of Ely to

put an interdict upon his preaching. L. evaded the interdict, and increased his popularity by carrying on his services in the chapel of a monastery which was outside of episcopal jurisdiction. His enthusiasm for the reformed faith drew upon him a reprimand from Wolsey, but having subsequently declared that the marriage of Henry VIII. with Catherine of Aragon was illegal, he was appointed one of the royal chaplains, with a living in Wiltshire. In 1535 L. became Bishop of Worcester, 'and in a vehement address to the clergy in convocation, taunted them with their greed and superstition in the past, and with their inactivity when the king and his parliament were labouring for the revival of religion.' But L.'s enthusiasm transcended the bounds permitted by the scheme of moderate reform entertained by the king, and (in 1540) he was forced to resign his see, having refused to accept the Act of Six Articles. Shortly after he was arrested in London and committed to the Tower, where he remained until the accession of Edward VI. Though L. was liberated and offered his bishopric under the young king, he preferred to go into comparative privacy, which was only broken by an occasional outburst of vigorous preaching. With Mary's ascent to the throne came a period of popular reaction against the Reformers, and L. was again sent to the Tower, and shortly transferred to Oxford, where (September 1555) a commission sat and condemned him to death at the stake. On the 16th of October the sentence was carried into execution, and 'old H. L.', in the midst of the flames, addressed a fellow-martyr in the often-quoted words, 'Play the man, Master Ridley, we shall this day light such a candle, by God's grace, in England, as I trust shall never be put out.' L.'s *Sermons* have often been republished (latest edition, 4 vols. Lond. 1845), and have a permanent value in literary history from their homely and unaffected diction, their directness and simplicity of thought, and the mingled humour and earnestness with which they are inspired. See the Rev. R. Demaus' *H. L. (1869)*, Foxe's *Book of Martyrs*, Froude's *History of England*, chap. iv., and Green's *History of the English People*.

Latin Empire. See BYZANTINE EMPIRE.

Latin Language and Literature. *Latin Language.*—The L. L. belongs to the great Indo-European, or Aryan (q. v.) class of languages. The old Latin existed as a spoken tongue at a very early period, and has almost entirely perished. It was composed of elements derived from various tribes of the Indo-Germanic family, concerning the date and route of whose entry into the peninsula of Italy we have no certain knowledge. These elements were Umbrian, Oscan, Etruscan, Sabine, and Pelasgian; but, as the Etruscan was composed of Oscan and Pelasgian, and the Sabine connected the Umbrian and Oscan, they may be reduced to three—viz., Umbrian, Oscan, and Pelasgian, by the last of which the L. is nearly related to the Greek. The alphabets of all the Italian peoples were borrowed directly from that of the Dorian Greeks of Italy and Sicily, the Roman alphabet being probably obtained from the Greek colony of Cumæ; and in subsequent times, with the increasing intercourse between the two peoples, the Greeks exercised a most powerful influence alike on the literature and language of Rome. The names for balance (*statera*), for measuring-rod (*groma*), for engines in general (*machina*), and for coined money (*numus*), the grammatical and philosophical nomenclatures, and numerous terms connected with the art of navigation (*anchora*, *prora*, *gubernare*, &c.), were all borrowed directly from the Greek, and serve to show how deeply Rome was indebted to Greece for the very rudiments of her civilisation. Again, Greek deities were either identified with the national gods of Latium, or admitted into the Roman Pantheon as new divinities. Saturnus was identified with Kronos, and Hercules—the god of enclosures—with the Greek Herakles; Castor and Pollux, both purely Greek in origin, became the tutelary guardians of the Italian mariner; and it was in Greek that the Cumæan Sibyl wrote her far-famed oracles. Yet not for a single moment must we fall into the old delusion of deriving Latin, as a language, from Greek. They are both sisters, varieties of one and the self-same type, standing in the same relationship to one another as Zend and Sanskrit, Provençal and the French of Paris. Even though in Greek we find some forms more primitive than their Latin analogues, yet conversely there meet us in Latin others more primitive than either in Greek or Sanskrit, e.g., *estis* than *Sansk. ssha*, or *sunt* than *Gr. eisi*. Similarly *vicus* and *vinum* adhere more closely to their original type than do *oikos* and *eimos*, in

which the digamma disappeared at an early date. In Latin, too, that agglutinative system which underlies all inflectional languages has often survived where it has disappeared from other Aryan languages, especially in the formation of its verbs, the inflections of which are based on the affixing of the verb of existence *fu-* to the crude verbal form. Thus *ama-bo* = *ama-fio* = 'I am coming into love' = 'I am about to love'; and *ama-vi* = *ama-fui* = 'I have come into love' = 'I have loved.' *Mecum* and *tecum* are as truly agglutinative in their character as the Turkish *benden*, 'me-from,' *senden*, 'thee-from,' and similar forms. The Latin tongue gradually spread from its original seat throughout the whole of Italy, and was carried by the victorious Romans into all the countries successively brought beneath their yoke. During this period, and increasingly as the language became more polished and refined, a marked difference subsisted between its spoken and its written forms, even in the mouths of highly-educated men, and necessarily in a much greater degree among the provincials and the country people. The L. L. reached its greatest perfection of structure, power, and genius in the Ciceronian and Augustan age. In the 6th c. B.C. it had become thoroughly corrupted by the admixture of foreign tongues, and exhibited the symptoms of disorganisation and decay. Classical Latin was the dialect of Latium, in Latium the dialect of Rome, at Rome the dialect of the Patricians. 'It was,' says Max Müller, 'the language of a restricted class, of a political party, of a literary set.' And we know that it must have changed greatly before their time, for Polybius says (iii. 22) that even highly-educated Romans could with difficulty interpret the ancient treaties with Carthage, and Quintilian (i. 6, 40) that the Sallian priests could barely understand their sacred hymns. Once established as the language of literature and civilisation, the classical dialect became stationary and stagnant, brilliant and smooth, but, like an icebound river, cold and stiff. And as Hindustani is not the daughter of the Sanskrit of the Vedas—as, indeed, no literary dialect has ever been the mother of another language—so the sources of Italian and the other Romance languages must be sought for in the popular dialects of Italy, not in the classical literature of Rome (see ROMANCE LANGUAGES). That, as a living speech, was swept away in the convulsions of the falling empire, and in its stead arose the popular or vulgar dialects, which all along had formed a kind of undercurrent. *Cheval* from *caballus*, *feu* from *focus*, *fiorage* from *formagium*, *maître* from *maleaptus*, these and dozens of the commonest words of every-day life in French, Italian, and the Rumanian of Wallachia, bear living witness to the fact. See Burnouf, *Méthode pour étudier la Langue Latine* (Par. 1841); Donaldson, *Varonianus* (Lond. 1852); Bopp, *Vergleichende Grammatik* (2d ed. Berl. 1857-62); Max Müller, *Lectures on the Science of Language* (2 vols. Lond. 1862-64); Corssen, *Ueber Aussprache, Vocalismus, und Betonung der lateinischen Sprache* (2d ed. Leips. 1868-69); and Kegan Paul's translation of Baur's *Philological Introduction to Greek and Latin* (Lond. 1877).

Latin Literature.—That the art of writing was known at an early period at Rome, and that there were schools under the Tarquins for the instruction of the middle classes, we learn from the legend of Virginia (449 B.C.). But of a primeval literature we have but few existing specimens—some scanty fragments of the Fescennine Verses (q. v.), the Atellanæ (q. v.), the Litany of the Arval Brothers, of Sallian and Saturnian verse, and ancient laws, chief among them the Twelve Tables (q. v.). In all of these the interest lies rather in the matter than in the form. The fathers of that L. L. that has come down to us were Greeks, and its commencement dates from the establishment at Rome of Livius Andronicus (q. v.), a Tarentine prisoner of war (272 B.C.). To his translation of the Odyssey succeeded the dramas of Nævius (q. v.), Plautus (q. v.), and Ennius (q. v.), all adaptations of Greek originals, in which the very scene was laid in Hellas. Pacuvius, Attius, Cæcilius Statius, and Terentius (q. v.) followed closely in the track of their foregoers; the first history of Rome was written in Greek by Fabius Pictor (circa 200 B.C.); and Cato (q. v.) alone can in any sense be called a truly national writer. The period from the death of Sulla to the end of the reign of Augustus (78 B.C. to 14 A.D.) forms the Golden or Augustan Age of L. L. The drama declines, and prose-writings, historical and philosophical, with epic and lyric poems, rivaling, sometimes almost transcending, their Hellenic models, take its place. The greatest names are, in prose, Varro (q. v.), Cicero (q. v.), Cæsar (q. v.), Sallust (q. v.), Cornelius Nepos

(q. v.), Livy (q. v.), and Vitruvius (q. v.); in poetry, Lucretius (q. v.), Virgil (q. v.), Horace (q. v.), Tibullus (q. v.), Propertius (q. v.), and Ovid (q. v.). The Silver or Imperial Age (14-193 A.D.) is marked by epigrammatic histories, sparkling epigram, and loathing hopeless satires of vices before which the follies touched on by the earlier satirists are very purity. To it belong Velleius Paterculus (q. v.), Valerius Maximus, Seneca (q. v.), Columella (q. v.), Curtius (q. v.), the Elder and Younger Pliny (q. v.), Quintilian (q. v.), Frontinus (q. v.), Tacitus (q. v.), Suetonius (q. v.), Appuleius (q. v.), and Aulus Gellius (q. v.); and the poets Persius (q. v.), Lucan (q. v.), Silius Italicus, Valerius Flaccus (q. v.), Martial (q. v.), and Juvenal (q. v.). To these must be added the great jurists Gaius (q. v.), Papinian (q. v.), Paulus (q. v.), and Ulpian (q. v.), and the Latin Fathers (q. v.), partly belonging to the Silver, and partly to the Brazen Age (193-476 A.D.). The latter period also included Eutropius (q. v.), Ammianus Marcellinus (q. v.), and Macrobius (q. v.), with the poets Ausonius (q. v.), Prudentius (q. v.), and Claudian (q. v.), and closed with Cassiodorus (q. v.) and Boëthius (q. v.). Yet not even in the flood of barbaric invasion might the lamp of Roman learning be quenched. That lamp, snatched half-dying from Greece, fanned into fresh lustre, and handed on by seven centuries of writers, was still to illumine and be fed by unborn generations. Aquinas, Duns Scotus, and Akempis of Catholic, and Erasmus and Beza of Reformation times, stand forth among the ecclesiastical authors of post-classical Latinity, which numbers also historians from Bede to Camden, poets from St. Gregory to Milton, and scholars and commentators down to our own day. See Dunlop, *History of Roman Literature* (3 vols. Lond. 1824-28); Bähr, *Geschichte der röm. Literatur* (Karlsr. 1828); Munk, *Geschichte der röm. Lit.* (3 vols. Berl. 1858-61); Bernhardt, *Grundriss der röm. Lit.* (4th ed. Brunsw. 1865); Teuffel, *Geschichte der röm. Lit.* (Leips. 1870); Pierron, *Histoire de la Littérature romaine* (6th ed. Par. 1873); Professor Sellar, *The Roman Poets of the Republic* (Oxf. Clar. Press, 1863), and *The Roman Poets of the Augustan Age* (Oxf. 1877); and C. T. Crutwell, *History of Latin Literature* (Lond. 1878).

Latini, the people of Latium, the name given by the Romans to a district of Central Italy, situated on the Tyrrhenian Sea, between Etruria and Campania. At first Latium included simply the southern part of the Tiber basin; but when the Hernicans, the Æquians, the Volscians, and the Aurnucans were merged with the Latins in the Roman Commonwealth, the name was extended to their territories. The L. were a mixed race, one branch being more closely related to the Greek or Pelasgic stock, and the other being akin to the Oscans, Sabines, and Umbrians. The L. first appear in history as a confederation of thirty cities, of which Alba was the head.

Latitude and Longitude are the angular co-ordinates by which the position of a place upon the earth's surface is accurately determined. Assuming the earth to be a true sphere, it is obvious that the plane containing the poles and the given point passes through the centre of the earth, and intersects the surface in a great circle which cuts the equator at right angles in two points diametrically opposed to each other. This plane is called the *plane of the meridian*, and the great circle in which it intersects the surface the *meridian*. The angle at the centre, which is subtended by the portion of the meridian intercepted between the given point and the nearer point of intersection on the equator, is called the *latitude* of the point, so that the latitude is increased as the point is removed farther from the equator until it reaches either pole, where the latitude attains its maximum, 90°. According as the point is N. or S. of the equator the latitude is termed N. or S. latitude. The line which connects points having the same latitude is evidently a small circle on the sphere, lying in a plane parallel to the equatorial plane. Small circles drawn in this way are called *parallels of latitude*, or simply *parallels*. By knowing only the latitude we cannot thereby determine the position of the place, which may lie anywhere on the corresponding parallel: the other angular co-ordinate, the *longitude*, is necessary. The longitude may be defined as the angle which the meridian plane of the place makes with a fixed and arbitrarily chosen meridian plane, or, as the actual distance measured in degrees between the points where the equator cuts the meridian of the place and the zero meridian line. The meridian of Greenwich is the zero line used by the English and Americans, from which other longitudes

are measured E. or W. as the case may be. Places in longitude 180° E. or W. lie of course upon the great circle of which the Greenwich meridian constitutes the one half. The French take the meridian through Paris as their zero, and the continental nations employ the same, or it may be the meridian through the Faroe Islands. Places which are on the same meridian have of course the same longitude; and hence a place of given latitude and longitude is at the point of intersection of the parallel and the meridian which correspond respectively to the given latitude and longitude. The absolute distance between any two meridians diminishes as the latitude increases, and accordingly a length of a degree of longitude varies with the latitude from as much as sixty-nine statute miles at the equator to nothing at the poles. A degree of latitude also varies in length but slightly, since its variation is due only to the oblate form of the earth, which makes a degree of latitude at the poles greater by almost exactly 1 per cent than one at the equator. The usual methods of finding the latitude and longitude of a place are best treated of under Navigation (q. v.).

Latur' d'Auvergne', Théophile Malo Corret de, a French soldier, Napoleon's 'First Grenadier,' was born at Carhaix, Brittany, November 23, 1743. He entered the army in 1767 and fought in the Spanish service at Port Mahon in 1782. In the French republican army he rendered such conspicuous service at Chambéry and at the Pyrenees that he was offered a generalship, but preferred to remain a simple captain of grenadiers. Subsequently 8000 grenadiers (the '*colonne infernale*') were placed under his command. He retired in 1795, but was soon afterwards captured at sea by an English cruiser, and detained a prisoner for more than a year. In 1799 he re-entered the army and was killed in an action at Oberhausen, Bavaria, June 27, 1800. L. published *Nouvelles Recherches sur la Langue, l'Origine, et les Antiquités des Bretons* (Bayonne, 1792, later edition, with the title *Origines Gauloises*, Hamburg, 1802), and several minor philological works.

Latreille', Pierre André, a French naturalist, was born at Brives in Corrèze, November 29, 1762. In 1778 he went to Paris and entered the college of Cardinal Lemoine. After his ordination in 1786 he retired to Brives, where he occupied his ample leisure in the study of insects. In 1798 he returned to Paris and assisted Lamarck in the Jardin des Plantes till the death of the latter in 1829, when L. succeeded him as professor of natural history. L. died at Paris February 6, 1833. The more important of his numerous writings are *Histoire Naturelle des Crustacés et des Insectes* (14 vols. 1802-5), *Histoire Naturelle des Reptiles* (4 vols. 1802), *Genera Crustaceorum et Insectorum* (4 vols. 1806-9), *Mémoires sur divers Sujets de l'Histoire Naturelle des Insectes*, &c. (1819), *Familles Naturelles du Règne Animal* (1825), and *Cours d'Entomologie* (2 vols. 1831-33).

Latten (Fr. *laiton*), the old English name (sometimes written *latoun*) for a mixed metal, a variety of brass, much used for Monumental Brasses (q. v.), candlesticks, and other metal work. It began to be manufactured in England in the 16th c., after having been long imported from Flanders and Germany.

Latticed, or **Trellé**, a heraldic term applied to a shield on which narrow strips of wood cross each other, as in trellis-work. The bars are nailed at the intersections, but are not interlaced as in Fret (q. v.).

Lattice-Girder, a type of girder whose horizontal members are connected by lattice-worked lacing. Examples are furnished by Blackfriars Railway Bridge across the Thames, and the wrought-iron railway bridge which crosses the Rhine at Cologne.

Lattice Leaf, or **Lace Leaf Plant**. This interesting aquatic was introduced to our hothouses from Madagascar by the late well-known missionary the Rev. W. Ellis, and claimed immediate attention from the curious structure of its leaf. Instead of the ordinary type of leaf, in this plant from the very small extent to which the cellular tissue is developed, it resembles the mere framework or skeleton of one, consisting simply of a stout mid-rib, with several parallel ribs on each side, and the whole connected by numerous cross nerves. The botanical name established for the genus is *Ovairandra* (being the native equivalent for Water Yam), belonging to the natural order *Naiadeæ*, and the above-mentioned species is called *O. fenestralis*. The fleshy farinaceous root is used as an article of food.

Lau'ban, a town of Prussian Silesia, on the Queis, 78 miles E. of Breslau by rail, has four churches, a convent (founded in 1320), an orphanage, &c. Besides lead and bell foundries, there is an extensive factory, which turns out annually 12,000,000 linen pocket-handkerchiefs (value £262,500), and 6,000,000 of cotton (value £50,000). Pop. (1875) 10,092.

Laud, William, Archbishop of Canterbury, was born October 7, 1573, at Reading, in Berkshire, where his father was a well-to-do clothier. From the free school of his native town he passed to St. John's College, Oxford (1589), where he obtained a fellowship (1593), graduated (1598), and was ordained priest (1601). Through the patronage of Charles Blount, Earl of Devonshire, and Richard Neile, Bishop of Rochester, he became successively vicar of Stanford, in Northamptonshire (1607), and of North Kilworth, in Leicestershire (1608), rector of West Tilbury, in Essex (1609), president of his old college (1611), prebendary of Lincoln (1614), Archdeacon of Huntingdon (1615), Dean of Gloucester (1616), prebendary of Westminster and Bishop of St. Davids (1621). In 1622 he disputed with Fisher, the Jesuit, before George Villiers, Marquis of Buckingham, and the countess his mother, the particulars of their conference being published by both parties. He officiated as Dean of Westminster at the coronation of Charles I. (1625), in place of Williams, the disgraced Bishop of Lincoln; and a year later was translated to the see of Bath and Wells, made Dean of the Chapel Royal, and sworn a privy councillor, being raised to the bishopric of London in 1628. Chosen Chancellor of Oxford in 1630, he sought to resuscitate the study of Arabic by collecting Arabic MSS. for the Bodleian Library, and founding a chair of Arabic; and on August 4, 1633, he was finally elevated to the archbishopric of Canterbury. That very morning, so we learn from his *Diary*, a person came to him with the offer of a cardinal's hat, but he refused, saying that something dwelt within him which would not suffer it till Rome were other than it was. In truth, there was but one office in the Roman Church that L. could have stomached—the papacy itself, preferring to be sovereign over little rather than viceroy of much. But that little could be magnified, and here lies the secret of all L.'s policy. He has been called popish. He was as little a Papist as the Pretender was a Hanoverian because he assumed the state and title of a king of England. The Roman Church was a branch of the Church Catholic, and as such possessed certain rites and doctrines; his Church was also a true, if younger branch, and must possess them also. But the Roman Church had a visible head. So, too, must the English. And who fitter than he who was already so, at least in title—the king? There were many arguments in favour of and consequences arising from this theory. Borrowed from the Eastern, it aimed a side-thrust at the envied Western Church. It was certain to commend its advocate to the king, whose vanity it flattered. That king derived his authority from the Church's consecrating oil,—the Laudian and Caroline doctrines of divine right crossing here,—was in a manner the Church's son, and the greater the son, the greater also the mother. But a king acting by the advice of ministers, a king in whose realm political equality was granted to all religions, could not be supreme governor of the Church in the same sense as Alexander Komnenos. He must be absolute, as the Church must be undivided. So L. supported Strafford (q. v.) in his policy of 'Thorough,' and himself set about the suppression of Puritanism in England, and of Presbyterianism in Scotland. In the former country he drew up a list of 'orthodox' and 'Puritan' ministers, and these, the wheat and the tares, he proceeded to separate by scolding, suspending, and depriving. Freedom of worship was withdrawn from Huguenot refugees, Englishmen abroad were forbidden to attend Calvinistic services, and at home the substitution of 'gospel preaching,' justification by faith, and the observance of the Sabbath by an elaborate ritual, by the doctrines of the real presence, celibacy, and confession, and by the *Book of Sports*, was vigorously enforced by the courts of the High Commission and the Star-Chamber. Nor was a policy without results which checked the growth of Protestantism within the Anglican communion, and has itself borne fruit in the Non-jurors, the Tractarians, and the modern Ritualists. In Scotland it was otherwise. There the first attempt, in 1617, to introduce episcopacy had merely failed. The second (1635-37) gave birth to the Covenant (q. v.), the Covenant to the 'Bishops' War,' and this in turn to the assembling of the Long Parliament, which sent the

Archbishop to the Tower, December 18, 1640. After lying there three years, he was brought to trial, March 12, 1644, before the House of Lords. The trial lasted twenty days, but the Commons, fearing to trust the issue to the verdict of the Peers or of a Middlesex jury, prepared a wholly unconstitutional bill of attainder, and he was beheaded on Tower Hill, January 10, 1645. A 'ridiculous old bigot' is Macaulay's estimate of L., but he was more than that. Waspish he was, harsh and violent in speech and action, and childishly superstitious; but against these defects must be set his personal unselfishness, munificence, and encouragement of learning, his industry and marvellous capacity for administration. His very bigotry was an inheritance, for we must not forget that Whitgift, Bancroft, and Abbot, had, under the Ecclesiastical Commission, founded in 1583, wielded the self-same spiritual tyranny that brought their successor to the block. L.'s *Diary* was published in 1694, his *Works* during 1857-60, and the best life of him is that in vol. xi. of Hook's *Archbishops of Canterbury* (Lond. 1875).

Laud'anum. See OPIUM, MEDICINAL PREPARATIONS OF.

Lau'enburg, a former duchy in the N. of Germany, formally annexed to Prussia by an Act of 28th June 1876. It is bounded by Holstein, Mecklenburg, Hanover, and Hamburg, has an area of 454 sq. miles, and a pop. (1871) of 49,651. Ratzelburg (pop. 4293) is the capital, and larger towns are Mölln and Lauenburg.

Laugh'ing Gas. See NITROGEN.

Launce, sometimes called 'sand-eel,' a *Telostean* fish belonging to the *Malacopterygii* or 'soft-finned' section of the order. The *Ammodytes laucea*, the common species, inhabits the sand of the British coasts, and is dug in great quantities for food and bait. It attains a length of 6 or 7 inches. The colour is a delicate silvery white. The L. burrows swiftly in the sand by means of the projecting underjaw. No ventral fins are developed, and it is hence included in the section *Apoda*. The skin is thick and soft, the scales being rudimentary. No teeth exist, and both dorsal and anal fins are very long, the tail-fin being deeply forked. The 'sand-eel' proper or 'hornels' is the *A. tobianus*, of a brown colour, and attaining a length of 12 inches.

Launceston, a market-town of England, in the county of Cornwall, 18½ miles N.W. of Tavistock by rail, on the Kensey, a tributary of the Tamar, has a fine 16th-c. church, a ruined Norman castle, two market-halls, a mechanics' institute, a grammar-school founded by Edward VI., &c. Its trade is chiefly agricultural. Pop. (1871) 2935. With Newport, L. returns one member to Parliament.

Launceston, the second town in Tasmania, is situated on the river Tamar, about 40 miles from its mouth. The streets are wide and straight, and are lighted with gas. The chief public buildings are the town hall and the Government offices. Several of its churches are fine edifices. L. carries on an active trade with Melbourne, with whose citizens it is in high favour as a place of summer resort. Pop. (1875) 11,000.

Launch, a strongly built boat, adapted for carrying heavy weights, and the largest attached to ships of war. Steam launches carrying one gun are found very serviceable in rivers and shallow waters.

Launch, the operation of sending a ship afloat. An inclined plane or 'launching way' of blocks and planking is laid down under each bilge, and is carried into the water sufficiently far to enable the stern of the ship to be water-borne before the stem leaves the 'ways.' A 'cradle,' consisting of 'bilge-ways,' 'poppets,' and other timbers, supports the ship after the removal of the keel-blocks and shores, and slides with her down the 'ways' into the water. The 'ways' have a gradient of about 1 foot in 11 feet. The day previous to the L. the sliding surfaces are well greased, and the keel blocks are removed, and when the moment of L. arrives the 'dogshores' are knocked away, the ship is christened, and with accelerating motion she glides into the water. The planks and 'cleats' bolted to the ship's bottom are subsequently removed in dock. Launching on the keel, that is with a sliding-way under the keel, is practised in the French navy.

Lauraceæ, or the Laurel Family, is a large order of dicotyledonous trees, undershrubs, and herbs, principally natives

of tropical Asia and America. Many are aromatic and fragrant, yielding volatile and fixed oils, others furnish camphor, and others have bitter and tonic barks. Some supply useful timber. The representative species is *Laurus nobilis*, and is the only one indigenous to Europe. (See LAUREL.) The most valuable plants of the order will be found mentioned under camphor, sassafras, cinnamon, cassia bark, green-heart, and avocado-pear. The cassythæ or dodder laurels, which range under L., are curious leafless climbing parasitic plants.

Lau'reate, Poet, in England, an officer of the royal household. The name is derived from *laurus*, a 'bay,' from the ancient custom of crowning poets. The salary is £100, and an extra £27 in lieu of a tierce of canary, formerly allowed. The first P. L. on record is John Key, in the reign of Edward IV. Ben Jonson held the office under James I. Since Charles I. the succession of laureates has been John Dryden, Nahum Tate, Nicholas Rowe, Laurence Eusden, Colley Cibber, William Whitehead, Thomas Wharton, II. J. Pye, Robert Southey, William Wordsworth, and Alfred Tennyson.

Lau'el. Under the name of L. several widely distinct plants are included by gardeners, e.g., species of *Cerasus*, &c., but the noble, or victor's L., otherwise the sweet-bay (*Laurus nobilis*), is the only one to which the name rightly applies. It is a native of S. Europe, whence it has been long introduced into various more northern countries as a garden evergreen shrub. The leaves possess an agreeable, aromatic, slightly bitter taste, and are in consequence used in cookery for flavouring purposes. In ancient Greece the berry-bearing sprays of L. served to decorate the conquerors in battle and in the Olympic games.

Laurel-Water is prepared by distilling water over the bruised leaves of the cherry-laurel, *Cerasus laurocerasus*, and is occasionally employed in minute quantities as a flavouring agent in cooking instead of bay-leaf water. L.-W. contains hydrocyanic acid, and is a virulent poison.

Laurentian System, in Geology, is represented by the lowest recognisable sedimentary formation constituting the earth's crust. The name is derived from the river St. Lawrence in N. America, in the basin of which the rocks of this period, highly contorted and metamorphosed, attain their greatest development. There they have been worked out very fully by Logan and Dawson. They are anterior in time to the Cambrian rocks, and in this are comparable to the old gneiss which underlies the Lower Silurian in the Scottish Highlands. The Scottish gneiss has consequently been included by Murchison and Geikie in the Laurentian, even though contemporaneity is not, and cannot hope to be, established. In Scandinavia, Bohemia, and Bavaria, similar old gneiss formations have been referred to the Laurentian. Eozoon (q. v.) is the only known fossil.

Laurustinus, an evergreen shrub, a native of S. Europe, now common in several varieties in gardens, its permanent leaves and the early appearance of its corymbs of white or pinkish flowers rendering it a favourite. It is the *Viburnum Tinus* of botanists.

Laur'vik, a seaport town in Norway, 70 miles S.W. of Christiania, on a fjord of the same name at the mouth of the Numedalslaagen, which affords motive power to many manufactories. It has considerable trade, especially in timber, though much of its former importance has now been transferred to Horten, a seaport 37 miles N.N.E. In 1873, 694 vessels entered the harbour of L., which is large and deep. Pop. (1875) 6509.

Lausanne (anc. *Lausonium*, or *Lousana*), the chief town of the canton of Vaud in Switzerland, is very beautifully situated 1690 feet above the sea, on the slopes of Jura, about a mile from its port, Ouchy, formerly called Rive (Fr. 'shore'), on the N. shore of the Lac Léman, and 35 miles N.E. of Geneva by rail. The streets of the older portion are steep and narrow; but the extensive additions around this are well and regularly built. The quarters of St. François and St. Laurent are connected by a viaduct called the Grand Pont, or Pont Pichard. The Protestant cathedral, 353 feet long and 151 broad, completed in 1275, is a magnificent Gothic building, with a tower 250 feet high, and contains many fine monuments. L. has a scientific museum, a collection of paintings, a fine hospital, and an institution for the blind. The trade of L. is considerable. Its chief industries

are brewing, lithographing, and the spinning of cotton and wool. Its schools are numerous and good. At L., Gibbon composed the most of his great work. Pop. (1870) 26,520.

Lava (It. 'what flows like water'), includes all the products of a volcano which are or have been ejected in a molten condition. The L., as it issues from the crater or some lateral orifice, flows down the slope as a *coulée* or stream. The surface exposed to the air soon cools and hardens, while inside the mass may long remain glowing, in virtue of the bad conductivity of the rock for heat. Near the surface of cooled L., where the cooling has been rapid, the structure is vesicular; but this character soon disappears as we get below the surface, where gradual cooling has resulted in the formation of a hard, compact stone, often columnar and crystalline. All our traps, basalts, trachytes, &c., were no doubt at one time molten rock, precisely analogous to the lavas of Vesuvius, Etna, and Skaptar Jökull.

Laval, the chief town of the department of Mayenne, France, on the river Mayenne, 13 miles W. of Le Mans by rail. It is a quaint town, and with a château of the former dukes of L. and La Trémouille, now a prison, an old church of the Trinity, and another of St Vénérand, dating from the 15th c. The celebrated linen called *toiles de L.*, chiefly tablecloths and napkins, has been produced here for nearly 600 years, and is sold to the value of £20,000 at each of the monthly markets. Other industrial products are cottons, paper, leather, and pottery. Pop. (1872) 22,892. The Vendéans gained a great victory over the Republicans near L., 25th October 1793.

La Valett'a. See VALETTA, LA.

La Vallière, Françoise Louise de la Baume le Blanc, Duchesse de, born at Tours 1644, lost her father, the governor of Château d'Amboise, in early life, and was taken to court by her mother. Being appointed maid-of-honour to the sister-in-law of Louis XIV. she came much in contact with the king, whose mistress she was for several years. After 1662 she bore him four children, but his affection towards her cooled when the star of Mme. de Montespan had risen. It was in these years of royal neglect that she is supposed to have written *Réflexions sur la Miséricorde de Dieu, par une Dame Pénitente*, though they were not published until 1680 (new edit. by Cornut in 1854, with Bossuet's corrections on copy, dated 1688). Contemporary testimony, female as well as male, proves that, notwithstanding her relationship to the king, L. was a woman of genuine modesty. Indeed, her charms were rather those of grace, agreeableness, and sincerity, than remarkable beauty of person. In 1674 she bade adieu to the king, who had been indifferent to her, entered a Carmelite nunnery, where, having become 'the example and idol of the community,' she died, June 6, 1710. See Abbé Lequeux, *Vie de Madame de L.*; and Roissy, *Hist. de Madame de L., Duchesse et Carmélite*.

Lavater, Johann Kaspar, a Swiss divine and physiognomist, born November 15, 1741, at Zürich, early showed a taste for painting and enthusiasm for religion. Having taken orders in 1762, he became (1769) a pastor at Zürich, where he devoted much time to portrait-painting, and gradually came to believe the human face to be a perfect index of the character. To prove this, L. collected from all sides portraits of eminent persons, and afterwards published his famous *Physiognomische Fragmente* (4 vols. 1775-78). At the same time he attacked with great force the rationalism of his time, giving in *Pontius Pilatus* (1782-85) a confession of his faith that cost him many friends. Men wrapped in mystery, like Cagliostro or Mesmer, had a special attraction for L. When Switzerland was seized by the French Republic, he boldly rebuked the oppressors, and was imprisoned by them in 1799. In a few months he regained his liberty, but was shot at Zürich, 26th September 1799, when that town was taken by Masséna, and died of the wound January 2, 1801. L.'s other chief works were *Schweizerlieder* (1767), *Aussichten in die Ewigkeit* (1769-73), and *Tagebuch* (1772). He himself published 2 vols. of *Vermischte Schriften* (Winterthur, 1774-81), and, in 3 vols., *Sämmtliche Kleine Prosaische Schriften* (ib. 1784-85); Gessner, *J.'s nachgelassene Schriften* (5 vols. Zür. 1801-2); and Orelli, *L.'s Ausgewählte Schriften* (8 vols. ib. 1841-44). L.'s writings show true genius, but want art. In his own day he was greatly admired by some, but to others was as much an object of contempt and scorn.

See Bodemann, *L. nach seinem Leben, Lehren, und Wirken dargestellt* (Gotha, 1856).

Lavaur, an old town of France in the department of Tarn, on the river Agout, 20 miles N.E. of Toulouse. It has a cathedral of St. Cécile of Albi, and the river is here crossed by a grand stone bridge of the 18th c. Pop. (1872) 4485.

Lavender, the popular name for a species of *Lavandula*, a genus belonging to *Labiatae*. The common L. (*L. vera*), a native of S. Europe, is frequently seen in old-fashioned gardens, and is further largely cultivated for the sake of its agreeable perfume, and for the oil on which this property depends. When the oil is dissolved in spirits of wine and mixed with other perfumes it forms the much appreciated L.-water. It is also sometimes administered medicinally as a stimulant and carminative, but is inferior to other preparations, such as peppermint. Broad-leaved L. (*L. spica*) yields oil-of-spike, an ingredient in the preparation of artists' varnishes, and used also by painters on porcelain. Other species are cultivated in greenhouses. The word L. is traced to the Latin *lavare*, 'to wash,' as being the plant used to scent newly-washed linen (whence the expression, 'laid up in lavender'), or from its being employed to perfume the baths.

Medical Properties of L.—The oil of L. is an aromatic stimulant and carminative, useful in hysteria, hypochondriasis, and other nervous affections, but is principally used as an adjuvant to other medicines. Spirit of L. is given in doses of from 30 to 60 minims, and the compound tincture of L. in doses of from ½ to 2 drachms.

La Ville'marqué. See VILLEMARQUÉ.

Lavoisier, Antoine Laurent, a celebrated French chemist, was born at Paris, August 16, 1743. In order to obtain sufficient means to carry on his scientific experiments, he sought and obtained in 1768 the post of farmer-general. In 1776 he was chosen Director of the Royal Powder and Saltpetre Works, and in 1791 was appointed to the Commission for considering new weights and measures. His great fame rests upon his discoveries in chemistry, which completely overthrew the then universally accepted phlogiston theory, and established the modern theory (see CHEMISTRY). His pre-eminent merits as a scientist did not save him from the dangers of the Revolution, and he fell a victim to the guillotine on May 8, 1794. L.'s chief works are *Traité Élémentaire de Chimie* (2 vols. 1789, 3d ed. 1801); *Opuscules Physique et Chimiques* (1774, 2d ed. 1801); and *Mémoires de Chimie*, published by his widow in 1805. See Volhard's *Biographie de L.* (1870).

Law (Heb. *thorah*, Gr. *nomos*, 'custom'), in the Scriptures uniformly means a manifestation of the will of God, which is represented as the ultimate foundation of moral obligation. L. is thus equivalent to a rule of conduct, however revealed, but is applied more particularly to the Scriptures, which contain the revealed will of God as a rule of faith and practice, and more especially still to the L. of Moses or the Pentateuch. As opposed to the Gospel, L. means all the positive precepts of revelation, and consists of two parts:—the Jewish ceremonial L., which Christian theologians regard as having been abrogated by the Gospel, and the moral L., which is of perpetual obligation. It is maintained by Protestant theologians that the moral L. contained in the Scriptures is perfect, inasmuch as (1) everything that the Bible pronounces to be wrong is wrong, and everything it declares to be right is right; (2) nothing is sinful which the Bible does not condemn, and nothing is obligatory on the conscience which it does not enjoin; and (3) the Scriptures are thus a complete rule of duty, so that there is and can be no higher standard of moral excellence. See Hodge's *Systemat. Theology* (Edinb. 1873).

Law, the term especially applied to the system of rules by which the inhabitants of a country are associated, by which their conduct to one another is regulated, and their rights and interests in property ascertained. The L. of Nations regulates the intercourse of one nation with another (see INTERNATIONAL LAW). It is a partly written and partly unwritten L.; the first depending on treaties, the second on reason and on the usage of the various civilised nations. By those, the rights of the respective nations in peace and in war are regulated. The Municipal L. of a country is divided into the *civil* and the *criminal*—the

former regulating the rights and interests of individuals in private property, the latter prescribing a rule of conduct to each individual in relation to others, with penalties for infringement of these rules. The term *Civil L.* is also specially applied to Roman L. (See CODE.) This L., which was at one time that of the Continent of Europe, has materially influenced the jurisprudence of every modern European state. England has adopted less from it than any other country. Scotland has followed it closely. In many respects that country has wholly adopted it. See COMMON L. EQUITY.

Law, John, a famous financier and speculator, the son of a goldsmith, was born in Edinburgh, 21st April 1671. In his youth he showed great arithmetical talent. Handsome and accomplished, he combined pleasure and study in an extraordinary way. Having to leave the country in 1694, after killing an opponent in a duel, he wandered about Italy, where he gained a livelihood by gambling, and planned gigantic financial schemes. He settled in Paris in 1714, when he was worth over £100,000. Two years later he started a private bank with great success. His monetary visions captivated the Regent, who established the 'Royal Bank of France' in 1718, with L. as Director-General. In 1719 he floated the great bubble Mississippi Scheme, and became Comptroller-General of France, and one of the greatest personages in Europe. On its failure next year he fled to Brussels. He died in indigence at Venice, March 21, 1729. See J. P. Wood's *Life of L.* (1824), and Thiers' *L. et son Système de Finances* (Par. 1826; new ed. 1858).

Law, William, an English divine, was born at Kingscliff, Northamptonshire, in 1686, and educated at Emmanuel College, Cambridge. He forfeited a fellowship by a refusal to take new oaths on the accession of George I. He was for ten years tutor in the family of Mr. Gibbon, father of the historian, and afterwards lived with Mrs. Hutcheson and Miss Hester Gibbon, the three devoting their combined incomes to charitable purposes. His *Serious Call to a Devout and Holy Life*, and other writings, teach a severe and steadfast piety, and gave no small impetus to the Evangelical revival. He died April 9, 1761. His collected works were published in 9 vols. in 1762. See his *Life*, by R. Tighe (1813), and *Notes and Materials for his Life*, printed for the Theosophical Library, 1856.

Lawburrows, in Scotch law, are writings or letters, in the name of the sovereign, commanding a person to find security against using violence towards another. Any one taking out L. against another, incurs risk of an action for damage, which will be awarded if malice be proved. The corresponding term of English law is *Articles of the Peace*.

Law of Nations. See INTERNATIONAL LAW.

Lawrence, a city of Massachusetts, U.S., on the Merrimack River, 26 miles N.W. of Boston by rail. It has twenty-one churches, a city hall, a court house, a public library of 14,000 vols., two dailies, four weekly newspapers, and a fine common of 17 acres, enclosing a miniature lake. The chief works are the Pacific cotton-mills (capital £500,000), with 5000 employes, the Atlantic mills, with 1400, and the Washington, with 2900. There are also large duck, woollen, and paper mills, steam-engine works, &c. Water-power is supplied by a dam of solid granite, 900 feet long and 40 high, thrown across the rapids in 1845. A canal, 90 feet wide and $1\frac{1}{4}$ miles long, leads off the water; another canal on the opposite side of the river has been constructed recently. L. was incorporated as a town in 1847, and as a city in 1853. Pop. (1870), 28,921.

Lawrence, the second city in Kansas, U.S., on both sides of the Kansas river, 38 miles S.W. of Leavenworth by rail. It is a railway junction, and the seat of the State university, and has a great trade in pork, packing, iron-founding, flour-milling, and manufactures of woollens and machinery. Pop. (1870) 8320. It was burned in the Quantrell raid in 1863, but has since been rebuilt, and is one of the finest of western cities.

Lawrence, the name of a family sprung from the N. of Ireland, and illustrious in the annals of British administration in India. Four sons of Colonel L., who himself led a storming party at Seringapatam in 1799, entered the Indian army, and one the civil service.—**Sir Henry Montgomery L.** was born at Mutorah in Ceylon, 28th June 1806, and after passing through Addiscombe, joined the Bengal Artillery in 1822. After working some years as Revenue Surveyor in Goruckpore,

he commanded the Sikh Contingent during the second Afghan invasion of 1842. Afterwards he was resident at the Court of Nepal, from which time date his frequent contributions to the newly-founded *Calcutta Review*. He took part, as chief political officer in the first Sikh war of 1846; and from henceforth till 1853 his name is intimately associated with the Punjab, where he laid the foundations of a model government, first as Resident at Lahore, and afterwards as President of the Board. In 1853 he was removed to Rajputana, and in 1857 he was appointed chief commissioner in Oude. Here he was overtaken by the Mutiny, a catastrophe which he had himself anticipated, and which was stimulated by a policy towards native states and native gentlemen which he had always opposed. On 30th May 1857 the Sepoys at Lucknow mutinied, but the foresight of Sir H. L. had secured the residency quarter of the city. On 30th June he was induced to lead a disastrous reconnaissance to Chinhut. On the following day the residency was besieged, and Sir H. L. was mortally wounded by one of the first shells fired during the siege. He died on the 4th of July. He had been nominated as Governor-General of India, in provisional succession to Lord Canning, and than his death there could have been no greater loss. He has a monument in St. Paul's Cathedral, and a statue was unveiled at Calcutta in December 1875; but his grandest monument is the L. Asylums for children of European soldiers in the hill stations of India, which he founded at his own expense, and which were completed by public subscriptions, and have now been taken over by Government. See *Life of Sir H. L.*, by Sir H. Edwards and H. Merivale (Lond. 1872).—**Sir John Laird-Mair L.** (now Lord L.) was born 4th March 1811, in Yorkshire, and went to India in the Bengal Civil Service in 1829. In 1849 he was selected as one of the three members of the Lahore Board of Administration for the Punjab, of which his brother Henry was President; and in 1853 he became Chief Commissioner of that province, where he developed a unique system of administration. Here he successfully weathered the Mutiny, and was not only able to disarm the Sepoys, and maintain order in the Punjab, but also to send down a succession of reinforcements, which determined the issue of the Delhi siege, and indirectly the fate of India. From 1863 to 1868 he was Governor-General of India, and received a peerage on his return to England. His term of office was marked by troubles with the Mohammedans on the N.W. frontier, the Bhutan war, and the terrible Orissa famine. Lord L. was the first Chairman of the London School Board.—**Sir George L.** was born in 1805, and entered the Bengal Cavalry. He also attached himself to the political department. He was for some years military secretary at Cabul, and afterwards Commissioner of Peshawur. In both capacities it was his misfortune to be taken prisoner, in 1842, and again in 1848. He succeeded his brother Henry as Political Agent in Rajputana in 1857, and has written a book on the events which occurred there during the Mutiny.

Lawrence, Sir Thomas, an English portrait painter, was born at Bristol, May 4, 1769, but spent his childhood at Devizes, where his father became a hotel-keeper. He only received two years' schooling, but early showed an extraordinary facility with his pencil. He was placed under an excellent master at Bath in 1782, in which year he won the silver plate of the Society of Arts for a copy in crayon of the 'Transfiguration.' In 1787 he removed to London, and exhibited at Somerset House. In 1791 he was elected an associate of the Royal Academy, and succeeded Sir J. Reynolds as principal painter to the king. He was knighted in 1815 by the Prince Regent, at whose request he visited foreign courts to paint the series of crowned heads, statesmen, and soldiers forming the Waterloo Gallery at Windsor. He became P.R.A. in 1820, and died January 7, 1830. L. was a fine colourist and skilful draughtsman. His pictures of beautiful women and children are instinct with grace and refinement. Those of the Kemble Family are historical. See his *Life and Correspondence*, by D. E. Williams (3 vols. Lond. 1831), and a *Collection of Engravings* of fifty of his pictures (Lond. 1845).

Lawrence, St., born at Rome in the early part of the 3d c., was one of the seven archdeacons of that city in the reign of Valerian (253-260) and the pontificate of Sixtus II. Summoned by the prefect to render up the treasures of the Church, L. collected all the sick and aged, the widows and orphans of his

flock, and presenting them, 'Behold,' he said, 'the treasures that I promised you!' For this act of defiance he was broiled over a slow fire, August 9, 258, and the church of St. Lorenzo Fuori le Mura is said to mark his burial-place. The Escorial (q. v.), the city of Norwich, and other towns and structures dedicated to the saint, are built in the form of a gridiron.

Lawrence, St., the great boundary river between the United States and Canada, and, together with the great lakes, the most magnificent system of inland navigation in the world. It rises in the plateau W. of Lake Superior, under the name of the St. Louis. It has a course of 160 miles before entering the lake, from which it issues through the rapids of St. Marie. The obstacle to shipping presented by the rapids has been overcome by the construction of a canal in the state of Michigan. Lake Huron, the second of the great series, after receiving Lake Michigan from the S.W., discharges its waters by the St. Clair S. into Lake Erie. The river Niagara (q. v.) connects Lake Erie with Lake Ontario, and has a descent of 230 feet at the famous falls. On the Canadian side the Welland Canal continues the navigation interrupted by the falls and the rapids. From Lake Ontario the St. L. proper issues, flowing almost directly N.E., gradually expanding into a wide estuary below Quebec, receiving the Ottawa above Montreal, containing many small islands, and entering the gulf of the same name after a course of 700 miles. Some 30 miles above the entrance of the Ottawa, the St. L. becomes a purely Canadian river. Its chief tributaries besides the Ottawa, are from the N. the St. Maurice and the Saguenay, and from the S. the Sorel, which drains Champlain Lake. Beyond Montreal navigation is impeded by rapids and cataracts, but vessels can proceed by means of various canals and cuttings on the Canadian side. To the N. of Quebec the river is frozen over for about five months. The system of canals extends the navigation of the St. L. and the lakes to a distance of over 2200 miles.—**Gulf of St. L.**, an inlet of the Atlantic, is enclosed W. by New Brunswick, N. by the Canadian district of Labrador, and S. by Nova Scotia. It communicates with the Atlantic by a passage 120 miles wide between Newfoundland and Cape Breton, by the Strait of Belle Isle to the N. of Newfoundland, and by the Gut of Canso to the S. of Cape Breton. Within the gulf are Anticosti, Prince Edward's, St. Paul's, and many smaller islands, which are more or less dangerous to shipping on account of the dense fogs and shifting currents. The fisheries of the gulf are very productive.

Laws of England. See COMMON LAW; EQUITY; COLONIES, LAWS OF ENGLAND AFFECTING.

Laws of Probability. See PROBABILITY, LAWS OF.

Law Terms, in England are Hilary, 11th January to 31st January; Easter, 15th April to 8th May; Trinity, 22d May to 12th June; Michaelmas, 2d November to 25th November. These are the periods of sitting in full court. In Scotland the Court of Session sits from 15th October to 20th March, and from 12th May to 18th July. See under BILL, *Bill Chamber*.

Lawyer. English law, see BARRISTER, ATTORNEY; Scotch law, see ADVOCATE, WRITER TO THE SIGNET.

Layamon, or Law'man, author of a poem called the *Brut*, was a priest of Ernel, now known as Arley Regis or Lower Arley, on the W. bank of the Severn in Worcestershire. From a passage towards the close of the work, it has been inferred that he wrote in the first decade of the 13th c. Absolutely nothing, however, is known of his character or life. English scholars had long been aware of the existence of the poem, but had strangely neglected to examine it. It is merely mentioned by Warton and Tyrwhitt. George Ellis in his *Specimens of the Early English Poets* (1790) first introduced it to the notice of the public, and hazarded the prediction that it would never be printed. Subsequently, Mr. Guest in his *History of English Rhythms* gave a longer extract, with a literal version and careful annotations, and in 1847 the whole work was edited by Sir Frederick Madden in 3 vols., containing two texts separated apparently by an interval of fifty years, a translation, and a glossary. The subject matter of the *Brut* was not new. It had been handled twice, if not thrice before;—by Geoffrey of Monmouth in his *Historia Brittonum* (professedly a translation into Latin of an Armorican original, the *Brut-y-Brenhyned*), and again by the French poet Wace in his *Brut d'Angleterre*, but L. was the first who presented the legend or myth of a Trojan conquest

and colonisation of Britain in an English dress. While mainly founded on Wace, the native version has many additions drawn from other sources or invented by the author himself. Its literary merit is not inconsiderable, but its great value is linguistic. The *Brut* of L. is the most important specimen of the first stage of 'Transition English' that survives. In its pages we behold our language, as it were, in the very act of casting off its earliest grammatical forms, and assuming those that are familiar to the readers of Chaucer. Sir Frederick Madden notes as peculiarities of L. 'the use of *a* as an article; the change of the Anglo-Saxon terminations *a* and *an* into *e* and *en*, as well as the disregard of inflexions and genders; the masculine forms given to neuter nouns in the plural; the neglect of the feminine terminations of adjectives and pronouns, and confusion between the definite and indefinite declensions; the introduction of the preposition *to* before infinitives; . . . the constant occurrence of *en* for *on* in the plurals of verbs, and frequent elision of the final *e*.' Though chiefly translated from the work of a French trouvère, the language hardly shows a trace of the influence of a French vocabulary. In 56,800 lines (including both texts) there are not more than ninety French words, an unanswerable argument in favour of the opinion that the Norman Conquest did not immediately, nor for a long time, produce any serious change in the speech of the English people.

Layard, Austen Henry, an English traveller, statesman, and diplomatist, was born in Paris in 1817. He spent his youth in travel, and after mastering many European languages, acquired great proficiency in those of the East. In 1845-47 he conducted the celebrated excavations at Nimrud, a village on the Tigris, resulting in the discovery of the magnificent Assyrian remains now in the British Museum. Two years later he undertook a second journey of exploration to Asia Minor. He was *attaché* at the Porte in 1849, and Under Secretary for Foreign Affairs for a few weeks in 1852, visited the Crimea in 1854, and on his return took a leading part in the investigation of the conduct of the war. He was elected Lord Rector of Aberdeen University in 1856, visited India in 1858, and was Under Foreign Secretary for a second time, 1861-66, President of the Board of Works, 1868, and Ambassador at Madrid, 1869-77. Immediately before the outbreak of war between Russia and Turkey, April 1877, he was selected to succeed Sir Henry Elliot in the difficult post of Ambassador to the Porte. L. has published *Nineveh and its Remains* (1849), *The Monuments of Nineveh*, with Drawings (1849, 2d series, 1853), *Popular Account of Discoveries at Nineveh* (1851), *Discoveries in the Ruins of Nineveh and Babylon* (1853, abridgement, 1867), *Speeches on the Turkish Question* (1853-54), *Letters on Communication with India* (1859), *Speech on the Danish Question* (1864), &c.

Lay'ering, in gardening, a method of propagating plants from *layers*, or young shoots which have a tendency to send out roots. To facilitate this, an oblique slit is made just above the bud, and the shoot being covered slightly with mould, it is so left for some weeks. When the roots have struck, the layer is cut off from the parent stem and transplanted.

Laz'ulite, a mineral composed essentially of phosphate of alumina, with traces of magnesia, silica, and ferrous oxide. It has a fine azure colour, with a vitreous lustre. L. occurs in veins of clay slate at Salzburg, in Styria, N. Carolina, and other places.

Lazzaro'ni, a nickname still often applied to the red-capped and barelegged boatmen, fishermen, porters, &c., of Naples, and which arose during the Spanish viceroyship, when an epidemic, identified with the sickness of Lazarus in the parable, raged among the lower orders of that city. In the 17th and 18th centuries the L. really formed a distinct caste of idle, picturesque outcasts, caring for nothing beyond sunshine and maccaroni, and happy in their ignorance of higher wants. They had their recognised chief (*Capo Lazzaro*), and played an important part in many of the popular movements, notably in the rising of Masaniello (1647). No such days any longer exist, the modern Neapolitan populace being remarkable alike for industry and frugality.

Lead (symbol, Pb; atomic weight, 207) is a bluish-gray metal, characterised chiefly by its softness and fusibility. Though soft, it lacks tenacity, and can be drawn into thin wire only with difficulty. It melts at 325° C., and boils and volatilises at the

temperature of white heat. A freshly-cut surface speedily tarnishes, and, when melted, the metal is rapidly oxidised. At high temperatures, however, the oxide coating melts, and protects the molten metal from further oxidation. When slowly cooled, L. crystallises in octohedra. Its specific gravity is 11.4; and this high specific gravity, taken in conjunction with the softness and easy fusibility of the metal, peculiarly adapts L. for the manufacture of shot and bullets. The mineral Galena (q. v.) is the chief source of L.; but the native metal is itself occasionally met with in small quantity, while the carbonate of L., or *white lead ore*, forms an important ore in the United States and in Spain. Galena is essentially a sulphide, with the composition PbS , and is frequently associated with zinc sulphide (blende), copper pyrites, quartz, fluor spar, &c., and sometimes considerable quantities of the sulphides of silver, bismuth, and antimony are present. The metal is extracted from the ore by the following series of processes. The ore is purified mechanically as far as possible, and then spread over the hearth of a reverberatory furnace, being at the same time mixed with a small proportion of lime. Here it is roasted, with a full supply of air to render the necessary oxidation sure. Part of the sulphide is transformed into the sulphate; another portion loses sulphur, and absorbing oxygen becomes the oxide, sulphurous acid being at the same time evolved. When the roasting has sufficiently advanced, the temperature of the furnace is raised till the oxide and sulphate act each upon the unaltered sulphide which remains, furnishing the metal, and giving off sulphurous acid. The metal flows into the hollow of the furnace, and is covered by the fused slag, which consists chiefly of the silicates of lime and L.-oxide. By the addition of a little more lime and a small quantity of coal, more L. is separated out, the proportion of silicate of lime in the slag is increased, and the slag thereby rendered less fusible. The melted L. is then allowed to run out into an iron basin, from which it is ladled into pig-moulds. L. prepared in this way frequently contains a considerable quantity of silver, which, if present in the proportion of three ounces or more to the ton, is readily separated by Pattinson's *desilverising process* or by the zinc process (see SILVER). L. forms four compounds with oxygen; the sub-oxide (Pb_2O), the oxide (PbO), the red oxide (Pb_3O_4), and the peroxide (PbO_2). The first is believed to be the compound formed when the bright surface of newly cut L. tarnishes in the air. The oxide is produced when the metal is heated in the air; but its appearance varies with the manner in which the metal is heated. Thus, at a moderate temperature it takes the form of a yellow amorphous powder known in commerce as *massicot*; but if the heat be sufficient to fuse the oxide, the compound on cooling assumes a brown scaly appearance, and is then known as *litharge*. When heated to dull redness and cooled, litharge becomes yellow. The oxide of L. is a powerful base, and tends to form basic salts. It dissolves readily in hot solutions of potash and soda, and is deposited as pink crystals on cooling. The red oxide, otherwise known as *red L.* or *minium*, is prepared by heating massicot in the air to about $320^\circ C$. It is largely used in the manufacture of flint-glass and lucifer matches, and is employed as a pigment. The peroxide occurs naturally as *heavy L. ore*. It may be prepared by boiling finely powdered red L. in diluted nitric acid. It parts readily with oxygen to other substances, is insoluble in dilute acids, and has no basic properties. It is sometimes called plumbic acid, and is believed to form plumbates with potash and soda.

The most important of all L. salts which have the oxide as their base is the well known *white L.* It is a basic carbonate, being a combination of the carbonate ($PbCO_3$) and the hydrated oxide ($PbO \cdot H_2O$), and having a composition usually formulated as $PbO \cdot H_2O$, $2(PbCO_3)$, though generally other basic carbonates are present. It is always formed when the metal corrodes under the influence of air and water, and its production is encouraged by the presence of decaying vegetable matter evolving carbonic acid. It may be manufactured on a large scale in two ways, the more modern of which consists in boiling acetic acid with litharge, and thus forming the tribasic acetate of L., ($Pb(C_2H_3O_2)_3 \cdot 2PbO$), which is then subjected to a current of carbonic acid, and decomposed into the carbonate of L. and the neutral acetate. The acetate is now treated as the acetic acid was at first, with a similar production of the tribasic salt, and the carbonate again precipitated by carbonic acid. The carbonate carries down with it a variable quantity of the oxide, and the resulting compound is white L. The carbonic acid may be sup-

plied by combustion or fermentation, or even by exhalation from the earth. The older or Dutch method consists in subjecting metallic lead to the action of acetic acid (obtained from common vinegar) in the presence of dung, spent tan, or such organic matter in a state of fermentation, and thus forming the oxide, which unites with the acid to produce the tribasic acetate. This compound is decomposed by the carbonic acid evolved from the fermentation, and white lead is obtained as a coating on the metal. White L. is largely used as a white paint, but it has the great disadvantage of being extremely poisonous, and those who work much with it invariably bear symptoms of poisoning. The pure carbonate is found usually associated with galena. Sulphate of L. occurs in nature as *anglesite*, or L.-vitriol, quantities of which are imported from Australia for smelting purposes. Chromate of L. ($PbCrO_4$), or chrome yellow, is prepared by mixing dilute solutions of acetate, or sugar of lead and chromate of potash. The rare *red L. ore* of Siberia consists principally of this compound. The basic chromate ($2PbO \cdot CrO_3$), or orange chrome, is obtained by boiling the yellow chromate with lime. L. forms only one pure chloride ($PbCl_2$), corresponding to litharge in constitution. It is one of the few chlorides which are not readily soluble in water, and is precipitated from a solution of L. upon addition of hydrogen chloride (HCl), or other soluble chloride. The oxychloride ($PbCl_2 \cdot PbO$), formed by heating the chloride in air, is sometimes used as a substitute for white L. in painting. If litharge be heated with sal-ammoniac, *Turner's yellow*, another oxychloride, with composition $PbCl_2 \cdot 7PbO$, results. Iodide of L. (PbI_2) is prepared by treating a solution of the nitrate or acetate of L. with iodide of potassium. It appears as a bright yellow precipitate, which may be dissolved in boiling water, and reprecipitated in golden scales. There are at least three sulphides of L.: the subsulphide (Pb_2S) produced during the smelting of galena, the sulphide (PbS), and the persulphide. The composition of the last, which is obtained as a red precipitate from the action of a sulphur saturated alkaline sulphide upon a solution of L., has not been ascertained, but it is probably PbS_2 . The sulphide always results as a black precipitate when a solution of a L. salt is treated with sulphuretted hydrogen.

Medicinal Preparations and Properties of L.—The preparations of L. used in medicine are the acetate, the sub-acetate, the carbonate, the iodide, the nitrate, and the oxide. The *acetate* of L., or *sugar of L.*, is sedative and astringent, diminishing morbid mucous discharges and hemorrhages. It is administered in phthisis to check expectoration; in bronchitis to abate profuse secretion, and in chronic diarrhoea and dysentery. Externally, *acetate* of L. is applied as a sedative, desiccant, and astringent, and also for injection in gonorrhoea. The preparations of *acetate* of L. are the L. and opium pill, the ointment, the lotion, the suppository and pessary. The *subacetate* of L., or *liquor plumbi diacetatis*, is a dense, clear, colourless liquid, with alkaline reaction and sweet astringent taste. It is used externally as an astringent and sedative in sprains, bruises, &c., and is applied by means of cloths kept wet. The *carbonate* of L. is applied externally in powder, or as an ointment, for ulcers and inflamed and excoriated surfaces. *Nitrate* of L. is used in the preparation of the *iodide*, which is applied externally as an alterative and discutient in the form of ointment and emplastrum. *Oxide* of L., or *lithargyrum*, is used for external application only, to allay inflammation, and chiefly in the form of emplastrum.

Lead-Poisoning may be caused by the long-continued and injudicious use of L. as a medicine; by the absorption of the salts of L. contained in solution in drinking water, or in various foods and drinks, from adulteration; or from their having been prepared in vessels of L.; by absorption through the integuments of those who are in the habit of handling the soluble salts of L.; or through the lungs of those exposed to vapours containing L. The L., being absorbed, is diffused through the entire body, and accumulates in the spleen, the liver, the lungs, the kidneys, the heart, and the intestines, producing a peculiarly painful affection of the alimentary canal, called Colic (q. v.), or *colica pictorum* and *painter's colic*, and very frequently affecting the muscles of the extremities, causing palsy or *wrist-drop*; and, finally, ulceration of the gums and alveolar processes, accompanied by a peculiar blue line along the free margin of the gums, but absent where a tooth or stump is wanting. The excitability of the muscles is always much diminished in para-

lysis from L.-P., while it is normal in spontaneous paralysis, so that the nature of the affection may be determined by the stimulus of Faradisation. *Treatment*.—The object to be attained is the elimination of the poison by the excretions, and for this purpose purgatives are to be administered in the first instance, followed by repeated doses of camphor mixture, sulphate of magnesia, and tincture of hyoscyamus. The hot bath and repeated enemata of hot water are also serviceable. In L.-P. *palsy* the hot bath, containing from two to four ounces of the sulphuret of potassium, mixed with from twenty to thirty gallons of water, has been highly recommended, and the poison may be eliminated by the kidneys through the action of iodide of potassium. Galvanism, in the form of Faradisation, is of service as a local stimulant to the nerves; but severe shocks, especially at the commencement, should be avoided, and the treatment should not be commenced until the poison has been eliminated. Those exposed, from their occupation, to L.-P. should practise scrupulous cleanliness, and should never handle food with unwashed hands. The use of drinks acidulated with sulphuric or acetic acid is also a valuable preventive in such cases.

Leading a Witness. It is a rule of law that *leading* questions, that is, such as suggest to a witness the answers advantageous to the cause for which he appears, are not allowed, except in cross-examination.

Leaf-Cutter, Bee (*Megachile*), a genus of *Hymenopterous* insects or bees, having a broad head, and thick, stout body, the jaws being large and scissor-like. Another genus is *Osmia*, also known as mason, carpenter, or upholsterer bees. These insects cut the leaves and wood of trees for the purpose of obtaining materials for their nests; *Osmia* excavating nests in wood. *O. paretina* and *O. lencomelana* are well-known species, *Megachile centuncularis*, a familiar example of the first-named genus, cuts the leaves of roses, and joining the pieces thus obtained, forms cells for the reception of the eggs.

Leaf-Insect, a peculiar genus of *Orthopterous* insects, so named from the remarkable resemblance presented by the front wings to leaves. They belong to the family *Phasmida*, in which are also included the peculiar insects known as 'walking-sticks' or 'spectres,' from the peculiar twig-like form of their bodies. The leaf-insects form the genus *Phyllium*, the familiar species being the *P. siccifolium* of the E. Indies. The fore wings are exceedingly leaf-like, and are veined so as to mimic the exact appearance of leaves, while the legs are also broadened to assist, as it were, in the illusion. The males possess antennæ of 24 joints, the females of 9 joints.

Leaf-Rollers, the popular name of a family (*Tortricidæ*) of Moths or Lepidopterous insects, which obtain their name from the habit of their larvæ in rolling up leaves, to form protective cases for the chrysalides or pupæ. The codling-moth (*Carpocapsa pomonella*) lays its eggs on apple and pear trees, its larvæ burrowing into the core of the fruit. The strawberry leaf-roller (*Anchylopera fragaria*), an American species, folds the leaves of that plant, and a third species is the *Loxotenia gossypiana*, or cotton leaf-roller, which operates on the leaves of cotton plants.

League, a measure of length, supposed to have been introduced into England by the Normans, and corresponding to the modern French *lieue* (Ital. *lega*, Sp. *legua*, Low Lat. *leuca*). The sea L., that in common use, is equal to three nautical miles, about 3.45 statute miles. In France two distinct leagues are in use—the *lieue de poste*, equal to 2.42 English miles, and the *lieue moyenne*, about 2.76 English miles, or the 25th part of a degree.

League (Fr. *ligue*, Low Lat. *liga*, from Lat. *ligo*, 'I bind'), a political confederacy of states-princes, or individuals for the purposes of mutual aid or defence. Of such, the most memorable are the Ætolian and Achaian Leagues; the Hanseatic L. (q. v.); the L. of Cambrai (q. v.); the L. of Schmalkald (q. v.); the Holy L., or the L., founded 13th February 1576 at Péronne by Henri de Guise (q. v.); the L. of Würzburg, founded 10th July 1609 at Munich under the leadership of Maximilian I. of Bavaria, which played so important a part in the Thirty Years' War (q. v.); the Solemn L. and Covenant (q. v.); and the Anti-Corn Law L. (q. v.).

Leake, William Martin, Lieut.-Col., LL.D., born at London in January 1777, entered Woolwich Academy, and ob-

taining a commission in the artillery (1794), served in the W. Indies. In 1799 he received the post of gunnery instructor to the Turkish army at Constantinople, and a year after proceeded to Egypt, by way of Asia Minor and Syria, to co-operate against the French. He made a survey of Upper Egypt (1801), and of the coasts and fortresses of European Turkey (1804), and spent the next six years in two journeys in the Morea, four in Northern Greece, and in a lengthened residence in Albania. He returned to England in 1810, quitted the service in 1820, and died at Brighton, January 10, 1860. His works, which are still regarded as unrivalled, include *Researches in Greece* (1814); *Topography of Athens* (1821); *Journal of a Tour in Asia Minor* (1824); *Historical Outline of the Greek Revolution* (1826), warmly advocating Greek independence; *Travels in the Morea* (1830); *Travels in Northern Greece* (1835-41); and *Numismata Hellenica* (1854).

Leamington, a watering-place of England, in Warwickshire, on the Leam, a tributary of the Avon, 2 miles E. of Warwick, owes all its prosperity to its mineral springs—saline, sulphurous, and chalybeate—which, though noticed by Camden and Dugdale, and analysed in 1688, only began to attract patients towards the close of last century. The town is, therefore, almost wholly modern; among its principal buildings being the Royal Spa (erected at a cost of £25,000), the Victoria Baths, Warneford Hospital (1832), a Proprietary College (1847), a Hydropathic Establishment (1864), and a fine Roman Catholic church (1864). There are also a public library, museum, and philosophical institution, the arboretum, Jephson Gardens, &c. Brewing and the manufacture of kitchen-ranges are the only industries. The watering-season is from May to October, but during the winter months L. is also a great hunting centre. Pop. (1811) 543; (1871) 20,910.

Leap-Year contains 366 days, and occurs every four years, by which device the civil year is brought into practical agreement with the true astronomical year. To make the approximation still nearer the intercalary day (the 29th of February) is omitted in all the full centuries except those which are divisible by 400. Thus, 1892 and 1896 will be leap-years, but not 1900. The year 2000 will, however, be a L.-Y.

Lease, Contract of. (See, for English law, LANDLORD AND TENANT.) In Scotland, under a lease of land there is an implied reservation of mines and minerals and of the power of working them, on payment of surface damage. The landlord independently of stipulation has a right of Hypothec (q. v.) in security of his rent. See also RENT, MAILS AND DUTIES, EJECTION AND INTRUSION.

Lease and Release, in English law, was a form of conveyance of land. It was rendered obsolete by 4 Vict. c. 21, and is now quite superseded by 8 and 9 Vict. c. 106, which substitutes a simple deed of grant.

Least Squares, Method of, is a method of calculation, now universally employed in the reduction of astronomical observations, which aims at finding the most probable value of a quantity determined by a series of observations. According to the theory of probabilities, inaccuracies of observation are as likely to be in defect as in excess, and also more likely to be small than great. Hence, the probability of an error of magnitude x occurring must depend upon x^2 , and must be some function of x^2 , which diminishes very rapidly as x increases. This is the fundamental principle upon which the theory has been discussed by Legendre, Gauss, Laplace, Airy, and others. The most probable result of a number of observations is that which makes the sum of the squares of the errors the least possible, provided the observations are equally worthy of confidence. If the observations are not equally reliable, *weights* must be attributed to the several observations in proportion to their presumed exactness, and after that the value must be found which makes the sum of the squares of the errors an absolute minimum.

Leath'er (Old Eng. *lether*, perhaps from *hlidan*, 'to cover') consists of the skins or hides of animals, especially of the larger mammalia, prepared by certain chemical processes which preserve them from putrefactive decay, give them the power of resisting moisture, and communicate a soft uniform tenacity to the whole substance. This is effected by several distinct processes, all of which depend on combining the gelatinous tissue of the hides or skins with astringent or with mucilaginous substances.

A great variety of hides and skins are available for the purpose of making L., and owing to the almost limitless useful applications of the substance, the skins of certain animals are usually devoted to distinct uses. The hides of oxen are the most valuable of all for L.-making, as they form the principal material for making the soles and uppers of boots, and for machinery belting, besides having innumerable other applications. The hides of wild cattle are much more valuable than those of domestic oxen, and the trade in dry and salted hides from S. America is consequently of the greatest importance to tanners. Horse hides are tanned principally for saddlery purposes, as also are pig skins and seal skins, but the latter are besides much used for boot uppers. Calf, sheep, lamb, goat, and kid skins are tanned or tawed for glove-making, bookbinding, morocco L., wash L., and many other purposes. Hippopotamus, elephant, and walrus hides, which are of enormous thickness, are tanned for use on polishing wheels for cutlery. The furs and skins of many animals are tanned or dressed with the hair on; but for ordinary L.-making the skin undergoes a preliminary operation called

Liming or Unhairing.—Hides as received at the tannery are first washed or thoroughly soaked in water to free them from blood, salt, and other extraneous substances adhering to or impregnating them. In this process they are rendered uniformly soft and supple, and thereafter the flesh side is dressed with a knife for clearing off all fleshy matter. The ears or other shreds are then cut off and handed over to the glue manufacturer, after which the hides are steeped for three or four weeks in pits among limewater. The action of the lime loosens the hairs, and at the same time it combines with the fatty matter of the skin, forming an insoluble lime soap which is subsequently removed. Instead of liming, a process called sweating is sometimes used for loosening the hair. It consists of piling the hides on each other in a warm place and leaving them till an ammoniacal odour proceeding from the pile betrays incipient putrefaction. The ammonia so generated acts in the same manner as the strong limewater. The hair is removed by stretching the hides on a sloping semi-cylindrical table—the 'beam' or 'tree'—and scraping them with a blunt dressing knife. The next operation consists in again macerating and washing the hides in water, and in dressing or shaving so as to bring the whole hide as nearly as possible to a uniform thickness. The operation of 'raising' follows, its object being to open the pores of the material and so enable it more quickly to imbibe and absorb the tanning solution. This is effected by immersing the hides in water acidulated with about one-thousandth part of sulphuric acid, and this bath at the same time frees the hides from the insoluble lime soap still adhering to them from the liming process. The hides are in this condition ready to undergo any of the ordinary processes for converting them into L.

Tanning.—The materials employed in this process will be found enumerated under TANNING SUBSTANCES (see also BARKS, TANNING). The operation consists in impregnating the fibres of hides with the tannin contained in any of the substances named under these heads, and the ordinary process is very slow in operation. It consists in first treating the hides with weak infusion of tan bark in large tanks or pits, moving them frequently from one tank to another, whilst constantly increasing the strength of the tan liquor in which they are immersed. After about six weeks' treatment in the *handlers*, as these tanks are called, the hides are transferred to tanks or pits called *layers*, in which they are spread out, a layer of coarsely ground bark being strewed between the separate hides. The pit is filled up with water to cover the pile of skins and so left for about three months, after which the skins are moved to another pit and similarly piled up, this time placing at the bottom the hides which were at the top in the previous layer. According to the thickness of the hides treated, they may require a third period in the layer pits. When the hides have a uniform brown colour throughout they are thoroughly tanned and ready for hanging in the drying loft, where the drying may be hastened by artificial heat. About 300 lbs. of English oak bark are required to tan 100 lbs. of hide, and the produce is 150 lbs. of L. Several processes for hastening the tanning of L. have been introduced, most of them being based on the pressure of tanning solutions into or through the hides operated upon. Others seek to facilitate the tanning by moving the hides alternately out of and into the tanning solutions. Not any one of these devices, however, has been completely successful.

Morocco L. is prepared from goat skins by a modified process of tanning called *sumacking*; the whole tanning operation in this case being finished in two or three days. The skins are tanned by being sewed up as bags and filled with water and pulverised sumach. Calf and sheep skins are similarly treated in England for making imitation morocco. The finished L. is variously dyed by the superficial application of strong solutions of dye-stuffs.

Currying is the process of dressing or finishing tanned L. For sole L., which requires to be firm and compact in texture, the only currying process consists in beating with hammers and passing the material between heavy rollers. Upper L. and other kinds which must be rendered soft and pliant, on the other hand, require elaborate currying processes, which vary according to the finish. The hide is first soaked with water and shaved to bring it to a uniform thickness throughout. It is again wetted and stretched out on a flat stone, after which it is *dubbed* or thoroughly impregnated with a mixture of cod oil and tallow. When the skin has imbibed the oleaginous mixture and become dry, it is *grained*, by rubbing on both sides with a grooved boxwood ball, and the flesh side is then scraped or whitened. The black colour is given to the grain side of upper L. by washing it over with a solution of tan bark upon which a solution of copperas is sponged. The L. is finally rubbed over with a paste of oil, tallow, glue, and lamp-black, and polished with a ball of glass, which completes the currying.

Tawing consists essentially in treating skins with a salt of alumina, oil, and farinaceous matter being sometimes used in addition. It is by this process that glove L. and wash L. are prepared; and by a modification known as *Hungarian tawing* heavy hides are prepared for saddlery and machinery purposes, in which great strength is essential. Kid L., used for gloves and ladies boot uppers, &c., is prepared (1) from the skins of young goats (real kid being used only for gloves); (2) from lamb skins; and (3) from calf skins (calf kid). These skins are treated with a paste composed of flour, yolk of eggs, alum, salt, and water. After thorough kneading and impregnating with this compound, the skins are packed up in bundles for some time. They are then rapidly dried, soaked in water, placed singly between cloths, and worked to render them soft and uniformly supple. Next they are shaved, dried, and finished, by dressing with white of egg or gum, and dyed by brushing the dye-stuff over the surface of the L.

Shamoying, so called from having been originally applied to chamois skins, is a process of preparing a kind of very soft pliant L. by treating the skin with oil alone. Most chamois or shamoy L. is now made from the inner or flesh side of split sheep skin, the grain side being saved and tanned for hat linings, &c. The process consists in alternately saturating with oil and hanging in the air the skins operated on. The oil becomes oxidised by exposure, and the completion of the process is ascertained by the yellow colour which the L. assumes. After washing in a solution of potash to remove the uncombined oil, the L. is ready for use. Buff and cordovan L., as well as the ordinary shamoy or wash L., are prepared by this process.

Leather, Vegetable. Several imitations of leather are now in extensive use for upholstery purposes. They all consist of a stout basis of linen cloth upon which a composition containing caoutchouc and other substances are spread. The composition used by different manufacturers varies much in constitution, each keeping his method as much as possible a trade secret. The cloth is grained in imitation of leather of different kinds, and as the composition adheres with remarkable tenacity, it forms a useful and cheap substitute for real leather in the numerous applications for which it is suitable.

Leatherwood is an American shrub with extremely tough branches, whence the name is taken. In botanical nomenclature it is *Dryas palustris*, belonging to the natural order *Thymelacææ*; the yellow flowers appear before the entire, ovate, alternate, leaves are developed. The bark has a sweetish taste, and, when chewed, excites a burning sensation in the fauces. The fruit is said to be poisonous. In geographical range it extends from Canada to Georgia.

Leave and Licence, a phrase of English law denoting that an act complained of was done by permission.

Leaven (Fr. *levain*, from *lever*, 'to raise'), is dough kept till putrefaction has set in, in which state it is employed to induce

fermentation in the manufacture of Bread (q. v.). L. was the ferment of the ancients, and it is still used, in place of yeast, by Parisian bakers.

Leavenworth, the largest city of Kansas, U.S., on the W. bank of the Missouri River, 39 miles N.W. of Kansas City. It is a great railway centre, and the Pacific line here crosses the Missouri by a magnificent iron bridge, constructed at a cost of \$1,000,000. The city has twenty-seven churches, many good schools, and four daily and six weekly newspapers. Near it are Fort L., with a military prison and the state penitentiary. There are important manufactures of carpets, furniture, stoves, engines, mining machinery, and iron bridges. The first house was built in 1854. Pop. (1871) 17,873.

Leaves. The ordinary or perfect leaf of a plant consists of a flat blade or lamina, usually green, and more or less horizontal, attached to the stems at points termed *nodes*, by a stalk called a *foot-stalk* or *petiole*. In aerial plants they are composed of vascular tissue in the form of *veins*, *ribs*, or *nerves*, of cellular tissue filling up the interstices between the veins, and of an epidermal covering or cuticle. They perform a most important part in the life of plants, and in conjunction with the roots assimilate the different substances absorbed in the sap. The microscope shows both sides of the leaf, but more especially the under, to have pores, in some instances so numerous that a square inch contains many thousands; these pores are round or oblong, and are called *stomata*, being the inhalers and exhalers of the atmosphere, and equivalent in their action to the breathing pores and lungs of animals. Two great divisions are recognised amongst L., namely, those with *reticulated* or *netted veins*, representative of dicotyledonous plants, and those with *parallel veins*, as commonly seen in monocotyledons, in which the vessels run in a straight or curved manner from base to apex, or from midrib to the margin of the leaf, and in which, if there is a union, it is effected by transverse veins which do not form an angular network. In the lowest orders of plants there is no true vascular system, and the same is usually the case in L. developed under water. The multiform shape, consistence, and position of L. have necessitated for technical purposes the creation of a very large series of terms, some of the principal of which it is necessary to know to understand the simplest botanical description of a plant. L. are *sessile* when the blade rests on the stem without the intervention of a petiole; *amplexicaul* when the sessile base clasps the stem horizontally; *perfoliate* when it not only clasps the stem, but closes round it on the opposite side; *sheathing* when the base of the blade or of the more or less expanded petiole forms a vertical sheath round the stem for some distance above the nodes. They are termed *radical* when so inserted as to appear to arise from the root. L. are *simple* and *entire* when the blade consists of a single piece, with the margin nowhere indented, *simple* being used in opposition to *compound*, and *entire* in opposition to *dentate*, *lobed*, or *divided*; *dentate* is applied when the margin is only cut a little way in, into what have been compared to teeth; *lobed*, or *cleft*, when more deeply indented or cut, but so that the incisures do not reach the midrib or petiole; *divided* or *dissected* when the incisions reach the midrib or petiole. A true *compound* leaf differs from the *divided* or *dissected* leaf in that the leaflets of the former separate from the petiole, as the whole leaf does from the stem, without tearing; whilst in the latter, if the segments be pulled asunder a torn edge is the result. Leaflets or segments are spoken of as *pinnate* when there are several succeeding each other on each side of the midrib or petiole, compared to the branches of a feather; *palmate*, or *digitate*, when several diverge from one point, compared to the fingers of the hand. The following are a few of the ordinary terms to define the outline of a leaf:—*Linear*, when long and narrow; *lanceolate*, about three times or more as long as broad, broadest below the middle and tapering towards the summit; *ovate*, shaped like the longitudinal section of an ordinary egg; *orbicular*, *oval*, *oblong*, *elliptical*, *rhomboidal*, when compared to corresponding mathematical figures. A leaf is said to be *glabrous* when without hairs of any kind; *scabrous*, when rough to the touch; *hispid*, when bearing stiff hairs; *hirsute*, when the hairs are dense and not so stiff; and the terms *viscous*, *filose*, *tomentose*, *downy*, in like manner explain themselves. The terms *opposite*, *whorled*, *alternate*, *scattered*, as applied to the position of the L. on stem or branch also naturally suggest their botanical meaning. For cotyledonary L. see COTYLEDON.

Lebanon, **Mount**, or **Djebel Libnan** (Heb. *laban*, 'white,' referring to the white limestone cliffs), the western and higher of two mountainous ranges of Syria, which enclose a long, narrow valley, anciently known as Coele Syria (q. v.). It runs for about 90 miles in a S.W. direction parallel to the coast, covers an area of nearly 3500 sq. miles, and has an average elevation of 8000 feet, its loftiest peaks being Dahr el Khadib (10,424 feet), Djebel Makmel (10,050 feet), and Djebel Sannin (8553 feet), while a pass on the road from Baalbek to Tripoli has a height of 7635 feet. The formation consists chiefly of hard Jurassic limestone, surmounted here and there by a grey chalk deposit, interspersed with basalt, schist, gneiss, and other metamorphic rocks. Several streams of classic fame rise in L.—the Leontes (*Nahr Lûdny*), Orontes (q. v.), Adonis (*Nahr Ibrahim*), &c. The line of cultivation extends to a height of 6000 feet, and no land goes unclaimed that would repay tillage. The base of the range is planted with mulberry trees, and the production of silk has been greatly extended of late years. In 1874 there were fifty-six silk-spinning factories in the district, employing upwards of 3500 persons, and of an aggregate value of £25,000. Olive-trees, tobacco, sugar-canes, and every description of grain and fruit thrive on the upper slopes, and the summits are crowned by pastures. There is but little forest-land, and the once famous Cedar of L. (q. v.) has almost disappeared. Though there are rich iron-deposits at Duma, Murjaba, &c., want of oak fuel is a bar to their successful working, the coal raised at Kornail (4000 tons in 1837) having proved wholly inadequate for smelting purposes. The district of L. is the most populous of Syria. In 1874 its pop. numbered 220,504, of whom 135,736 were Maronites (q. v.), and 25,088 Druses (q. v.), whilst 27,980 belonged to the Greek Church. The eastern range, **Anti-Lebanon**, or **Djebel esh-Sharki**, has an average height of 5000 feet, and culminates to the S. in Mount Hermon (*Djebel esh-Sheikh*, 9326 feet) on the southern slope of which rises the Jordan (q. v.).

Lebanon, a town of Pennsylvania, U.S., on the Swatara Creek and Union Canal, 5 miles N. of the great Cornwall iron hills, and 25 E. of Harrisburg by rail. It has fifteen churches, one daily and seven (two German) weekly newspapers, eight large furnaces, several machine-shops and factories, and the neighbourhood is rich in anthracite coal, copper, and marble. Pop. (1870) 6727.

Lebedjan', a town of Russia, government of Tambov, on the Don, has two great annual fairs. Pop. 6010.

Lebedjin', a town of Russia, government of Kharkov, on the Ol-hana, 90 miles N.W. of Kharkov. It has six churches, and carries on manufactures of girdles, sashes, &c. Pop. (1872) 11,897.

Leblanc, **Nicolas**, a French chemist, was born at Issoudun (Indre) in 1753. He studied medicine, and in 1780 became surgeon to the house of the Duc d'Orleans, but occupied himself chiefly with chemical researches. In 1786 the Academy of Sciences offered a premium for the invention of a new process for the manufacture of carbonate of soda. L. turned his attention to the subject, and in 1789 discovered the process now in use, by which the carbonate is prepared from common salt (see SODA). The importance of this discovery in the development of chemistry is incalculable, but L. himself reaped no benefit from his labours. He was forced to explain his method to the Government, who published it; and after a long series of unsuccessful endeavours to obtain an indemnity, L. died by his own hand, January 16, 1806.

Lebrija, a town of Spain, province of Seville, on a branch of the Guadalquivir, 40 miles N.N.E. of Cadiz by rail. It has a large Arabesque church, and its industries are chiefly weaving and brickmaking. There is a considerable trade in the fine oil and fruits of the vicinity. Pop. 10,338.

Lebrun, **Charles**, a French painter, was born at Paris, 22d March 1619, took lessons in design in his tenth year from Perrier and Vouet, and attracted the attention and patronage of the Chancellor of France by his 'Louis XIII. à cheval,' after three years' apprenticeship to his art. His allegoric picture in honour of Cardinal Richelieu resulted in an order for three more. In 1642 he went to Rome, and upon his return, in 1648, his 'Crucifement de Saint André,' 'Martyre de Saint Etienne,'

'Moïse frappant le Rocher,' won him the highest reputation. Fouquet gave him orders, Mazarin presented him to Louis XIV., Colbert appointed him *premier peintre*, and placed him at the head of the Gobelins manufactory. He died 12th February 1690. L.'s great decorative paintings at Versailles and the Louvre show his power of mingling the picturesque and dramatic details of fable with history.

Leocœ, the capital of a province of the same name, in the heel of the Italian boot, 8 miles E. of the Adriatic coast, and 25 S. by E. of Brindisi by rail. It is the see of a bishop, and has many beautiful buildings, among which are a cathedral and castle. A triumphal arch at the gate of St. Biagio commemorates the entrance of Charles V. There is a public library of 10,000 vols. The trade in the finest table-oil and cotton is important, and the government factory, which has been recently provided with the best modern machinery, produces tobacco equal to the finest of Seville. Pop. (1874) 23,247. The *Lupia* of the ancient Salentines, it is first called *Lycium* or *Lycia* (of which L. is obviously a corruption), in documents of the middle ages, when it was converted into a Norman countship. Count Tancred of L. became King of Sicily in 1189.

Lecc'o, an old town of N. Italy, in the province of Como, on the Adda, near where it leaves the S.E. arm of Lake Como, 20 miles N.W. of Bergamo by rail. It has thriving iron and silk industries, and was for some time the residence of Manzoni. Pop. (1874) 7040.

Lecky, William Edward Hartpole, was born near Dublin, March 26, 1838, educated at Trinity College, and graduated B.A. (1859). In 1861 appeared his *Leaders of Public Opinions in Ireland* (new ed. 1871-72). Four years later his *History of the Rise and Influence of the Spirit of Rationalism in Europe* (2 vols. 5th. ed. 1872), gained for him the respectful attention of the philosophical world. In 1869 the *History of European Morals from Augustus to Charlemagne* established his reputation for brilliant and scholarly generalisation. His three works have been translated into German by Dr. H. Jolowicz.

Lectern (Eccles. Lat. *lectorium*) is a reading-desk or stand, on which lies the Bible from which the lessons in the church-service are read. See AMBO.

Lectiary (late Lat. *lectionarium*) was a Calendar of Lessons (q. v.), by which the reading of Scripture was methodised. The passages appropriate to the times and seasons of festivals were chosen, and for the rest were either read in order as they come in the Bible, or were arbitrarily fixed by the bishops. The first L., according to some, was the Canon Paschalis of Hippolytus (q. v.). The Comes or L. of Jerome is reckoned by some to be a forgery by a later writer. The oldest extant L. is the Gallican L., which perhaps dates from the end of the 6th c.

Lectures, Copyright in. See COPYRIGHT.

Leocythidæ, a tribe of tropical dicotyledonous plants—often gigantic trees, natives of the western hemisphere, belonging to the natural order *Myrtaceæ*, and distinguished by their large almond-like seeds, alternate undotted leaves, and arrangement of the stamens. The fruit is a wooded multilocular capsule, often opening by a lid, and sufficiently large to be utilised as cups and bowls. See BRAZIL NUT, COMMON BALL TREE, and MONKEY POTS.

Le'da, daughter of Thestius, and wife of Tyndareus, king of Sparta, was, as the old legend runs, visited by Jupiter in the form of a swan, and bore by him two eggs, from one of which came Helen, and from the other Castor and Pollux. The visit of the swan to L. was a frequent subject of ancient art. After her death, L. was deified as Nemesis.

Led'bury, a market-town of England, in Herefordshire, on the Hereford and Gloucester Canal, 15 miles E.S.E. of Hereford by rail. It has malt-kilns and tanneries, and a trade in corn, hops, cider, &c. Pop. (1870) 2967.

Led'ru-Rollin, Alexandre Auguste, a French politician, born at Paris, 2d February 1808, educated for the bar, became advocate in 1830, obtained popularity by defending

many journals prosecuted by Government, in 1837 took the direction of the *Journal du Palais*, in 1839 became a republican member of Assembly, incurred prosecution and fine for expressing seditious opinions, and thereafter developed his political creed in *La Réforme*, a violent Radical journal. At the crisis of 1848 he was elected Minister of Interior to the Provisional Government; and it was then, while marching in procession to the Hotel de Ville, he cried to Lamartine, 'We are mounting Calvary.' The tide of revolution soon swept him from office, and in 1849 he fled to England, where he busied himself in writing and laying plans with Kossuth, Mazzini, and others for a 'European democracy.' In this country he wrote his only considerable works, *De la Décadence de l'Angleterre* and *La Loi Anglaise*. After an absence of twenty years he returned to Paris, was re-elected to the Assembly, and delivered one speech; but his eloquence was gone, and with it his popularity. He died at Fontenay-aux-Roses, January 1, 1875. A work of his on Atheism is still in MS.

Le'dum, a genus of small shrubs of the heath family (*Ericaceæ*), natives of the colder parts of the northern hemisphere. The leaves are of hard texture, usually bearing a rust-coloured pubescence on their lower surface. One species, the *L. palustre* of botanists, has received the name of Labrador tea, on account of its use as a makeshift for tea. Sir John Franklin reported it to yield a refreshing beverage.

Lee, or **Lee'ward** (Old Eng. *lido*, 'shelter'), a sea term for the quarter defended from the wind, towards which it blows, as opposed to that from which it blows—the *windward* or *weather* side.

Lee, a Virginian family, prolific of distinguished men, was founded by **Richard L.**, who settled in Virginia in the reign of Charles I. His grandson **Thomas** (died 1750) was president of the Council of Virginia, but is better known as the father of six sons, who all were celebrated leaders of the American Revolution—(1) **Philip Ludwell**, a member of the Council of State; (2) **Thomas Ludwell**, a judge of the Supreme Court; (3) **Francis Lightfoot**, a signatory to the Declaration of Independence; (4) **Richard Henry**, orator and statesman, born at Stratford in Virginia, January 20, 1732, and educated at Wakefield, England. He prepared the address of the colonists to the king, and the memorial to the House of Lords, was a member of the first American Congress in 1774, was author of the masterly second address of Congress to the people of Great Britain, and in a grand outburst of eloquence proposed in Congress, on 7th June 1776, the Declaration of Independence. He was President of Congress in 1784. In 1792 he retired from active life. He died June 19, 1794. His *Life and Correspondence* was published in 2 vols. by his great-grandson, R. H. L., in 1825. (5) **William**, born about 1737, Minister at the Hague, Vienna, and Berlin, died June 27, 1795. (6) **Arthur**, diplomatist and statesman, born December 20, 1740, and educated at Eton and Edinburgh. He obtained the degree of M.D. in 1765, but subsequently studied law. While in England he made the friendship of Johnson and Burke, and vindicated colonial rights by letters in the public journals. His *Appeal to the People of Great Britain* (1774), was at one time ascribed to Lord Chatham. From 1775 to 1780 he visited the capitals of Western Europe in the interest of the struggling republic. He sat in Congress 1782-85, and was a member of the Treasury Board, 1785-89. He died 12th December 1792. His *Life and Correspondence* (3 vols. Bost. 1829), was published by Robert H. Lee.—**Henry L.**, a daring soldier, son of a first cousin of the six famous brothers, was born January 29, 1756, at Stratford, Virginia. He obtained a captaincy in 1776, and ere long the command of a body of cavalry—the renowned 'L.'s legion.' He fought at Guilford and Eutaw, and reduced Forts Watson, Motte, Granby, and Galphin. (See the *Campaign in 1781 in the Carolinas*, by his son, Henry L., 1824.) In 1786 he was elected to Congress. He quelled the Whisky Insurrection in 1794. His *Memoirs of the War in the Southern Department of the United States*, appeared in 1809. He died at Cumberland Island, Georgia, March 25, 1816. His brother **Charles** was Attorney-General of the United States, 1795-1801.—**Robert Edward L.**, the ablest general in the Confederate army, son of General H. L., was born at Stratford, Virginia, 19th January 1807. He graduated at West Point in 1829, and be-

came captain in 1838. He served as chief-engineer in the Mexican War, 1846-48, when he was brevetted colonel, was superintendent at West Point 1852-55, and resigned his command in the United States army in April 1861 to head the Confederate forces in Virginia. In May 1862 he received the command at Richmond, and after seven days' hard fighting completely routed the Federal army. He invaded Maryland in August 1862, but received a check at Antietam on 17th September. He defeated Burnside at Fredericksburg in December 1862, and Hooker at Chancellorsville in May 1863; but on entering Maryland in July was repulsed by Meade at Gettysburg. His campaigns in 1864-65 were heroic struggles against the overwhelming forces of General Grant. With splendid strategy and indomitable bravery he disputed every inch of ground, but step by step his little army was beaten back, and after terrible slaughter Richmond fell on April 2, 1865. L.'s surrender at Appomattox a week later was the virtual conclusion of the civil war. He became President of Washington College, Lexington, in October 1865. In 1866 he edited his father's *Memoirs*. He died October 12, 1870. See *Life of R. E. Lee*, by J. E. Cooke (New York, 1872); *Le Général L.*, by E. L. Childe (Par. 1874); *Personal Reminiscences of General R. E. L.*, by J. W. Jones (New York, 1874); *Un Vaincu, Souvenirs du Général L.*, by Mme. Boissonnas (Par. 1875), and *Life and Campaigns of General L.*, by his nephew E. L. Childe (Lond. 1875).

Lee, Frederick Richard, R.A., landscape painter, was born at Barnstable, June 1798. He served as a cornet at Waterloo. Some landscapes exhibited by him at the British Institution first attracted attention. He exhibited at the Royal Academy in 1824, becoming an associate in 1834, and a member in 1838. Among his most successful pictures are 'The Silver Pool,' 'Fisherman's Haunt,' 'The Bay of Biscay,' 'Harvest Field,' 'A Village Green,' and 'Plymouth Breakwater.'

Lee, Nathaniel, an English dramatist, was born in 1650. Upon leaving Cambridge he took to the stage, but proved a bad actor, though a good reader. At the age of twenty-five he produced his first play, *Nero*. The best known of his productions are *The Rival Queens*, or *Alexander the Great* (1677); *Theodotus*, or *The Force of Love* (1680); *The Princess of Cleve* (1689); and *The Massacre of Paris* (1690). L. also joined Dryden in writing *Edipus* (1679) and *The Duke of Guise* (1685). In these are to be found passages marked by wonderful delicacy of fancy and intense dramatic passion, but the style frequently degenerates into mere bombast. L., who was subject to fits of insanity and dissipation, died in 1692.

Lee, Robert, D.D., a leader of the liberal section of the Church of Scotland, was born at Tweedmouth, in Northumberland, 11th November 1804. He studied at St. Andrew's University, was ordained in 1832, was called to Arbroath in 1833, to Campsie in 1836, and, on the Disruption (1843) was made minister of Grey Friars', Edinburgh. In 1846 he became Regius Professor of Biblical Criticism in the University of Edinburgh, and the valuable results of his study of the Bible text appeared in *The Holy Bible, with about 60,000 Marginal References and Various Readings* (1854). His *Prayers for Public Worship* appeared in 1857, and for their use in Grey Friars' he was arraigned before the Presbytery of Edinburgh (1859), and later before the General Assembly, when he won a favourable verdict by a singularly eloquent defence. His *Reform of the Church of Scotland in Worship, Government, and Doctrine* (1860) discussed the liturgy, postures in worship, instrumental music, festivals and feasts, &c., with the view of bringing the Church into greater harmony with the age, and the opinions it contained were reported favourably on by the General Assembly in 1864. The first organ used in the service of the national church was introduced into Grey Friars' in April 1865. The General Assembly subsequently reversed the decision of 1864, and Dr. L. was preparing a case for the civil courts when he died at Torquay 12th March 1868. See *Life of Dr. R. L.* by the Rev. R. H. Story (2 vols. 1870).

Lee, Samuel, D.D., an eminent linguist, was born at Longnor in Shropshire, May 14, 1783, educated at the village school, and apprenticed to a carpenter at Shrewsbury (1795). While working at his craft he taught himself Latin, Greek, Hebrew, Chaldee, Syriac, and Samaritan, until in 1810, having

married and turned schoolmaster, he found a patron in Archdeacon Corbett, through whom he formed a connection with the Church Missionary Society, and was enabled to proceed to Queen's College, Cambridge (1813). He graduated in 1817, took orders (1818), and having by this time mastered eighteen languages, became successively Professor of Arabic (1819), chaplain of Cambridge Gaoi (1823), rector of Bilton in Yorkshire (1825), Regius Professor of Hebrew (1834), and rector of Barley in Hertfordshire, where he died, December 16, 1852. Of his works, which include a host of translations from and into English, the most important are his *Hebrew Grammar* (1827; 6th ed. 1844); *Hebrew, Chaldaic, and English Lexicon* (1844); *On the Study of the Holy Scriptures* (1830); and *Inquiry into the Nature of Prophecy* (1849).

Leech, John, artist and caricaturist, was born in London in 1817, and educated at the Charterhouse. In 1841 he joined the *Punch* staff, and for more than twenty years his initials appeared in almost every number. In broad, easy, spirited sketches of hunting, sporting, and fireside subjects, he satirised social failings and foibles with genial humour. Five volumes of his sketches, *Pictures of Life and Character*, have been published (1854-69), and two volumes of his *Pencilings from Punch* (chiefly political), 1864-65. He illustrated Dickens's Christmas Stories, Albert Smith's novels, Blaine's *Encyclopædia of Rural Sports*, and many other works. He died October 29, 1864. See Brown's *Memoirs of J. L.* (1866).

Leech, the name applied to various genera of *Annelida* or worms, belonging to the order *Hirudinea* (= *Suctorioria* or *Discophora*). The animals included in this section are distinguished by aquatic habits, and by a sucking-disc at one or both extremities. The hinder sucker is invariably present, but in cases where the anterior sucker is absent, its functions are discharged by the mouth. The skin is smooth, and bristles or setæ are for the most part wanting. The integument is, however, highly muscular, and consists of at least three layers of circular, radiating, and longitudinal fibres. A body-cavity (*perivisceral space*) is wanting in these worms. The nervous system, as in all *Annelosa*, lies ventrally or on the floor of the body. It consists in the common L. of twenty-three ganglia, and pigment-spots or rudimentary eyes may be found to exist on the head-segments. The mouth opens below the front sucker. The pharynx is muscular, and provided with two or three horny teeth having serrated or saw-like edges. The stomach is very large, and in the common L. has nine lateral dilatations or coeca. The intestine is short, the anus opening above the hinder sucker. There is no very distinct circulatory system, but the *lateral or segmental organs* (or excretory organs) consist of seventeen tubes, with glandular walls arranged along each side of the body. In these forms, male and female generative organs exist in each animal, but the contact of two such hermaphrodite individuals is necessary for the fertilisation of the eggs. The eggs are enclosed in *cocoons* or *capsules*. The common leeches belong to the family *Hirudinidae*, in which the individuals are hermaphrodite. The body is narrowed in front and behind. Of the medicinal leeches two well-marked species exist—the *Hirudo medicinalis*, the 'German L.', possessing a body of dark-green colour, spotted below with black, and *H. officinalis*, the 'Hungarian L.', of olive-green colour, and without spots. Each of the three jaws or teeth in the latter species has from seventy to ninety tooth-like serrations on its surface; each tooth when moved by appropriate muscles acting as a finely-toothed saw in dividing the skin. The bodies of the leeches number from 80 to 100 rings or segments. The cocoons containing the eggs are laid in summer and in winter, and in from four to six weeks the young are developed. The young take three years to become sexually mature, and leeches may live from eighteen to twenty years. The horse-leeches form the genus *Aulacostomum*, and possess cylindrical bodies. The hinder lip of the sucker is wanting, and the body possesses few or no lateral dilatations. The genus *Hamopsis* also includes species familiarly named horse-leeches, and which inhabit freshwater pools. In their young state, species of *Hamopsis* may be swallowed by cattle in drinking water, and may attach themselves to the throat or enter the windpipe of these animals. Many other genera are included in the L. order. The land leeches (*Hamadipsa Ceylonica*) are peculiar forms occurring in Ceylon, India, and other parts of Asia. They infest swampy grounds, and affix them-

selves to the legs of travellers and of horses, causing much irritation by their numerous bites. Commercially regarded, the L. is a subject of great interest. Vast quantities are imported from the Continent—Germany, Hungary, and Russia contributing the chief supplies. Hamburg is the chief exporting port; leeches being sent thither from the lakes of Pomerania and Brandenburg, and from Posen in Prussia. Leeches are captured by men who wade into their native waters and allow the annelids to fasten themselves to their limbs, the leeches being quickly detached by an exercise of dexterity. They are exported commonly in tubs, packed amongst damp mud, each tub containing about 2000 leeches. Pereira mentions that four dealers in leeches some years ago imported 600,000 monthly into London alone. The annual consumpt of Paris is at least 3,000,000 leeches.

Leeching, or the application of Leeches (q. v.), is in many cases preferable to venesection or cupping for the abstraction of blood. General blood-letting by venesection is now practised only in rare cases, and local depletion by means of Cupping (q. v.) is, in many cases, inadmissible. The part to which the leeches are to be applied should be thoroughly cleansed, and may be moistened with milk or blood, and the leeches should be dried by rubbing them in a clean linen cloth. They may be caused to adhere to a particular spot by placing them in an open pill-box, a wine-glass, or a narrow tube, called a leech-glass. A single leech will abstract from a drachm and a half to three or four drachms, and it may be caused to disgorge the blood by the application of salt to its body. Profuse hæmorrhage sometimes follows L., and this may be arrested by the application of a bit of cobweb, some fluff of lint, or by malico leaf, nitrate of silver point, solution of perchloride of iron, or saturated solution of alum.

Leeds, the largest town in Yorkshire, and the greatest centre of the woollen cloth industry in England, is situated in the valley of the Aire, $4\frac{1}{2}$ miles N.E. of Manchester, and $186\frac{1}{2}$ N.N.E. of London by rail. The city proper lies on the N. bank of the Aire, and is connected by two stone and four iron bridges with its suburbs of Hunslet and Holbeck. Of late years it has been greatly improved, and the western part in particular has many fine streets. The most notable buildings are the large cruciform church of St. Peter, rebuilt in 1838, at a cost of £29,770, with a tower 130 feet high, a peal of thirteen bells, stained windows, and several statues; the 'Laudian' church of St. John, consecrated in 1634, containing the tomb of John Harrison, the founder; the town-hall (1858, cost upwards of £140,000) covering an area of 5000 sq. yards, and having many fine statues, and a large, ornate hall, in which there is one of the grandest organs in Europe; a corn exchange, in form of a Roman theatre, built in 1863; the castellated jail at Armley; the Royal Infirmary, one of the principal works of Sir G. G. Scott, erected at a cost of £100,000 in 1864–69, in the First Pointed style, and near it, the L. School of Medicine, a handsome Gothic structure; the Grammar School (cost £13,000) designed in decorated Gothic by E. M. Barry; and the new Royal Exchange founded in 1873, opened in 1876. L. has also a stock exchange, 'mixed' and 'white' cloth halls, a philosophical hall with a museum (rebuilt 1863), a free library of 30,000 vols., established in 1870, a public subscription library of 30,000 vols., founded by Priestley in 1768, a mechanics' institute, a Wesleyan training college, a school of art, with some 600 students, a working-men's institute, an industrial school, a reformatory (at Adel), a large general market, a cattle market, five railway stations, eleven banks (Beckett's, a fine structure by Sir G. G. Scott), many handsome hotels (especially the Queen's, opened by the Midland Railway Company in 1861), a theatre (another being built, 1877), four daily and five weekly newspapers, &c. Three miles N.E. of L. is the beautiful Roundhay Park, 733 acres in extent, with a lake of 33 acres, bought by the corporation for £140,000 in 1872. Near L. are the noble ruins of Kirkstall Abbey, which dates from between 1147 and 1153, and Adel church, built in 1140, in the vicinity of which was a Roman station where have been found various antiquities. The textile industries of L. were extensive even in the 16th c. Formerly, however, it was only the coarser woollens that were made here, while now the superior cloths of L. are unrivalled for fineness and elegance. Besides cloths for all kinds of wearing apparel, superfine broad and coarse narrow cloths, the goods are chiefly shawls, blankets, and Scotch camlets. In 1871 there were

1108-cloth factories, with 26,134 hands. Of late years the iron industry has greatly increased, and now it employs over 15,000 persons, and machinery is produced annually to the value of £2,000,000. There are also extensive manufactures of leather (2194 employes in 1871); flax, silk, and worsted goods, earthenware (1472), paper, tobacco, glass, oil, and chemicals. Pop. in 1841, 151,850; in 1851, 171,805; in 1861, 207,153; in 1871, 259,212; now (1877) 298,000. L. returns three members to Parliament. It is the ancient British *Loidis*. Its first charter was received from Charles I. in 1626. It contributed to the ship-money in 1638, and suffered a fearful visitation of plague in 1644–45. Although it sent a representative to Cromwell's Parliament, it was only created a parliamentary borough by the Reform Bill of 1832.

Leek (*Allium Porrum*) is a perennial culinary vegetable that has been in cultivation in Britain from an unknown period, and was grown by the Egyptians in the days of Pharaoh. The flavour is milder than that of onions, or other species of *Allium*, which recommendation, combined with the esteem in which it is held as a wholesome vegetable, has caused it to be largely used for soups, stews, &c. At present it is very generally cultivated, more especially in Scotland and Wales. If planted in a rich deep soil with a dry bottom, it grows to a very large size. The L. from time immemorial has been regarded as the badge of Welshmen, who still make a show of it on St. David's Day.

Leek, a market-town of England, in Staffordshire, on the Churnet, $1\frac{1}{2}$ miles S.E. of Macclesfield by rail, has a town-hall (1806), mechanics' institute (1862), public baths, &c. The manufacture of silks is the staple industry, but there are also dye-works, a factory for farm implements, &c. Pop. (1871) 15,544.

Leer, a town of Prussia, province of Hanover, on the Leda, near its junction with the Ems, and 16 miles S.E. of Emden by rail. It has considerable shipping, and manufactures sugar, chicory, tobacco, beer, and brandy. Pop. (1875) 9339.

Leeuwarden (Frisian, *Lieuwert* or *Lionwerd*), a pretty market-town of Holland, capital of the province of Friesland, 72 miles N.E. of Amsterdam, 16 miles E. by N. of Haarlingen by rail, and on the canal between that town and Gröningen, has twelve churches, an old palace of the House of Orange, a fine town-house, and manufactures of carriages and musical instruments. Pop. (1876) 27,108.

Leeuwenhoek, Anton van, a Dutch microscopist and naturalist, was born October 24, 1632, at Delft, where he died August 26, 1723. He was the greatest microscopist of his time, and by means of his fine instruments, constructed by his own hand, made many important discoveries in natural history. He discovered the *Kolibera* (q. v.) or wheel-animalcules, and was probably the first to observe the circulation of the blood in living animals. L.'s works were collected and published in 1724 under the title *Opera Omnia Arcana Nature*.

Leeuwin, Cape, the S.W. extremity of Australia, is situated in $34^{\circ} 19'$ S. lat., $115^{\circ} 8'$ E. long. It consists of a bluff of granite, against which the sea beats with tremendous force.

Lee'ward Islands. See ANTILLES.

Lee'way is the angle between a vessel's course and the direction in which her keel points, or the deviation of the course run from the course steered upon. This deviation is necessarily caused when the vessel is steered obliquely with reference to the current or wind, but its amount varies for different vessels.

Lefebvre, François Joseph, Duc de Danzig, a French marshal, was born at Ruffach, Alsace, 25th October 1755. Like most of Napoleon's generals he rose from the ranks, entering the Guards as a private in 1773, and in twenty years working his way to the post of general of brigade. At the siege of Fort Vauban, at Mannheim, at Apach, Sainte-Croix, and Nadelange, he led a division to victory. In the following years he distinguished himself at the battles of Marmont, Nivelles, Florinal, Primont, Epte, Ochtrup, Roer, Welp, Eichelkamp, Spick, Henef, Anilschorn, Nidda, and Oberdiefenbach. Wounded at Stockach, where he vigorously resisted the attack of 36,000 Austrians with 8000 men, he returned to Paris, and in 1800 entered the senate, but soon returned to active service. In 1806 he led his division against the Prussians, and in the follow-

ing year laid siege to Danzig in conjunction with the Polish army. On the capture of that city he was created Duc de Danzig. After the Restoration he was named a peer of France. L. died 14th September 1820.

Lefkosi'a, the ancient *Leucosia*, capital of Cyprus, near the N. coast, on the Pidius, on a plain between two mountain ranges. It is walled, and its chief buildings are the mosque of St. Sophia, and the governor's palace. The industries are in silk, cotton, and leather. Pop. 18,000. L. was the residence of the Lusignan kings of Cyprus.

Lefort, François, was born in Geneva (1656), served in France among the Swiss Guards, obtained a captaincy in the Russian army, and under Romadanofski fought with bravery against the Turks. He was an active promoter of the *coup d'état* which raised to the sovereignty Peter the Great, who rewarded his services by making him his chief favourite. Into his hands was confided the care of army and navy; in 1697 he headed an embassy to the principal European courts, Peter following in his suite *incognito*; during the revolt of the Strelitzes in 1697, it is said his humane intervention saved thousands from massacre; and in the course of his long ministry he procured many important reforms, especially in favour of religious toleration and free-trade. He died at Moscow 20th March 1699. See Voltaire's *Pierre le Grand*.

Leg, the name specially given to the hinder extremity, whole or part, of vertebrate animals, and applied indiscriminately to indicate the locomotive appendages of lower animals, such as insects, crustaceans, &c. In man and vertebrates, the L. consists (1) of a *pelvic arch or girdle* supporting the bones of the L. proper; (2) of a *femur* or thigh; (3) of a *tibia*; and (4) *fibula*—the former being popularly known as the shin-bone; (5) of seven bones forming the *tarsus* or ankle; (6) of a *metatarsus* or instep composed of five bones; and (7) of the *phalanges* or bones of the toes, numbering three in each toe, with the exception of the great toe, which is composed of two phalanges only. The term L. is more properly limited to the portion of the hinder or lower limb, lying between the knee and the tarsus or ankle, and supported by the *tibia* and *fibula*. The tibia is, with the exception of the femur, the largest and longest bone in the body. It is expanded to form a flat head above, for the reception of the *condyles* of the thigh. Its shaft is of triangular and prismoid form, and narrows as it approaches the ankle. The anterior border forms the *shin* or *crest*, and the lower extremity presents five surfaces; the lower surface being smooth for articulation with the *astragalus* of the ankle. The *fibula* lies to the outer side of the L. It is a very slender bone, its upper extremity lying parallel with the knee joint; whilst its lower end forms the outer prominence of the ankle. The chief muscles of the L. comprise the *tibialis anticus*, the *extensors* (*pollicis* and *longus digitorum*) and *peroneus tertius*, in front; the muscles of the calf or back of the L. being the *gastrocnemius*, *soleus*, and *plantaris*; the *tendo Achillis*, or great tendon of the heel, being formed by the united tendons of the *gastrocnemius* and *soleus*. The muscles of the front of the L. bend the ankle on the L.; those of the calf raising the heel, and assisting in the actions of walking, dancing, leaping, and also in standing. The arteries of the L. are the *anterior tibial*, which is accompanied by two veins, and the *posterior tibial* artery, also possessing two *vena comites*. The chief nerves are the *posterior tibial nerve*—a large branch of the *internal popliteal* and the *external popliteal*. The most frequent seat of *fracture* of the tibia is its lower fourth; whilst the fibula most commonly gives way just above its lower extremity.

Legacy. The bequest of a L. confers only a contingent property on the legatee, which does not become complete till the assent of the executor or administrator has been given; but before assent, the bequest is transmissible to the personal representative of the legatee, and will pass by his will. If executors omit to pay legacies at the expiry of one year after the death of the testator, legatees are entitled to interest from that period. In the event of deficiency of assets to pay the debts, all the general legacies must be proportionally abated; and if the legatees have been paid, and debts in excess of the residue appear, they must refund rateably.* If a legatee die in the life-

time of the testator, the L. falls into the residue of the personal estate, unless the terms of the bequest clearly show that the testator meant it to go to the representatives of the legatee. This rule of law is, however, modified by the Wills Act in favour of the issue of the legatee living at the testator's death. If a L. be left to any one conditionally, as *if* he attain the age of twenty-one, and he die before that time, it is a *lapsed* L. But a L. *to be paid* when he attains the age of twenty-one is a vested L.; and if the legatee die, his representative is entitled to it. A frivolous or immoral condition imposed on a legatee is void, and the legatee is entitled to his L. without fulfilling it. The duty on a L. to a child or parent, or to any lineal descendant or ancestor of the deceased, is £1 per cent.; to a brother or sister or their descendants, £3 per cent.; to a stranger in blood, £10 per cent. A L. to husband or wife is exempt from duty.

Legati (Lat. 'sent with a message') were among the Romans originally ambassadors or commissioners chosen by the senators from their own number, but especially, in the time of the republic, the chief officers of the generals in command, who appointed them, with the sanction of the Senate, and for whom the L. acted during their absence. Pompey, when in Asia, had fifteen L., and three is the smallest number ever mentioned as employed. During the Empire, *legatus* chiefly meant a governor sent into a province by the Emperor. It is now a title given by the Roman Curia not only to its ambassadors, but also to many archbishops. There must, therefore, be distinguished two classes of L.—*L. nati*, and *L. dati*, or *missi*. *L. nati* ('by birth') are those who hold certain archbishoprics to which the legateship is permanently attached. These had originally the same power as papal legates generally, but from the 16th c. this has been so diminished that they properly retain only the bare title. To *L. dati* or *missi* ('sent') belong:—(1) Delegates, intrusted with full powers for a special mission; (2) Apostolic Nuncios, who are bound to execute the orders of the Pope according to his mandate, and who possess jurisdiction in the provinces assigned to them, having authority to decide the ordinary *casus reservati* ('reserved cases'), and to grant indulgences for more than one hundred days, but less than one year; (3) *L. a latere* ('from the side'), cardinals delegated by the Pope, who appear as his actual representatives, and possess many of the highest prerogatives. From the *L. a latere ordinarii* are distinguished the *extraordinarii*, who are commissioned to act in individual cases of importance, as in calling a council, or on an embassy to a sovereign.

Legato (Ital.). A musical term for a smooth, connected manner of singing or playing an instrument; it is opposed to *Staccato*.

Legend (Lat. *legenda*, 'to be read'), a term applied originally to portions of Scripture, later to other writings of religious instruction, appointed to be read in the public services of the Church or to the monks in their refectories. Theoretically, at least, the term was one of the widest comprehensiveness, and might be expected to cover every variety of composition and every shade of merit—good, bad, and indifferent. Written by monks for monks, it was natural, however, that legends should deal mainly with matters ecclesiastical, with hagiology, as the *Libri Lectorum*; with martyrdoms, as the *Libri Passionales*; or with the 'clean' or monastic life, as the Old English *Ancren Riwle*, composed in the 12th or 13th c. for the edification of the nuns of Tarente in Dorsetshire. The *Vita S. Antonii* of Athanasius, and the *Vita Patrum* of Gregory of Tours, are among the earliest productions of the kind, and these let forth a flood of less genuine imitations. From Greece were imported into France and Italy legends, the authors of which, familiar with the fictions and fables of the East, composed their works in the spirit of a romance, and which acted powerfully on the more sober narratives of the Western Church. But another and a stronger influence was at work. Legends, guarded by no canon, could scarcely escape that mingling of paganism with Christianity which prompted Redwald, King of the E. Angles, to establish in the self-same church one altar to Christ and another to devils, which perpetuated the Saturnalia in the sports of Christmas, and has retained the old phallic and fire worship in a hundred observances that, though grown harmless and meaningless, still linger on amongst us. As in popular folklore the hammer of Thor and the trident of Siva both came to be identified with the cross of Christianity, so in L.

* A specific legacy, as of a piece of plate, must be paid in full: but it is postponed to the claims of the legatee's creditors.

the Slavs have transferred the attributes of Perun, the god of thunder, to the prophet Ilya (Elijah), and of his mother Perunatela, or of Lada, the counterpart of Freya to the Blessed Virgin; the god of *Beowulf* is simply Woden under a different title; and the *dramatis personæ* of Grimm's *Brother Frolick's Adventures* reappear in the Alsatian version as Christ and St. Peter. A more innocent cause of that blending of truth and fiction which presents itself in legends was the fondness of the pious monks for fastening on saints, real or created for the occasion, every story of antiquity or chivalry that could, they fancied, either 'point a moral or adorn a tale,' much as we attribute a *bon-mot* to Sydney Smith or Theodore Hook. Of this tendency *Barlaam and Josaphat* (q. v.) presents a striking instance, as through it the founder of Buddhism has actually won his way into the calendars of the Eastern and Western Churches. From these combined causes many legends, originally intended for historical, gradually became the very reverse of history; legends in general fell into disrepute; and the terms *L.* and *legendary* came to hold their present significations of 'falsehood' and 'untrustworthy.' True, many legends enshrined unquestioned facts; others, like those of Christopher, or of Augustine and the Child by the sea-shore, were beautiful allegories; but then it was so easy for assailants of that Church which had adopted these legends to point out that this was false, or that was only true of another than him of whom it was told, that such and such stories were monstrous or obscene; so convenient to confound the Church's literature with her dogmas, that legends, and especially or exclusively corrupt legends, were brought by those assailants into a prominence, and represented as possessing a coherent unity which the Church herself had never intended or appointed they should hold. Here it is impossible to mention more than a very few of the principal collections of legends, such being the *Legenda Aurea*, or Golden Legend (q. v.), the *Gesta Romanorum* (q. v.), the *Flos Sanctorum* of Ribadineira (2 vols. Madr. 1599-1610), the *Acta Sanctorum* (q. v.), and the *Lives of the Saints*, by Baring-Gould (15 vols. 1872-77).

Legendre, Adrien Marie, a French mathematician, was born at Toulouse, September 18, 1752. Through the influence of D'Alembert, he early obtained the chair of mathematics in the military school at Paris, and in 1783 became a member of the Academy. In 1787 he was engaged, along with Cassini and Méchain, in calculating the true longitudinal distance between Paris and Greenwich, the results of which were published in the *Exposé des opérations, faites en France, &c.* (1792). He was a member of the *Bureau des Longitudes*, and held important positions as a director of the University, and Examiner in l'Ecole Polytechnique. He died at Paris, January 10, 1833. His chief works are *Eléments de Géométrie* (1794), *Exercices de Calcul Intégral sur divers Ordres de Transcendentes et de Quadratures* (3 vols. 1807), supplemented by his *Traité des Fonctions Elliptiques* (2 vols. 1827), *La Théorie des Nombres* (2 vols. 1830), besides some twenty more or less valuable memoirs upon various questions in pure and applied mathematics, such as double integrals, the theory of parallels, method of least squares, and attractions of spheroids and ellipsoids.

Leger-Lines (Fr. *liger*, 'light') are small lines above or below the staves in music, being a continuation of the latter.

Le'ghorn (It. *Livorno*), one of the chief ports of Italy, and capital of a province of the same name, at the mouth of the Calambrone, 62 miles W.S.W. of Florence, and 12 S.S.W. of Pisa by rail. It is connected by a canal with the Arno, which enters the sea 7 miles farther N., and is itself intersected by several smaller canals. The city is regularly and handsomely built, but the houses are high, and the streets narrow and gloomy. There are many fine churches and other public edifices, including three hospitals, an observatory, a free library, &c., and the suburbs have been greatly extended and embellished of late years. The Jewish synagogue, in point of size and richness, is the second in Europe. The aqueduct and great reservoir are remarkable structures. Near the port is a monument to Ferdinand I. L. has an old and new harbour; the latter, the more southerly, is capable of receiving vessels of the heaviest tonnage, and is overlooked by a lighthouse. On a little island stands the lazaretto. In 1873 some 11,000 ships of all sizes entered the port, the export and import trade amounting in value to £7,200,000. The imports are mainly coal, iron, cutlery,

petroleum, sugar, codfish, pilchards, and herrings; the exports, straw hats, straw-plaiting, silks, borax, marble, sulphur, fruits, and anchovies. Besides the straw-plaiting industries, there are manufactures of oil, soap, tobacco, salt, *Rosolio* liqueur, &c. The port of L. was free, and enjoyed many privileges till 1867. Many visitors are attracted hither by the baths and mineral springs. Pop. (1874) 97,096, of whom some 8000 are Jews. The earliest notices of L. are of the 9th c., and relate to the building of a church, but the place only began to grow in importance after the destruction of the port of Pisa, at the end of the 13th c. In the 14th c. it came under the protection of France, and was sold to Genoa for 26,000 gold ducats in 1407, to be sold by its new owners to Florence for 100,000 gold florins in 1421. The Medici improved its harbour, strengthened its fortifications, and conferred on its inhabitants exceptional privileges. Religious toleration was established, and merchants of all nations flocked hither. It was held by the French in 1796-99, retaken by them in 1800, and greatly impoverished by forced loans. An Italian and British force recovered it in December 1813. The Austrians took L. in May 1859, and quelled a slight rising there in 1857.

Le'gio (from Lat. *lego*, 'I choose') was the name applied in the Roman army to a large body of troops, comprising infantry, cavalry, and in later times, artillery also. At first, the L. was composed exclusively of Roman citizens, but the privilege was subsequently extended, till in the third c. A.D., even barbarians were admitted. From its institution by Romulus till its extinction under the empire, the L. passed through important changes of constitution. These have been referred to five periods, of which we may usefully select the third—from B.C. 300 to B.C. 107—for fuller representation. Four L. were levied yearly, two being assigned to each consul, and each L. usually contained from four to five thousand men. Polybius thus marshalled in three lines a L. 4000 strong: Hastati, 1200 in number, youths in the first bloom of manhood, formed the first line; Principes, also 1200 in number, men in the full vigour of life, formed the second line; and Triarii, 600 in number, experienced veterans, formed the third line. These three bodies were each divided into ten maniples or companies. There were also 1000 Velites, who acted as light-armed skirmishers, and were distributed equally among the Hastati, Principes, and Triarii. The cavalry, 300 in number, were divided into ten *turme*, or squadrons of thirty men each, and each *turma* into three *decurie* of ten men each. The chief officers of the L. were the military tribunes, of whom at this time there were six, and under them were sixty centurions, and sixty *optiones*, or lieutenants. The Hastati, Principes, and Triarii wore armour, consisting of shield, helmet, breastplate, and greave, and their offensive weapons consisted of a sword, and heavy javelins. In place of the latter, however, the Triarii carried pikes. Two of the bravest men in each manipule were appointed standard bearers, and each L. had its silver eagle. The L. were originally numbered in the order in which they were raised; and some derived titles from the deities, under whose patronage they were placed, the countries where they had been levied, the scene of their most brilliant achievements, &c.

Le'gion, The Thundering (Lat. *legio fulminatrix*), was a name supposed to have been given to a Roman legion in connection with a well-known legend. In the war with the Marcomanni A.D. 174, the Emperor Marcus Aurelius and his army were on the eve of perishing from thirst, when a sudden outburst of thunder and lightning accompanied with rain relieved the Romans, and terrified their foes. Christian writers represented that the deliverance had been miraculously vouchsafed to the prayers of the Christian soldiers in the imperial army, and the incident became the subject of a famous historical controversy. See Lardner's *Jewish and Heathen Testimonies*, chap. xv.

Legion of Honour, a French order, founded under the Consulate by a law of May 19, 1802, as a recompense for all services rendered to the state. With the First Consul for its *ex officio* Grand Master, it consisted of a Grand Council of seven members, presided over by a Grand Chancellor, and of sixteen territorial cohorts, each of which had its centre, master, revenues, and council of administration, and was composed of 7 grand officers, 20 commandants, 30 officers, and 350 legionaries—in all 6512. This number was subsequently augmented; the title legionary was replaced by chevalier; a fifth and

superior grade was established, that of the Grand Cordon; and two great schools for the daughters of members of the legion were founded March 29, 1809. The decoration consisted of a five-rayed star, bearing the imperial effigy and eagle, and surmounted by the imperial crown. At the Restoration the title of commandant was changed to commander, and of grand cordon to grand cross, while the effigy of Henri IV. was substituted for Napoleon's, and the fleurs-de-lis replaced the eagle, to make way themselves for the tricolor in 1830. By a law of January 22, 1852, the decoration was restored to its original form, except that it bore the head of Napoleon III., and the legion itself was reconstituted on a fresh basis. In 1843 there had been 49,417 members, but this number was now diminished by the creation of but one fresh chevalier for every two deceased. The grand crosses were limited to 80, grand officers to 160, commanders to 400, and officers to 2000—exclusive of the imperial family and of foreigners, the latter being merely 'admitted,' not 'received,' and consequently taking no oath. Pensions of from 250 to 5000 francs, conferred on disabled members, are defrayed out of the revenues of the order, which were greatly augmented by Louis-Philippe. The Palace of the Legion, erected in 1786 for the Prince de Salm, was burnt by the Communists, 23d May 1871.

Legitim, or **Bairns' Part of Gear**, a Scotch law term, denoting the share of the Goods in Communion (q. v.) legally falling to the children on the death of their father. The claim of L. may be excluded by giving the children a provision in an antenuptial contract of marriage, under the name of L. A provision in a contract of marriage excluding the claim, without making any other provision for the children, would be inoperative against them. A father may, however, frustrate the claim by a conversion of his moveable estate into heritage. A child claiming L. must collate (see **COLLATION**) any separate provision received from the father, and all considerable sums of money advanced to the child must also be collated, unless on account of education. See **JUS RELICTÆ, DEAD'S PART**.

Legitimacy. See **BASTARD AND BASTARDY**; for Scotch law, also **BASTARDY, DECLARATOR OF, and BASTARDY, GIFT OF**.

Legitimation. The doctrine of the law of England is that 'once a bastard always a bastard.' Scotch and foreign law allow L. by the subsequent marriage of the parents. If, however, there was a legal obstacle to the marriage of the parents at the date of the child's birth, their subsequent marriage will not make the child legitimate. When, again, another marriage has intervened between the date of the birth and the marriage of the parent, it was doubted whether L. took place; but it has been decided that it does. The rights, however, of children born legitimate cannot be set aside by the L. of a bastard. A child born illegitimate in England of parents domiciled there at the time of its birth, would be legitimated by the subsequent marriage of its parents in England, if at the date of the marriage they were domiciled in Scotland, or in any other country in which the principle of L. *per subsequens matrimonium* is recognised. If, however, the parents were domiciled in England at the date of the marriage, the fact that the marriage was constituted in Scotland would not have the effect of L. A child legitimated *per subsequens matrimonium*, cannot succeed to real estate in England.

Legitimists sprung into existence as a French political party after the revolutionary events of July 1830. They were opposed to the claims of Louis-Philippe, son of the Duc d'Orléans, who traced his descent through a branch of the Bourbon family in a direct line from the second son of Louis XIII., and they advocated the cause of Henri, Duc de Bordeaux, Comte de Chambord, grandson of Charles X. In the French Assembly the *côté droit* has continued with unwearied faithfulness, under every vicissitude, to scheme for the recognition of Henri V., as they term the representative of the elder branch of the Bourbon family. After the fall of the second empire (see **CHAMBORD**), there seemed some likelihood that the L. would be successful in restoring the Comte to his throne, no fewer than 280 deputies having presented him with a programme of constitutional government, to which they asked his signature. His claim to 'divine right' gave his party no practical chance for recommending him to the country. In the Assemblies of the Republic the L. are not numerically important, but they exercise considerable power

by combining at times with the Bonapartists and Orleanists to thwart the democratic aims of the *côté gauche* and *centre gauche*.

Legna'no, a town of N. Italy, province of Verona, 25 miles S.S.E. of Verona by rail. It lies in a swampy rice district, is of some strategic importance, and has leather and straw-hat industries. Pop. (1874) 13,355.—Another Italian town of the same name, 17 miles N.W. of Milan, has several interesting churches, containing rare pictures. It was the scene of a great victory won by the Milanese over Friedrich Barbarossa, 29th May 1176. Pop. (1874) 6685.

Legs, Human, are often used as heraldic charges, and may be naked, booted, or in armour, and couped (cut off smoothly) or erased (with a ragged edge) at the thigh. The leg (*jambe* or *gambe*) of an animal is a common crest.

Legume, the fruit of a leguminous plant—e.g., the pod of the pea. It consists of a single carpel which splits into two halves, not only along the ventral suture (as is the case in the allied fruit called a follicle), but also along the dorsal suture; the seeds are attached to the ventral suture. A variety called a Lomentum is constricted above and below each seed, breaking into separate pieces when ripe at these several constrictions.

Legumin, or **Vegetable Casein**, is an azotised product and essential part of the seeds of leguminous and some other plant. It may be procured in solution from kidney-beans and peas, by bruising them in a mortar with cold water and straining.

Legumino'sæ, a very extensive and important natural order of Dicotyledonous plants dispersed through all parts of the world, but more especially abundant in tropical countries, and ranging from lowly annual weeds to gigantic trees. It is divided into three large sub-orders, viz., *Papilionacea*, of which the bean and the pea are examples; *Casalpinia*, represented by cassia, baubinia and ceratonia; and *Mimosæ*, including the acacias, mimosas, &c. The order embraces many valuable medicinal plants, such as those yielding senna, kino, copaiva, balsams of Peru and Tolu, tamarind gums arabic and tragacanth, &c.; important dyes, as indigo and logwood; many valuable timbers, as rosewood; numerous staples of human and cattle food, as peas, beans, haricots, vetches, clovers, &c. The properties of the order are in general wholesome, although it contains some poisonous species—e.g., laburnum. The leaves of various species of the sub-order *Mimosæ* display a peculiar irritability when touched; this is particularly instanced in the case of *M. sensitiva* and *putida*, commonly called 'sensitive plants.'

Leh, the chief town of the province of Ladakh or Middle Thibet, which now forms part of the State of Cashmere, in feudatory connection with the British Government of India. It is situated on the right bank of the Indus, hidden amid the ranges of the W. Himalayas, 11,278 feet above the sea, and 210 miles due N. of Simla. A British Commissioner resides here, to administer justice, &c., conjointly with a Cashmere official. L. has great commercial importance, as the centre where trade caravans from Yarkund and Thibet meet, to separate again on their way towards different parts of Cashmere and the Punjab. In 1873 the trade was registered to the value of £177,000. The imports from the N. are gold, silk, a drug called *charas*, and *pashmina* or shawl wool; from India, cotton-piece goods, tea, brocades, spices and sugar. Pop. 9000.—An European trading company now (1877) goes direct into Yarkund, under the enterprising direction of Mr. Russell.

Leibnitz, properly **Leibniz**, **Gottfried Wilhelm, Freiherr von**, one of the greatest of German thinkers, was born July 6, 1646, at Leipzig, where his father was professor in the university. After studying here for two years, he removed to Jena in 1663, and the same year published his first printed treatise, *De Principio Individui*, which was followed three years later by his *Dissertatio de Arte Combinatoria*, a work containing philosophical speculations upon mathematics and a universal language. In 1666 he applied at Leipzig for his doctor's degree, which was refused him on account of his youth. This induced him to leave his native place and go to Altdorf, where he presented his thesis (*De Casibus perplexis in Jure*) and graduated. He then visited Nuremberg, where he applied himself to chemistry, or rather alchemy. In 1667, on the invitation of Baron von Boyne-

burg, the prime minister of the Elector of Mainz, he took up his residence at Frankfurt, where he was much engaged in legal and diplomatic business. In 1672 he was sent on a diplomatic errand to Paris, and here he spent the greater part of the next four years, acting in the capacity of a councillor of the court of Mainz. In 1673 he visited England, made the acquaintance of Newton, Wallis, Boyle, Oldenburg, and other celebrities, and was elected a member of the Royal Society of London. His connection with Mainz terminated with the life of the elector in 1676; and he left Paris, accepting the invitation of the Duke of Hanover to fix his residence in the Hanoverian capital. On his way he made a detour through England and Holland, visiting Spinoza at the Hague. Henceforward he made Hanover his home, filling numerous political and literary offices under Dukes Johann Friedrich, Ernst August, and Georg Ludwig (afterwards George I. of England). He was employed by the first to write the History of the House of Brunswick, a task which he never completed, but which directed his attention into many collateral enquiries in politics and philology. Nor did he content himself with historical records; but speculated upon the origin of the globe and the evidences of Geology (q. v.). These speculations are given in his posthumous work *Protegea* (Gött. 1749). For three years (1687-90) he travelled through Germany and Italy, visiting the principal libraries in search of material for his projected work. After his return he was busily engaged in arranging his varied treasures; but much of his time was taken up in diplomatic and ecclesiastical business. Thus in 1700 he went to Berlin with a view of more closely uniting Hanover and Brandenburg, and while there powerfully aided in establishing the Academy of Sciences. He was elected perpetual president; and in the first volume of the transactions (*Miscellanea Berolinensia*, 1710) appear papers by him upon a vast variety of subjects—mathematics, physics, chemistry, poetry, archaeology, &c. L. took a lively interest in everything relating to education; and promoted a plan for the union of the Romish and Lutheran churches, entering into negotiations, which, though encouraged by the courts of Hanover and Berlin, proved abortive. It was after his settlement in Hanover that his philosophy was gradually matured and systematised. His *Meditationes de Cognitione, Veritate, et Ideis* appeared in 1684, and in 1696 he published a short and able criticism of Locke's famous essay on the Human Understanding. A fuller and more formal reply he compiled later, but did not publish at the time on account of Locke's death in 1704. It is contained in his most important philosophical work, *Nouveaux Essais sur l'Entendement Humain*, published by Raspe in 1767. The second in importance of his works is the *Théodicée* (1710), which was written avowedly to refute Bayle's sceptical views, and still occupies a foremost place in the literature of theology. His speculations drew him into a controversial correspondence with Samuel Clarke, in the midst of which he died, November 14, 1716. As a mathematician, L. is celebrated as the independent discoverer of the methods of the differential calculus; and in this connection was embroiled in a discussion with Newton, or rather Newton's friends, regarding the claims of each to priority. The main features of his philosophical system are given under the articles MONAD and OPTIMISM. His works were published by Dutens in 6 vols. in 1768; and in 1840, his philosophical works, published originally by Raspe, were re-published by Erdmann. A collected edition was begun by Pertz (11 vols. 1843-62); another, by Klopp (5 vols. 1864-66). See Guhrauer, *G. W. Freiherr von L. Eine Biographie* (Bresl. 2 vols. 1846; translated into English by Mackie, Boston, 1845).

Leicester (Lat. *Legionis castra*), the county town of Leicestershire, England, on the Soar, 29 miles N.N.W. of Northampton by rail. It has many fine churches, of which Sir G. G. Scott restored St. Mary's (1860), and erected St. Andrew's (1862) and St. Matthew's (1867). Other edifices are the Guildhall, Corn Exchange, Museum, Alderman Newton's School (1865), Wigston's Hospital (rebuilt 1866), and the Trinity Hospital. L. has made rapid commercial progress during the last twenty years. The staple industry, the manufacture of hosiery, employed, in 1874, 4707 weavers; and bootmaking, worsted and cotton spinning, brewing, tanning, lacemaking, ironfounding, the manufacture of farm implements, &c., are largely carried on. Pop. (1871) 95,220. L. returns two members to Parliament. It is a place of great antiquity—the capital of the

Coritani, and the Roman *Rata*; was the scene of three parliaments; and sustained sieges by the Danes (886), William Rufus (1088), and Prince Rupert and Fairfax (1645). Richard III. slept here, at the Blue Boar Inn, the night before Bosworth Field (1485); and Cardinal Wolsey died at the now ruined abbey of St. Mary de Pratiss (1530).

Leicester, Robert Dudley, Earl of, fifth son of John Dudley, Duke of Northumberland, was born in 1531. On Elizabeth's accession in 1558 he became her prime favourite. She showered honours, offices, and gifts upon him. His wife, Amy Robsart, died in 1560 under suspicious circumstances, L. being thought to aspire, not without encouragement, to the hand of the queen. To allay suspicion, Elizabeth proposed L. as the husband for Mary Queen of Scots, who did not approve the choice. In 1575 he entertained Elizabeth at Kenilworth for seventeen days, at a cost of £60,000. In 1576 he privately married the Countess of Essex. On the news reaching the queen, he incurred, but only temporarily, her displeasure. He was military commander in the Netherlands 1585-87, and at Tilbury 1588. A successful intriguer and clever courtier, he was devoid of solid ability and of principle, and was an incapable soldier. He died at Cornbury in Oxfordshire, 4th September 1588. See Froude's *History of England*.

Leicestershire, an inland county of England, is bounded N. by Nottinghamshire, N.E. by Lincolnshire, E. by Rutland, S.E. by Northamptonshire, S.W. by Warwickshire, and N.W. by Derbyshire. Area, 799 sq. miles: pop. (1871) 269,311. The surface is almost wholly occupied by undulating hills, the highest of which is Bardon Hill (853 feet) in the N.W. portion of the county, which, though now bare of trees, still retains the name of Charnwood Forest. The formation is New Red Sandstone, with the exception of the Great Oolite and Lias in the E., the coalfields of Ashby-de-la-Zouch, and some isolated hills of mountain limestone. L. is watered by the Soar, a tributary of the Trent, has a mild, dry climate, and a loamy soil. In 1876 there were 103,415 acres under corn crops; 24,667 under green crops: 34,010 under clover, sanfoin, and grasses in rotation; and 293,247 in permanent pasture, exclusive of heath or mountain land; also 17,917 horses, 128,088 cattle, 428,155 sheep, and 25,438 swine. The chief crops were barley, wheat, oats, beans, turnips, mangold, potatoes, and hay. Most of the cheese known as Stilton is made at the dairy farms round Melton Mowbray. The county returns four members to Parliament. The chief towns are Leicester (q. v.), Ashby-de-la-Zouch, Bosworth, Market Harborough, Lutterworth, and Melton Mowbray. L. is rich in Roman remains—roads, stations, and tumuli—and has besides the ruins of three castles and five abbeys and nunneries.

Leigh, a manufacturing town of England, in Lancashire, 7½ miles S.W. of Bolton by rail. The staple industry is the silk manufacture, but it also possesses extensive iron-foundries, cotton-factories, breweries, and flour-mills. There are large collieries in the vicinity. Pop. of parish (1851) 5206; (1871) 33,592.

Leigh-ton, Alexander, born in Edinburgh in 1568, studied at Leyden, where he obtained a medical diploma, and at Edinburgh, where he became Professor of Moral Philosophy (1603), came to London (1613), and, having failed to obtain the licence of the College of Physicians to practise as a doctor, accepted the lectureship of a Calvinist meeting-house. In 1629 he had printed in Holland *An Appeal to the Parliament, or Zion's Plea against the Prelacie*, in which the prelates were denounced as men of blood, episcopacy as antichrist, and the queen as a daughter of Heth. For this he was arrested, February 29, 1630, brought to trial, June 4, and sentenced to be degraded from the ministry, whipped, pilloried, and branded with a double S.S. ('sower of sedition'), to have his ears cut off, and his nose slit, to pay a fine of £10,000, and to be imprisoned for life. He escaped, but was recaptured, and, after undergoing this barbarous punishment, lay in the Fleet Prison until released by the Long Parliament (1640), which also voted, but never paid him, £6000, and made him keeper (1642) of Laud's palace at Lambeth, at that time a State prison. He is said to have died insane, either in 1644 or 1649.—**Robert L.**, 'the saintly archbishop,' son of the above, is variously stated to have been born at Edinburgh or London, in 1611 or 1613. He certainly entered the university of the former city in 1627, took his M.A.

In 1631, resided for some years with relatives at Douai in France, where daily intercourse with Catholics widened his views and sympathies, and returning to Scotland, was ordained to the ministry of Newbattle, near Edinburgh, in December 1641. L.'s dislike to the Covenant, his non-attendance at the meetings of his presbytery, and his request to be allowed to preach not 'to the times' but 'for eternity,' are recorded in the records of the Presbytery of Dalkeith and of the Newbattle kirk-session (published in vol. iv. of the *Proceedings of the Society of Antiquaries in Scotland*). He joined the 'Engagement Party' for the king in 1648, corresponded actively with English episcopalians, and in February 1653 finally resigned his cure, but was notwithstanding elected in the same year Principal of the University of Edinburgh. In this post, and this only, L. seems to have found rest. He preached the truths of Christianity, leaving others to settle its disputes; by a visit to Cromwell he procured a grant of increased funds to his university; and won the respect of the most different parties. But at the Restoration he was called on through his brother, Sir Elisha L., a secret convert to Catholicism, to accept a mitre, and choosing Dunblane, the poorest and smallest see of Scotland, was consecrated December 15, 1661. Too liberal for the narrow, too yielding for the hard times on which he was thrown, L. spent the next eleven years in fruitless endeavours to counteract or undo the work of Sharp and Lauderdale, to heal divisions, and to restore within his diocese more frequent services and celebrations. Twice he repaired to the court of Charles, in 1665 and 1669, the second time to tender his resignation, but in place of its acceptance he found himself translated to the archiepiscopate of Glasgow. Two years more of heartsick struggles with the intolerance of evil times, and he retired from the unequal contest, first to Edinburgh, then in 1674 to Broadhurst in Sussex, the residence of his sister, Mrs. Lightwater. Here he lived, busied only with study, prayer, and meditation, until his death, which took place during a visit to London in an inn in Warwick Street, June 26, 1684. L.'s influence, unfortunately so small on his own times, has been great on posterity. His 'golden' *Commentary on the First Epistle of St. Peter* is marked by a thorough Scottish metaphysical faculty, lit up by pleasant humour, and has won the admiration of men of all shades of opinion, from Doddridge to Coleridge, forming as it does the basis of the latter's *Aids to Reflection*. And his *Sermons* and *Predicationes Theologicae* are only less valuable. Editions of his works have been published in 1808, 1819, 1825, 1828, and by the L. Club, the last volume of their series appearing in 1875. See the account of L. in Bishop Burnet's *History of his Own Times*.

Leighton, Frederick, A.B.A., an English artist, was born at Scarborough, 3d December 1830, studied at Rome, Berlin, and Frankfurt, and produced his first finished picture, 'Cimabue Finding Giotto Drawing in the Fields,' at Brussels in 1848. After further study at Paris, Frankfurt, and Rome, he sent to the Royal Academy in 1855 the large picture 'Cimabue,' representing the triumphal procession in Florence of the master's picture 'Madonna,' a work that produced a great impression in England, and was at once purchased by the Queen. This was followed in rapid succession by a brilliant series of classical, scriptural, and dramatic works, which have earned for him an honourable place in the first rank of English painters. Among the chief of these are 'The Triumph of Music' (1856), 'Scene from Romeo and Juliet' (1858), 'Capri—Sunrise' (1860), 'Michael Angelo Nursing his Dying Servant' (1862), 'Dante in Exile' (1864), 'Syracusan Bride leading Wild Beast to the Temple of Diana' (1866), 'Actæa' (1868), 'St. Jerome' (his diploma work, 1869), 'Hercules Wrestling with Death for the Body of Alcestis' (1871), 'Weaving the Wreath' (1873), 'Moorish Garden; a Dream of Granada' (1874), 'Daphnephoria' (1876), and 'the Music Lesson' (1877). In 1877 he produced his remarkable essay in sculpture, 'An Athlete Wrestling with a Python,' which was purchased by the Academy from the Chantrey Fund for £3000. As a painter L. is distinguished by strong individual character, and staunch adherence to the traditions of the schools, especially that of Venice.

Leighton-Buzzard ('Buzzard' is a corruption of the Fr. *beau desert*, and 'Leighton' of the old *Leggan-buhr*, 'the fortress of the legion'), a market-town of England, Bedfordshire, 40½ miles N.N.W. of London by the North-Western Railway. It has an old church dating from the 13th c., a new one, St. Andrew's, erected in 1866, a market-house, and a restored Gothic

cross. There is some industry in straw-plaiting. Seven fairs are held here during the year. Pop. (1871) 4696.

Lein'ingen, a mediatised German house, of which the male line became extinct as early as 1220, but was renewed by Friedrich of Saarbrück, grandson of the previous Count, and in 1317 split into two. In 1799 the head of the chief branch was made a Prince. The possessions of the L. family now form parts of Baden, Bayern, and Hessen. Queen Victoria's half-brother, Prince Karl (1804–56), was father of the present Prince Ernst of L. (born 9th November 1830), captain of the royal yacht 'Alberta.'

Leinster (Irish Gael. *Laighen*, 'a broad-pointed spear,' used by the original settlers, according to the legend of the annalists; the *ster*, 'station,' is a later Scandinavian addition), the most south-easterly of the provinces of Ireland, is bounded N. by Ulster, W. by Connaught and Munster, S. and S.E. by St. George's Channel, and E. by the Irish Sea. Its greatest length from N. to S. is 137 miles, and from E. to W. 83 miles; area, 7619 sq. miles; pop. (1871) 1,339,451. L. is mountainous in the E., especially in Wicklow. With the exception of isolated peaks and hilly tracts, the rest forms a plain intersected by numerous rivers, and in the N. diversified with lakes. The chief rivers are the Dee, Boyne, Liffey, Slaney, and Barrow (with its affluents the Nore and Suir). The Shannon separates it from Connaught. The main industries are tillage, cattle-breeding, and linen manufacture. From 1841 to 1871 the pop. of L. decreased on the average 1½ per cent. per annum. L. comprises twelve counties. See IRELAND.

Lei'pa, or **Böhmisch Leipa**, an old town of Bohemia, Austria, on the Pulsnitz, 46 miles S.E. of Dresden by rail, has cotton, linen, and woollen manufactures. Pop. (1869) 8514.

Leipoa, the aboriginal name of a bird belonging to the family *Megapodidae*, peculiar to Australia and New Guinea, and called by the colonists the native pheasant. The only species known is *L. ocellata*, which very much resembles a pheasant, except that it lacks the long tail of the latter. The L. inhabits sandy plains, where it builds a curious mound-like nest, about 3 feet high and 8 feet in diameter. The lower part of the nest is very hard, and this, added to the fact that ants are always numerous near it, gives the nest very much the appearance of an ant-hill. The L. lays about a dozen eggs, and if these are removed, it will continue, like the common domestic hen, to lay fresh ones.

Leip'zig, after Dresden the largest city in the kingdom of Saxony, is situated in an extensive plain, near the confluence of the small rivers Elster, Pleisse, and Parthe, by which it is in part intersected, 65 miles W.N.W. of Dresden by rail. It is, after Hamburg, the most important commercial town in Germany, is the imperial centre of the book trade, and the seat of the supreme commercial tribunal for the Empire, and of one of the oldest and most renowned universities in Europe. The interior of the city is somewhat irregular and dingy, dating mainly from the 17th and 18th centuries. It is girt by five handsome modern suburbs, now forming a continuous belt, from which it is separated by the Promenades, a chain of fine gardens and shady walks, occupying the place of the old fortifications. Along the line of the Promenades are several fine squares, as the Augustus Platz (on which are many of the finest buildings), Fleischer Platz, and Ross Platz, while the suburbs are ornamented by the Löhrens Garten, Rosenthal, Johannesthal, Johanna Park, &c. The finest buildings are the Augusteum, the seat of the University, built by Geutebrück, after Schinkel's designs, in 1836; the new theatre, an ornate imposing edifice in Renaissance style, designed by Langhaus, and opened in 1868; the museum, a handsome work by Lange (1858), containing rich collections of plaster casts, engravings, and pictures, and among the latter four celebrated landscapes by Calame; the large Pleissenburg, originally a citadel, in which took place Luther's disputation in 1519, but now used as a barrack; and the *rathhaus*, of date 1556, occupying one side of the Markt Platz, near the centre of the city. Of the few good churches, the most notable are the Nicolaikirche, a Gothic structure, dating from 1525, and Thomas-kirche, consecrated in 1496, and containing a beautiful marble altar. L. has a municipal hospital (1811), a physiological institute, a botanic garden, and a conservatory of music, now ranked among the first in Europe. The university (Protestant) is the

most important in Germany in respect of attendance, having, in 1876, 156 professors and teachers, and 2925 students, of whom 1171 were studying jurisprudence, 989 philosophy, 428 medicine, and 337 theology. It was founded in 1409, and has a library of 150,000 vols. and 2000 MSS., while the city has another of 100,000 vols. and 2000 MSS. As a centre of book-selling and publishing, L. ranks next to London and Paris. In 1871 there were 249 book firms, 21 book-commission merchants, and 114 publishers, most of whom had their own printing establishments. Publishers throughout Germany have book depôts here, and packages of new works pour daily into the city, to be at once circulated again. The German booksellers congregate in great number at the Easter or 'Jubiläe' Fair, and transact business at their own Börse. L. has an extensive typefoundry industry and manufacture of chemicals, waxcloth, ether, oils, perfumes, musical and scientific instruments, cigars, hats, &c. Three celebrated annual fairs are held, at Easter, Michaelmas, and New Year, and the first two are still attended by a vast concourse (some 40,000) of merchants and traders, comprising Jews, Greeks, Bulgarians, Armenians, Turks, Persians, and even Chinese. The staple commodities are furs (£1,000,000 worth yearly), leather, cloth, woollen wares, linens, and glass; and transactions are valued annually at £10,000,000. A wool market is also held for three days in June. Pop. (1875) 127,387. L. is said to have been originally a Slavic settlement, its name, *Lipz*, meaning 'town of the lindens,' from *lip* or *lapi*, 'a linden.' It clustered round a castle built by King Heinrich I., and is first mentioned in history as a town in 1015. It was fortified in the 11th c., received various privileges from Otto the Rich, Markgraf of Meissen, about 1170, and thereafter increased rapidly. As early as 1180 biennial markets, at Easter and Michaelmas, were held, and attained great importance in the 15th c. In 1458 a New-Year's fair was added, and subsequently the privileges of the town were extended by the Emperor Maximilian. The *L. Conference* between Luther, Eck, and Karlstadt (1517) connects L. with the advance of the Reformation. The town was five times besieged and taken during the Thirty Years' War. Tilly took it in 1631, and later the Swedes and the Imperialists held it alternately. Its growing commerce was again checked by the Seven Years' War. In and about it took place the great battle of L., or 'battle of nations,' between Napoleon with 180,000 men, and an allied force of 300,000, commanded by Prince Schwarzenberg, Blücher, and Bernadotte. After a terrible conflict of three days the French were forced to evacuate L., with the loss of 3,000 killed and wounded, and 30,000 prisoners, on the 18th October 1813. See Gretsche, *Beiträge zur Geschichte L.'s* (Leips. 1836); Grösse, *Geschichte der Stadt L.* (Leips. 2 vols. 1840-42); Sparfeld, *Chronik der Stadt L.* (Leips. 2d ed. 1851); and Zarncke, *Die Urkundlichen Quellen zur Geschichte der Universität L.* (Leips. 1857).

Leith, after Glasgow and Greenock the chief port of Scotland, is situated on the S. side of the Firth of Forth, at the mouth of the Water of Leith, distant 2 miles N.N.E. from the centre of Edinburgh, with which city it is connected by the continuous line of houses in Leith Walk, and by direct railway and tramway lines. It lies on low ground, and is divided by the Water of Leith into two parts, called North L. and South L. (now more correctly West and East L.). The older portions of the town are squalid and straggling, although considerable improvement has been effected in recent years. The Water of Leith is here crossed by four bridges, and the harbour opposite the docks is spanned by an iron bridge worked by hydraulic power, and swinging in a single leaf over a waterway 120 feet in width. This bridge was recently erected by the Dock Commissioners at a cost exceeding £32,000, chiefly to carry the railway traffic across the harbour. In South L. are extensive links, formerly much used for golfing, and containing several mounds raised by Cromwell's soldiers in 1560. The more notable buildings are the parish church of St. Mary, built in 1450, with a modern front and tower; the elegant Anglican church of St. James, with a spire and peal of bells, designed by Sir G. G. Scott; North L. parish church, with a spire 184 feet high, erected in 1814 at a cost of £14,000; Trinity House, founded in 1555, and rebuilt in 1817; the town-hall (built 1827); the Royal Exchange buildings (cost £16,000), the High School, the Corn Exchange, now partly used as a reading room, custom house, and various banks, and other offices. Facing the shore, to

the W., is L. Fort, the head-quarters for the Royal Artillery in Scotland, with accommodation for 400 men and 150 horses, and the Caledonian Railway Station, of recent construction, lies between the Fort and the Shore. The industries of L. are mainly distilling, brewing, sugar-refining, the building and repairing of ships, flour-milling, engineering, and the making of sailcloth, ropes, soap, chemicals, bottles, &c. It is now the second port in Scotland for the export of coal. But the principal feature of L. is its splendid harbour and extensive docks. There are (1877) four wet docks, with a total water area of 26 acres; the last constructed, the Albert Dock, alone covers 10½ acres. To the E. of the Albert Dock, and on the shore of South L., a new wet dock with a centre quay and a water area of 16½ acres is (1877) in course of construction. The reclamation work for this dock and for railway accommodation adjoining, encloses 110 acres of the seashore, and ample provision is made for the public in the way of roads and accesses to the shore, &c. There are also several graving docks, of which the largest (the Prince of Wales) is 450 feet long, 73 wide at the entrance, and 24 deep on sill at spring-tide. Two magnificent piers, the E. 3530 feet, the W. 3123 feet long, stretch out into the Forth, forming delightful promenades, and affording beautiful views of Edinburgh and the Fife hills. The trade of L., mainly foreign and colonial, and to a large extent transit, is steadily increasing. In the year ending 15th May 1877, there entered the port 4279 vessels of 919,655 tons (2130 steamers, of 576,031); and cleared, 4275 of 916,506 tons (2136 steamers of 577,418). In the same year the tonnage dues on vessels amounted to £28,721, and shore dues on goods (inward and outward) to £39,820; the total revenue of the port was £82,570, and expenditure (including cost of new wet docks) £124,603. Eleven years ago (1865) the total revenue was only £42,176. The chief imports are grain, timber, flour, guano, bones (for manure), tobacco, fruits, wine, cattle, and oil-cake; the exports are coal, iron, paper, ale, spirits, &c. The quantity of coal exported in the two years ending 15th May 1877 was 607,509 tons. With Portobello and Musselburgh, L. returns one member to Parliament. Pop. (1871) 44,277. L. is a place of considerable antiquity, reference being made to it in documents of the 12th c. It was the chief port in Scotland for several centuries, and was under the control of the municipality of Edinburgh till 1833, but since then the town has had its own provost and council, while the harbour and docks have been vested in a corporation of commissioners elected by various public bodies of Edinburgh and L.

Leit'meritz (Czech *Litomerice*), a town of Bohemia, on the right bank of the Elbe, which is here spanned by an iron bridge 597 yards long, 35 miles N.W. of Prag, has a fine cathedral (founded 1054), six churches, five educational institutions, &c. Brewing, salmon fishing, straw plaiting, and agriculture are the principal industries, and large quantities of fruit are annually exported to Berlin and St. Petersburg. Pop. (1869) 10,023.

Leit'omischl, a town of Bohemia, on the Lantschna, an affluent of the Elbe, 88 miles E.S.E. of Prag, has fine churches and the noble *schloss* of the ducal branch of the house of Walstein. The staple industries are the cultivation, spinning, and weaving of flax. Pop. (1869) 6789.

Lei'trim (Irish Gael. *Líath-dhrúim*, 'the grey ridge'), a county of Ireland, province of Connaught, surrounded, except in the N.W., where it borders on the Bay of Donegal, by Sligo, Roscommon, Longford, Cavan, Fermanagh, and Donegal. The area is 597 sq. miles, 25 of which are under the larger rivers and lakes; the pop. (155,297 in 1841) was, in 1871, 95,562, of whom 85,974 were Roman Catholics. The S. portion of L. is a plain, bordered on the W. by the Slannon, studded with small loughs and intersected with affluents of that river and the Erne, but the rest (two-thirds of the county) is very mountainous. The chief penks are Truskmore (2072 feet) in the N., Slieve-an-Ierlin (1922 feet), and Slieve-na-Killa (1711 feet) in the E. L., at its narrowest part, is nearly cut in two by Lough Allen. The prevailing rock in the S. of L. is limestone, and in the N. sandstone; the soil is fertile only in the S. The main crops are oats, potatoes, and hay. In 1871, 86,738 acres were under tillage; 212,632 in pasture, 3265 plantation, and 66,580 waste, bog, mountain, &c. Some of the inhabitants are employed in making frieze, coarse woollens, and linen, and in working limestone and

coal. Iron and lead ores are also found in L. There are three market-towns, Carrick-on-Shannon (which is also the assize town), pop. (1871) 1431; Mohill, pop. (1871) 1062; and Manor-Hamilton, pop. (1871) 977. The county has two members of Parliament. L. was conquered by the English in the reign of Elizabeth. Brian O'Rourke rebelled in 1583, and in 1596 his son, Teague O'Rourke, who was not reduced till 1603.

Leland, Charles Godfrey, a versatile American writer, born at Philadelphia, August 15, 1824, graduated at Princeton College (1846), travelled in Europe, and studied at Heidelberg, Munich, and Paris, and returning to America in 1848, was called to the bar (1851). Relinquishing law for literature, he wrote for periodicals, and was editor of several American magazines, but shortly after the close of the Civil War, in which he saw some service, settled in England, where he has since continued to reside. L.'s fame rests chiefly on his *Hans Breitmann's Ballads* (5 parts, 1867-70; complete ed. 1872), written in the broken English of a Pennsylvania German; somewhat similar to which is his *Pidgin English Sing-Song* (1876). He is also author of two works on the English gypsies, various translations from the German, the *Egyptian Sketch-Book* (1873); *Johnnykin and the Goblins* (1876), &c.

Leland, or Laylonde, John, the first English antiquary, born in London about 1506, passed from St. Paul's School to Christ's College, Cambridge, where he graduated in 1521; afterwards, at Oxford and Paris, studied, besides Greek and Latin, Anglo-Saxon, Welsh, French, Spanish, and Italian; and having taken orders, received the living of Popeling in Calais Marches (1530), the posts of chaplain and librarian to Henry VIII., and the title of King's Antiquary (1533), with a commission to examine all the libraries of the kingdom. For six years he travelled through England and Wales, compiling notices of the towns, castles, and religious houses, catalogues of libraries and extracts from the books they contained, with miscellaneous topographical and historical memoranda. Six more years he spent in the task of arranging the mass of material he had thus accumulated, receiving the rectory of Haseley, Oxfordshire (1542), and a canonry of King's College, Oxford (1543), but his reason gave way; he became perfectly insane in 1550, and died at London, 18th April 1552. Of his invaluable collections, which were dispersed at his death, some have perished, others were deposited (1632) in the Bodleian Library at Oxford. Of the latter the *Commentarii de Scriptioribus Britannicis*, was edited by Anthony Hall (2 vols. Oxf. 1709); and the *Itinerary* (9 vols. Oxf. 1710-12; 3d ed. 1770); and *De Rebus Britannicis Collectanea*, by Thomas Heaure (6 vols. Oxf. 1715; 2d ed. 1770).

Leland, John, D.D., a Presbyterian divine, born at Wigan, in Lancashire, 18th October 1691, was educated at Dublin, and receiving the pastorate of a congregation in New Row in that city (1716), continued to labour there until his death, 16th January 1766. He was the author of an answer to Tindal's *Christianity as Old as the Creation* (1733); to Morgan's *Moral Philosopher* (1739), for which Aberdeen University conferred on him its doctor's degree; to Dodwell's *Christianity not Founded on Argument* (1742); and to Bollingbroke's *Letters on History* (1752). He also wrote *A View of the Principal Deistical Writers in England* (1754); and *The Advantage and Necessity of the Christian Revelation* (1762). See the life, by Isaac Weld, prefixed to his posthumous *Discourses on Various Subjects* (4 vols. 1769).

Lely, Sir Peter (Peter van der Faes), was born at Soest, Westphalia, in 1618. He was a pupil of the painter Peter Grebber. In 1641, the year following that of Van Dyck's death, he visited England, where he soon fell to portrait-painting, following Van Dyck's popular style. Undisturbed by political changes around him, he pursued his profession with equal success under Charles I., Cromwell, and Charles II., by whom he was knighted. Being court-painter to Charles II., he was chiefly occupied, as might be expected, in executing female portraits, and his array of 'Windsor Beauties' remains to testify to the king's taste and the painter's skill. His portraits of men are, as a rule, wanting in vigour; but his ladies, for easy attitude, graceful drapery, and depth of expression, equal those of Van Dyck. Of his historical subjects, the best known are 'Susanna and the Elders,' 'Jupiter and Europa,' 'Cimon and Iphigenia.' L. died in 1680.

Lemaître, Frédéric, one of the greatest of French actors, was born at Havre, in July 1798, and studied for two years under Lafon at the *Conservatoire*. He played at the 'Odeon,' and 'Comédie,' but found his proper sphere at the 'Porte-Saint-Martin,' where his brilliant and versatile powers gained him the name of the *Talma du Boulevard*. The ease with which he passed from the tragic through the airiest comedy to all the phases of the eccentric and grotesque, made him the great actor of the new romantic school of art and poetry. He embodied the finest conceptions of Dumas and Victor Hugo, and among his many leading parts were 'Ruy Blas,' 'Lucrece Borgia,' 'Kean,' and 'Robert Macaire.' L. died 1st February 1876.

Léman, Lake. See GENEVA.

Lemberg (Polish, *Lwow*; Lat. *Leopolis*: Fr. *Léopol*), the capital of Galicia, Austria, on the Poltew, 368 miles N.E. of Vienna, and 190 miles E. of Cracow by rail. The older part of L. is uninteresting, but its seven suburbs make it one of the finest towns in Austria. It is the seat of a Catholic, a Greek, and an Armenian archbishop, and has twelve monasteries and thirty-one churches, chief of which are the Roman Catholic cathedral (1344), in the Gothic style, the Dominican church, and the Greek Cathedral of St. George, with the archiepiscopal palace. The Rathaus is modern, and has a tower 262 feet high. There are many educational institutions, and a university, founded in 1784, which has 1000 students, and a library of 50,000 volumes. The National Institute, founded by Count Ossolinski in 1817, possesses 100,000 volumes, and a large museum of paintings and antiquities. L. has a great commission trade, and manufactures attar of roses, wax-lights and lucifer-matches, naphtha, paper, and machinery. During the six weeks following the 6th of January there is annually held a great fair and money-market. L., formerly called Löwenburg, from its founder Lew or Leo Danielwicz, Prince of Halicz, dates from 1259. It was taken by Kazimierz III. in 1348, and was besieged by the Tartars in 1525, the Russians and Cossacks in 1556, Radoczy in 1657, the Turks in 1672, and the Swedes, under Karl XII., in 1704. In the first division of Poland it fell (1772) to Austria. Pop. (1876) 87,109.

Lemm'a (Gr. 'something assumed') in geometry, is a preliminary proposition, established with a view to facilitate the demonstration of a theorem, or the construction of a problem.

Lemming (*Myodes Lemmus*), a genus of *Rodentia* (q. v.), inhabiting N. Europe, and included in the *Murida* or Rat family. The ears are very small. The feet have hairy soles, and the structure of the fore-feet is eminently adapted for digging in the ground. The tail is extremely short and hairy. The teeth number sixteen, and include two incisors, two premolars, and four molars in each jaw. The average size of the L. is about 6 inches. The colour is dark-brown above, the under parts being yellowish-white. The chief interest attaching to the L. arises from its periodical migration in immense hordes from the interior to the sea, travelling invariably in a straight line. If rivers or lakes of considerable breadth intervene, the animals swim across; and so destructive are they, that the Roman Catholic clergy are accustomed to use a form of exorcism whenever they appear in any district.

Lemnian Earth, a mineral substance of a clayey consistency, found in the island of Stalimene (ancient *Lemnos*), and used by the Turks as a medicine. Formerly it was dug up annually with considerable ceremony, and stamped with an official seal.

Lemnos (still so-called, and also by its modern name *Stalimene*), is an island in the Aegean Sea, about halfway between Mt. Athos and the Hellespont. It is 147 sq. miles in area, and its rocks exhibit manifest signs of volcanic action. L. was the fabled residence of Vulcan, who is said to have fallen upon it when hurled by 'angry Jove' from heaven. It had a famous labyrinth, and its chief production is a species of red earth. See LEMNIAN EARTH.

Lemon (Fr. *limon*, from the Turkish *limun*, and that from the Arab. *lismun*), a fruit which is the produce of *Citrus Limonium*, one of the varieties of Linnæus' *C. medica*, of which other varieties are the Citron, the Lime, the Sweet L., and, in the opinion of some authorities, the Orange also. According to Alph. de Candolle, the L. was unknown to the ancient Greeks.

and Romans, its culture only extending into the W. with the conquests of the Arabs. It is now largely grown as an article of commerce in various countries bordering on the Mediterranean, the fruit being used extensively in the preparation of *L.-juice*, which is largely employed in the manufacture of lemonade and by calico-printers. *Oil of L.*, expressed or distilled from the fresh peel, serves for flavouring, &c., and from it citric acid is prepared. *L.-peel* is the outer rind of the fruit, and used either in a fresh or dried state, for various domestic and medicinal purposes. The *L.* has become naturalised in parts of S. America, and in some of the W. India islands. *L. coloured* expresses the purest yellow without any brightness.

Medicinal Properties of the L.—*L.-juice* is administered in febrile and inflammatory affections, and in acute rheumatism, but its chief use is as an antiscorbutic, its properties as such having been ascertained in 1609. It was not, however, till 1795 that the Admiralty gave a general order for the supply of *L.-juice* to the crews of the navy.

Lemonade, a cooling pleasant antiscorbutic beverage prepared by adding sliced lemons and a sufficiency of sugar to boiling water, leaving the mixture till it cools, and then straining off the liquor. The name is also commonly given to an aerated beverage (see *AERATED WATER*) to which a proportion of syrup of lemons is added.

Lemon Grass (*Andropogon Schenanthus*) is a native of the deserts of Arabia, &c., frequent in British gardens as a stove-conservatory plant. The fresh leaves when bruised emit a delightful lemon-like scent, and a fragrant oil known medicinally as *Siri-oil* is obtained by distillation. A similar species occurs in arid places of the interior of N. Australia.

Lempriere, John, D.D., was born in Jersey about 1755, and studied at Pembroke College, Oxford. In 1788 he published the *Classical Dictionary*, which for many years was familiar in the hands of English classical students, but which has long been displaced by works more equal to the demands of modern scholarship. *L.* published a *Universal Biography* in 1808, and died 1st February 1824.

Lemur, the name given to various genera of *Strepsirrhine* or lower monkeys, chiefly inhabiting Madagascar, but also occurring in the E. Archipelago. They have, as a rule, fox-like heads. All the feet are provided with five toes, and the hinder feet are usually larger than the fore feet. The nail of the second finger is long and curved. The most familiar forms are the ring-tailed *L. (L. caffa)*, the red *L. (L. ruber)*, the diadem *L. (Propithecus diadema)*. The Flying Lemurs (*q. v.*) or *Galeopithecida* have relations

Lemur.

rather with the Insectivora than with the true *L.*

Lemures were the spirits of the departed, believed by the Romans to wander about at night in frightful forms, and terrify the living. Their festival, called *Lemuria*, was held on the 9th, 11th, and 13th of May, when certain ceremonies were performed with the view of propitiating them.

Le'na, one of the principal rivers of Siberia, rises near Irkutsk, in the mountains that line the N. shore of Lake Baikal, flows N.E. for about half its course, and then almost due N., entering the Arctic Ocean by two main and six minor channels. It is 2540 miles long, and its chief affluents are, on the left, the Viljui and Nun, and on the right, the Aldan, Vitim, and Olekma. The chief towns upon it are Kirensk, Vitimsk, Olekminsk, Jakutsk and Schigansk. The *L.* is by far the greatest trading river of E. Siberia, and is open from May till November.

Len'elos, Ninon de, the French Aspasia of the 17th c., was born of good family at Paris, 13th May 1616. Her mother endeavoured to train her piously; but her father cultivated with

more success her taste for pleasure. She was singularly beautiful, spoke several languages with ease, excelled in other accomplishments, and enjoyed a yearly income of £10,000. When seventeen she left the maternal roof, some say under the protection of Richelieu, others, under that of the Duc de Colligny. It matters not which was first; her intrigues continued for fifty years, and with more than fifty lovers. In one instance, indeed, she remained with an amorous gentleman in the country for three entire years; but such a breach of her own rules was not to be tolerated, and her mob of admirers recalled her to Paris. In the case of one family—the Seignés—she was mistress successively to father, son, and grandson. She closed her list of successful adorers with Chateaucneuf at seventy, but was considered beautiful when nearly ninety. Of her two sons, one, ignorant of his parentage, made love to her, and shot himself on learning the truth. Despite her character, the best of society visited her; authors and authoresses were proud to correspond with her; and anxious mothers brought their children to her home to study society—for manners then took the place of morals. Ninon was no worse than many ladies of her time—only more beautiful and more distinguished in her connections. She died in 1705. There are some genuine letters of hers in the works of St. Evremont, but those under her name addressed to the Marquis de Seigné are spurious. See *Sardière's Vie de N. de L.*; *Bret's Mémoire sur N. de L.*; and *Voltaire's Lettre sur Mlle. de L.*

Lenkoran, a Russian port on the Caspian, at the mouth of a small stream of the same name, 133 miles S.S.W. of Baku, and 20 miles from the Persian frontier, is an important station for trade between Russia and Persia. Pop. 6000.

Lennepe. See *WUPPERTHAL*.

Lennepe, Jacob van, a great Dutch novelist, born at Amsterdam, 24th March 1802, was the son of David Jacob van L., the philologist, who died in 1853. *L.* chose the profession of law and acquired a large practice. After publishing at Amsterdam *Vaderlandsche Legendes*, a collection of heroic legends, he produced two successful political comedies, *Het dorp aan die Grenzen*, and *Het dorp over die Grenzen* (Amst. 1830), inspired by the revolution in Belgium at that time. Of his subsequent dramatic pieces, which number about thirty, *De Vrouw van Waardenburg* (1859) is the most popular. The list of his novels contains more than fifty, of which the best known are *De Roos van Dekama* (Amst. 1837); *Ferdinand Huyck*, and *De lotgevallen van Klaasje Zevenster* (5 vols. ib. 1866). Among his other works were an *édition de luxe* (12 vols. 1857–66) of the poet Vondel (*q. v.*); *Geschiedenis van Noord-Nederland* (1865 et seq.), and *Nederlands Roem* (1856 et seq.). *L.* died August 26, 1868. The elegant and interesting style of *L.*, and his animated pictures of scenes from the national history, have led his countrymen to call him the 'Walter Scott of Holland.'

Lennox'town, a post-village of Scotland, in Stirlingshire, on the Glazert Water, near the Lennox hills, 11 miles N.N.E. of Glasgow by rail. It has calico printworks, lime and alum works, and, in the vicinity, extensive collieries. Pop. (1871) 3917.

Lenocin'ium, a term of English and of Scotch law, more commonly used in the latter than in the former, denoting a husband's connivance at his wife's adultery. It affords the wife a valid defence against an action for divorce on the ground of adultery.

Lens (Lat. *lens*, 'a lentil') is a thin, usually circular, segment of glass, or other transparent material, bounded by two surfaces, one of which at least must be curved. If parallel rays of light be transmitted through such a structure, they in general suffer refraction, so as to converge to a point on the other side of the *L.*, or to diverge as if radiating from a source of light placed at a point on the same side of the *L.* from which the incident rays approach. This optical property divides lenses into two great classes, to the first of which the varieties known as the double convex, plano-convex, and concavo-convex or meniscus, a diametral section of which is crescent-shaped. These make parallel rays converge, while the double concave, plano-concave, and convexo-concave make them diverge. Assuming the *L.* to be circular, the straight line drawn through the centre perpendicular to the opposing surfaces is the *axis* of the lens. Now, in accordance with the known laws of Optics (*q. v.*), a ray of light falling upon the curved surface of a denser medium, at any angle within certain

Limits is bent in *nearer* the normal at the point of incidence. Consequently, rays passing through a glass L. will be refracted towards the normal at the point of incidence, and away from the normal at the point of emergence. If the L. be double convex both normals drawn inwards approach the axis, and hence any incident ray will be refracted towards the axis. A pencil of rays parallel to the axis will be made to converge, and those which are near the axis, should the bounding surfaces be portions of spheres, will approximately converge in one point on the axis which is termed the principal focus. If a source of light, therefore, be placed at the focus, the diverging rays which fall upon the L. are refracted so as to become nearly parallel. The rays from a source of light at a greater distance than the focus converge at a point, whose distance from the L. is also greater than the focal distance, while rays from a source nearer than the focus still diverge after passing through the L. It is for this reason that an object within the focal distance appears magnified to an eye placed close on the other side of the L. The great importance of lenses lies in their application to the construction of optical instruments, such as the microscope, telescope, spectacles, &c., and to these reference must be made for a fuller discussion of the purely optical properties, as well as the phenomena attending the combination of lenses in various ways.

Lens, a town of France, department of Pas-de-Calais, on the Souchez, 12 miles N. of Arras by rail. It is the ancient *Elena* or *Lenense*, and has sugar refineries, distilleries, &c. Pop. (1872) 7298.

Lent (Old Eng. *lencten*, 'spring') is a fast of forty days (hence its Greek and Latin names, *tessaraktoste* and *quadragesima*) previous to the celebration of Easter. At first the observance only lasted forty hours—from the afternoon of the Crucifixion-day to the morning of the Resurrection-day. It was then extended to three, four, or six days in the week before Easter, according to the option of different churches, and afterwards to three and six weeks, always excepting the Sundays, which were celebrated as a festival in honour of Christ's Resurrection, and in some churches, especially in the East, also the Saturdays or Sabbaths. To this period of thirty-six days Ash-Wednesday and the three following days were authoritatively added in the 6th c., probably by Gregory the Great, from the idea that it was meet to follow the example of Moses, Elias, and Christ, who fasted forty days. St. Gregory's rule that L. begins on the Wednesday of the seventh week before Easter, is universally followed in the West, but in the Eastern Church L. begins on the Monday after Quinquagesima.

Lenthall, William, Speaker of the Long Parliament, was born at Henley-on-Thames, Oxfordshire, in June 1591; educated at Thame School and St. Alban Hall, Oxford, and called to the bar at Lincoln's Inn in 1616. Elected M.P. for Woodstock, he was chosen Speaker of the House of Commons (1640), and as such was desired by Charles I. to point out to him the five members whom he had come down to arrest, January 4, 1642. 'May it please your Majesty,' said L., falling on his knees, 'I have neither eyes to see, nor tongue to speak, but as the House directs me.' He was rewarded for his conduct on this occasion by the posts of Master of the Rolls, Commissioner of the Great Seal, and Chancellor of Lancaster, but shared in the expulsion of the Rump, and retired from public life until 1654, when he sat for Oxfordshire, as again in 1656. At the Restoration his name was exempted from the Act of Indemnity, but he obtained a pardon, and retired to Burford Priory, Oxfordshire, where he died, September 3, 1662, having on his deathbed recanted his 'puritanical errors' to the Bishop of Chichester.

Lentibularia, *cea* is an order of plants, chiefly aquatic, or growing on marshy ground. The two principal genera are *Pinguicula* and *Utricularia*, both having several representatives in British flora. (See BUTTERWORT and BLADDERWORT.) The total number of species of the order is about 150, for the most part indigenous in the temperate and cold regions of the globe.

Len'til (*Ervum* or *Vicia Lens*, or *Lens esculenta*) is a leguminous plant belonging to the same genus as the Tares, consequently closely related to the Vetches. It is a slight growing annual, of about eighteen inches high, having racemes of a few pale blue flowers, succeeded by short, smooth pods, each containing two seeds. From these seeds a palatable and nutritious food is obtained—one of the important 'pulses' of various East-

tern countries, thus rendering the L. a staple item of cultivation in Egypt, Syria, Bengal, &c. In Britain the consumption is limited, principally to the preparation of so-called patent invalids' food, such as Revalenta, of which L.-meal is nearly an equivalent. The necessary supply is usually imported from Egypt, though home-cultivation has been advocated, not only for the seed produce, but for the sake of the fodder remaining after its removal. The L. is spoken of as an article of food in Genesis xxv.

Lenti'ni, a town of Sicily, province of Syracuse, 25 miles N. by E. of the city of that name by rail, and on the E. side of Lago di L. Its chief industries are gunpowder-making and the lake fisheries. There are many interesting antiquities. Pop. (1874) 10,578. L. was one of the earliest (B.C. 730) of the Greek settlements in Sicily.

Lento (It.). A musical term for a slow rate of movement. **Lentando** means *becoming slower*.

Le'o, the name of thirteen popes, of whom the following are the most important:—**L. I.** ('the Great'), born towards the close of the 4th c. either at Rome or in Tuscany, was sent by Boniface I. on a mission to Carthage (418), and by the Emperor Valentinian III. to Gaul, to settle the dissension between Aëtius and Albinus, in the course of which negotiation Sixtus III. died, and L. was unanimously chosen his successor (440). Favoured by circumstances, he strove successfully to extend the powers of the papacy. He crushed the Pelagian, Manichean, Eutychian, and Priscillian heresies, brought the church of Africa to acknowledge the supremacy of Rome, and retained that of Illyria in obedience. Hilary of Ailes (q. v.) succumbed before his claims, and four of his legates presided at the Council of Chalcedon (451), where his epistle to Flavianus, Bishop of Constantinople, was admitted as the rule of faith for the Church-Catholic. It was L. who induced Attila to evacuate Italy (452); but he could only prevail upon Genseric (q. v.) to refrain from murder and conflagration, and to spare three of his churches from the general sack (455). He died November 10, 461. Of his writings, which comprise 96 *Sermones* and 173 *Epistolæ*, the best editions are by Quesnel (Par. 1675) and the brothers Ballerini (3 vols. Verona, 1755-57).—**L. X.** (*Giovanni de' Medici*), second son of Lorenzo de' Medici, born at Florence, 11th December 1475, received the tonsure in his seventh year, along with the abbacies of Fontendolce and Passignano; became cardinal *in pectore* (1488), and full cardinal-deacon (1492); shared in the expulsion of the Medici family (1494); in 1499 visited Venice, Germany, and France; and returning to Rome, led a life of pleasure, busied only with music and letters. In 1505, however, Julius II. made him governor of Perugia, and in 1511 Legate of Bologna and head of the Papal contingent to the Holy League, commanding which at the battle of Ravenna (1512), he was taken prisoner by the French. On his release he lived successively at Bologna and Florence, working for the restoration of the Medicis, till in 1513 he succeeded Julius on the throne of Peter, at the early age of thirty-eight. L. had a mighty part to play. On the eve of the Reformation, and in the full flush of the Renaissance, Christendom demanded for its head a saintly and learned politician, a liberal ecclesiastic, one who should know how to forward reformation from within, and advance the New Learning from without. Partly, but only partly, L. answered to the call. Aided by his secretaries Bembo (q. v.) and Sadoleto, he founded a Greek college and press, under the direction of Andreas Lascaris (q. v.); he re-endowed the University of Rome, gathering scholars and manuscripts from all parts of Europe; and was besides a splendid patron of painting, sculpture, and architecture. But his very merits in this direction engendered his gravest fault. To find funds for the rebuilding of St. Peter's, he issued those Indulgences (q. v.) which called forth the theses of Luther, and in these L. could only see the 'quarrel of friars.' Politically, L. followed in the track of his predecessors, his object, like theirs, being to attain the independence of Italy from foreign supremacy by pitting the rival powers against each other. By Sforza's victory at Novara he effected the expulsion of the French; and he brought Louis XII. (1514) to recognise the Fifth Council of Lateran, and François I. (1515) to substitute the Concordat for the Pragmatic Sanction of 1438. He joined Urbino to the Papal States, and purchased Modena of Maximilian I., with whom he shared in the defeat of Marignano (14th September 1515). In 1518 he proclaimed

a five years' truce among all Christian princes, to leave them free to act against the Turks, but broke it himself by the conclusion of a secret treaty with Karl V. (8th July 1521). L. died at Rome, December 1, 1521.—**L. XIII.** (*Gioacchino Pecci*), born of a noble family at Carpineto, near Anagni, 2d-March 1810, was a great favourite with Gregory XVI., but not with Pius IX. so long as Antonelli lived. He obtained, however, a Cardinal's hat in 1853, and as Archbishop of Perugia proved himself an able administrator. He was elected Pope 20th February 1878. L. is described by those who know him as 'of blameless character, sincerely religious, well versed in Church matters, and of moderate and even liberal opinions.' See Roscoe, *Life and Pontificate of Leo X.* (4 vols. 1805); and Ranke, *Die Röm. Päpste* (1834).

Leo, surnamed **The Isaurian**. See **BYZANTINE EMPIRE**.

Leo, a constellation of the N. hemisphere, the principal stars of which form a well-marked sickle. It has one star of the first magnitude, *Regulus*. L. is the fifth sign of the Zodiac (q. v.).

Leominster, a town of England, in Herefordshire, on the river Lug, 12 miles N. of Hereford and 127 of London by rail. It has an old parish church (restored by Sir G. G. Scott), a town-hall, market-house, and corn-exchange. The district is famed for the breeding of cattle, sending to the shows most of the prize 'Herefords.' Besides the weekly Friday markets there are seven fairs held here in the course of the year. Pop. (1871) 5863. L. sends one member to Parliament.

León, a former kingdom and province in the N.W. of Spain, bounded N. by Asturias, S. by Estremadura, E. by Old Castile, and W. by Portugal and Galicia, now divided into the lesser provinces of L., Zamora, and Salamanca. The country is only flat in the centre and S., where it is watered by the Douro and its tributaries, and where are produced large quantities of flax, hay, garden fruit, drugs (especially Icelandic moss), walnuts, &c. There is also much sheep (merino) and cattle-rearing. The N. is a romantic region of high mountains, upland heaths and vast forests. In the N.W. the amphitheatre of El Yezro (the Roman *Bergidum*, the *Interamnium Flavium* of Ptolemy), girt with snowy peaks, is known as the Spanish Switzerland. The Leonese boast of being the 'old Christians,' free from admixture of Moorish blood, and are high-spirited though indolent and illiterate. After passing through the hands of the Romans, Goths, and Arabs, the land was conquered by Alfonso the Catholic (A.D. 739-757). The Christian kingdom of L. and Oviedo was permanently united to Castile by Fernando III. in 1230.—L., the capital of a province of the same name, Spain, on the left bank of the Bernesga, and above its confluence with the Torio, 90 miles N.W. of Valladolid by rail. It is the *Legio septima gemina* of the Romans. The seat of a bishop and a celebrated school, it has a richly-sculptured Gothic cathedral, fourteen churches, eleven convents, a fine town-house (1585), and many palaces of the dukes of Uceda, the counts of Luna, the Guzmans, &c. It is the centre of the Spanish flax and linen trade, now greatly diminished, and has an important yearly horse market. There are remains of the old Roman wall, 20 feet thick. Pop. 9603.

Leon, a city of Nicaragua, and capital of a department of the same name, 10 miles inland from the Pacific. It adjoins the Indian town of Subtiaba, and has a cathedral (1746-74), some twelve other churches, a new episcopal palace (unfinished in 1873), an old one of 1678, and connected with it the College of San Ramon, the University of Nicaragua. The central streets are paved and lighted. The vicinity is very picturesque, and there are many mineral springs at the foot of the neighbouring Sierra de los Marrabios. L. has almost no industries, but carries on some trade through the port of Corinto. Pop. 24,000. The town was founded originally on the W. side of Lake Managua in 1523, but was removed hither in 1610. It was formerly the capital of Nicaragua.—**L.**, the second largest city of Mexico, state of Guanajuato, on a tributary of the S. Iago, 200 miles N.W. of Mexico city. It was founded in 1576, but its modern growth dates from the middle of the present century. The great emporium for the teaming plains or *bajis* of Guanajuato, it has large manufactures of cottons, woollens, leather, saddlery, &c., and a few miles to the N. are the iron mines of Comanja. In 1875 contracts were concluded for the construction of railways between L. and Mexico, and L. and Rio Grande. Pop. 100,000.

Leonforte, a town of Sicily, province of Catania, overlook-

ing the river Dithaino, 33 miles W. of Catania by rail. Its churches contain some good pictures, and there is a trade in grain, oil, almonds, sulphur, and wine. Pop. (1874) 12,010.

Leonidas I. became king of Sparta about B.C. 491. When the Greeks made a stand against Xerxes at the pass of Thermopylae, L., at the head of only 300 Spartans and about 5000 auxiliaries, repeatedly drove back the hosts of the Persian king. Ephialtes, a Malian, having betrayed to the enemy a pass over the Anopæa which enabled them to attack the Greeks in the rear, L. and his noble band refused to retreat, and fell in battle, bravely charging the advancing foe.

Le'online Verses, in Latin poetry, are verses whose closing syllable rhymes with the cæsura in the third foot. They occur occasionally in Virgil, more frequently in the elegiacs of Ovid, and were generally adopted by the Latin hymn-writers and versifiers of the middle ages. Their name is derived from Leonius, or Leoninus, who in the 12th c. was canon of the churches of SS. Benedict and Victor in Paris, and dedicated several poems in this metre to Pope Alexander III., or from one of the Popes Leo. An example is

'Si Trojæ fatis aliquid restare putatis.'—Ovid.

Leopard (*Felis leopardus*), a well-known species of carnivorous mammals, inhabiting Africa and Asia, and allied to the American Puma (q. v.) and Jaguar (q. v.).

The average length of the L. is about 7 feet, and its colour is a golden yellow, on which black spots of rosette shape are disposed. A variety named the black L. (*Leopardus*, or *Felis melus*), is also known; and it may be remarked that by many authorities the distinctions between the L. and the nearly-allied panther (*F. pardus*) are not regarded as of stable or clearly specific nature. The L. has great strength and activity, and commits much havoc among cattle and sheep.

Leopard.

Leopard, The, in Heraldry, was a common charge on the arms of abbots and abbesses, as it was thought to be a cross between the pard and lioness, and therefore unproductive of issue. *Leopard* was the ancient blazon for the lion *passant*, or *passant guardant*, and it is a moot-point whether the three animals in the English royal arms were originally lions or leopards. Of the L. English heraldry has retained only the face and head.

Leopardi, Giacomo, Count, was born at Recanati, 29th June 1798, and educated under his father's roof. Before his sixteenth year he had read through a vast proportion of the literature of Rome and Greece, and had taught himself French, English, Spanish, German, and Hebrew. His life, after 1814, has been divided with some accuracy into three periods, during which he devoted himself respectively to philology, poetry, and philosophy. During the philological epoch he wrote many dissertations and translations. In 1822 he went to Rome and took a subordinate position as librarian, continuing his critical labours, whilst he developed the somewhat sorrowful views of poetry which he had exhibited four years previously in two canzoni addressed to Monti. In 1823 he returned to his father's house, and composed *Bruto minore*; in 1825 and 1826 he lived between Milan and Bologna, in 1827-29 at Florence. L. died at Naples, 18th June 1837. A collected edition of his works, entitled *Versi e Prose di Giacomo L.*, was published at Florence in 1849. Since his death his fame has increased in his native land, and some critics have not hesitated to rank him as the greatest of Italian poets after Dante.

Le'opold I., **Georg Christian Friedrich**, son of the Duke of Sachsen-Koburg, was born 16th December 1790, entered as a youth the Russian army with the rank of general, saw a good deal of service, accompanied the Emperor Alexander to the Congress of Erfurt, and the army to Paris. In 1814 he visited England with the allied sovereigns, returned again in 1815, married the Princess Charlotte, heiress to the throne, receiving the title of Duke of Kendal with an annual pension of £50,000. L. refused the throne of Greece in 1830. On June 4, 1831, he was elected King of the Belgians. He married, August 3, 1832, Louise-Isabelle, eldest daughter of the French king. During

the French Revolution of 1848 L. stemmed the excitement in Belgium by frankly offering to lay down his crown, if the nation thought they would be happier under a republic. The simplicity of the King's life, his interest in art, science, and industry, and his earnest but unambitious desire for the prosperity of his kingdom, raised Belgium to a high pitch of contentment. He died 10th December 1865. See La Guéronnière, *Études et Portraits Politiques*.—His son, L. II., born at Brussels, 9th April 1835, is following in his father's footsteps.

Lepanto (anc. *Nauspakto*, mod. Gr. *Epacto*, Turk. *Ainabakti*), a decayed town of Greece, in the nomarchy of Akarnania-Etolia, on the W. side of the Gulf of L. It is girt by an old Venetian wall, and has numerous mosques and a good harbour. Pop. 900. The Venetians, who received it from the Greek emperors of the East, strongly fortified L., and held it for four months against 30,000 Turks. It was, however, taken by Bajazet II. in 1499. Don Juan of Austria gained a great naval victory near L. over the Turks, 7th October 1571.

Lepidodendron (Gr. *lepis*, 'a scale,' and *dendron*, 'a tree') is a genus of fossil plants frequent through the greater part of the coal formation. Compared with existing vegetation, they appear to occupy a position between cone-bearing trees and the club-mosses, having fruit that assimilates to the former, while in essentials their stem agrees with the lycopods. The remains of L. are met with in the form of dichotomous trunks up to nearly 50 feet in length, bifurcating branches beset with linear or lanceolate leaves, and the cone-like fruit which bears the name of *Lepidostrobus*. 'The stems consist of a thin cuticle, a double cellular zone, a vascular cylinder, and a pith; they are marked with rhomboidal or orbicular scale-like scars' (*Bulbour*). Fifty-nine species are recorded by the palæontologist, Dr. Schimper.

Lepidoptera (Gr. 'scale-winged'), a well-known order of Holometabolic insects, including the butterflies and moths. They have four wings covered with minute overlapping scales, which in the commoner forms appear to the unassisted sight as fine dust. The mouth is *suctorial*, the chief organ being formed of the long, confluent *maxilla* or lesser jaws, which constitute a *proboscis* or *antlia*—a spiral tube used in sucking up the flower-juices upon which the insects subsist. The upper lip and mandibles are rudimentary, and the *labium* or lower lip is of modified nature. The *palpi* of the lower lip form cushion-like organs adapted for the protection of the proboscis when at rest. The antennæ are many-jointed, and may be club-shaped, filiform, or of comb-like shape. The compound eyes are large, and the simple eyes or ocelli number two; but these latter may be altogether wanting. The pro-thorax, or first segment of the chest, is small, and the wings have veins arranged in a radial fashion. A 'sucking-stomach' is developed, the intestine is long and convoluted, and the ovaria exist in the form of four tubes provided with a *seminal receptacle*. The *larvæ* appear as caterpillars, provided with five or six ocelli on each side, and possessing fleshy *prolegs* behind the six true legs in front. The *chrysalides* or *pupæ* are *obtectæ*, and are inclosed in pupæ-cases or cocoons, usually formed by the larvæ from the secretion of special glands or *spinnerets*. The classification of these insects has yet to be scientifically modelled. One mode of arrangement divides the L. into the Nocturnal L. (Moths), *Crepuscular* or twilight-flying forms, and Diurnal L. or butterflies. A second system of classification is that which divides them into *Micro-L.* and *Macro-L.*, and a third system divides the L. into *Rhopalocera* (those with club-shaped antennæ), and *Heterocera* (those with variable antennæ).

Lepidosiren, or **Mud-Fish**, a peculiar genus of fishes, usually considered to form the sole example of the order Dipnoi (q. v.), but by Günther regarded as more properly united with the genus *Ceratodus* (or the Australian 'Barramunda') to form a sub-order of the *Ganoïdæ* (q. v.) fishes. Two distinct species are known—the L. or *Protopterus annulatus* from the Gambia, and the L. *paradoxa* from the Amazon. The former has thirty-six, the latter no less than fifty-five pairs of ribs. The L. differs from all other fishes not only in having a three-chambered heart, but a more lung-like air-bladder, and nostrils which open backwards into the mouth—this latter character being, however, represented in the Ilag-fishes (q. v.). Occasionally, also, outside gills have been met with, all these characters evincing a close approach to the amphibian or frog-like vertebrata. The

pectoral and ventral fins are filamentous structures, the latter being abdominal in position. The body is covered with scales, and a distinct skull, cranial bones, and lower jaw exist, although the spine is represented by a *Notochord* (q. v.). There is, then, every reason to conclude that in the L. we meet with a genus of transitional nature, connecting the fishes with the Amphibians (q. v.). In habits the Lepidosirens are very peculiar. They appear to exist in their native rivers during the wet season, but on the approach of the dry season burrow in the mud, and thus become enclosed through the drying of the mud in a kind of nest—breathing air during this stage of their existence by means of the lung-like air-bladder.

Lepidus was the name of a distinguished family of the Aemilia gens, which occupied a prominent position in the Roman state from the beginning of the 3d c. B.C. to the close of the 1st c. A.D. **Marcius Aemilius L.** was prætor B.C. 49, and when the civil war broke out between Pompey and Cæsar, he joined the latter. On Cæsar's assassination, however, L. espoused the cause of Antony, and when Octavian deserted from the senate, the three formed a triumvirate. Though included in this body on its renewal (B.C. 37) for a second five years, L. occupied an entirely subordinate position. In B.C. 39 he made an effort to assert himself by independent action in an attack upon Sicily, but his troops eventually deserted to Octavian, to whom he was compelled to surrender. He was deprived of his rank, though not of his wealth, and was commanded to live in retirement at Circeii. L. died B.C. 13.

Lepisma, a familiar genus of *Thysanourous* insects familiarly known by the name of 'spring-tails,' from the possession of several long abdominal appendages, by means of which they are able to take leaps of considerable extent. The abdominal bristles in L. are short, and number five, three being much longer than the others. The eyes are minute, and consist of twelve simple eyes or ocelli. *L. saccharina* is a familiar species, inhabiting houses and destroying tapestry and silken fabrics. *L. domestica* is of a white colour, spotted with black. *Machilis* is an allied genus. No wings exist in these insects. The body is covered with minute scales resembling those found in *Lepidoptera* (q. v.), and from the presence of delicate markings on these scales they become available as test objects for the microscope.

Leporidae. See HARE.

Lepra, **Tetter**, or **European Leprosy**, is a non-contagious and chronic inflammation of the skin terminating in an eruption of raised, circular patches, which become covered by thin, semi-transparent scales of white and morbid epidermis. L. is most frequently situated in the vicinity of the knee and elbow joints, and often recurs at particular periods for several years, lasting for several months at each time. During the progress of L. the scales are often thrown off, and replaced by successive formations. There are various forms of the disease, as *L. diffusa*; *L. inveterata*; *L. nigricans*; *L. syphilitica*; *L. capitis*; and *L. unguium*. Treatment:—The most potent specific remedy is the *Liquor potassæ arsenitis*, or *Fowler's Solution*, in from five to ten minim doses, thrice daily, after meals. In very chronic cases, the *Liquor hydropotassici hydrargyri et arsenici*, or *Donovan's Solution* may be given. Baths are also advantageous, and when the skin is cracked and fissured, oxide of zinc ointment or glycerine should be applied.

Leprosy, or **Lepra Tuberculosa**, is identical with the *elephantiasis of the Greeks*, and the *lepra of the Arabians*, but different from the *elephantiasis of the Arabians*, and the *lepra of the Greeks*. It has existed from the earliest times, and its diffusion throughout the world has been almost universal. In some countries where it raged with intense severity it has entirely disappeared, and in others it has continued with all its original severity till the present time. L. is a constitutional disease, showing itself by the deposition of a peculiar albuminous substance in the skin, mucous membrane, and other surface tissues of the body—*L. tuberculosa*; or by affecting chiefly the nervous centres and the nerves—*L. anæsthetica*. Both forms are chronic in their course, generally incurable, and most frequently terminate in death. The earliest symptom is the development of erythematous patches of a dull-red or purplish hue, generally in the superciliary region, succeeded by thickening of the skin, in the form of tubercles, which form a heavy mass along the eyebrows, and gradually extend over the whole face. The ears

also are early affected, the helix being much enlarged, and the lobule elongated. The brown patches are early developed on the backs of the hands and fingers, and there is usually a considerable degree of numbness and insensibility; but the defective sensation is less marked than in the anæsthetic form. When the disease attacks the mucous membrane or internal organs, there may be loss of vision, smell, and taste; and when the larynx and air-tubes are affected, there is hoarseness or loss of voice, dyspnoea, and bronchitis. In the anæsthetic form there is great depression, desire for solitude, pale shrunken skin, insensibility and atrophy, terminating in ulceration, and the dropping off of the extremities. In this form the chief seat of the morbid deposit is the spinal cord, the ganglia, and the sheaths of the nerves. The average duration of life in the tubercular form is nine years and a half, and in the anæsthetic form, eighteen years and a half. *L.* is common in India, Norway, Crète, Syria, and many other parts of the world. In Norway there is 1 leper to 833 persons, and within historic times, *L.* seems always to have infested the same maritime area as at present, the limitation being partly due to the intervention of an elevated and thinly populated mountain chain. *L.* is most common among the lower and poor classes, and males are more frequently attacked than females. There is no distinct evidence that *L.* is contagious, but it is generally considered to be hereditary. One or other of these influences is a stern reality, and they may co-exist. There is no special condition, mode of life, kind of food, locality of residence, or climate known which accounts for the maintenance or spread of *L.* See *Om Spedalskhed Som Endemisk Sygdom i Norge*, by Dr. Bikenkap (Christ. 1860), and *Modern Indian L.*, by Dr. H. V. Carter (Bom. 1876).

Lepsius, Karl Richard, was born at Naumburg, 23d December 1813, studied at Leipzig, Göttingen, Berlin, and at Paris; he received the Volney prize (1834) for his treatise *Palæographie als Mittel der Sprachforschung*. Through Humboldt's influence *L.* was appointed chief of a scientific expedition to Egypt (1842). Upon his return to Berlin (1846), he received the Professorship of Egyptian Archaeology, again went to Egypt (1866), discovered a bilingual inscription of the time of Ptolemy Euergetes at Tanis, returned to Berlin, and was placed over the Prussian State Library in 1874. *L.* has devoted himself to the elucidation of every aspect of Egyptian life, and among his chief works are *Das Todtenbuch der Ägypter* (1842), *Die Chronologie der Ägypter* (1849), *Denkmäler aus Ägypten und Aethiopien* (1849-59), *Leben aus Ägypten* (1852), *Die Ägyptische Elfe* (1865), *Ueber einige Ägyptische Kunstformen*, &c. (1872).

Leptospermum, a large genus of *Myrtaceæ*, consisting of evergreen shrubs or small trees, common to New Zealand, temperate and sub-tropical Australia, and some of the islands of the Indian Archipelago. In the early days of British colonisation of Australasia, the leaves of *L. scoparium* were much used in bush journeys to yield by infusion a substitute for tea, thereby fixing the settlers' name of 'tea-tree' to this and perhaps some other species of the genus. *L. levigatum* has received the cognomen of the 'sandstay' in Australia, from its efficacy in arresting the progress of drift sand.

Lerici, a seaport of Italy, province of Genoa, on the Gulf of Spezia. It is walled, and is guarded by a castle in which Garibaldi was confined in 1862. There are English lead-works here, importing ore from Sardinia. Pop. (1874) 5940.

Lerida (the *Ilerda* of the Romans), a strongly fortified town of Spain, and capital of the province of *L.*, on the right bank of the Segre, a N. branch of the Ebro, 120 miles W. by N. of Barcelona by rail. It is the military key of Aragon and Catalonia, and has a castle, two cathedrals, one of the 13th c., a lyceum, and manufactures of gunpowder, leather, woollens, cottons, glass, &c. Its university, founded in 1300, was suppressed by Philip V. The river is here crossed by a stone bridge of seven arches. To the S.W. are the forts of Garden, Hornabeque, and S. Fernando. Pop. 19,581. The adjoining plain (*El Fontanet*) was the scene of the victory of Scipio Africanus over Hanno. In the first year of the civil war (B.C. 49) Caesar, in a brilliant siege of *Ilerda*, forced the legates of Pompey to capitulate with five legions.

Lernææ, a genus of lower *Crustaceans*, belonging to the order *Ichthyophthira*, the species of which are found parasitic on fishes of various kinds. One species infests the gills of the

cod; *L. gubina* is found on the gobies; and *L. radiata* is a third species. A nearly-allied genus is *Lernæopoda*, in which the body is of worm-like conformation, and the males exist as mere specks attached to the females. The body consists chiefly of the united head and chest, and the jaws are modified to form organs adapted for adhesion to the bodies of their hosts.

Leroy' de Saint-Arnaud, Jacques, a French marshal, was born at Paris, August 20, 1801, entered the army in 1816, withdrew for some years, and in 1831 re-entered his profession. In the African wars he distinguished himself so highly that in 1847 he had reached the grade of field-marshal, and two years later was conducting operations against the Kabyles as commander-in-chief. His reputation as a prompt and inexorable warrior pointed him out to Louis Napoleon, who used him in the *coup-d'état* of December 2, 1851, and afterwards created him War Minister. In this office he proved himself as efficient in administration as in war. During the Crimean War he distinguished himself at Varna and Gallipoli, and co-operated with Lord Raglan in the battle of the Alma, 24th September 1854, but died of an incurable disease, nine days after, on board the frigate *Berthollet*. A volume of *Lettres* was published in 1855 (2d ed. 1864), which, if they show little literary skill, are full of keen insight into the tendency of many contemporary events.

Lerwick, the chief town of the Shetland Islands, on the E. coast of the Mainland, about the centre of Bressay Sound, 21 miles N.E. of Sumbrugh Head, and 100 N.E. of Kirkwall. It is a straggling place, rising up from the shore, with some fishing industry and sale of Shetland hosiery. There are several churches, and the walls of Fort Charlotte, which was built originally in Cromwell's time, and re-built in that of George III., after whose consort it was named. In 1875 there entered and cleared the port 458 vessels of 76,721 tons. Pop. (1871) 3516. *L.* was founded by Dutch smugglers in 1670.

Le Sage, Alain René, a famous French writer, was born May 8th, 1668, at Sarzeau, near Vannes in Brittany, became heir to a small fortune at his father's death (1682), which his uncle squandered, studied under the Jesuits at Vannes, and then disappeared from historical view for several years. In 1694 he married Marie-Elizabeth Huiyard in Paris, and began to devote himself to literature. Failing in his first effort, which was a translation from a Greek sophist, *L.* tried the bar with equal want of success. In 1702 he invaded the theatre with *Le Point d'Honneur*, and prosecuted studies and translations in Spanish, writing all the time under strong pressure of necessity. *Le Diable Boiteux* (1707) was the first romance which fairly established his reputation, and though it is based upon the Spanish of Guevara, its whole atmosphere and the characters are French. *Turcaret*, his greatest drama, was represented in 1709, and whilst it satirically lashed some of the prominent vices of the period, it gave bitter expression to the sense of injustice in things with which the difficulties of his early life had inspired him. *L.* published in 1715 *Histoire de Gil Blas de Santillane*, a romance which was not only his masterpiece, but which, next to *Don Quixote*, has perhaps achieved the widest celebrity of any European book. There are few Aryan languages into which it has not been translated. *L.* continued to write translations and plays, most of which bear the mark of the haste with which they were composed. Towards the close of his life he retired to Boulogne, where he died 17th November 1747. His *Œuvres Complètes* appeared at Paris in 12 vols. 1828. See Sainte Beuve's *Causeries du Lundi*, vol. ii.; Ticknor's *History of Spanish Literature* (Lond. 1849); and Audiffret's *Notice Historique sur A. R. Le S.* (Par. 1822).

Lesbos, called by the modern Greeks *Mitylen* or *Metelino*, and by the Turks *Medilli* or *Medellu-Adassi*, is the largest and most important island off the coast of Asia Minor, from which it is 10 miles distant. Area, 600 sq. miles; pop. 40,000, of whom 15,000 are Turks. The surface is mountainous, and the climate healthy. In ancient times it produced excellent wine, but its chief exports now are figs, oil, and gall nuts. The six Æolian cities of *L.* were Mytilene, Methymna, Arisba, Pyrrha, Antissa, and Eressus. The intellectual fame of *L.* is attested by the names of Alccæus, Sappho, Terpander, and Arion, in poetry and music; of Hellanicus and Theophrastus, in history; and in philosophy and science, of Theophrastus, Pittacus, and Cratippus. The chief town is Castro.

Lesley, Leslie, or Lesly, an illustrious Scottish family, the founder of which, Malcolm, son of Bartholf, received a grant from David, Earl of Huntingdon, of Lesslyn or L., in Aberdeenshire, towards the close of the 12th c. During the next two hundred years the family grew and prospered, made wealthy marriages, and split into several branches, the chief of which were the Rothes and Balquhain lines. The former was ennobled in 1457, with the title Earl of Rothes, and to it belong John and Norman L., the assassins of Cardinal Beaton (q. v.); and David L., grandson of the fifth Earl, and son of the first Baron Lindores (title created 1600, extinct 1775), who, after serving under the 'immortal' Gustavus, routed Prince Rupert at Marston Moor (1644), and Montrose at Philiphaugh (1645), was defeated by Cromwell at Dunbar (1650), fought at Worcester (1651), and was for nine years a prisoner in the Tower. Created Lord Newark (title extinct 1791) in 1661, he died in 1682. The earldom of Rothes is now (1877) held by Henrietta Waldegrave, sixteenth in descent. To the Balquhain branch belong John L. (q. v.), Bishop of Ross; Alexander L. of Auchintoul, a Muscovite general, and governor of Smolensko (died 1663); John L., Bishop of Clogher (died 1671); and his son, Charles L. (born 1650, died 13th April 1722), a celebrated non-juror; Walter L., a soldier of fortune in the Austrian service, in 1637 created Count (title extinct 1844) in reward for his part in the murder of Wallenstein; and lastly Alexander L., who, having won a high reputation in the Dutch and Swedish services, especially by his successful defence of Stralsund (1628), was recalled home (1639), and appointed commander-in-chief of the forces of the Covenant. As such he entered England, took Newcastle, crossed the Tyne, successes which led to the Treaty of Ripon (1641), and to the elevation of L. to the Earldom of Leven. He fought against the king at Marston Moor, but for him at Dunbar; was imprisoned by Cromwell in the Tower (1651), but released at the request of Christina of Sweden; and returning to Scotland (1654), died at Balgonie 4th April 1661. The present Earl of Leven is eleventh in descent from him. See *Laurus Lesliana Explicata*, by Father William L. (Grätz, 1692); *The Pedigree of the Family of L. of Balquhain* (Bakewell, 1861); and *Historical Records of the Family of Leslie*, by Col. Leslie of Balquhain (Edinb. 1869).

Lesley, John, a Scottish prelate, born September 29, 1526, studied at the universities of Aberdeen, Poitiers, Toulouse, and Paris, and was made vicar-general of Aberdeen in 1554. He was a staunch upholder of the Catholic faith, publicly defending it in disputations with Knox and other reformers, and in 1561 repaired to Mary at the court of France, to lay before her proposals for the suppression of heresy by armed force. Returning in the Queen's train to Scotland, he was made, in 1564, Abbot of Lindores and Bishop of Ross, and to him, as one of sixteen commissioners, was chiefly due the publication of a Scotch codex, known as the *Black Acts*, from its being printed in black letter (1566). Faithful to his unfortunate queen, he waited upon her at Bolton (September 1568), was one of her commissioners at York, and appeared as her ambassador at the court of Elizabeth. There, finding entreaties useless, he joined in the plot for Mary's marriage to the Duke of Norfolk, and was imprisoned in the Tower, at Winchester, and at Ely. Released in January 1574, he resided one year in France, and three at Rome, where he published his *De Origine, Moribus, et Rebus Gestis Scotorum* (1578), and in 1579 became vicar-general to the Cardinal de Bourbon, Archbishop of Rouen. Twice the Huguenots seized him to give him up to Elizabeth, and he only escaped by ransoms of 3000 pistoles. In 1593 he was made Bishop of Coutances, but shortly after retired to the monastery of Guirtenburg, near Brussels, where he died May 31, 1596. L. founded the Scotch colleges at Rome, Paris, and Douai. He was the author of five Latin works, and of a *History of Scotland, from 1436 to 1561* (edited by T. Thomson for the Bannatyne Club, 1830), which is of great linguistic value.

Leslie, Charles Robert, R.A., born of American parents in London, 19th October 1794, became a student at the Royal Academy in 1811, where his studies were superintended by two distinguished Americans—Benjamin West and Washington Allston. He at first essayed large historical pictures, but soon found himself more at home with humbler subjects. His first important work, 'Anne Page and Master Slender,' was followed by 'Roger de Coverley going to Church,' exhibited at the Royal

Academy in 1820. Next year his 'May-day in the Reign of Elizabeth' made him an A.R.A.; and in 1826 he became R.A. In 1847 he was elected Professor of Painting at the Royal Academy, a post which he held four years. He died 5th May 1859. No English artist ever excelled L. in illustrating the writings of the great poets and humorists of his country. L. published in 1843 *Memoirs of John Constable, R.A.*, and in 1858 a *Handbook for Young Painters*. In 1860 Tom Taylor edited L.'s *Autobiographical Recollections*.

Leslie, Sir John, a Scotch mathematician and natural philosopher, was born at Largo, Fifeshire, April 16, 1766, and was educated at the universities of St. Andrews and Edinburgh. In 1788 he went to Virginia as tutor to two young American students; and after his return settled in London in 1790, obtaining a certain independence by the translation of Buffon's *Histoire Naturelle des Oiseaux* (1793). In 1805 he obtained the chair of mathematics in Edinburgh, rendered vacant by the appointment of Playfair as Professor of Natural Philosophy. In 1819 he succeeded Playfair in the chair of physics, was made a baronet in 1832, and died November 3, the same year, at Coates, his residence in his native county. L. is well-known as the inventor of the differential thermometer, with which he made his famous experiments on the radiation of heat; and of the hygrometer, with which he discovered the process of artificial freezing. As an original experimenter, L. stands among the first of his time. His chief works are *Experimental Inquiry into the Nature and Properties of Heat* (1804); *Elements of Geometry* (1809); *Geometry of Curve Lines* (1821); *Elements of Natural Philosophy* (vol. I., 1823); besides numerous memoirs in the *Edinburgh Philosophical Transactions*, and valuable articles in the *Encyclopædia Britannica*.

Lessing, Gotthold Ephraim, a celebrated German writer, born January 22, 1729, at Kamenitz, in Ober-Lausitz, went to Leipzig University in 1746, where he neglected theological study, for which his father had designed him, for literature, science, gymnastics, and the study of the stage. In 1748, after a short stay at Wittenberg, L. removed to Berlin, where he published *Beiträge zur Histoire und Aufnahme des Theaters*, besides some poems and translations for the booksellers. He graduated at Wittenberg in 1752, returned to Berlin, where he associated with Moses Mendelssohn and Nicolai, and completed (at Potsdam) *Miss Sara Sampson*, the first German drama that broke with the French academic rules. From this time till 1760, when he was elected a member of the Berlin Academy, and went to Breslau to be secretary of General Tauentzien, he wrote fables, started (1759) the critical review, *Briefe die neueste Literatur betreffend*, and began *Virginia*, a tragedy, completed (1772) under the name of *Emilie Galotti*. At Breslau, where he remained till 1765, he wrote *Minna von Barnhelm*, which marked an epoch in the national literature. His greatest work is *Laokoon, oder über die Grenzen der Malerei und Poesie* (1766), which wrought a revolution in criticism, and has gained for L. the honour of first expounding the true principles of æsthetics. After a two years' stay in Berlin he became director of the Hamburg theatre, and published *Dramaturgie* (1768-69), a series of theatrical reviews, ranking only second in importance to *Laokoon*, in which he did battle for the English drama against the French. In 1770 he was appointed librarian at Wolfenbüttel, where he brought to light Berengar of Tours' treatise against Lanfranc, *De Corpore et Sanguine Jesu Christi*, and published (1774-78) *Wolfenbüttelsche Fragmente eines Ungenannten* (an acknowledged work by H. C. Reimarus), thereby involving himself, till his death, 15th February 1781, in endless theological disputes with various opponents, bitterest of whom was the Hamburg clergyman Goeze, against whom L. directed his spirited *Antigoeze*. His drama *Nathan der Weise* (1779) is a noble plea for toleration and a rational religion, whose main idea is laid down in philosophic form in *Die Erziehung der Menschenschichte* (1780), which contains the germ of Herder's view of the philosophy of history. Though only the forerunner of the later great period of German poetry, and not himself a great poet, L. saw the weakness of his own age, and claimed superiority for the more natural poets of earlier times. See L.'s *Sämmtliche Schriften* (30 vols. 1774-94); critical ed. by Lachmann (13 vols. 1838-40); by Maltzahn (12 vols. 1853-55), and the Biographies by his brother Karl (1793); by Danzel and Guhrauer (1850-54); and by Stahr (5th ed. 1868). L. left fifty-four plans of dramas,

In some of which the outline was to a considerable extent filled in. These were published by Robert Roxberger (Berl. 1876).

Less'ons. (Fr. *leçons*, Lat. *lectiones*, 'readings') are 'portions of the Holy Scriptures read in churches at the time of divine service.' The use of L. formed a part of the service of the Jewish synagogue (Luke iv. 17; Acts xiii. 15). Justin Martyr (about 140) in his *Apology* speaks of 'the memoirs of the apostles, or the writings of the prophets' being read 'as long as the time permits.' According to the Apostolic Constitutions, after two L. from the books of Moses, Joshua, Judges, Kings, Chronicles, Job, Solomon, the sixteen prophets, &c., had been read, psalms were sung, and then another lesson was read from the Acts or Epistles, and one from the Gospels. Particular, appropriate L. were soon appointed for the different seasons of the ecclesiastical year. Thus, in Holy Week, Job and Jonah were read; on Good Friday were read 'all such Scriptures as had any relation to the cross;' and on Easter day such passages as gave an account of Christ's resurrection; between Easter and Pentecost the Acts of the Apostles was read, to give men the evidence and proofs of his resurrection in the miracles of the apostles contained in that book. During Lent Genesis was read, or, according to the Gallican Lectionary, the Acts and the Apocalypse. After Pentecost the Pentateuch and the Books of Samuel and Kings were read, followed by Job, Proverbs, and Ecclesiastes, and these again by Tobit and Judith. Besides the canonical Scriptures and apocryphal books, L. were read out of lives of saints, homilies of the fathers, and acts of the martyrs. The L. were at first read by the deacons, but afterwards by the readers, an inferior order of the clergy appointed for the purpose (see HIERARCHY), although the reading of the gospel was afterwards reserved for a deacon, an archdeacon, or even a presbyter.

L'Estrange, Sir Roger, an English author, was born at Hunstanton Hall, Norfolk, 17th December 1616. An ardent royalist by education and sympathy, he was imprisoned from 1644 to 1648, when he escaped to the Continent. He returned to England in 1653, and on the Restoration became censor of plays. He started the *Public Intelligencer* in 1663, and the *Observer* in 1679, journals in which he championed High Toryism with an able but virulent and vindictive pen. He was knighted by James II. His mind failed latterly. He died in London 11th September 1703. L. published many political pamphlets and classical translations.

Le'thal V'apon, in Scotch criminal law, means a weapon such as a man would use in assaulting another with the intention of killing him. Were a stick the implement of assault, the weapon would not *prove* intention to kill; but were a sword the implement, it would be held to do so. The corresponding term of English law is 'Fatal weapon.'

Le'the (Gr. 'forgetfulness'), in Greek mythology the river of oblivion in Hades (q. v.), of which spirits drank before entering Elysium (q. v.).

Let'ter, a term in the law of England and of Scotland. *Letter Missive* is a letter from the sovereign to the Dean and Chapter (q. v.), enclosing the name of a person whom he desires them to elect a bishop. *Letter of Attorney* is, in English law, a writing empowering some one to act legally for the writer; as to transfer stock or sign a deed. The person empowered is called the *attorney* of his constituent. The instrument may be general or special. In the first case it may embrace the transactions of the whole affairs of the constituent; in the latter case, the power may be restricted to one transaction. The agent has precisely the same legal power as his principal, until the letter is recalled. L. of A. is generally executed under hand and seal, that is, by Deed (q. v.); and when it contains authority to bind the principal by deed, it is essential that it be so executed. *Letter of Credit*, see under CREDIT, *Credit*, *Letter of Licence* is a letter given by creditors to their debtor allowing him prolonged time for paying his debts, and protecting him from arrest. *Letters Patent*, or *Open Letters*, are writings sealed with the great seal of England, by which the grantee is protected in the profit of a discovery or privilege. (See PATENT.) In Scotland, *Signed letters* are writs for enforcing the decrees of courts, or for attaching the property of debtors, or for citing parties before the Court of Session (q. v.). They run in the name of the sovereign, and are authenticated by the

Signet (q. v.). *Letters of Marque* was a commission from the crown during war, authorising a private ship to make war upon and seize property belonging to the enemy. So doing was called *privateering*. The system was abolished by the treaty of Paris in 1856; but there can, of course, be no guarantee against its revival. See *Maritime Warfare*, by Thomas Gibson Bowles (Ridgway, Lond. 1877). *Letters, Private*. The receiver of a private letter has but a joint right of property in it along with the writer. The receiver is not entitled to publish it, and an injunction has been granted to restrain the printing of letters without the consent of the executors of the writer. This rule prevailed in the case of *Hansom and Hobhouse*, executors of Lord Byron, v. *Knight*, although there appeared a strong presumption that the writer expected that the receiver would publish them.

Letters are the primitive elements of articulate utterance, not of language—which is not mere sound, but always significant sound. It was a favourite idea with Epicurus and Aristotle to compare the concurrence of atoms with the fortuitous formation of words from letters. But though by putting twenty-four L. together in every possible variety, we might produce every word of every spoken language—the number of such combinations amounting, according to Leibnitz, to 620,448,401,733,239,439,360,000—still none of these would be words if they lacked the one necessary ingredient, the ideas, namely, that called them into life. Nor does the existence of roots consisting of a single vowel, as Sansk. *i*, 'to go,' or Chinese *i*, 'one,' prove that a letter may be a root; it only shows that a root may be a letter. One word there is, and one only, consisting of mere letters—*alphabet*, and even that is formed not of the sounds, but of the names of the sounds, *alpha* and *beta*. By themselves, then, L. have no existence, any more than colour exists apart from some ethereal substance; or, if we must view them abstractly, it is as dead, like notes only acquiring vitality and significance through combinatory ideas. But as optics treats of colour and light as self-existent, so it is convenient to anatomise the phonetic structure of language without reference to its living function. Thus doing, we find that physiologically L. fall into three main groups—L. formed (1) of vocalised breath, Vowels (*phōnēnta*), requiring no contact of the tongue with the other organs of speech, as *a* or *o*; (2) of breath not vocalised, Breaths or Semivowels (*hēmi-phōna*), with slight contact, as *h*; and (3) of articulate noise. Checks or Consonants (*aphōna*), with complete contact. The last, again, are subdivided, according to the different parts of the active and passive vocal organs by which they are formed, into (1) Gutturals, by the root of the tongue and the palate, as *k*; (2) Dentals, by the tip of the tongue and the teeth, as *t*; and (3) Labials, by the upper and lower lip, as *p*. Another division of the checks, and one, too, of great importance to the philologist, as on it is based Grimm's Law (q. v.), is that into Hard (*tenues*), Soft (*medie*), Hard *t*-spirated (*tenues aspirate*), and Soft Aspirated (*media aspirate*). Thus—

	Guttural.	Dental.	Labial.
Hard . . .	K	T	P
Soft	G	D	B
Hard Aspirated	KH	TH	PH
Soft Aspirated	GH	DH	BH

In Sanskrit, although the soft aspirated checks largely predominate over the hard aspirates, still the system is complete; Greek has one set of hard aspirates, *ch*, *th*, and *ph*; in Latin, Gothic, and O. H. German there are no real aspirates; and in the Slavonic languages the aspirates were originally wanting. But, though thus deficient, these languages were rich in L. compared with the dialects of rude and uncivilised races. The Mohawks, for instance, have no labials; the natives of the Society Islands, no gutturals; and *s* is absent from the Australian and many of the Polynesian languages. The following list shows the relative wealth of consonants in some of the principal languages:—Hindustani has 48 consonants (14 of which are Arabic); Sanskrit, 39; Turkish, 32 (of which only 25 are really Turkish); Persian, 31 (9 of them Arabic); Arabic, 28; Kafir, 26, besides the clicks; Hebrew, 23; English, 20; Greek, 17 (3 of them com-

pound); Latin, 17 (1 compound); Finnish, 11; and some Australian languages only 8. See ALPHABET, PHONETIC WRITING, and the separate articles on each of the letters; also Max Müller's *Lectures on the Science of Language*, vol. ii. lecture 3; Dr. M. Thausing's *Natürliche Lautsystem der Menschlichen Sprache* (Leips. 1863); and the works on phonetics by Alexander J. Ellis.

Letter-Wood is procured from *Brosimum Alicastrum*, a large tree belonging to the bread-fruit family (*Artocarpacæ*). It is a native of British Guiana and Trinidad. The name has been chosen in consequence of the rich brown, hard, and heavy heart-wood being mottled and streaked with more or less regular black spots, forming an exceedingly beautiful effect when the wood is polished. Hence it is in demand for fine veneering and inlaying: the supply, however, is small. Snake-wood and leopard-wood are synonyms.

Lett'io is one of the two divisions, the other being Slavonic, of the Wendic branch of the Indo-European family, and falls itself into three subdivisions—Lithuanian, Old Prussian, and Lettish, languages which, though of little literary value, are of great linguistic importance, as preserving in their grammatical forms closer affinities with Sanskrit than either Greek or Latin. Of these, Lithuanian is written in Roman characters, with an orthography based upon Polish, and its earliest literary document is a small catechism of 1547. It has an approximation to the post-positive article, in its inflection of adjectives by the incorporation as a suffix of the demonstrative pronoun, thus *geram*, 'to good,' *geranjam*, 'to the good,' where *-jam* is the dative pronoun. Its popular songs (*dainos*) were collected by Rhesa (Königsb. 1825), its tales, proverbs, and riddles (*misla*) by Schleicher (Weim. 1857), who has also edited the complete works of Christian Donaleitis (died 1780 as pastor of Tolmingkemen), the leading poet of Lithuania (St. Petersburg. 1865), and published a Lithuanian grammar (Prague, 1856), the best dictionary being by Nesselmann (Königsb. 1854). The Old Prussian, which became extinct in the 17th c., and is only known through some paternosters and a 16th c. catechism, possessed a definite article, and is handled by Nesselmann in his *Thesaurus Lingue Prussicæ* (Berl. 1873). Lettish, the youngest of the group, was first reduced to writing in the middle of the 16th c., but now possesses a considerable literature (in 1865 upwards of 1900 works), mostly of a religious character. See Bienenstein, *Die Lettische Sprache* (2 vols. Berl. 1864).

Lettres-de-Cachet were letters written by order of the kings of France, signed by a secretary of State, and sealed with the royal seal, which were meant to anticipate the delays of justice. Armed with them, the police were entitled to seize and keep people in custody without trial, or even intercourse with their friends, so long as government had a mind to do so. Before the Revolution of 1789 they were put to the most infamous uses to gratify the cravings of private revenge or unfounded suspicion. See Taine's *Les Origines de la France Contemporaine* (1875).

Lett'uce is applied to the genus *Lactuca*, which belongs to the chicory tribe of the *Compositæ*, and consists of some fifty species, distributed through temperate regions of the N. hemisphere, appearing also in S. Africa. The L. is an annual or perennial leafy herb, with a milky juice, the alternate leaves often sagitate, flowers mostly yellow, arranged in small capitula, the fruit with a long slender beak. The best-known representative is the garden L. (*L. sativa*), which was known to the Greeks and Romans as a salad herb. Some suppose it to be a state of the wild *L. virosa*, much modified by long cultivation, whilst others consider *scariola* as its origin; but like many of our common culinary vegetables and cereals, the native country and original stock is a mystery, and any statements are little better than botanical literary speculations. In Britain it has been grown at least from the time of Elizabeth. The very numerous gardeners' varieties range under the names Cos and Cabbage L., the first including those with round leaves and growth something like a small cabbage, and the latter those with upright oblong leaves. By suitable management a crop may be secured all the year round. The milky juice mentioned above as a characteristic of the genus yields the *Lactucarium* or L.-opium of materia medica.

* **Leuca'dia**, the ancient name of **Santa Maura** (q. v.).

* **Leu'oine** ($C_6H_{12}NO_2$) is one of the products of the decomposition of glue, horn, wool, and other animal substance, either

during putrefaction, or under the action of an acid or alkali. It crystallises in white shining scales, which melt at 100°. It is slightly soluble in water, sparingly so in alcohol, and insoluble in ether.

Leucipp'us, the founder of the Atomistic philosophy in early Greece, and the teacher of Democritus (q. v.). Nothing is known regarding his life.

Leucis'cus, a genus of *Teleostean* fishes, represented by the roach (*L. rutila*); dace (*L. vulgaris*); chub (*L. cephalus*); bleak (*L. alburnus*); and minnow (*L. phoxinus*). It is included in the *Cyprinida* (q. v.). The dorsal and anal fins are short. No barbules or mouth-filaments exist.

Leu'cite, a mineral found in abundance in the lavas of Italy, crystallising like the garnet in trapezohedra. It is usually opaque, and gray or white in colour. It is a silicate of alumina and potash, and is interesting as the mineral by which Klaproth first discovered that potash was not confined to the vegetable kingdom.

Leucocythe'mia (Gr. *leukos*, 'white,' *kytos*, 'a cell,' and *hæma*, 'blood'), is a disease in which the number of white corpuscles in the blood is greatly increased, with a simultaneous diminution of the red. L. is the result of exhausting diseases, serious acute affections, or affections of the lymphatic glands or of the spleen. The disease was first described by Drs. Craigie and Bennett of Edinburgh, and Professor Virchow of Berlin in 1845.

Leuco'ma (from Gr. *leukos*, 'white'), is the term applied to a white opacity of the cornea—the transparent part of the eye (q. v.). *Nebula*, the slightest degree, includes only those opacities which are cloudy or hazy. In *albugo*, the effusion of lymph is dense, and has a pearly appearance. True L. is always the result of cicatrization, and has a contracted circumscribed appearance. In most cases it is persistent and incurable.

Leucorrhoe'a (*leukos*, 'white,' and *rhoe'*, 'I flow'), a white, mucous discharge, very frequently the result of debility. Treatment:—General hygienic measures to restore the general health. Astringent injections, containing gallic or tannic acid, alum, sulphate of zinc or the sulpho-carbulate of zinc are serviceable.

Leuc'tra, a village in Bœotia, to the S. of Thebes, famed as the scene of the victory, B.C. 371, by which Epaminondas and the Thebans overthrew the supremacy of Sparta.

Leuk (*Loèche*), a Swiss village, in the canton of Valais, on the right bank of the Rhone, gives name to the celebrated mineral springs, distant eight miles northwards, at the head of the Dala valley and at the foot of the Gemmi pass. The springs, twenty-two in number, are saline and sulphurous, and vary in temperature from 93° to 123° F. The bathers are required to remain as long as eight hours in the water. L. is chiefly frequented by Swiss, French, and Italian visitors.

Leu'then, a village of Prussia, in Lower Silesia, 9 miles W. of Breslau, is famous as the scene of a great victory gained by Friedrich the Great over the Austrians, 8th December 1757. The loss of the latter was 7000 killed and wounded, 21,500 prisoners, and 134 pieces of artillery.

Leut'schau (Mag. *Löcze*), a town of Hungary, in the comitat of Zips, 37 miles N.W. of Kaschau. Its Gothic Jacobikirche contains the largest organ, and its Protestant gymnasium is the oldest, in Hungary. There is a famous mead-brewery, and flax, saffron, hops, and fruit are largely cultivated in the neighbourhood. Pop. (1869) 6887.

Le Vaillant, François, a French traveller and naturalist, was born at Paramaribo in Dutch Guiana, in 1753. He early showed a decided taste for travel, and during his stay in Paris from 1777 to 1780 studied natural history most assiduously. In 1781 he set out for the Cape, and for about sixteen months travelled through portions of S. Africa. He made a second series of travels—this time for eighteen months—and returned to Paris in 1785, devoting his time to the arrangement of his valuable collections. Under the Reign of Terror he suffered one year's imprisonment, and escaped death only through the fall of Robespierre. He died at his residence near Sézanne, in Champagne, November 22, 1824. L.'s chief works are *Voyage dans l'Intérieur de l'Afrique* (2 vols. 1790); *Second Voyage dans l'Intérieur de l'Afrique* (2 vols. 1796); *Oiseaux d'Afrique* (6 vols. 1796-1812);

and natural histories of *Perroquets* (2 vols., 1801-5); *Oiseux-Parad's, Rolliers, &c.* (2 vols. 1801-6).

Levant' (Ital. *levante*, 'orient,' or 'rising'), a geographical name given by European nations generally to the E. waters and shores of the Mediterranean. The chief ports, Constantinople, Smyrna, Iskanderun, Aleppo, and Alexandria, are called by the Italians *Scale di Levante*, by the French, *Échelles du L.*, i.e., steps of the L. The name L. originated early in the middle ages when the Italian republics controlled European commerce.

Levant and Couchant (Fr. 'rising up and lying down'), a legal phrase applied to animals to indicate that they have been long enough on land not their owner's to rise up and feed, 'such time,' according to Blackstone, 'being held to include a day and night at the least.'

Leva'ri Facias, Writ of. See ELEGIT and FIERI FACIAS.

Levee (from Fr. *se lever*, 'to rise'), originally a morning assembly of visitors to a sovereign, is in England applied to a general gathering at court of guests of rank and fortune from among the Queen's subjects, and differs from a *drawing-room* in that it is restricted to gentlemen, except in the case of the chief ladies of the court.

Level and Levelling. A level surface is one at which the force of gravity is everywhere perpendicular. At any locality on the earth's surface, such a surface is practically plane and parallel to the plane containing the horizon, and an instrument which shows the direction of a line parallel to this plane is called a *level*. Such an instrument is the plummet or plumb line which, if provided with a graduated quadrant or semicircle, indicates at once the horizontal plane, to which the line is everywhere perpendicular. The most convenient and accurate instrument is, however, the *spirit-level*, which consists of a slightly curved tube nearly filled with liquid—usually spirit—of wine. The air-bubble always seeks the highest point. Hence, if the ends of spirit-level be so set that reversal of the instrument does not change the position of the bubble, the points of support must be situated in a horizontal line. In this way astronomical and geodetical instruments are now universally set and tested. Another form of level consists of a U-shaped tube filled to a certain height with water or other liquid, the upper surfaces of the columns of which meet, in accordance with hydrostatic laws, lie in a horizontal line, and thus afford an easy and in many cases sufficient and accurate method for fixing such a line. This form of apparatus may be conveniently used for the purposes of *levelling*, though, of course, a telescope with spirit-level attached is the more accurate. Levelling is an extremely convenient method for ascertaining the height of small elevations. Levelling staves furnished at the top with a level, and carefully graduated throughout their length, are fixed perpendicularly at intervals. The level of each is then compared carefully with the next above it, and thus the height of the elevation is ascertained.

Le'ven, Loch (Gael. *Leamhan*, the lake of the 'elm tree'), a beautiful sheet of water in the E. of Kinross-shire, Scotland, is $3\frac{1}{2}$ miles long, and 2 broad, contains several islets, of which the largest are St. Serf's Inch, with the remains of the Culdee Priory, founded in the 8th c. (where excavations in July 1877 resulted in the discovery of the dust of St. Ronan, abbot of the priory in the 10th c., and of Patrick Graham, first archbishop of St. Andrews), and another about half a mile from the town of Kinross, with the ruins of Loch Leven Castle. The loch, fed by the Queich, Gairney, &c., and drained by the Leven into the Firth of Forth, is famed above all lakes in Scotland for the quality of its trout. Queen Mary was imprisoned in the castle in June 1567, but escaped on the 2d of May 1568.—*Loch L.* is also the name of a romantic inlet on the E. side of Loch Linnhe (q. v.), between the counties of Inverness and Argyle, 11 miles long, by one broad, and enclosed by lofty mountains. A river L., flowing from Loch Lomond into the Clyde, is celebrated in exquisite verse by Smollett. There are other streams of the name in Gloucestershire, Yorkshire, Cornwall, Cumberland, and Lancashire.

Le'ver, in mechanics, is a rigid rod, movable about a fixed point called the *fulcrum*, and having at two or more points weights or forces applied. The motion is usually supposed to take place in a vertical plane, and the power applied to be used to raise a weight. Calling the power P, and the weight W, it is easily

deducible, upon the universal law, that work done has its equivalent in work spent (see ENERGY), that the *moments* (see MOMENT) of the forces with respect to the fulcrum are equal; and that, therefore, $P : W = \text{distance of } W \text{ from fulcrum} : \text{distance of } P \text{ from fulcrum}$. This is the principle of the L., which holds under all possible modifications of form which this machine may assume. See BALANCE, WHEEL AND AXLE, &c., which are as truly levers as the simple rod described above.

Le'ver, Charles James, an Irish novelist, was born in Dublin, 31st August 1806. He studied medicine at Dublin and Göttingen, and was appointed in 1837 physician to the British Legation in Berlin. While there he published his first novel, *Harry Lorrequer*, a rollicking story of Irish military life. *Charles O'Malley* (1840), *Jack Hinton* (1843), and *Tom Burke* (1844) followed in the same vein—works of abundant dash and spirit. His later novels, though less exuberant, have much of his old brilliancy, and are calmer, riper studies. Such are *The Knight of Gwynne* (1847); *Roland Cashel* (1849); *Sir Jasper Carew* (1855); *The Martins of Cromartin* (1859); *Luttrell of Arran* (1865); *Sir Brooke Possbrooke* (1867); *The Brambleighs of Bishop's Folly* (1868); *Lord Kilgobbin* (1872), &c. L. was editor of the *Dublin University Magazine* (1842-45), and contributed the brilliant series of *Cornelius O'Dowd* papers to *Blackwood*. In 1858 he was appointed British consul at Spezzia, and in 1867 to a similar post at Trieste, where he died June 1, 1872.

Leverrier, Urbain Jean Joseph, the greatest of living French astronomers, was born at St.-Lô (Manche), March 11, 1811. After a distinguished course at l'École Polytechnique, he accepted the office of engineer to the administration of tobaccos, thereby fixing his residence in Paris. In 1836 he made some interesting experiments upon the compounds of phosphorus and hydrogen, but afterwards relinquished chemistry for the more congenial study of mathematics. In 1846 he startled the astronomical world by indicating the spot where a planet, further removed from the sun than Uranus, should, in accordance with the results of theory, be situated. The almost immediate sighting of this predicted planet by Galle of Berlin created a great sensation; and honours were showered upon the young astronomer from all sides. The same prediction was simultaneously made by an Englishman, J. C. Adams of Cambridge (q. v.). In 1854 L. succeeded Arago in the observatory of Paris, was dismissed owing to some misunderstanding in 1870, but reappointed in 1873. As a Member of the Legislative Assembly, he has been a keen promoter of the education movement in France; and chiefly through his endeavours has the extensive system of meteorological observation been developed in the country. His most valuable contributions to astronomical science are his tables of Mars, the Earth, Venus, and Mercury.

Le'vi (Heb., from *lavah*, 'to adhere,' cf. Gen. xxix. 34, and another explanation of the etymology in Num. xviii. 2) was the third son of Jacob by his wife Leah. The tribe was entirely devoted to the service of religion, either as regular priests or as subordinate officials. To leave them free for this work they had no territory assigned them, except forty-eight cities. But in lieu of this they were supported by the tithes of the rest of the people.

Leviathan (Heb. 'a serpent,' or 'dragon') occurs four times in the A. V. of the Bible, besides Job iii. 8 ('mourning,' marg. L.). In Job iii. 8, xli. 1, and Ps. lxxiv. 14, the crocodile is evidently meant, in Ps. civ. 26, probably some species of cetacean. In Isa. xxvii. 1, L. as a serpent is applied figuratively to a foreign power.

Levi'ta, Elias (properly **Elia Ha-Levi Ben Ascher, Aschkenasi**, i.e., 'the German'), a learned Jewish grammarian, born about 1470 at Neustadt, near Nürnberg, removed to Venice, where, as afterwards at Padua (1504-9) and Rome (from 1514), he taught Hebrew with great success. On the sack of Rome by Karl V. in 1527, he was forced to return penniless to Venice, whence he went (1540) to join Paul Fagius at Isny, in Swabia, returning in 1547 to Venice, where he died in 1549. L.'s knowledge of Hebrew was profound, and his enlightened views and fair spirit were appreciated alike by Christians and Jews. He promulgated the opinion, held by the first reformers, that the vowel points of Hebrew were invented by certain Jews of Tiberias in the 6th c. His chief works were *Bachur*, a Hebrew grammar (1518); *Meturgeman*, a dictionary to the Targum

(1541); and *Masoreth Hammasoreth*, on the criticism of the Hebrew Scriptures (1538, Ger. trans. by Semler, 1772).

Levites sometimes denotes the whole tribe of Levi (cf. Ex. vi. 25; Lev. xxv. 32), but specially is the title of that portion of it—the families of Gershon, Merari, and Kohath—which discharged the subordinate duties of the priesthood as assistants to the smaller portion of their own tribe called the sons of Aaron or the Priests (Num. viii. 19), and who formed as it were the body-guard of the ark of Jehovah (Num. iv.). According to the traditional view, the L. having been appointed to their duties at Sinai, were re-organised by David in preparation for the service of the temple. Having been the bearers of the ark to Zion (1 Chron. xv.) some of them were appointed 'to minister before it,' to be door-keepers, and especially for choral service (1 Chron. xv. xvi.), and this arrangement was adopted by Solomon on the completion of the temple (2 Chron. viii. 14). Such of the L. as returned from Babylon resumed their functions as these had been formerly assigned to the various classes. On the other hand, it has been pointed out that while in Exodus the sons of Aaron only are the priests, in Deuteronomy there is no distinction made between members of the tribe of Levi, who are all competent to be priests; that Samuel differs from Chronicles in making no mention of L. as bearers of the ark to Zion, or of Levitical musicians; that Ezekiel gives the services of the altar to the sons of Zadok, and excludes the rest of the sons of Levi from the priesthood, not by reference to the Mosaic law, but because they had been ringleaders in idolatry (Ez. xlv. 10-16). This has led some critics to the conclusion that it was only by degrees that the whole temple service was assigned to the L.

Leviticus, the third book of the Hebrew Scriptures, is so called from its consisting chiefly of laws concerning the priests (see **LEVITES**), sacrifices, &c. The traditional view that the book came from the hand of Moses, as it stands, has been strongly controverted by some critics; e.g., it has been maintained that Moses could not have written both chapters xviii. and xx., the latter being simply a repetition of the former, but not so well arranged. The book, as a whole, is of the highest importance for a knowledge of Jewish antiquities.

Lévy, the name of a great publishing firm in Paris, founded by two brothers, Calmann and Michel, in 1836. The brothers were born at Phalsbourg (Meurthe), the former 19th October 1819, the latter 20th December 1821. They have issued a multitude of works in all departments of literature—writings of Guizot, Victor Hugo, Lamartine, Sainte-Beuve, Renan, Kénu-sat, Balzac, Heine, &c.; translations of Macaulay, Poe, Dickens, Thackeray, Motley, &c. A specialty with the firm is dramatic literature, including contemporary plays, the *Entrée Acte* (since 1858), and a *Bibliothèque Dramatique*. Michel L. retired several years ago.

Lewes (Old Eng. *læde*, 'pasture land'), the county town of Sussex, England, on the Ouse, 50 miles S. of London, and 7 N. of Newhaven, its port, by rail. It has massive remains (the gatehouse and keep) of a Norman castle, and some slight ruins of a priory founded by William de Warenne, who married Gundreda, the daughter of the Conqueror, and to whom was given the town and surrounding territory. The bodies of Warenne and Gundreda were discovered here in leaden coffins in 1845. L. has an Early English church of St. Anne (restored in 1867), one of St. Thomas-à-Becket, in perpendicular style, the Fitzroy Memorial Library, an exchange, large barracks, a theatre, &c. There are manufactures of paper, leather, rope, twine, and farm implements, besides iron and brass founding, brewing, and boat and barge building. In addition to bi-weekly markets, fairs are held on Whit-Monday and 6th May for horses, on 20th July for wool, and on 21st-28th September for South Down sheep, when over 50,000 are sometimes penned. Three papers are published weekly, and races take place in June and August on the course at Mount Harry. Pop. (1871) 10,753. L. sends one member to parliament. It was anciently a Roman station, and many antiquities have been found in the vicinity. The battle of L., the great victory of the baronage under Simon de Montfort over Henry III. was fought near the town, 14th May 1264.

Lewes, George Henry, a variously gifted and cultured English author, was born in London, April 18, 1817, educated abroad, and after pursuing lengthened studies in medicine and

philosophy devoted himself to literature. He edited the *Leader* newspaper from 1849 to 1854, founded the *Fortnightly Review* in 1865, and has contributed very largely to several magazines. If never very profound, he is always luminous, sensible, and attractive. The *Life of Goethe* (1855, Ger. trans., 8th ed. 1872) was the first work of his which could be termed thorough. It is one of the best specimens of biographical literature produced in the 19th century. His *Biographical History of Philosophy* (new ed. 1864, under the title *The History of Philosophy from Thales to Comte*), has at least proved it a possibility to write on such subjects in a clear, graceful, incisive style; and his *Comte's Philosophy of the Sciences* (1853) forms a better guide to the study of Positivism than most of the more pretentious works on the subject. L. has also published *The Spanish Drama* (1846); *Rose, Blanche, and Violet*, a novel (1848); *The Life of Robespierre*, and a tragedy entitled *The Noble Heart* (1850); *Seaside Studies* (1858), and *Physiology of Common Life* (1860); *Aristotle* (1861; Ger. trans. 1865); *Actors and Acting* (1875); but his reputation as an original thinker is based on *Problems of Life and Mind*, of which 2 vols., constituting the first series, appeared in 1874-75; *The Physical Basis of the Mind*, constituting the second series, in 1877.

Lewis-with-Harris, the largest and most northerly of the Outer Hebrides, the N. part of which, Lewis, belongs to Ross-shire, the S. and lesser portion, Harris, to Inverness-shire. Area 770 sq. miles; pop. (1871) 25,947. It lies about 30 miles off the coast of Ross-shire, from which it is separated by the North Minch, is 60 miles long and 30 broad, and its coast is indented by Broad Bay, and Lochs Erisort, Scaforth, Resort, Roag, &c. The scenery is varied and sublime, wild mountain masses alternating with green pastoral glens, gemmed by solitary tarns, or penetrated by long, sinuous arms of the sea. A broken chain traverses the island, rising in Suanival and Clisseval to a height of 2700 feet, and running N. to the Butt of Lewis, a promontory 142 feet above the sea. There are many small streams; the largest lake is Langabhat; the inlets are full of rocks and minor islands, of which the chief are Tarnansay, Scarpa, Bernera, and Scalpa. The climate is mild, observations of four years at Stornoway giving the mean at 46° F., and the rainfall at 32.2 inches. Some barley and potatoes are raised, and there is a productive fishing industry. Otters and seals abound in the rivers and on the shores; deer and hares are plentiful; the salmon and trout fishing are among the best in Scotland, and the winged game is specially rich. The chief town is Stornoway (q. v.). Sir James Matheson, Bart., whose seat is Stornoway Castle, purchased the district of Lewis for £190,000, and has introduced various improvements. Gaelic is generally spoken, and in the N. there is a purely Scandinavian colony. Perhaps the most interesting remains on the island are the ancient church of Rowdill, in the extreme S., and pre-historical standing-stones of Callanish (forty-eight in the form of a cross) near Loch Roag, 16 miles W. of Stornoway.

Lewis, Right Hon. Sir George Cornwall, the son of a Radnorshire baronet, was born in London, 21st April 1806, educated at Eton and Christ Church, Oxford, and called to the bar in 1831, where he did not, however, practise. In 1839 he was appointed Poor-Law Commissioner, a post previously filled by his father. In 1847 he was returned to Parliament for Herefordshire, and became Secretary to the Indian Board of Control, in 1848 Under Secretary for the Home Department, in 1850 Financial Secretary to the Treasury. L. was elected M.P. for Radnor in 1855, having been deprived of his seat for three years, a period during which he conducted the *Edinburgh Review*. In the government of Lord Palmerston L. became Chancellor of the Exchequer (1855), Home Secretary (1859), and War Secretary (1861). He died 13th April 1863. During the whole period of his political activity L. devoted himself with enthusiasm to science, history, philosophy, and philology. In 1835 appeared an *Essay on the Origin and Formation of the Romance Languages*; in 1852, *On the Methods of Observation and Reasoning in Politics*; in 1855, *An Inquiry into the Credibility of Early Roman History*; in 1861, *Astronomy of the Ancients*; and in 1876, *On the Influence of Authority in Matters of Opinion*. L.'s mind was of a severely critical and judicial order. The keen distrustful logic that directs and guides his thinking has a certain icy charm. It is at least the outcome of rigorous honesty. L.'s scholarship was at once deep, exact, and wide. His name will be remem-

bered even if his books should be superseded. His wife, **Lady Maria Theresa L.** (born 8th March 1803, died 8th November 1865), was also an author.

Lewis, Matthew Gregory (Monk Lewis), was born in London, 9th July 1775. While in Germany he composed *The Monk*, his best known book, vigorously but coarsely written, full of murders, ghosts, and impurities. *The Bravo of Venice* (1804) was his second-best novel, and the *Castle Spectre* (1797) his only successful play. One or two stirring ballads of his still live, and his *W. Indian Journal* is a good book of travels. He died returning from a visit to his estates in the W. Indies, 14th May 1818. *L.'s Life and Correspondence* was published in 1839.

Lewisia is a genus of Mesembryaceæ represented by a single species, the *L. rediviva* of Pursh. It is a somewhat succulent perennial, bearing in the midst of its fleshy bunch of leaves a single stalk surmounted by a single rose-coloured flower. The leaves wither away as soon as the flower expands, and the whole plant passes entirely from sight in less than two months from its first appearance above ground. It is indigenous to N. W. America; and the large starchy root was once extensively used by the Indians as an article of food.

Lewiston, a city of Maine, U.S., on the Androscoggin river, 35 miles N. of Portland by rail. It has splendid water power, supplying 10 cotton-mills, with 242,548 spindles, and 5 woollen-mills, which together produced goods to the value of \$11,500,000 in 1873. The river here falls 50 feet over a ledge of rocks, and the vicinity is very picturesque. In the public park there is a soldier's monument. *L.* is now (1877) the second largest city in the State. Pop. (1870) 13,600.

Lexington, a city in Kentucky, U.S., on a branch of the Elkhorn river, 20 miles S.E. of Frankfort by rail. It has eighteen churches, a public library of 16,000 vols., a State asylum, an orphanage, &c. The Transylvania university, the oldest in the Western States, founded here 1798, was united to the Kentucky State University, removed hither in 1865, and the institution had in 1872, 21 professors, 9 other teachers, 579 students, and 20,000 volumes. There is a large agricultural trade and carriage bagging and rope factories. *L.*, incorporated in 1787, was for some time the State capital, and soon became the chief place W. of the Alleghanies. Pop. (1870) 14,801.—*L.*, a city of Missouri, on the S. bank of the river Missouri, 250 miles W. of St. Louis (370 by river). It is a railway centre, and has a coal trade. Pop. (1870) 6336. *L.* was taken by the Confederates, 20th September 1861, retaken on 16th October following, and again unsuccessfully attacked by General Blunt in October 1864.—*L.*, a post-village (pop. 2277) of Massachusetts, 11 miles N.W. of Boston by rail, was the scene of the earliest (18th April 1775) resistance to the British troops, in the War of Independence. Though a slight and ineffectual affair, it has gained for *L.* the name of 'the birthplace of American liberty.'

Lex Loci Contractus, a legal term denoting the law of a country in which an obligation was contracted. *L. L. C.* rules all relating to the nature of the obligation; while *Lex Fori*, or law of the country whose courts are asked to enforce the obligation, regulates the mode of action for that purpose. See INTERNATIONAL LAW.

Ley or Lye (Lat. *lix*, ashes, lye), water impregnated with an alkali, such as soda-ash or potash, employed in soap-making and other industries. In printing, benzine forms an efficient substitute for *L.* in cleaning type.

Leyden or Lei'den ('the fort on the marsh'; the *Lugdunum Batavorum* of the Romans), a well-built town in the Dutch province of S. Holland, on both sides of the Oude Rijn ('Old Rhine'), 7 miles from the sea, and 16 miles N. of Rotterdam by rail, with many canals and wide streets, of which the Breestraat ('Broad Street') is one of the finest in Europe. The oldest part is the citadel, on a hill in the centre. Among its public buildings are St. Pancras' Church (1280), near which is the corn exchange, on a bridge with covered porches; St. Peter's (1315), in which are buried Boerhaave, Scaliger, Spanheim, and Camper; the town house, with pictures by Lucas van Leyden, Cornelis Engelbrechtsen, and Van Bree; and the famous university (founded in 1575, and connected with many great names, as Grotius, Descartes, and Ruhnken), now attended

by 600 students, and enriched with an observatory, a valuable library, and fine anatomical and botanical collections. *L.* was the birthplace of the painters Rembrandt, Dow, Metzu, and Mieris, and the seat of the famous Elzevir (q. v.) printing-press. Printing and cloth-manufacture were formerly the main industries of *L.*, which is now the chief mart in Holland for wool and woollen goods. There are some iron-foundries and salt-works, and a lively trade in agricultural produce. Pop. (1876) 40,724. *L.* suffered greatly from a siege (31st October 1573 to 24th March 1574), and subsequent blockade by the Spaniards, till saved by Prince William of Orange, who, piercing the dams of S. Holland, laid the surrounding lands under water, and raised the siege (3d October 1574).

Leyden, John, a Scottish poet and scholar, was born at Denholm, Roxburghshire, 8th September 1775. He studied at Edinburgh University, not only the prescribed subjects, but French, German, Spanish, Italian, and Icelandic. In 1797 he was licensed as a probationer of the Church of Scotland, but never received a charge. In 1799 he published *A Historical and Philosophical Sketch of the Discoveries and Settlements of the Europeans in Northern and Western Africa at the close of the Eighteenth Century*. Two years after, he edited with great learning the *Complaynt of Scotland*, the authorship of which he attributed to Sir David Lindsay. He also assisted Walter Scott in collecting materials for his *Minstrelsy of the Scottish Border*. In 1802 he undertook the editorship of the *Scots Magazine*, but in the same year obtained an Indian surgeons'hip, for which he qualified himself in six months. Before leaving he finished his poem entitled *Scenes from Infancy*. Gaining his Indian experience first in the districts of the Mysore, he removed for health's sake to Prince of Wales Island, where he obtained information for his essay on the *Languages and Literature of the Indo-Chinese Nations* (10th volume of *Asiatic Researches*). Thence he removed to Calcutta, as Professor in Bengal College, afterwards becoming judge of the Twenty-Four Pergunnahs of Calcutta. He accompanied the governor-general, Lord Minto, to Java, there to accumulate information as to the institutions of native tribes; but at Batavia he was struck down by fever 21st August 1811. By extraordinary combination of genius with industry, *L.* raised himself from the humblest position to the first rank of European scholars. In all departments of philology he was learned; but his labours in the field of Asiatic language and literature are of special value. His *Poetical Remains* were published in 1819; and a new edition of his *Poems and Ballads*, with memoir by Walter Scott, in 1858. The centenary of his birth was celebrated in 1875, and in the same year an edition of his *Poems*, with *Life*, was published by Nimmo (Edinb.).

Leyden, Lucas van, was born at Leyden in 1494. He studied drawing under Cornelis Engelbrechtsen, and when a mere child produced paintings and prints prized now by collectors as rare curiosities. Some of his pictures are to be seen at Vienna, Dresden, Berlin, and Munich; one or two are to be found in this country; but his greatest work, 'The Last Judgment,' adorns the town-hall of Leyden. He was one of the first to engrave from his own paintings, and latterly devoted himself entirely to etching. Two hundred of his prints are extant, the most famous of which are 'Mahomet and the Monk Sergius,' and the 'Eulenspiegel.' His pictures are stiff but bold, and mellow in colour. His engravings rank next to those of Albert Dürer, wanting the free touch of that artist, but full of expression, and excelling in the rendering of aerial perspective those of other contemporaries. *L.* led an extravagant life, and died in 1533.

Leyden Jar. See ELECTRICITY and ELECTROSTATIC INSTRUMENTS.

L'Hospital, Guillaume François Antoine de, Marquis, a French mathematician, was born at Paris in 1661. His father intended him for the army, but this he soon abandoned, and devoted himself to the study of mathematics—particularly the newly invented calculus developed by Leibnitz and the Bernoullis. He was one of the four men in Europe who solved the *brachistochron*, viz., 'to find the curve on which a material point will fall from one point to another in the least possible time.' The others were Newton, Leibnitz, and Jakob Bernoulli. *L'H.* then proposed, as a challenge, 'of all the curve

lines which can be described on a given rectilinear base and of a given length, to find that which contains the greatest area.' L'H. also solved Newton's problem of the solid of least resistance. Cycloids and epicycloids were the favourite subjects of his meditations. His chief works are *Analyse des infiniment Petits* (1696), and *Traité Analytique des Sections Coniques* (1707). L'H. died 2d February 1704. In spite of the mean accusations of John Bernoulli, repeated by Montucla in his *Histoire des Mathématiques*, no one has ever seriously doubted L'H.'s brilliant originality or his fairness towards his great contemporaries.

L'Hospital, Michel de, a great French statesman, born in 1505 at Aigueperse in Auvergne, studied law at Toulouse and Padua, was auditor of the Rota at Rome, came in 1534 to Paris, where he practised as an advocate and counsellor for the Parliament, was appointed by Marguerite of Valois her chancellor, and in 1554 became superintendent of finance. On the accession of François II. (1559) he entered the Council of State, and in 1560 was made chancellor of the kingdom by Catherine de' Medici. A good man, a genuine patriot, and a prudent councillor, he laboured to restore order and smooth party differences, but his moderation was taken for secret heresy, and led to his losing the seals, 24th May 1568. He died at Bellebat, near Étampes, 13th March 1573, during the Civil War, against which he had constantly remonstrated. See his *Oeuvres Complètes*, by Dufey (5 vols. Par. 1824), and the biographies by Villemain and Lévêque de Pouilly.

Liability, Limited, Acts. See JOINT STOCK COMPANIES, LAW REGARDING.

Lianas (from French *liane*) are woody, climbing, or twining plants that often in tropical countries, by their exuberant and interlacing growth, so mass together the forests as to render the traveller's progress a matter of the greatest difficulty. In Brazil, for instance, species of bignonia overtop the tallest trees, their flexible stems twisted like ropes pass from tree to tree, descend to the ground at intervals, take fresh root, again ascend other trees, and thus continue a perennial growth over vast areas. The rattans or canes are also L., climbing over and amongst the trees and supporting themselves by the hooked spines of their leaf-stalks, and the 'Supple-Jacks,' 'Wild-Irishmen,' and 'Bush-Lawyers' of the colonies come under the same category. The clematis may be quoted as an illustration, on a small scale, of this group of plants.

Lias Formation, The, is usually regarded as forming the base of the Jurassic or Oolitic System (q. v.), lying between the Upper Trias and the Lower Oolite. It is divided into three sections, called respectively the *Lower L.*, the *Marlstone*, and the *Upper L.* The Lower L. consists essentially of bluish-grey argillaceous limestone, alternating with laminated clay or shale, rich in fossil remains of corals, molluscs, fish, and reptiles. It furnishes limestones which are in some places extensively used for flags and building stones. The Marlstone is a well-marked division, composed mainly of calcareo-argillaceous sandstone, which is widely quarried in the N. and S. of England for the ironstone which it contains. The Upper L. consists of a thick deposit of blue clay, topped by bands of brown and yellow sands which were at one time classed with the Inferior Oolite. The L. is exceedingly rich in fossils, and each of the subdivisions has its characteristic assemblage of fossils which at once separates it from the rest. The clayey consistency of the formations in many places, and the presence of corals, molluscs, and fish, stamp them in great measure as marine deposits; but there are nearly 100 distinct species of plants (chiefly cycads), besides numerous remains of insects and reptiles (*Ichthyosaurus*, *Plesiosaurus*, &c.), which indicate the contemporaneous existence of conditions for terrestrial life.

Libanius, a distinguished Greek sophist and rhetorician, was born at Antioch, A.D. 314 or 316. He went to Athens in pursuit of knowledge, and there prosecuted his studies with marked success. He opened a private school at Constantinople, and attracted numerous pupils; but in consequence of the revengeful spirit manifested by his professional rivals he was (346) expelled from that city, to which, however, he subsequently returned on several occasions. He taught also, and with equal success, at Nicomedia, to which place he was warmly attached. He finally retired to his native city, where he died

in 393. Though a pagan, he was moderate and tolerant in spirit, and was at once the teacher and friend of St. Basil (q. v.) and John Chrysostom (q. v.), and the favourite of the Emperors Julian (q. v.) and Theodosius (q. v.). Many of his works are still extant, the best edition of the orations and declamations being by Reiske (4 vols. 1791-97), and of the epistles by Wolf (1738).

Libations (from Lat. *libo*, 'I pour out'; Gr. *loibai* or *spendai*), drink-offerings of unmixed wine, milk, or honey, were employed by the Greeks and Romans in the ratification of a treaty, at funerals, and on many other public and private occasions, as at the opening and close of a banquet, when the Greeks made L. to the Good Genius, to the sound of a flute, by pouring wine and laying a cake upon the altar, with the word *hygieias*; the Romans, to the Lares, by committing to the flames upon the hearth wine or some delicate morsel, or both together. L. are also common to the Celtic, Teutonic, Slavonic, and other folk-lore.

Libau', or **Leepaja**, a seaport of Russia, government of Courland, on a low tongue of land between the L. lagoon and the Baltic, 120 miles W.S.W. of Riga. It is a railway terminus, and an emporium for the grain and hemp of W. Russia. Its chief buildings are a town-house, several churches, a synagogue, hospital, and theatre. The harbour, constructed in 1865, is free of ice during most of the year. In 1873, the imports (herrings from Norway, colonial wares from Lubeck, wine, salt, &c., from England, and fruit from Italy) amounted to £200,219; and the exports, mainly grain, flax, linseed, and railway sleepers, to £723,959. L. is a favourite bathing-place for the Courland aristocracy. Pop. (1870) 10,767.

Libel is a malicious defamation of one man by another, by means of writing or representation. Spoken defamation is *Slander* (q. v.). With regard to an individual, any matter maliciously hurtful to his reputation is a L.: With regard to Government, all matter holding it up to public contempt or disesteem is libellous.

In a civil action, a L. must appear to be false as well as defamatory. In a criminal information by an individual, when the L. contains a direct charge which the applicant can deny, the court will require an affidavit that the charge is unfounded.

Between L. and mere verbal defamation there is an important distinction, the former being presumed to be a more deliberate injury, and more widely and permanently diffused. Hence the word *swindler*, if spoken of another, unless in relation to his calling, is not actionable, but if published in a written form, it is so. Printing or writing may be libellous though the scandal be not directly charged, but obliquely and ironically. To constitute L. it is not necessary that the person libelled be named; if so described or indicated as to leave no reasonable doubt to whom the libellous matter was meant to apply, this is enough. A comment on a literary work, holding it and its author up to ridicule, is not libellous, unless it attack the writer in his domestic or social relations, or in circumstances unconnected with his literary work. The same rule applies to criticism on the works of a professional artist. Under Lord Campbell's Act, if one man publishes or threatens to publish a L. on another, with intent to extort money or other valuable consideration from him, the offender is liable to three years' imprisonment, with or without hard labour.

Libel (ecclesiastical) is the name given to the summons commencing a suit, and containing the accusation of the plaintiff or pursuer.

Libéria, a negro republic on the W. coast of Africa, in Upper Guinea, founded in 1821 by the American Colonisation Society, extends from the Sherbozo River in the N.W. to the Pedro River in the S.E., a distance of some 600 miles, and has an extreme breadth from the coast inland of nearly 100 miles. Area estimated in 1873 at 9700 sq. miles; and the pop. at 720,000, of whom 19,000 are emancipated American slaves, and the rest natives. The coast is low and sandy, except in the S.E., where it is precipitous, and the interior rises in woody hills and lofty mountain ranges, opening in fine fertile valleys, watered by many small streams. The climate is tropical, and very dangerous for immigrants. Among the forest trees are teak, mahogany, rosewood, palms, and various dye and gum-trees. Along the St. Paul River are the principal farms, and here 300,000 lbs.

of sugar were produced in 1871. Coffee is successfully raised, and cotton is indigenous, yielding two crops yearly. Other products are maize, rice, wheat, barley, oats, vegetables, tomatoes, cucumbers, lemons, oranges, guavas, tamarinds, pineapples, and African peaches. Besides the principal of these articles, L. exports palm-oil, gold-dust, ivory, and hides. The capital is Monrovia, with some 13,000 inhabitants; and other settlements are New Georgia, Caldwell, Virginia, Edina, Greenville, Lexington, &c. The constitution is modelled on that of the United States. Election is by ballot, and every male citizen who possesses real estate has the suffrage. No white man is admitted to citizenship. The president is elected for two years, senators for four, and representatives for two. In 1875 the revenue (chiefly customs' duties) amounted to £21,500, and the expenditure to £23,100. English is the official language. L. was proclaimed an independent state in 1847, and was recognised by Britain in the following year. See Thomas's *West Coast of Africa* (New York, 1860), and Stockwell's *Republic of L.* (New York, 1868).

Liberius, Bishop of Rome from 352 to 356, was one of the bishops who, on account of their refusal to subscribe the condemnation of Athanasius at the synods of Arelate (353) and Milan (355), were deposed from their sees and banished. To regain his office L. afterwards subscribed the semi-Arian confession of faith drawn up by Eusebius of Nicomedia. In spite of this heterodoxy he is regarded as a saint by the Roman Catholic and Greek Catholic Churches.

Liberty, a term of English law denoting the same as *Franchise* (q. v.).

Liberty, Equality, and Fraternity are the formulae representing from different points of view the creed of a certain class of political speculators. Different republics have adopted the phrase as a motto, and France, at the present time (1877), adorns with it the portals of all her public institutions. The democratic idea which it represents has now passed in some form or other into the literature, politics, and religions of every region where Aryan civilisation prevails. The doctrine in its boldest shape simply means a readjustment of society with the elimination of all the inequalities of class. Its most important English manifestation in the present generation is made in the writings of those who profess it as the Religion of Humanity. In their view the destiny of the human race can only be nobly and efficiently fulfilled by the withdrawal of all restraints upon human conduct, by the practical realisation of a scheme under which the cruel contrasts in the lot of life may be removed, and by the sublimation of self-love into a general love for the whole family of man. In the ethical works of J. S. Mill, in the miscellaneous writings of John Morley, and the English school of Comtists, these principles, though not systematised, are represented in their highest literary form. L. F. Stephen in his *L., E., and F.* (1873) subjects them to a keen analysis, and supports the thesis that the people who use these words most rationally exaggerate their advantages, and that the words themselves are ill-adapted to be the creed of a religion, while they do not typify any state of society which a reasonable man ought to regard with enthusiasm or self-devotion.

Libourne, a town of France, department of Gironde, at the confluence of the Dordogne and Isle, 20 miles N.E. of Bordeaux by rail. It has remains of old fortifications, and a tower of the 14th c. The Dordogne is crossed by a stone bridge, and the Isle by a suspension bridge. L. has tanneries, nail and rope factories, &c., and a large trade in grain, timber, salt, brandy, and wine. Pop. (1872) 11,456.

Libra, an insignificant constellation, situated on and to the S. of the celestial equator, just below the feet of Bootes. Its importance arises from its once having been the *sign* of the zodiac which the sun occupied at the time of the autumnal equinox. When used in this sense, it corresponds to the *constellation* Virgo.

Libraries. The oldest national library of which we have record is that collected by Osymandus, king of Egypt, at Memphis, some 14 centuries B.C., according to Diodorus of Sicily, whose general testimony is supported by modern Egyptologists. But the most superb in Egypt, perhaps in all the ancient world, was the Alexandrian Library (q. v.), enriched by the addition of that of Pergamus (q. v.). Alexandria also possessed a great library in the Sebasteum, and another of later date attached

to its 'School.' L. gathered early in Hebrew synagogues and Persian palaces, but more remarkable are the 'L. in clay' of Assyria. In the palace at Nineveh the excavations revealed a vast collection of clay tablets, bearing cuneiform inscriptions, and forming a sort of royal library. Some 20,000 such tablets are now in the British Museum. Pisistratus is said to have been among the earliest of the Greeks who projected a great library, and one of the most famous private collectors was Aristotle. The L. of the various countries they conquered were eagerly acquired by the Romans. Sulla brought from Athens the library of Apellicon. Magnificent private L. were possessed by Crassus, Cæsar, Cicero, and Lucullus—the latter, like Sulla, generously allowing free access to his treasures. Julius Cæsar projected a *public* library, and chose Varro as librarian, but the scheme was foiled by the dagger of Brutus. After the reign of Augustus, the emperors were ambitious to found and give their names to L. According to Publius Victor, Rome had 29 public L., the first of which was opened by Asinius Polio. Augustus founded two public L.—the Octavian and Palatine. The most important of all was the Ulpian of Trajan. At Herculaneum was discovered a library of 1700 scrolls. Constantine the Great began the formation of a library at Byzantium, especially for the rescue of the Christian works that had been doomed to destruction by Diocletian. It is commonly supposed that Amurath IV. sacrificed it in a fit of devotion; yet many scholars still believe it to be concealed in the Scraglio. The largest L. in ancient times might correspond to modern collections of 80,000 vols.

In the Middle Ages the chief conventual L. were Benedictine; such are those of Monte Casino (q. v.), Fleury on the Loire, Clugni in Burgundy, Corbie in Picardy, St. Gall (q. v.), those of the monasteries of Christ Church and St. Augustine at Canterbury, and the abbeys of Durham and Peterborough. Karl the Great founded a library near Lyon; the choice books of Karl the Bald are now in the British Museum; Pope Sylvester II. was an ardent collector of classics.

On the revival of learning in the 15th c., learned men, aided by princes, popes, and scholars, were despatched throughout the civilised world to collect MSS., and in the course of a few years most of the classics now known were brought together in the rich L. of Rome, Naples, Venice, Florence, Vienna, and Paris. The L. of Federico, Duke of Urbino, and Matthias Corvinus, King of Hungary, were counted among the marvels of the age. Now, also, began the formation of those town L., in which Germany is so rich. Modern L. continued to multiply with increasing rapidity after the invention of printing.

Of modern L., all that can be given is the merest summary. In Great Britain the chief L. are the British Museum (q. v.), with 1,150,000 vols., the Bodleian (q. v.), with 330,000, the Advocates' Library (q. v.), Edinburgh, with 250,000, Cambridge University with 250,000, Dublin University with 170,000 (each entitled to a copy of all books published in the empire); Edinburgh University with 138,000, Glasgow University with 105,000, Liverpool (public) with 100,000, and Manchester with 120,000. Those of Paris are the Nationale with 2,000,000 vols., the Arsenal (300,000), St. Geneviève (200,000), Sorbonne (140,000), Mazarin (160,000), and Institute (100,000); Bordeaux has 140,000 vols., Lyon 120,000, and Rouen 120,000. Those of Germany are the Berlin Royal (710,000, and 15,500 MSS.), Breslau University (340,000), Darmstadt (450,000), Dresden (305,000), Gotha (240,000), Göttingen (360,000), Hamburg (250,000), Heidelberg (175,000), Königsberg (200,000), Leipsic (350,000, and 2500 MSS.), Munich (800,000, and 25,000 MSS.), Munich University (300,000), Strassburg (160,000, rich in Incunabula, q. v.), Wöllenbüttel (250,000), Würzburg University (200,000), and Tübingen (220,000). Germany has some 15 other L. of over 100,000 vols. Those of Italy are the Vatican (105,000 vols. and 25,000 MSS.), the Casanata, Rome (160,000 vols.), the Brera, Milan (185,000), the Ambrosian, Milan (140,000), the Nazionale, Florence (300,000), Nazionale at Naples (200,000), Bologna (200,000), Parma (140,000), Turin (150,000), and St. Mark's, Venice (120,000, and 10,000 MSS.). Other remarkable L. are the Imperial, St. Petersburg (802,700, and 28,536 MSS.), Moscow University (160,000), the Royal, Copenhagen (500,000), Copenhagen University (200,000), Stockholm (125,000), Christiania (150,000), Upsala (150,000), Brussels (250,000), Freiburg (250,000), Madrid National (230,000), the Imperial Public, Vienna (400,000), Vienna University (210,000), Buda-Pesth (200,000), Athens (125,000), Harvard College, U. S. (250,000),

the Library of Congress, Washington (280,000), Boston (public, 225,000), and the National, Mexico (100,000). In 1874 there were 790 public or associated L. in the United States, with an aggregate of 7,760,118 vols.

Libraries and Museums, Free, Act. The 18 and 19 Vict., c. 70, may be adopted by any municipal borough, if by the last census the population exceed 5000, and if two-thirds of the ratepayers consent. A rate may be levied not exceeding one penny per pound, for the founding and maintaining of a free public library. By 29 and 30 Vict., c. 114, a public meeting to consider the adoption of the Act is to be called on the request of the town council, or on the request of the ratepayers residing in the borough, and parishes or districts may unite in adopting the Act.

See *Memoirs of L.* (2 vols. Lond. 1859), and *L. and Founders of L.* (Lond. 1864), by E. Edwards.

Libration, the name given to two inequalities of the moon, arising from the circumstances that her orbital motion is not uniform, and that her axis of rotation is not perpendicular to the plane of her orbit. The effect of the first is to render apparent at times a small strip of her surface lying just round the eastern or western edge of her visible disc; while, in virtue of the second, portions of her surface surrounding either pole come into view.

Libri-Carucci, Guillaume, a mathematician, of Italian origin but French by naturalisation, was born at Florence, January 2, 1803. In 1823 he became Professor of Physics at Pisa, and the succeeding year went to Paris, returning to Florence in 1825. In 1830, compelled for political reasons to leave Italy, he revisited Paris, and in 1832 succeeded Biot in the Collège de France. L. is perhaps best known in connection with the charge of abstracting books and MSS. from the public libraries to the value of £20,000. He was found guilty, and condemned to ten years' imprisonment, but had in the meantime fled to England, where he died in October 1869. L.'s chief work is *l'Histoire des Sciences Mathématiques depuis la Renaissance jusqu'à la Fin du XVIIe. Siècle* (4 vols. 1838-41), and he is the author of numerous memoirs, scientific and political.

Libya was the name applied by the early geographers to that portion of Africa which lay between Egypt, Æthiopia, and the shores of the Atlantic, and which was bounded on the N. by the Mediterranean, and on the S. by the mythical river Oceanus. The L. of Homer and Hesiod comprised Africa to the W. of Lower and Middle Egypt; and to Herodotus L. was sometimes the whole of ancient Africa, and sometimes Africa exclusive of Egypt. The province of L. Proper lay between Egypt and the Syrtis Major, and comprehended the regions of Marmarica, and Cyrenaica or Pentapolis. The wars with Carthage, the Jugurthine war, and various expeditions of discovery gave to the ancients a more extended knowledge of the continent, but its form and dimensions were not clearly ascertained till the Portuguese doubled the Cape of Good Hope in 1497.

Licence is in law a power or authority given to a man to do some lawful act. It cannot be assigned unless it bear to be granted to a man and his assignees. See GAME LAWS. Under DANCING, *Dancing and Music L.*; MARRIAGE LICENSING ACT, 1872.

English Licensing Act (1872). This Act, which does not extend to Scotland, was passed to amend the licensing Acts. Justices having an interest in the liquor trade are disqualified from acting. No L. granted at a general license meeting in respect of premises not previously licensed is to be valid in counties till it is confirmed by the county licensing committee. Registers of licences are to be kept in licensing districts, and every person applying for a new L. is to state the name of the owner of the premises for which the application is made.

Licentiate (Lat. *licentia*, 'permission,' i.e., to deliver lectures and afterwards to dispute for the degree of doctor), a degree intermediate between bachelor and doctor, now restricted to the theological faculty in continental universities, and only used in England at Cambridge, which gives the degree of L. of Medicine. L., in Scotland, means one *licensed* by a presbytery to preach.

Lichen is a papular disease of the skin, distributed upon a single region, or over the entire surface of the body. The papules are conical in form, of the size of millet seeds, slightly reddish in colour, and are attended with itching, tingling, and smarting. They may terminate in resolution, furfuraceous desquamation, or in superficial ulceration. L. is described under

six varieties, depending on the appearance, situation, form, and severity of the disease, viz.: *L. simplex*, *L. annulatus*, *L. circumscriptus*, *L. urticatus*, *L. tropicus*, *L. agrius*. In *L. simplex* the eruption is ushered in by smarting and pruritus, which are increased towards night. In three or four days the redness and pruritus subside; the papules decline, disappearing entirely in a week or ten days, and then follows a furfuraceous desquamation of the cuticle. In the chronic form, successive crops appear, and the eruption may be prolonged for months or years. The use of indigestible articles of diet and spirituous drinks, more especially in hot weather, is a frequent cause of L. **Treatment:** milk and farinaceous diet, saline aperients, with locally a tepid bath, a lotion containing *liquor plumbi diacetat*, distilled vinegar, or lemon juice, will be sufficient to allay the irritation in *L. simplex*.

Lichens. In the present state of the scientific discussion, as to whether L. are a family of autonomous plants or are Fungi parasitic upon Algæ, it seems desirable to speak of them here as the former, the theory of their dual constituency not having as yet been accepted by the bulk of botanists. L. form one of the largest tribes of cellular cryptogams, are distributed through all countries of the world, generally draw their nourishment from the air, are of slow growth and long endurance, and may roughly be described as consisting of two parts, namely, their frond or thallus, and their fructification. The thallus is commonly developed in the form of incrustations, which cover stones, and the bark of trees, or penetrate between the lamellæ of the epidermis of woody plants. These are termed Crustaceous L., and are mostly so closely united to the substance on which they grow, as not to be separable without injury. In another group—the Foliaceous L.—the thallus forms flat-like expansions, which can be completely detached from the ground, stone, or bark, &c., that supports them, since they are attached to their host only in a few places by root-like organs called Rhizines. A third form of L.-thallus is shown in the Fruticose group, which are attached only by a narrow base at one spot, and grow in the form of miniature much-branched shrubs. Certain genera again are met with in a slimy condition, and are called Gelatinous L. The reproductive organs appear in the form of protuberances of various kinds, either bursting through the surface of the frond, and expanding into shield-like or hollow discs, or remaining covered by its outer layer, and opening by pores; the first form the Gymnocarpous L., the latter Angiocarpous L. Berkeley, one of the prominent authorities on cryptogamia, says in fructification they agree with ascomycetous Fungi, and like them have either a second form of fruit (stylospores), contained in distinct cysts (pycnidia), or minute bodies variously borne, which are supposed to have the power of impregnation. Nylander (the best specialist), divides L. into three families, using the vegetative element for separating purposes, whilst Acharius employs the fructification for his divisions. L. furnish valuable dyes, and to some extent are useful for food. See ARCHIL, CUDWEAR, ICELAND MOSS, LITMUS, REINDEER MOSS, TRIPE DE ROCHE.

Lichfield, an old episcopal city of England, in Staffordshire, on a small feeder of the Trent, 18 miles S.E. of Stafford, and 116 N.W. of London by rail. The cathedral, the architectural glory of L., is partly of the Early English period, and has been restored by Sir G. G. Scott. It is 410 feet long, and 153 wide, has three spires (the central one 280 feet high), and is rich in beautiful sculpture. The body of St. Mary's Church was rebuilt (1868) in Second Pointed style, to harmonize with the tower. L. has a diocesan theological college, a museum and free library, and a grammar school, founded by Edward IV., and attended by Addison, Ashmole, Johnson, and Garrick. The industries are brewing, malting, flax-spinning, paper-making, and market-gardening. Pop. (1871) 7347. The name L., originally *Licedfeld*, means 'field of corpses,' and possibly marks the scene of a battle of which there is no record in history. The ancient see of L. corresponded to the original Anglian kingdom of Mercia, and was established as an archbishopric by Offa (q. v.) in rivalry of Canterbury. The town received its first charter from Edward II., and returns one member to parliament.

Licinia gens was a celebrated plebeian gens, to which belonged C. *Licinius Calvus Stolo*, who carried the measure throwing open the consulship to the plebeians, and who, when

tribune, brought forward the rogation to restrict each citizen to 500 jugera, or about 333 acres, of the public land. The rogation was adopted, and in 356 B.C. L. was himself convicted under it. The L. G. attained the imperial dignity in the person of *L. Publius Flavius*, a Dacian peasant, who by the favour of the Emperor Galerius was raised to the rank of Augustus, and made governor of the Illyrian provinces, A.D. 307. In 313 he married Constantina, sister of Constantine, and, by defeating Maximinus, became sole master of the Eastern empire. In 315, and again in 323 war broke out between Constantine and L., in which the latter was completely crushed. He was banished to Thessalonica, where in 324 he was put to death by the orders of his rival.

Lictor (from Lat. *ligo*, 'I bind'; he who *binds* the rods or the culprits) was an attendant granted to Roman magistrates of the highest rank, as a sign of official dignity. The lictors bore the Fasces (q. v.) and walked in single file before the magistrate, calling out to the people to make way for him, and to pay their respects to him. They had also to execute sentences of judgment, to bind criminals to the stake, to scourge, and to behead them. In the earliest times the kings had twelve lictors; and, on the first institution of the consulship, twelve were assigned to each consul. In the city the axe was removed from the fasces of the consul, and in the Comitia the lictors lowered their fasces in acknowledgment of the supreme power of the people.

Liddon, Rev. Henry Parry, D.D., D.C.L., the greatest living preacher in the English Church, born in 1830, studied at Christ Church, Oxford, and graduated in 1850, became Johnson's theological student (1851), and having taken orders, was Vice-principal of Cuddesdon Theological College (1854-59). He was made a canon of Salisbury in 1864, and as Bampton lecturer (1866) delivered a masterly course of sermons, *The Divinity of our Lord* (Oxf. 1867). In 1870 he was advanced to a prebend of St. Paul's Cathedral, and the same year became Ireland Professor of Exegesis in the University of Oxford. As a leader of the Anglo-Catholic party, L. has attended several of the Bonn conferences of the 'Old Catholics,' and in 1876 expressed his sympathy with the Greek Church by a visit to the revolted provinces of Turkey. He is the author of *Lenten Sermons, Some Words for God, Sermons Preached before the University of Oxford, and Some Elements of Religion*.

Lic. The uttering of a L. is not usually punishable by law, unless uttered under legal procedure, when it constitutes the crime of *Perjury* (q. v.).

Liebig, Justus, Freiherr von, a celebrated German chemist, was born at Darmstadt, May 12, 1803. His taste for the physical sciences early showed itself, and after studying successively at Bonn and Erlangen, he obtained in 1822 a stipend from the Grand Duke of Hesse-Darmstadt, which enabled him to visit Paris, where he stayed two years perfecting his knowledge of chemistry. A memoir on *Pulmonic Acid*, presented at the Academy of Sciences, attracted the attention of Humboldt, who introduced the young chemist to Gay-Lussac, Dumas, and other distinguished men of science, and who by his influence obtained for L. the post of extraordinary professor of chemistry at Giessen in 1824. In 1826 he was appointed ordinary professor in the university, and as such established a laboratory for teaching practical chemistry, the first of its kind in Germany. This laboratory was for nearly twenty-five years the resort of students from all parts of the world, and the system of instruction pursued here has been the model to other like institutions. In 1850 L. succeeded Gmelin at Heidelberg, and two years later removed to Munich, where he performed his double duties as professor of chemistry and director of the chemical laboratory, till his death, April 18, 1873. His world-wide reputation as a chemist, and as one of the founders of that branch of the science known as organic chemistry, secured him many honours. In 1845 Ludwig II., Grand Duke of Hessen, conferred on him the title of baron. He was a member of almost all the scientific societies in Europe, and was repeatedly invited to fill chairs in England and other countries. The latest tribute to his memory is a monument at Darmstadt, unveiled May 12, 1877, the seventy-fourth anniversary of his birth. L.'s numerous and valuable researches are contained in some three hundred memoirs, the majority of which are published in the *Annalen der Chemie und Pharmacie*, begun by him and Geiger in 1832,

and in the *Handwörterbuch der Chemie* (9 vols., 1837-64), which he compiled together with Poggendorff of Berlin. His most important works are—*Die organische Chemie in ihrer Anwendung auf Agricultur* (1840, 8th ed. 1865), *Die Thierchemie oder organische Chemie in ihrer Anwendung auf Physiologie und Pathologie* (1842, 3d ed. 1846), *Grundsätze der Agricultur Chemie* (1855), *Theorie und Praxis der Landwirthschaft* (1856), *Naturwissenschaftliche Briefe über die Moderne Landwirthschaft* (1859), and *Suppe für Säuglinge* (2d ed. 1866). The most popular of his writings are his *Chemische Briefe* (1844), translated into English under the title of *Familiar Letters on Chemistry*. They are charmingly written, and were published with a view of indicating the importance of studying chemistry as a general branch of education. L.'s life work has done more than the work of any other single individual in directing the attention of agriculturists, physiologists, and pathologists to the bearing of chemistry upon their special departments. The animal tissues, their manner of deriving material from the nourishment taken into the body, and their decomposition, were investigated by him in great detail. He showed the source of animal heat to be the decomposition of the carbon present, and traced back the carbon to certain kinds of food, such as starch, sugar, oil. Fat he attributed to the oxidation of hydrogen in the starch and sugar of the food—a theory which met with powerful opposition. He analysed flesh, and found it to contain kreatine, lactic acid, phosphoric acid, inosinic acid, &c., and discussed the chemical processes of respiration. Though some of his theories have been proved erroneous, there can be no question that L. gave the sciences intimately related to the chemistry of life an immense impetus, and that in his discoveries, and in the practical applications of these discoveries, he must be regarded as the greatest chemist of the 19th c.

Liechtenstein, a small principality, bounded N. and E. by the Tyrol, S. by the Grisons, and W. by the Rhine, which separates it from the canton of St. Gall. Area, 60 sq. miles; pop. 8060. It is very mountainous, excepting a narrow strip along the Rhine. There is some produce of wheat, flax, good wine, and cattle. Vaduz is the chief town with a pop. of 921. L. is governed by an annual diet of representatives, subject to a council at Vienna, where the prince usually resides. From mediatised possessions in Austria, Prussia, and Saxony the prince derives a revenue of other 1,400,000 florins. L. was the smallest state in the former German Confederation.

Liège (Germ. *Lüttich*, Flem. *Luik*), a province of Belgium, is surrounded by the provinces of Luxemburg, Namur, Brabant, and Limburg, Dutch Limburg, and Rhenish Prussia. Area, 1117 sq. miles; pop. (1875) 635,076 (nearly all Walloons and Roman Catholics). It is drained by the Maas, which receives on the right the Ourthe, with its affluents Ambève and Weeze (or Vesdre). L. is occupied on the S. and E. with offsets of the Ardennes, some peaks reaching 2000 feet. Herveland, the fertile district N. of the Weeze, produces butter and 'Limburg cheese' in great quantity. Cloth, hardware, machinery, firearms, and cannon are extensively manufactured. Of mineral products, iron and coal abound; and copper, lead, zinc, alum, and several kinds of stone are largely worked.

Liège, the capital, the most picturesque town in Belgium, lies on both sides of the Maas, near its junction with the Ourthe, 55 miles E.S.E. of Brussels by rail. It is divided by the river into an old or upper quarter with narrow streets, and a new quarter with open streets and squares. The river is spanned by seventeen bridges, the most remarkable being Pont des Arches, the Boverie Bridge, and Pont de Val-Benoît. There are several fine churches, among which are the cathedral of St. Paul's, completed in 1557, St. James's Church (1014-1538), a Gothic building, St. Martin's, where, in 1246, the feast of Corpus Christi (q. v.) was instituted, St. Bartholomew's, built in the 12th c.; and the church of the Holy Cross, consecrated in 979; a beautiful palace of justice, formerly the residence of the prince-bishop; a university, founded in 1817; and an excellent school of mines. On an overhanging rock lies the citadel, once regarded as very strong. L. has a large trade, and its chief industries are tanning, and the making of cannon, firearms, glass, and cloth. Close to the town are large iron-mines and coal-pits. Pop. (1871) 115,956. L. (anc. *Leodici vicus*, 'the people's town'), is mentioned as early as the 8th c., when it

was a bishop's see. It rapidly increased, and its rich citizens sustained constant struggles with its bishops, in which they were supported by France. Charles the Bold, in connection with the bishop, took L. in 1467, demolished its walls, and carried off its cannon. The Archduke Maximilian I. had twice to reduce it to subjection. In Louis XIV.'s time it was several times taken by the French, and in 1702 by Marlborough in the War of the Spanish Succession. At the Peace of Lunéville (1801) it fell to France, but by the Vienna Congress and a special convention (23d March 1815) was attached to Holland, and after the Revolution of 1830 became a part of Belgium. See Henaux, *Histoire du Pays de L.* (Bruss. 1876).

Liegnitz, (Slav. 'the town on the marsh'), a town of Prussia, Silesia, at the confluence of the Schwartz and Katzbach rivers, 40 miles W.N.W. of Breslau by rail. It was fortified till 1758, when its walls were turned into promenades, and it has a large castle, a scientific collection, a theatre, several cloth, leather, and tobacco factories, and an extensive trade in vegetables. Pop. (1875) 31,442. L. was the residence of the dukes of L. from 1164 to 1675, and the scene of victories gained by Friedrich II. over the Austrians, 15th August 1760, and by Blücher over the French in 1813.

Lien, in English law, is the legal right which one person has to hold the property of another on account of a debt due by the owner of the property to the holder of it. Attorneys and solicitors have a L. for their costs over the deeds and other documents of their clients. Bankers have a L. over the shares of their shareholders; factors and agents over the property of their principals; innkeepers over the baggage of their guests. No L. can be exercised when the possession of the property has been wrongfully obtained; nor can it be exercised over property delivered by a bankrupt, or in contemplation of bankruptcy. *Hypothec* (q. v.) and *Retention* (q. v.) are the similar terms of Scotch law.

Lierre, or **Lier** (*Ledi*), a town in Belgium, in the province of Antwerp, at the junction of the Greater and the Lesser Nethe, 22 miles N.N.E. of Brussels by rail, has oil-mills and breweries, and considerable manufactures of musical instruments, knives, lace, silk, calico, and beet-sugar. Pop. (1875) 15,659.

Lieutenant (Fr. *lieu tenant*, Lat. *locum tenens*, 'one holding place for another'), a subordinate or representative officer. The term is used to designate junior officers in all European armies. In the British army the L. holds rank immediately below the captain. The daily pay runs from 10s. 4d. in the Life Guards to 5s. 3d. in the Royal Marines, which is also the pay of sub-lieutenants in most regiments. In the Royal Navy the lieutenant holds a rank equivalent to that of captain in the army, six years' service and the passing of an examination being indispensable. A lieutenant in command of a sea-going ship draws 14s. 9d. a day full pay, one without command 11s. 6d., a sub-lieutenant 5s.

Lieutenant, Lord-, of a county, is the representative there of the crown, the chief of the magistracy, and the medium of communication between that body and the government. He has also the control of the auxiliary military forces; and, having the power to raise them and grant commissions in cases of rebellion, is responsible for the public security and peace. He is assisted by permanent deputy-lieutenants. The office is of considerable antiquity. 'Commissions of array,' which empowered a chosen person to array troops in each county, were drawn up during the reign of Henry IV., and were superseded in the 16th c. by 'Commissions of lieutenantancy.' The disputed right of the crown to issue these commissions was the immediate cause of the civil war, but this right was confirmed at the Restoration by Parliament, 14 Charles II., cap. 3.

Lieutenant, Lord-, of Ireland, the Queen's viceroy in that country. The office is usually given by the government in power to a political supporter, and it consequently becomes vacant with a change in the Administration. The opinions of the Cabinet regarding matters connected with his government are communicated to him through the Home Secretary. He has extensive powers, the superintendence of justice, and the control of the police. The commander-in-chief of the forces in Ireland acts under his orders if necessary. He can confer knighthood, but his power of bestowing other preferments and honours is limited to a recommendation to the crown.

He has the assistance of a privy council. Till within a century ago the L.-L. was rarely in Ireland, but now he resides principally at Dublin Castle, where he holds a viceregal court, to maintain the dignity of which he is allowed £20,000 a year. In his occasional absence lord justices are appointed.

Lieutenant-Colonel, the title of the responsible commander of a regiment in the British army. The superior post of colonel of the regiment, excepting in the artillery and engineers, where the colonel is the real commander, is a lucrative but merely honorary appointment, usually held by a general. The number of lieutenant-colonels on full pay in the army was 564 in 1876, their daily pay varying from 29s. 2d. in the Life Guards to 17s. in the Marines. In the same year there were 529 lieutenant-colonels in the auxiliary forces.

Lieutenant-General, the second in rank of the four grades of generals in the British Army. In 1876 there were 138 lieutenant-generals in the army list. In France 'lieutenant-general du royaume' was a title given to a temporary regent. Louis-Philippe was thus designated before he accepted the crown in 1830.

Life, the expression applied in physiology to indicate the sum-total of the functions which mark the active state of organic things. What L. in its essential principle is, we do not know; and definitions of L. are useless from our utter ignorance of the nature of the condition we attempt to define. Recent biological speculations have tended to connect L. with protoplasm as a property of that substance. This idea is very far removed from demonstration, and so long as chemical and physical forces of themselves fail to produce L. or vital action, so long must the biologist reasonably regard L. as an independent force or principle, which invests matter, but is yet not of it. See PROTOPLASM and VITALITY.

Life, in Law, is presumed to extend to 100 years.

Life, Mean Duration of, at a given age, is the average length of life enjoyed by a given number of persons who are of that age. Thus, if n be the number of persons of the same given age at a given time, n_1 the number left after the lapse of one year, n_2 the number after the lapse of two years, and so on, then evidently the number of those who have died during the first year is $n - n_1$. These may be assumed to enjoy each half a year of life; and hence, since $n - n_1$ live half a year and n_1 a whole year, the n enjoy, in the first year of calculation, an aggregate of $n_1 + \frac{1}{2}(n - n_1) = \frac{1}{2}(n + n_1)$ years. Similarly, in second, third, &c., years, they enjoy $\frac{1}{2}(n_1 + n_2)$, $\frac{1}{2}(n_2 + n_3)$, &c. The sum of these until none is left surviving, gives the aggregate number of years enjoyed by the n persons; and consequently, this sum divided by n gives the average life of each individual. It is represented by the series

$$\frac{1}{2} + \frac{n_1 + n_2 + n_3 + \dots}{n}$$

The M. D. of L. is practically found from tables of mortality, which give, out of a certain number born, the number of those left at each successive birthday. On account of the necessary imperfection of the tables, and also because of the assumption that those who die in any one year die at regular intervals throughout the year (an assumption the more correct the greater the number involved in the calculation), the results cannot of course be regarded as mathematically correct.

Lifeboat, a boat of peculiar construction designed to rescue shipwrecked persons. The essential qualities of a L. are—(1) Extra buoyancy, (2) great lateral stability or resistance to upsetting, (3) speed against a heavy sea, (4) immediate discharge of water, (5) self-righting if upset, (6) ample space for passengers and crew, and (7) facility of transport along the shore and in launching. A quarter of a century ago no L. existed combining all these qualities, while in June 1877 there were 266 stations in the United Kingdom under the control of the Royal National L. Institution, thoroughly equipped with its excellent lifeboats and other life-saving apparatus.

The first L. was invented in 1780 (patented 1785) by Lionel Luken, a London coachbuilder. Extra buoyancy was obtained by bands of cork and air-cases, and an iron keel served for ballast. This L., notwithstanding its merits, received little attention; and not till 1789 was the need for providing a boat for saving life in tempestuous weather forcibly brought home to

the public mind. In September of that year the ship 'Adventure' was wrecked at the mouth of the Tyne, in view of crowds on shore only 300 yards distant, and the whole crew perished for want of means to succour them. A subscription was forthwith started by gentlemen in the district, and a premium offered for the best L. Henry Greathead, of S. Shields, was thereafter intrusted with the construction of a L. which was to combine the several advantages of the leading competition boats. This L., which had great curvature of keel and bottom, raking stem and stern, with 30 inches of sheer, and internal lining and external fender of cork, was launched in January 1790, and by the year 1804 thirty-one such lifeboats had been built and 300 lives saved. Notwithstanding their deficiencies, as inability to discharge water and to right when upset, Greathead's lifeboats practically remained the chief protection of our coasts for upwards of fifty years. In December 1849 the upsetting of the South Shields' L., resulting in the loss of twenty pilots, created a fresh and energetic movement to provide lifeboats more worthy of the name, and a premium of 100 guineas was offered by the Duke of Northumberland for an improved L. The prize was awarded to Beeching of Yarmouth, whose L., improved and modified, constitutes the L. adopted by the Royal National L. Institution, which possesses in the highest degree the recognised qualities of a L. The form is that of a whale-boat, sides straight, raking stem and stern, with a long flat floor amidships, the whole being diagonally built of fir and copper-fastened. The most common dimensions are—length, 33 feet; breadth of beam, 8 feet; and inside depth, 3 feet 4 inches. This size pulls ten oars double-banked. Extra buoyancy is obtained by means of large air-cases in the extremes, and by others in the sides. The self-ejection of water is provided for by six relieving-tubes in the deck, closed with self-acting valves which freely admit of the egress of water, but obstruct its entrance from below. These tubes free the L. of water in twenty or thirty seconds. For ballast, which increases stability, gives additional weight, and enables the boat to make headway in a heavy sea, an iron keel of about 9 cwt. and about the same weight of cork packed in cases under the water-tight deck are provided. Should the bottom of the boat be stove in, the cork-cases would keep her afloat. Self-righting is secured by considerable sheer of gunwale, the air-tight chambers in the bow and stern, the cork ballast, and the keel. When upset, the L. is buoyed up by the end air-chambers, but the ballast and keel place her in the condition of unstable equilibrium, which is destroyed immediately the keel heels to one side of the perpendicular, and then in virtue of her centre of gravity the L. rights herself, and the water escapes through the relieving-tubes. The annexed diagram represents a cross-section of the foregoing L., showing the arrangements amidships. A A are the side air-cases, B B the relieving-tubes, C C the cork ballast, D the keel, E E the watertight deck, F a thwart, G a scuttle for ventilation and fitted with a pump to

Section of Lifeboat.

discharge water leaking beneath the deck. The L. carriage of the Royal National L. Institution is admirably adapted for transporting the L. along the shore, and for launching her on a level keel with her crew seated ready for rowing.

Of late years an important addition in the form of collapsible boats, invented by Rev. E. L. Berthon, of Romsey, Hants, has been made to the means of saving life at sea. The frame, of Canada elm, is composed of the keelson with stem and stern posts attached, and on each side, jointed by a peculiar chain-hinge, are four longitudinal flat curved timbers. Externally and internally the frame is covered with a skin of specially prepared soft and pliable canvas, which the curved timbers divide into water-tight compartments, thereby localising the effect of fracture. In collapsing, the timbers arrange themselves in parallel

planes on each side of the keelson. A boat 32 feet long and 11 feet broad, capable of holding 100 men, can be compressed into two feet of breadth. British troop-ships and men-of-war are supplied with these boats, which are stowed away at the ships' sides, and may be expanded and lowered with crew on board with great rapidity.

The Royal National L. Institution was founded in 1824, and up to 1876 has been instrumental in saving 23,790 lives. It is supported entirely by voluntary contributions, and additions are annually being made to the number of L. stations under their management, while rewards are given to the several crews engaged in saving life. See R. Lewis, *History of the L. and its Work* (2d ed. Lond. 1877), and Rev. J. Gilmore, *Storm Warriors* (Macmillan & Co., 1875).

Life Estate, in English law, is an interest for a life—either the life of the owner or of a third party—in real property. The right entitles the owner to use and enjoy the subject without wasting its substance, or *salva rei substantia*, according to the expression of the Roman law. When in land, a L. E. is Freehold (q. v.). The analogous term of Scotch law is Life-rent (q. v.).

Life-Guards, the two senior regiments in the British household cavalry, superseded in 1783 four troops of Horse Grenadiers raised from the gentry in 1660, 1661, 1693, and 1702, for the sovereign's personal defence. They served in the Peninsula, and did brilliant service at Waterloo. The men are still carefully selected, and form a splendid body of soldiers. The daily pay of a private is 2s. 0½d., or twice that of a private in the infantry of the line. The uniform is scarlet, with steel helmets and cuirass. This useless and cumbersome armour only dates from 1815. The strength of each regiment in 1876 was 27 officers, 64 non-commissioned officers, and 343 rank and file, with 275 horses (black).

Life Insurance. See INSURANCE.

Life-rent, a term of Scotch law analogous to that of Life Estate (q. v.) in English law. The proprietor of the subject is called the *Fiar* (q. v.); the subject is called the *Fee* (q. v.), and the temporary possessor, the *Liferenter*. The legal liferents are *Terce* and *Courtesy*. See these articles.

Life-Saving Apparatus. Under this head are mentioned the principal contrivances, other than the Lifeboat (q. v.), that have been designed for saving life at sea. A description of the machine used for rescuing persons from buildings on fire is given under FIRE ESCAPE. In the United Kingdom hundreds of lives are annually saved from stranded vessels by means of a rope thrown out from the shore with a hawser attached. To Sergeant, afterwards Lieutenant Bell, belongs the honour of having first proposed, in 1791, the employment of a mortar to project a shell carrying a deep-sea line; but the first to carry the idea into successful operation in 1807 was Captain Manby, R.N. His apparatus was adopted in 1811 for the coastguard service, and till a few years ago was regularly issued to the various stations, now under the control of the Board of Trade. Several improvements and modifications have been effected since its adoption, and at present the service-pattern consists of a 24-pr. oblong shot which is fired from a 5½ in. mortar. Four holes are drilled in the shot for the reception of fuses, and projecting from its base is an iron bolt terminating in an eye through which a 2 feet plaited hide thong is passed. The fuses emit a bright light illuminating the path of the projectile and enabling those on shore to correct wrong elevation. The thong serves to connect a deep-sea line to the shot and preserves the rope from injury from the flash of the mortar. The line is coiled up in a tub or box close to the mortar, so as to run out without check. The charge is 12 oz., and the maximum range of the projectile 400 yards, which is seldom attained, owing to the force of the wind against which it has almost invariably to be projected. Manby's shot has been almost superseded by rockets which possess several advantages over it for carrying a line. They are more portable, and as they are self-illuminating, fuses are unnecessary; the angle of elevation in firing is also much less than with the mortar, and less rope is consequently required. In 1865 the life-saving rocket designed by Colonel Boxer (which is here shown in section, together with the mode of attaching the line to the stick), was adopted by the Board of Trade, in preference

to Mr. Dennett's rockets, which had previously been used at some stations. The Boxer rocket is a compound one, and

Boxer 12-pr.
Rocket.

contains two rockets embedded in an inflammable composition and separated by a partition, the whole being enclosed in a metal cylinder and secured to a stick. It is fired with a detonating tube, or port fire and fuse, from a tripod stand at an elevation of 35° or thereby. The ignition of the first rocket carries the projectile to a little beyond the highest point of its trajectory, and at this point the second is calculated to explode, giving an additional impulse without undue strain on the line. The French *Société de Sauvetage* practise Delvigne's system of firing a steel bolt from a small cannon, swivel gun, or musket, according to the distance of the wrecked ship. In connection with the foregoing plans of establishing a communication with a stranded vessel, the sling life-buoy invented by Lieutenant Kisbee is generally employed. Like other life-buoys, it is annular and composed of cork, and in addition it has appended a pair of short canvas breeches. By means of the line thrown out to the ship the crew haul out a hawser, with the sling life-buoy suspended from it by a block, and tackle for pulling the life-buoy to and fro. When the hawser and tackle are properly secured to a mast, and one of the crew enters the sling life-buoy, the signal is given to draw him ashore. That being accomplished, the life-buoy is again pulled out to the ship, and the remainder of the crew are in like manner generally rescued. With the L.-S. A. of Messrs. Rogers and Adamson a double line of communication is at once established, and the work for those on board the ship greatly lessened.

They employ a cone block shot, fired from a mortar, to carry the double line. In 1875 there were 289 stations on the coast of the United Kingdom equipped with L.-S. A., and during the previous five years they were instrumental in saving 1740 lives. Other contrivances for saving life are generally carried on shipboard, as life-rafts, life-buoys, and mattresses formed of a waterproof covering packed with cork, and other appliances either inflated or capable of inflation so as to support an individual in water. There are several forms of tubular life-rafts made of metal tubes connected with girders. In midsummer of 1867 three men voluntarily crossed from New York to Southampton under sail on a tubular raft of inflated canvas. Mr. Stockwell's recently invented life-saving vessel presents advantages in stability and freeboard over others of its class. It is constructed of an annular metal cylinder, 20 feet across, and spanned by an open sparred deck. The inside of the tube is fitted up as a cabin, proper ventilation being attended to. Seats are arranged round the tube for holding provisions, and all the appurtenances necessary for navigation are provided. The vessel is carried above deck amidships on iron ways which can be lengthened so that in launching it may clear the ship's side. An important addition to L.-S. A. has lately been made by Mr. C. S. Merrimen of New York, who has designed a vulcanised indiarubber dress which covers the whole body, the face excepted. It is in two pieces, which join, watertight, at the waist; and in the hood, breast, back, and upper legs are air chambers, and tubes, provided with stop-valves, to inflate them. Numerous public exhibitions in proof of the value and utility of this dress have been given, on behalf of the inventor, by Captain Paul Boyton. In June 1875, he paddled himself, clad in the dress, across the English Channel, from Cape Grisnez to the South Foreland.

Liffey, a river of Ireland, some 80 miles long, rising in the Kippure Mountain, county Wicklow, at a spot 1715 feet above the sea: flows first S.W. then N.E. through Kildare, and W. through Dublin county, passing the city of Dublin before entering Dublin Bay.

Lifford (Irish Gael. *Leithbhean*, 'the grey water'), a decayed market-town of Donegal, Ireland, at the point where the Mourne and Finn form the river Foyle, 15 miles S.S.W. of Londonderry by rail. Near it are the ruins of a church said to have been founded by St. Columba. L. is given in the census of 1871 as a suburb of Strabane (q. v.) in Tyrone.

Ligature, the term applied in Surgery to the thread tied round a vessel to arrest the circulation. The L. is used to stop hæmorrhage after an accident or operation, or to stop the circulation through an aneurismal tumour. The later Roman surgeons employed it, but it afterwards fell into disuse, red-hot knives, the application of the actual cautery, boiling pitch or molten lead to the bleeding surface, being employed instead. In the middle of the 16th c. the use of the L. was revived by Ambrose Paré. It was not until 1761 that Sharpe, surgeon to Guy's Hospital, advocated its employment in this country as a mode of arresting hæmorrhage, but it did not come into general use until about the beginning of the present century. The ligatures most commonly in use consist of strong hempen or silk threads, but catgut and horse-hair are also used. The occlusion of arteries by means of Acupressure (q. v.) was introduced by the late Sir James Simpson. Carbolised ligatures, according to the method of Professor Lister, are now generally adopted, and those made of catgut may be left in the wound without causing irritation, as they are eventually absorbed.

Light is that form of radiant energy which is sensible to our organs of vision. Certain bodies have the power of always emitting L., others again have no such power inherent in themselves, and when seen are seen by borrowed L. The former, including the sun, the stars, some meteors, probably comets, and matter generally in a state of combustion, are called *luminous*; the latter *non-luminous*. Non-luminous bodies differ greatly in the manner in which they act to L. which falls upon them. Some which are called *transparent* permit the greater portion of the L. to pass right through; others, known as *opaque*, permit none to pass; while others, distinguished as *translucent*, *subtranslucent*, *semi-opaque*, &c., occupy intermediate positions. They all reflect or throw back a portion of the incident L.; and it is this reflected L. which gives to each object its peculiar colour. The ordinary white solar L. is, as is well known, heterogeneous, being composed of rays of various colours. These, whose resultant effect upon the retina produces originally the sensation of *white*, are before reflection absorbed by the body in different proportions, so that the resultant effect of the reflected rays is a colour-sensation other than white. Thus a red body is red because it absorbs the blue rays; a blue body blue because it absorbs the red rays. This explanation is supported by the fact that a body viewed in homogeneous L., in rays of red, yellow, green, blue, or violet, appears, if it be not fluorescent, of that colour (see FLUORESCENCE). From experience we learn that L. travels in straight lines as long as it keeps in the same homogeneous medium; but that, when it enters another medium of different density, any other transparent body in fact, it is in general *refracted*, and pursues a new course, which is also rectilinear as long as the ray remains in the new medium. See OPTICS, where the experimental laws of reflection and refraction are discussed in detail. L. then travels in straight lines, but further it travels with a measurable finite velocity. This fact was discovered and the velocity first measured by the Danish astronomer Römer in 1676. He observed that the eclipses of Jupiter's satellites occurred sometimes sooner, sometimes later, according to the relative positions of the earth and Jupiter, than the calculated time; and this discrepancy was only explicable upon the hypothesis that L. took about 16 minutes 16 seconds to cross the earth's orbit. The earth's distance from the sun is not quite 92,000,000 miles, which gives 187,000 miles per second as the velocity of L. Bradley's discovery of the Aberration (q. v.) of the stars affords another source from which to deduce the value of this velocity, which bears the same ratio to the earth's orbital velocity per second that the tangent of 20'·5 does to unity. From these data, the value comes out 185,000 miles per second. The velocity of L., however, may be and has been measured directly by terrestrial experiments; and the results agree closely with the above. The late French physicists, Fizeau and Foucault, attacked the problem in two totally different manners, and deduced 185,000 and 191,000 miles per second respectively. They applied their methods to find the velocity of L. in water, and proved that its velocity is less in the denser medium, a result which once for all decided between the claims of the rival theories concerning the nature of L. These are known respectively as the *emission* and *undulatory* theories. The former regards L. as material, as being made up of minute corpuscles, projected with great velocity from the luminous

source. The laws of reflection and refraction are sufficiently explained upon this hypothesis by supposing the corpuscles to take that path between two given points which in the circumstances is traversed in the least time, provided the further assumption be made that *L. travels faster in the denser medium*. This theory then, which, though supported by the authority of Newton, is quite at variance with experiment, must be abandoned. Even before this decisive experiment of Foucault, the corpuscular hypothesis, like the Ptolemaic system of astronomy in the days of Galileo and Kepler, was gradually becoming less and less tenable. The numerous assumptions which had to be made to account for the simpler phenomena, the increasing and utterly unmanageable complexity of these when the higher truths of experiment had to be dealt with, were condemnatory of the emission theory to the scientific mind. The constant velocity of *L.* could not plausibly be reconciled with the corpuscular theory, except upon some such assumption as suggested by Arago, that a luminous body projected light-particles with different velocities, but that only those which travelled with a certain definite velocity were capable of affecting our organs of vision. Each particle must be endowed with a different property according to its colour sensation; and the phenomena of fluorescence require the possibility of transmuting one particle into another of a different kind. To account for Diffraction (q. v.) and Interference (q. v.), Newton had to suppose the light-corpuscles to suffer attraction and repulsion when passing close past the edge of a body; and to explain the colours of thin plates, which were discovered by him (see NEWTON'S RINGS), he was forced to endow his corpuscles with peculiar properties, in virtue of which they were sometimes in a fit of easy transmission, at other times in a fit of easy reflection. Further the more complex phenomena of Polarisation (q. v.) are quite inexplicable upon the emission theory, except, of course, other arbitrary assumptions be made respecting the physical properties of the corpuscles—a method which may be made to explain anything, but is wholly unscientific, and restrains instead of advancing knowledge. No such necessity for continually rebuilding the foundations, so to speak, of the theory appears in the undulatory hypothesis, which has been gradually developed since the time of Huyghens the Dutch physicist, who seems to have been the first to enunciate it in anything resembling its present form. According to this hypothesis, *L.* is a form of energy which is transmitted in undulations and with a finite constant velocity through the space-pervading ether. The only assumptions are that this ether acts to light as an elastic solid, and that the particles are set into vibrations transverse to the direction of the ray of light, so as to give rise to waves in a manner somewhat analogous to the production of waves along a stretched rope. See UNDULATORY THEORY, where the nature and form of the undulations are more fully treated of. *L.* we have defined as a form of radiant energy; but it is not the only form. It is known that the sun emits other than light-rays, which are commonly called heat-rays and actinic-rays. These three forms differ in nothing essential. They differ only as long waves differ from short waves. The undulations which constitute radiant heat are too long to affect our organs of vision; the actinic rays consist of waves too short. They all, heat, light, and actinic rays, travel in straight lines with the same velocity; they are reflected and refracted according to the same laws; and they all suffer polarisation, plane, circular, and elliptical. No body is inherently luminous which is not heated to a high temperature; and the rays of *L.* which it emits are due to the direct transference to the luminiferous ether of the vibratory energy of the molecules. The molecules of a heated gas vibrate to a certain wave length, exactly as a tuning-fork vibrates to a certain note; and hence a glowing gas, if not too condensed, gives forth rays of a definite wave-length, which produce a definite colour-sensation upon the retina. In a very condensed gas or solid, the vibrating molecules do not vibrate freely, and the result is the production of rays of different wave lengths, which give a composite light, and continuous spectrum when viewed through a prism. (See SPECTRUM ANALYSIS.) The same medium which transmits these forms of radiant energy is also probably the seat of those electric and magnetic actions which still await explanation. In the various text-books of physics, the ordinary phenomena of *L.* are described and explained; but for the more scientific treatment of the theory, reference should be made to Lloyd's *Theory of Light* (3d ed. 1873), and Airy's *Undulatory Theory* (1870).

Light, Law regarding. The right to have light when it interferes with the convenience of a neighbour, is in English law a kind of Easement (q. v.), and in Scotch law a kind of Servitude (q. v.). In England and in Ireland the right may be acquired by twenty years' prescription. Thus, if one proprietor build on the edge of his ground, the conterminous proprietor cannot, after twenty years without building, build so as to obscure the light of the first builder. A right of *prospect* is not, however, recognised in English law, as it is by the Roman. In Scotland, a proprietor's right to build on his own ground cannot fall by prescription. It can only do so by written agreement.

Light'er, an open, flat-bottomed boat, chiefly used in *lightening* or unloading large vessels.

Light'foot, John, D.D., a great English Orientalist, born at Stoke-upon-Trent, Staffordshire, March 19 or 29, 1602, was educated at Morton Green, in Cheshire, and Christ's College, Cambridge, became assistant-master in Repton School, Derbyshire, and, having taken orders, received the curacy of Norton, Shropshire, where he formed an intimacy with Sir Rowland Cotton, his instructor in Hebrew. In 1628 he was presented to Stone in Staffordshire, and in 1631 to Ashley, and here he continued to reside till 1643, when, having come to London to attend the Westminster Assembly of Divines, he was made minister of St. Bartholomew's, Master of Catherine Hall, Cambridge, and rector of Great Marston, Herts. He became D.D. (1652), and Vice-Chancellor of Cambridge (1653), at the Restoration sat in the Savoy Conference (q. v.), and received a prebend of Ely, where he died, 6th December 1675. *L.*, who was profoundly versed in the Rabbinical literature, published, besides sermons, thirteen different works, which have been edited in a collected form by John Strype (2 vols. Amst. 1684, with a Life prefixed); by Leusden (3 vols. Utrecht, 1699); and by Pitman (13 vols. Lond. 1822-23); while the best-known of them, his *Horæ Hebraicæ et Talmudicæ*, has been separately edited by R. Gandell (4 vols. Oxf. 1859).—**Joseph Barker L., D.D.,** a distinguished scholar and theologian, was born at Liverpool in 1828, studied at Trinity College, Cambridge, where he graduated B.A. in 1851 as Senior Classic and Chancellor's Medallist. In 1853 he was Norrisian University prizeman, was appointed Tutor of Trinity College (1857), Hulsean Professor of Divinity (1861), examining chaplain to the Archbishop of Canterbury (1868), canon of St. Paul's (1871), and one of the deputy clerks of the closet to Her Majesty (1875). *L.* is the author of very learned editions of St. Paul's Epistles to the Galatians, Philippians, and Colossians, and of the Epistles of St. Clement of Rome (1869), a work *On a Fresh Revision of the New Testament* (1871), and many contributions to journals, of which the most notable are his papers in the *Contemporary Review* (1874-75) on 'Supernatural Religion.'

Lighthouse, a building erected on a conspicuous part of the coast from which a light is shown at night to warn and guide mariners, and to serve as a landmark by day. The term *pharology* is descriptive of the modern system of *L.* economy which also comprises lightships, beacons, buoys, fog-signals, and landmarks. Lighthouses are necessarily placed in exposed positions—on bold headlands, islands, isolated, and sunken rocks, low promontories, and shifting sandbanks—each requiring structures specially designed to meet the varied requirements of their sites. Ordinary stations have a tower and dwellings for the keepers, and bear a strong family resemblance, the principal difference being in the size and height of the tower, and the kind of lighting apparatus employed. Those towers which have been erected in the open sea on isolated wave-swept rocks or reefs, whether viewed as to the dangers encountered and difficulties overcome in their erection—their fitness for the unique sites they occupy, the solidity of their construction giving the maximum of strength with the minimum of material, or the severely simple grace and beauty of their outlines—are not only triumphs of engineering, but are among the most perfect specimens of modern architecture. The most important of those sea-girt towers are Smeaton's Eddystone, Stevenson's Bell Rock, and more recently Alan Stevenson's Skerryvore, James Walker's Bishop and Wolf Rocks, and Messrs. Stevenson's Dhu Hartach and Chicken's Rock lighthouses, information as to some of which will be found under

their separate heads. It will, therefore, be necessary only to refer to the apparatus for directing the rays proceeding from the radiant to the horizon—the lamps and their fuel—the distinctions or characteristics, and the lanterns.

The first L. towers had on their summits grates or chafers in which coal or wood was burned, and so recent is modern pharology that there are lighthouses in existence which have passed through all the successive stages of illumination from the wood-fire to the dioptric apparatus. A great step in advance was made when the lights, however feeble, were enclosed by glazed lanterns, but L. optics was for a long time far behind that of architecture. Among those who have contributed to the present system of L. illumination are Argand, Teulère, Fresnel, and the Stevensons. The first gave us the lamp known by his name, the second reflectors, and Fresnel and the Stevensons our systems of improved catoptric and dioptric lights.

Nothing can be simpler than a lamp placed in the window of a fisherman's cottage to guide him homewards, but to make this lamp efficient as a signal, as many of the rays as possible proceeding from it must be utilised. By placing a parabolic mirror behind the flame we can gather up the rays going off on one side, and reflect them in a beam of parallel rays in the opposite direction, or by placing a lamp behind a lens, which has the property of refracting or bending in a given direction all the rays falling on it, we can produce a similar beam of parallel rays. The former or independent burner system is named *catoptric*, and the refracting or central burner system *dioptric*, while apparatus combining reflecting and refracting instruments is styled *catadioptric*. The earliest reflectors, which were about 18 inches in diameter, consisted of small squares of mirror glass embedded in plaster of Paris, the lamps having thick torch-like wicks. About the end of last century they gave place to reflectors of silver-plated copper formed to the parabolic shape by hand hammering, burnishing, and polishing. They are from 21" to 25" diameter, and fitted with Argand burners 1" in diameter, their power being about 450 times that of the unassisted flame. By arranging a number of these reflectors on a circular frame there can be sent all round the horizon a number of beams of light of nearly uniform intensity, thus producing a *fixed light*, and by assembling them on a frame having three or more sides, each with from one to ten reflectors, and giving the frame a horizontal motion by machinery, a *revolving light* is obtained. As the faces of the frame come round, a beam of light sweeps the horizon succeeded by an interval of darkness, depending on the rate of revolution, until the next face with its reflectors comes into view. Reflectors are still used in some of the best lighthouses in Britain. The parabolic reflector, however, allows fully one-third of the rays to escape, by natural divergence, past the lips of the reflector. To obviate this defect, Mr. T. Stevenson, in 1849, devised the holophotal reflector, which consists (fig. 1) of a lens *l* with a parabolic mirror *a*, and instead of the back portion of the reflector he substituted a hemispherical mirror *bb*, which returns all the rays

Fig. 1.

falling upon it back on the flame. This form of apparatus has been largely used both in this country and abroad.

To Augustin Fresnel belongs the honour of inventing and introducing the dioptric system, and combining it with a central lamp having concentric wicks. He left three perfect instruments—the lens, reflecting prisms, and central belt for small fixed lights; and since his day nearly all the improvements in L. apparatus have originated with the engineers to the Scotch L. Board. Fresnel's lens is plano-convex, 3' 3" in height by 2' 6" in breadth, composed of a central disc about 11" in diameter, surrounded by annular rings gradually decreasing in breadth as they recede from the centre from 2½" to 1½"—the whole being separately built up. This arrangement not only admits of the thickness of the glass being reduced, but corrects spherical aberration. When illuminated by a four-inch lamp the power of

this lens equals that of 3000 Argand burners. If these lenses be assembled round a frame with a lamp in the focus, and made to revolve, they produce the same effect as a revolving catoptric light, but as they do not intercept all the rays of light, Fresnel formed a canopy of inclined lenses above the lamp. These collected the upper rays and transmitted them upon plane mirrors, which reflected them horizontally, while the rays falling below the lenses were utilised by silvered glass mirrors arranged like the leaves of a venetian blind (fig. 2). When designing the revolving light for Skerryvore, Mr. Alan Stevenson substituted fixed catadioptric prisms for the mirrors below the lenses, and at the time of its exhibition (1844) it was the most perfect revolving dioptric light in existence. The next improvement was devised in 1849 by Mr. T. Stevenson, who dispensed entirely with the double agents above and the mirrors below the lenses, and substituted totally reflecting holophotal prisms which parallelise the rays in every plane. These prisms act by internal reflection, and effect a great saving of light. The first order holophotal revolving light is now universally adopted, and consists (fig. 3) of eight lenses *L*, eight panels of eighteen prisms each above the lenses *p*, and seven panels of eight prisms *p*, each below the lenses, the whole forming a structure of glass nearly 9 feet in height and 6 feet in diameter, illuminated by a central lamp with four concentric wicks, the flame of which measures 3½" in diameter, and 4" in height.

Fig. 2.

Fig. 3.

Fresnel also applied the dioptric principle to fixed lights, which illuminate constantly the whole horizon, using the same profile for the refracting hoop as a vertical section through the axis of his polygonal lens. This hoop acts only in the vertical plane, giving out all round the horizon a vertical strip of light depending on the breadth of the central flame. To intercept the rays passing off above and below the belt, a series of totally reflecting prismatic rings project the rays in directions parallel to those coming from the hoop. But instead of the central hoop he used a polygon of thirty-two narrow lenses, with inclined mirrors above and below them. Mr. A. Stevenson, however, in 1835, resolved to improve the first order apparatus, and he had constructed a truly cylindrical belt for the Isle of May lighthouse, to the several sections of which he gave a rhomboidal form with oblique joints to prevent interception of light. He further dispensed with Fresnel's inclined mirrors, and had executed on a large scale totally reflecting prismatic rings (fig. 4).

Fig. 4.

To obviate the great loss of light by metallic reflection, Mr. T. Stevenson invented the dioptric holophote (fig. 5), consisting of a hemispherical mirror entirely of prismatic rings of

glass, so formed as to prevent any light passing through them, and to reflect totally the light that radiates backwards from the flame, and he combined with this mirror a lens surrounded by

Fig. 5.

the light does not require to be equally distributed round the horizon. One of the best examples of a condensing light is that of Luddonness on the Tay (fig. 6), where the whole rays are thrown

Fig. 6.

Lamps.—The lamps are either fountain-pressure or mechanical. The burners have all cylindrical wicks. When oil is used in the multiple wick lamp the burner requires to be kept cool by an overflow nearly three times greater than what the wicks can consume; but with paraffin the fluid is not allowed to rise beyond a certain height in the wick chambers, the overflow being returned by a tube to the fountain. The following table gives the number of wicks, the rate of consumption per hour, and the candle power for colza and paraffin of the lamps generally used in lighthouses:—

Number of Wicks.	Colza in Scotch Lighthouse Lamps.		Paraffin in the Doty Burners.	
	Rate of Consumption per hour in Gallons.	Candle Power.	Rate of Consumption per hour in Gallons.	Candle Power.
1	0133	11'33	0148	23'65
2	0521	51'16	0503	80'13
3	1395	160'8	1262	200'75
4	2077	261'3	1801	287'62

The introduction of paraffin has led to the adoption of five and even six-wick burners.

Illuminants.—The oils used in modern lighthouses are lard, seal, spermaceti, colza, olive, cocoa-nut, and more rarely hempseed. Until recently colza was very largely used, but it is fast giving way to paraffin, which is not only a more powerful, but a much cheaper radiant. Captain Doty invented burners whereby paraffin, such as is made by Young's Paraffin Company, with a high specific gravity and flashing point, can be consumed in L. lamps, effecting a saving in cost and augmenting the power of the lights from 10 per cent. for the four-wick burner to over 100 per cent. for the one-wick lamp. The Doty burners are equally suitable for the consumption of colza or paraffin.

Wherever gas can be applied without requiring to be specially manufactured at L. stations, it forms an efficient and cheap illuminant. In 1827 Mr. Wilson erected a very simple intermittent gas light at Troon harbour, the alternations of light and darkness being got by suddenly shutting off the supply of gas so as to extinguish the light and again as suddenly letting it on, the light being reignited by a separate small burner supplied by a 'by pass valve.' He also introduced the use of different powers of light to suit the varying states of the atmosphere. This mode of using gas has been revived by Mr. Wigham of Dublin, who has patented a 'crocus burner,' and other improvements which have been introduced into some Irish lighthouses with good results, so far as intensity of light is concerned.

The electric light, first tried at South Foreland, in 1858, is now used in five lighthouses. Mr. Holmes and Mr. Wilde have invented machines for generating the electric current, both of which require steam engines, regulators for keeping the carbon points in adjustment, and an extra staff of attendants, entailing considerable expense. Special dioptric apparatus was designed by Mr. T. Stevenson for utilising the small but intense light between the carbon points, but owing to difficulties, mainly financial, there is little prospect, in its present state, of the speedy introduction of the electric light in coast illumination.

Lanterns.—The apparatus, of whatever kind, requires to be enclosed within a lantern. In 1835 Mr. A. Stevenson introduced into the Scotch lights diagonal astragals, which do not intercept light in any azimuth throughout their whole height. The astragals are straight, of 1 inch section, and made of gum-metal, periodical painting being thereby entirely avoided. This trigonal arrangement secures a structure of great rigidity and strength, and is practically helical. Plate glass $\frac{1}{2}$ " in thickness is used for glazing. Mr. Douglass a few years ago patented a steel helical lantern 14 feet in diameter, but it is costly and requires annual painting.

Characteristics.—The main distinctions are *fixed* and *revolving*, and by the introduction of colour a sufficient variety is obtained. The principal characteristics are as follows:—*fixed*, *fixed red or green*, *revolving white*, *revolving red and white*, *flashing*, *intermittent*, *double lights*, either *fixed* or *revolving*. The *flashing* and *intermittent* lights were both introduced by the late Mr. R. Stevenson.

Light'ning is the luminous appearance accompanying a sudden electrical discharge between the clouds and the earth, or between cloud and cloud. There are three kinds of L., known respectively as *fork L.*, *sheet L.*, and *fire-balls*. The first appears as a continuous zig-zag line of light passing from earth to cloud, or cloud to cloud; and is very similar in configuration to the long sparks taken from the prime conductor of a good electrical machine. This suggests at once the probable cause of L.—the disruptive discharge between two contiguous charged bodies. Sheet L. consists of a more or less bright diffused flash, and is due probably to a disruptive discharge taking place behind the clouds, or below the horizon. Both of these kinds last for less than a thousandth part of a second, their apparent duration being entirely due to the persistence of the image upon the retina. Fire-balls, on the contrary, are said to last some seconds, and are usually described as descending slowly to the earth, rebounding once or twice upon the ground, and exploding with great violence. Of them, however, no authoritative observations are recorded. Fork L. is always, and sheet L. usually, accompanied by thunder, which is merely the audible effect of the disturbance in the air, due to the discharge of the L. Its duration and continuous irregular variation in intensity are usually attributed to the echoing of the sound from the clouds.

Lightning Conductor is a long metallic rod, placed on the top of a steeple, chimney, or high edifice, as a means of protection from lightning. If an electrically charged body be brought up to another, it first acts upon it inductively, electrifying the nearer portions with the opposite kind of electricity to what it itself possesses. When sufficiently close, a disruptive discharge takes place, and takes place always in the line of least resistance. Now a thunder cloud is a highly charged body; and as it passes over a portion of the earth's surface it must electrify it inductively. If sufficiently near, a discharge takes place as above indicated in the line of least resistance. By leading a conducting wire from a height to the earth a passage is opened up for the lightning to go to earth, which is as a rule of much less resistance than would be supplied by any ordinary erection of stone or wood. Thus a lightning conductor, by discharging the cloud overhead, very much diminishes the danger of accidents—since the probability of the lightning striking a badly conducting material is very small. Should the connection of the conductor with the earth be in any way broken, the effect will be not only to render the apparatus useless as a lightning conductor, but to very much endanger the structure to which it is attached.

Lights, Use of, in Public Worship. From the earliest times there has been a connection between the idea of the divine presence and that of a material light. Thus the presence of God was represented to Abraham on one occasion by 'a smoking furnace and a burning lamp' (Gen. xv. 7-17; cf. Jer. xxxiv. 18), to Moses in a burning bush (Exod. iii.), and to the Israelites in their wanderings by a pillar of fire (Exod. xiii.), while the Shechinah or symbol of the divine presence in the Tabernacle and Temple was evidently a bright light (cf. Exod. xl. 35, 1 Kings viii. 10, 11). It is not improbable that the original, literal significance of such an association may have been connected with sun or fire-worship. Be this as it may, as the Jews had had their seven-branched golden candlestick, the use of artificial light was early (4th c.) introduced into the ritual of the Christian Church. Candles were lighted when the Gospel was read, at the celebration of the sacraments of Baptism and the Eucharist, at funerals, and at the festivals of martyrs. Indeed the Feast of the Purification derived its name of Candlemas (q. v.) from the great number of lights used on the occasion. In Martin *versus* Mackonochie (1868), on appeal from the judgment of the Dean of Arches to the Judicial Committee of the Privy Council, Lord Cairns pronounced against the use of lights in the Church of England at the celebration of the Holy Communion.

Lignin (from the Lat. *lignum*, 'wood') is the substance which gives hardness and solidity to the cells and vessels of plants, forming the encrusting matter of their interior, and is often deposited in concentric layers. It occurs in large quantity in the wood of trees, and is present in the stems of herbaceous plants, giving support to the structure. It cannot be separated in a pure state, hence its exact composition is unknown. In some cellular plants it is absent, and the object of many horticultural operations—as blanching—is to prevent its formation. Dissolves in strong nitric acid forming oxalic acid. Is not coloured by iodine. (Ralfour, *Manual*, ed. 1875).

Lignite is wood in a state of fossilisation, intermediate between peat and coal, *i.e.*, imperfectly mineralised. Jet and brown coal may be quoted as examples of L.

Lignum-Rhodium, the commercial name for several woods having a pleasant smell resembling rosewood. The stem and root of the two species of *Rhodorrhiza*, a genus peculiar to the Canary Islands (sometimes merged into *Convolvulus*, q. v.), but the produce is not real rosewood as there implied), is the source of Atlantic L. R., and they yield also by distillation the powerfully scented Oil of L. R. *Amyris balsamifera*, a Jamaica small tree or shrub, belonging to the Myrrh and Frankincense family, yields another description of L. R., likewise an aromatic oil. It is stated, however, that the name L. R. was originally attached to the wood of *Liquidambar* (q. v.) *orientale*, a native of Asia Minor, but now seldom met with in the market.

Lignum-Vitæ is the greenish-black heart-wood of *Guaicum officinale*, an ornamental tree, native of Jamaica, St. Domingo, Guiana, &c. Contrary to the usual structure of wood, in this, the fibres cross each other diagonally, producing a timber of extraordinary hardness and weight, much used in the manufacture of blocks, pulleys, skittle-balls, pestles, &c. The tree also

yields Guaiac resin of *materia medica*, a stimulating diaphoretic prescribed for rheumatism, gout, and skin diseases; it is obtained by natural exudation, by incisions, or by heat applied to the felled wood.

Ligny, a village of Belgium, province of Namur, 10 miles N.E. of Charleroi, is famous for the great battle of June 16, 1815 (two days before Waterloo), in which Napoleon attacked and drove back the Prussians under Blücher. On the same day Ney engaged the British and Belgians under Wellington at Quatre Bras (q. v.). The object of Napoleon was to engage the Allies separately, and before they had time to co-operate.

Ligulate, or strap-shaped (Latin, *ligula*, 'a little tongue'), is defined in botany as not very narrow or long, and with nearly parallel sides. A frequent application is to the corolla of many of the Compositæ, *e.g.*, the white ray florets of the daisy, and the yellow florets forming the dandelion head.

Ligule. See GRASSES.

Liguori, Alfonso Maria de, was born 27th September 1696 at Marianella, obtained his doctor's diploma 1714, and practised successfully at the bar of Naples. In 1722 he forsook law for the Church, and was ordained to the priesthood in 1726. Burning with the desire to spread the doctrines of Christianity in true apostolic simplicity, L. went about among the people addressing them in a language new to their ears. In 1732 he founded a religious brotherhood for carrying out his conception of teaching, which, after much opposition, received the approbation of the Pope (25th February 1749). Under the name of the Order of the Redeemer the brotherhood rapidly spread throughout Italy, and as Liguorians made headway in Spain, Austria, and France. L. became, much against his inclination, Bishop of Santa-Agata dei Goti in 1762, and, as long as he held the office, distinguished himself by his pastoral visits and his generous schemes for charity. He died at Nocera dei Pagani, August 1, 1787, and left behind him seventy volumes which range over the whole field of theology. See *Life of St. Alphonsus de L.* (2 vols. Lond. 1848).

Liguorians, or *Redemptorists*, are the missionary priests who minister to the people by means of assiduous personal intercourse, discarding the externals of Catholic officialism. The order has been confounded with the Jesuits, but they have nothing in common. Besides the hold they have established over various Continental nations, they have in more recent years extended their sphere of labour to England, Ireland, and America.

Ligurian Republic, the name given to the republic of Genoa by Napoleon, June 6, 1797. The Genoese territory formed part of ancient Liguria, hence the name. See GENOA.

Lilac is a Persian word that accompanied the familiar shrub to which it is applied on its introduction to the gardens of western Europe in the 16th c. Its botanical name is *Syringa vulgaris*. L. belongs to the olive family. There are several garden varieties, differing principally in colour and size of the sweet-scented flowers. Other species in ordinary cultivation are the Persian L. (*S. Persica*), which has smallish lanceolate leaves, and *S. dubia* or *chinensis*, with large, almost scentless flowers. The bark has febrifuge properties. The wood is fine-grained, and serves various useful purposes, such as inlaying.

Liliaceæ, an extensive natural order of Monocotyledons, which is of special importance, chiefly on account of the horticultural value of many of its species, while others have medicinal and economic properties. Among the garden specialties may be mentioned the asphodel, convallaria or lily of the valley, day-lily, dogtooth-violet, fritillary, hyacinth, gloriosa, lily, squill, Solomon's seal, star of Bethlehem, tuberose, yucca. Of medicinal constituents, the aloes and squills are notable. Economic botany is represented by the phormium or New Zealand flax, and dragon's-blood; and some of the culinary and fodder products are the onion, leek, asparagus, grass tree, &c. Altogether the order contains of described plants about 1650 species. It is at present (1877) being monographed by Mr. J. G. Baker in a series of papers communicated to the London Linnean Society. He divides it into three sub-orders, Liliaceæ proper, Colchicaceæ, and Asparagaceæ.

Lille ('the island,' Flemish, *Rysse*), the capital of the department of the Nord, France, situated on a fertile plain on the

Deule, 62 miles S.E. of Calais by rail. It is one of the strongest fortresses in Europe, having been originally fortified in the 11th c., reconstructed by Vauban, and again improved in the present century. The principal buildings are the church of St. Catherine of the 12th c., the Gothic church of St. Laurence, that of Notre Dame, rebuilt recently in the Gothic style of the 13th c., and the Hôtel-de-ville, containing a gallery of 449 Italian (eighteen by Raphael), Flemish and Dutch pictures, and the Wicar collection of designs. L. has also a preparatory school of medicine and pharmacy, an academy of music, a botanical garden, various literary and scientific societies, and a library of 40,000 vols. Its importance, however, is chiefly industrial, and it is connected by a network of canals and railways with the coast, and the whole of Belgium and N. France. Flax is grown extensively in the vicinity, and there is a large manufacture of linen, especially of table-cloths. There are also great bleaching grounds, 36 cotton-spinning mills, Government tobacco factories producing 11,000,000 lbs. yearly, besides manufactures of beetroot-sugar, rapeseed oil, gum, powder, gloves, lace, porcelain, &c. Pop. (1872) 144,165. L. arose around a castle built here in an insulated marsh by Baldwin I., Count of Flanders, in 863, and called *L'Isle* (later L.), from its position between the rivers Deule and Lys. It belonged alternately to France and the Count of Flanders, fell to Burgundy at the end of the 14th c., passed to Austria, but was finally taken by Louis XIV. in 1667. During the War of the Spanish Succession it capitulated to Marlborough and the allies after a siege of 120 days in 1708, was restored by the treaty of Utrecht (1713), and was severely bombarded by the Austrians, who were obliged to raise the siege, on October 1792.

Lilliputian, 'diminutive,' an adjective derived from *Lilliput*, the name of an imaginary island, peopled by a race of pygmies described by Swift in *Gulliver's Travels*.

Lillo, George, a London jeweller with a turn for writing plays, was born 4th February 1693. The only one of his plays which kept the stage was *George Barnwell*, a tragedy played at Drury Lane for twenty consecutive nights in 1731, and a great favourite with Queen Caroline. *Fatal Curiosity* was his next best performance. Lillo wrote simply, with tenderness and good feeling, but no genius. He died 3d September 1739. See the biographical memoir prefixed to Davies' edition of L.'s *Dramatic Works* (2 vols. Lond. 1770).

Lilly, William, an English astrologer, was born at Diseworth, Leicestershire, in 1602, entered the service of a merchant in the Strand, whose widow he afterwards married, and in 1632 began the study of astrology. He read with enthusiasm Cornelius Agrippa's *Ars Notoria*, and soon acquired considerable reputation as a caster of nativities and foreteller of events. In 1644 he began the publication of his *Almanack*, which had a considerable influence, and continued till his death. L. sided with the Parliament in the Civil War, and under the Commonwealth acquired sufficient fortune to buy a small estate in Surrey.

At the Restoration he was imprisoned for a short time, and again fell under suspicion in 1666 as being in some way privy to the cause of the Great Fire of London. He died June 9, 1681, at his estate at Hershams. L. wrote numerous utterly valueless works, among them *Observations on the Life and Death of Charles, late King of England* (1651; reprinted 1774, along with his *Life*, written by himself).

Lily (*Lilium*), the genus from which the natural order Liliaceæ takes its name. It embraces about fifty species, often bearing large showy erect or drooping flowers, and contains several common garden favourites. The whole are natives of the N. temperate zone, ranging from the United States eastward to Japan.

Lilium Chalcedonicum.

The best-known and longest-cultivated are the White L. (*L. candidum*—the poet's L.), the Orange L. (*L. bulbiferum*—the Orangeman's L.) the Turk's-cap L. (*L. Martagon*), all three species of the Mediterranean district, the Tiger L. (*L. tigrinum*), a native of China, and *L. superbum* and *L. canadense*, belonging to the western hemisphere. Various Japanese species and varieties are more recent importations, and are very handsome. The medicinal and economic services are insignificant, though the bulb of several species, as *L. tenuifolium* and *L. avenaceum*, are eaten in some of the Eastern semi-civilised countries.

Lily of the Valley (*Convallaria majalis*), the sole representative of this genus of Liliaceæ. It is a general favourite, combining what may be termed the elegance and purity of plant life, enhanced by a delicate perfume, and appearing, moreover, in the woods, the garden, and the market at the early period of the year, when flowers possess a special attraction. Botanically, the L. of the V. may be described as a stemless herb, with a creeping rootstock, from which arise at intervals sets of two or three sheathed leaves, together with scapes bearing a one-sided raceme of white drooping almost globose flowers, which are followed in due course by a round red berry. The plant is a native of Europe and N. Asia. In England the home-growth is insufficient to supply the spring demand, and it is said that a single London florist annually imports from Germany alone 'clumps' and 'crowns' of the plant to the extent of four tons weight.

Lily-Tree, a name given to the *Dracena Draco* or Dragon-tree of Tenerife, as being a liliaceous plant, with a branching tree-like stem. Each branch is surmounted by a crowded head of lanceolate leaves, from amid which the flower-stalk rises forth. The common name is derived from the tree being one of the sources of Dragon's-blood (q. v.). The colossal and historic specimen at Orotiva was by Humboldt's measurements 70 feet high and 48 feet in girth. Unfortunately it was totally destroyed during a hurricane in 1867, after a supposed existence co-equal with the Egyptian pyramids.

Li'ma, the capital of Peru, at the foot of the Cordilleras, in a fertile plain, on the Rimac (of which the name L. is a corruption), 6 miles by rail from Callao, its port on the Pacific. The streets run regularly at right angles, and the houses are mainly built of sun-dried bricks. Of thirty-three public squares, the Plaza Mayor has an area of nine acres, and a covered colonnade on three sides. There are some seventy churches, and the chief buildings are the beautiful cathedral, built in 1748 on the site of a previous one founded by Pizarro; the palace of Pizarro, now used as Government offices; the University of San Marcos, founded in 1551; the senate-house, formerly the palace of the Inquisition; the Exhibition Palace, opened on July 1, 1872. L. has also a theological seminary, a college of medicine, a naval and military institute, a large penitentiary, two theatres, and a circus for bull-fights (the largest in the world). The transport trade of L., once famous, is still extensive. Pop. (1871) 160,056, comprising whites, blacks, Indians, and Chinese. L., generally styled 'the city of the kings' (*Ciudad de los Reyes*), was founded by Pizarro in 1535. It suffered severely from earthquakes in 1630, 1687, 1746 (the most destructive), 1806, and 1828.

Lima Wood, the commercial name of an important dye-wood used for the production of various tints of red, orange, and peach colour. See BRAZIL-WOOD and SAPPAN-WOOD.

Li'max, a genus of *Gasteropodous* mollusca, belonging to the *Pulmoniferous* section of the class, and represented by the various species of Slugs (q. v.). The shell is rudimentary, and is hidden by the mantle. The *L. ater*, or black slug, and the *L. antiquorum*, or great grey slug, are familiar species.

Lim'ber, a two-wheeled vehicle for the conveyance of artillery, furnished with an ammunition chest. For transport, the gun-carriage is hooked on to the L., which is drawn by horses. In action the L. is disattached and kept at a conveniently near distance. The vehicles are constructed so as to allow these two operations called 'limbering' and 'unlimbering' to be performed with the greatest speed and facility.

Lim'burg, a former duchy on the N.W. of Luxemburg, and on both sides of the Maas, was divided at the peace of Westphalia between the States General of the Netherlands and the Austrian Netherlands, fell to France in 1797, returned to the

Netherlands in 1814, joined Belgium in the Revolution of 1830, and was finally divided between the present states of Belgium and Holland in 1839.—*Belgian L.*, the most north-easterly province, has an area of 931 sq. miles, and a pop. (1873) of 203,922. It is coveled in the N. by part of the heathy *Campine*, but is partly arable, especially in the S. and along the E. border, where it is watered by the Maas. The chief occupation is cattle and swine rearing, and there are some iron and coal mines, besides paper, tobacco, and beet-sugar industries in the capital, Hasselt, St. Frond, Tongres, &c. 'L. cheese' is famous.—*Dutch L.*, a province in the extreme S.E. of Holland, is chiefly on the E. side of the Maas, but comprises in the N. a strip of the swampy *Peel* on the W. side of the river. Area, 1353 sq. miles; pop. (1875) 232,562. The country and products are similar to those of the Belgian province. Maastricht is the capital, and other towns are Roermond and Venlo.

Limbus (Lat. 'a border') is the term which was used by the schoolmen to denote 'the abode in the state intermediate between death and the judgment of those who lived before the coming of Christ, and of infants who died unbaptized.' It was divided into five divisions—(1) *Paradis*, where the fathers of the Old Church, who received an accession of glory through the incarnation of Christ, the faithful freed from purgatory, and the martyrs under the altar (Rev. vi. 9) await the resurrection; (2) *L. Patrum*, also called 'Abraham's bosom,' the place of those who lived before the time of Christ, but merited no accession of glory; (3) *L. infantum*, the place of unbaptized infants; (4) *Purgatory*, the place of the baptized whose imperfections require a remedial fire to purge away defilements and fit them for heaven; (5) *Infernum*, the place of those without hope.

Lime (CaO) is the oxide of calcium, and is prepared from the carbonate (CaCO₃) by burning out carbonic acid. The carbonate is the principal constituent in all limestones, chalks, and marbles, and occurs in nature crystallised as calc-spar and arragonite. It is also an important constituent in shells of fishes and in corals. To obtain L., a kiln in the form of an inverted cone of brickwork is filled with alternate layers of limestone and fuel, which are burned from below upwards. The carbonate is readily decomposed in the presence of the products of combustion of the fuel, and the resulting compound, *burnt* or *quicklime*, as it is called, is raked out from below. A ready test of its quality consists in sprinkling it with water, with which it should at once combine, evolving much heat, expanding greatly, and crumbling to the white powder known as *slaked lime*, or the hydrate of lime (CaO, H₂O). L. which slakes feebly is called a poor lime, and contains considerable quantities of foreign substances, silica, magnesia, alumina, &c. *Overburnt L.* contains hard masses of the silicate, which results from the combination of a portion of the L. with the silica found in the limestone. Slaked lime is about twice as soluble in cold as in boiling water—the cold water dissolving about $\frac{1}{10}$ th of its weight of L. If L. be treated with hydrochloric acid, the *chloride of calcium* (CaCl₂) results, which, when evaporated to dryness and heated, forms a white porous mass. It is extremely deliquescent, and is of great use in the laboratory for drying gases. Chloride of calcium is also formed when ammonia is prepared by the action of L. upon sal-ammoniac. The *fluoride of calcium* is abundantly met with in nature as fluor-spar, and is useful as a flux in metallurgical operations. L. is a powerful base, and when treated with acids forms well-defined salts. The *sulphate* (CaSO₄) is found native, forming gypsum and selenite. Gypsum when heated to between 300° and 400° F., and then powdered, forms what is known as *plaster of Paris*, which, when renixed with water, forms a hard solid mass of hydrated sulphate of lime. *Succo* consists of plaster of Paris mixed with a solution of size. The carbonate has been already mentioned as the chief source of all our L. It is the chief element in giving water its temporary hardness, and may be removed by adding to the water some L.-water when the carbonate is precipitated. It is very slightly soluble in pure water, but is readily dissolved in a solution of carbonic acid. Several distinct *phosphates* are known, but they are of minor importance. The mineral apatite is chiefly composed of a phosphate of L., and the phosphates obtained from calcined bones are the great source of our Phosphorus (q. v.).

Lime is the popular name for the fruit of one of the varieties of *Citrus medica* of Linnæus, distinguished as *C. limetta*. The

plant forms a tree of shrubby growth, and is largely cultivated in the S. of Europe, the W. Indies, &c. Its native country is supposed to be the mountainous region of Eastern India. It has been cultivated from an early date. The rind of the fruit is thin, and the acid contained in the pulp, besides being very abundant, is much purer than that procured from the lemon. It yields our principal supply of citric acid, and has also a considerable value in a medicinal point of view, furnishing the 'lime-juice' commonly administered aboard ship during long voyages, to preserve the health of the seamen in the absence of fresh meat and vegetables.

Lime, or **Linden**, the popular name of *Tilia*, the typical genus of the natural order *Tiliaceæ*. There are eight species, all peculiar to the northern hemisphere. The *T. parvifolia* is perhaps native through a small restricted area in England, but the common L. (*T. Europæa*) is certainly not indigenous. It is, however, well known from its common cultivation as an ornamental tree in parks, public gardens, boulevards, &c. In Scotland it does not appear to have been planted before the reign of Charles II. It grows under favourable circumstances to a height of 120 feet, and is exceptionally as much as 50 feet in girth. The pale, soft, and close-grained wood is sought for turning, carving, and charcoal-making. By maceration in water the fibrous portion of the bark of the L. can be separated, and easily divided into its thin component layers. These are used for making ropes, cordage, fishing-nets, peasants' shoes, and 'Russia' mats. The mats serve largely as packing material for heavy bulky goods, as furniture, machinery, &c., for covers and carpet substitutes, and for a variety of garden purposes. It is estimated that on an average 14,000,000 are made annually. In some parts of Russia the entire population go to the forests in May and June, the time at which the bark separates with the greatest facility. The villages are then almost deserted, all the inhabitants being occupied either in barking the L. trees or in making the mats. The sap is sometimes evaporated for the sugar it contains. The silver L. (*T. argentea*) of S.E. Europe is a magnificent tree, producing a fine effect in gardens with its leaves covered below with a silky-white pubescence. The flowers are deliciously fragrant, yield an abundance of honey, and by distillation a valuable oil. The wood is not attacked by boring insects. The basswood-tree of America (*T. Americana*) extends N. to 52°. Its timber is pale and soft, but is utilised in various ways.

Limerick, a county of Ireland, in the province of Munster, bounded N. by the Shannon and its estuary, which separates it from Clare, S. by Cork, E. by Tipperary, and W. by Kerry. Area, 680,842 sq. miles; pop. (1871) 191,936. It is hilly in the S. and W., the Slieve Felim mountains on the border of Tipperary rising to a height of 1670 feet. The country, stretching from about the centre to the estuary of the Shannon (the 'Golden Vale'), is flat and very fertile, being watered by the rivers Muckear, Maigue, Deel, &c., all flowing N. to the Shannon. In 1871 there were 189,176 acres under tillage, 404,467 in pasture, 8734 under plantation, 18,474 under water, and 59,991 in waste, bog, mountain, &c. Horned cattle and sheep are extensively reared; among the exports are butter, corn, and cider. The climate is moist and healthy. Limestone, trap, and sandstone are the chief rocks, and the western hills yield a fine reddish marble, an inferior kind of coal. Veins of iron, copper, and lead have also been found in L., but are almost unwrought. The country, indeed, has but few and slight industries. L. is the capital, and other towns are Newcastle, Askeaton, and Rathkeale. There is an unusual number of interesting remains, including stone circles, cromlochs, round towers baronial castles (upwards of 100), abbeys, and churches.

Limerick (Irish Gael. *Luimneach*, 'the barren spot'), the capital of the county of L., lies on both sides of the Shannon, 51 miles N. of Cork and 129 W.S.W. of Dublin by rail. It consists of the old English town on the S. end of the river islet known as King's Island, the old Irish town on the E. bank of the Shannon, the modern Newtown Perry on the same side, below Irish Town, and the large suburb of Thomond Gate on the W. or Clare bank of the river. The Shannon is here crossed by five bridges, one of which, the Wellesley Bridge, is a fine five-arched structure spanning the harbour. The two older parts of L. are crowded and dirty, and are liable to inunda-

tion by high tides. The English town has many quaint Flemish houses. Newtown Perry, with fine squares and broad handsome streets, is one of the best modern towns in Ireland, standing at some height over the river. The most notable buildings of L. are the cathedral of St. Mary, founded in 1180 and rebuilt in 1490, the Roman Catholic cathedral of St. John, built in 1860; the church of St. Alphonsus, containing a splendid altar of Caen stone and Irish coloured marbles; the county and city court-houses, the town-hall, linen-hall, exchange, custom-house, county hospital, Mount Barrington's infirmary, military barracks, literary institute, assembly-rooms, and theatre. L. has increasing manufactures of lace, gloves, linens, iron wares, fish-hooks, leather, and spirits. There are important weekly markets for corn, butter, and cattle, and the great Munster fair is held here on the last Thursday of June. The harbour, which is deep and commodious, was improved by an outlay of £200,000 advanced on loan by Government. A vast wharfrage irregularly skirts Abbey River and the main stream, and there are several large floating docks and shipbuilding yards. A large graving dock was opened by Earl Spencer, 13th May 1873. In 1875 there entered the port 576 vessels of 138,456 tons, and cleared 354, of 88,811 tons. The exports are cattle, pork, butter, grain, &c.; the imports, coal, timber, and manufactured goods. L. sends two members to Parliament. Pop. (1871) 39,828. The town was a place of note in the 5th c., and was first attacked in 812 by the Danes, who subsequently held it till the end of the 10th c., when they were forced to render tribute to Brian Boru. In 1106 it was made the residence of the kings of Thomond and N. Munster, but was occupied by the English in the reign of Henry II. In the Rebellion of 1641 L. became the headquarters of the Roman Catholics, but surrendered to Ireton after a six months' siege in 1651. The last stronghold that held out for James II., it was thrice assaulted in vain by William III. with 20,000 veterans, but after a six weeks' siege by Ginkel, it capitulated 3d October 1691. Its fortifications were dismantled in 1760.

Limestone is a widely distributed and important class of rocks, which consist essentially, sometimes almost wholly, of carbonate of lime. There are a vast number of different varieties, many of which are peculiar to certain formations, and are at once distinguishable by the trained eye. Limestones occur hard or soft, compact, concretionary, or crystalline. *Compact L.* is hard, smooth, and fine-grained, and frequently when of a pleasing colour is polished and used for ornaments. *Crystalline L.* varies from a coarse grained rock of various colours to a pure white grained one, known sometimes as statuary marble. Its crystalline structure may be due to the fragments of fossil shells of which it is composed (such, for instance, as *chalk*), or it may have been superinduced by metamorphic action on an originally compact L. A peculiar form of L. is that known as *Oolite*, which, from its constant occurrence in the British formations corresponding to the Jurassic rocks of the Continent, has given the name of Oolitic System to these formations. Its structure is concretionary, something like the roe of a fish—hence the name, signifying *egg-stone*. It is ordinarily a dull yellow colour—sometimes grey. Its capability of being cut in any direction makes it valuable as a building stone. *Fossilite* is an Oolite the concretions of which are as large as peas. *Fresh water limestones* are generally very smooth in texture, and dull white or pale grey in colour. They are frequently soft and earthy, and can be distinguished by their fossils or by their petrological relations. Stalactites and stalagmites are formed by the evaporating of dropping or slowly trickling water holding in solution a quantity of lime carbonate. There is an important class of limestones known as *Magnesian L.* or *Dolomite*, which contains a considerable quantity of carbonate of magnesia. Typical specimens are easily distinguishable by their crystalline texture, pearly lustre, and gritty feel. The colour is generally brown or yellow, occasionally with a dash of red. L. appears to be a truly aqueous rock, formed by deposition. It is not, however, the result of the mechanical subsidence of inorganic matter like sandstone and shale. It is in most cases traceable to an animal origin, though certain well-known varieties are chemically formed by precipitation from solution.

Lim'it, in Mathematics, is a determinate quantity, to which some variable quantity continually approaches in value, but never reaches, but from which the variable quantity may be made to

differ by an amount smaller than any assignable difference. For example, the series $1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \dots$, never reaches the value 2, but it continually approaches it, and by taking a sufficient number of terms may be made to differ from it by a quantity less than the smallest assignable but finite quantity; 2 is the L. of the series. Similarly, the area of a polygon inscribed in a circle may be made greater and greater by increasing the number of sides; but it can never be greater than the area of the circle, which it continually approaches in value, and which therefore is its L. Again, the tangent to a curve at a given point may be defined as the L. of a secant drawn through that point, as the two points of section are approached indefinitely near each other. The doctrine of limits was first logically expounded by Newton in his prime and ultimate ratios, and it is now recognised as the fundamental doctrine without which the calculus cannot strictly be established. See CALCULUS.

Limitations, Statute of. In English law the defendant in an action may under this statute plead the elapse of the time allowed by it for the commencement of the action. Personal actions for trespass, or for debt on simple contract must be begun within six years from the date of the cause founded on; and actions of assault, menace, or imprisonment within four years from the date of the injury committed. All penal actions for forfeitures under statute, must be brought within two years. Actions on bills of exchange, for attorneys' fees, and on mercantile accounts must be brought within six years from the date of the cause of action. See PRESCRIPTION, and IMMEMORIAL USAGE.

Limited Liability. See JOINT STOCK COMPANY.

Limnæa, a genus of air-breathing or Pulminiferous Gastropoda (q. v.), represented by the common water or pond-snail (*L. stagnalis*), and by other species. It belongs to the family *Limnæidae*, in which the shell is thin and well-developed. The aperture is simple, and the tip is sharp. The L. is commonly found on the stems of aquatic plants, or floating on the surface of the water through the conversion of the foot into a 'float.' The eggs are laid in masses in the form of gelatinous ribbons. Other genera are *Planorbis*, *Angulus*, and *Physa*.

Limnoria, a genus of *Iso-podous* Crustacea, celebrated for the ravages of one species—*L. terribilis*—on wooden piles which have been immersed in the sea. It belongs to the Cursorial section of the order *Iso-poda* (q. v.), in which section the feet are of equal length, and not adapted for swimming. The L. is also known by the names 'gribble,' and 'timber-boring shrimp.' Its colour is grey. The animal burrows deeply into wood. The average size is about one-fourth of an inch. The males are smaller than the females.

Limoges, a town of France, department of Haute Vienne, 112 miles N.E. of Bordeaux by rail, on the Vienne, which is here crossed by three bridges. Among its chief buildings are the granite cathedral of St. Stephen, commenced in the 13th c., but still unfinished; the Ogival church of St. Michael, with its lofty belfry; the bishop's palace (1787); a library, with 23,000 vols.; a noble hospital, founded in the 12th c., and recently restored; and the theatre, erected (1838) on the site of the famous abbey of St. Martial. L. is one of the chief manufacturing towns of France, turning out goods of a gross annual value of 30,000,000 francs. Its thirty-seven porcelain factories and thirty-four porcelain-painting workshops employ respectively 6000 and 2000 hands; and the cloths, cashmeres, flannel, woollens, and druggets of L. are widely famed. Other articles of industry are gloves, leather, hats, paper, cutlery, beer, &c.; and there is a lively transit trade between Paris and S. France in grain, wine, chestnuts, horses, and cattle. Pop. (1872) 44,944. L., the capital of the Gallie *Limovices*, but known to the Romans as *Augustoritum*, was successively captured by the Visigoths, Franks, Northmen, and English, the last of whom, at the order of the Black Prince, massacred 3000 of its inhabitants (1370). From the 12th to the 14th c. it was famed for its manufacture of Enamel (q. v.).

Lim'pet (*Patella*), a genus of *Gastropodous* Molluscs, belonging to the *Holostomatous* group of the class, and forming the type of the family *Patellidae*. The shell is of simple, conical form, the apex being turned forwards. The 'foot' is large, and forms a great broad disc, by which the animal attaches itself to rocks. The gills are ranged round the edge of the mantle;

hence the name *Cyclobranchiate* ('circular-gilled') gastropods in many systems of classification. The common *L. (P. vulgata)* is familiar on the rocks round the English coast. It adheres to the rock chiefly by the suctional action of the foot, which produces a vacuum through its contractions. Other genera of limpets are exemplified by the keyhole *L. (Fissurella maxima)*, in which an aperture exists at the apex of the shell; this aperture being used for the expulsion of the water which has been used in breathing. The duck-bill *L. (Parniothorus Australis)* inhabits tropical seas, and the 'cup and saucer *L. (Calyptrea)* is so named from the cup-shaped process found in the interior of the shell. Several tropical species of *L.* attain a very large size; the shell in one species measuring 12 inches in diameter.

Limpopo, Ouro, or Bempe, a large river in S.E. Africa. It rises near the S. boundary of the Transvaal district, in 24° 20' S. lat., 28° 35' E. long., and flows successively N.W., N.E., E., and S.E., describing two-thirds of a circle, before it falls into the Indian Ocean in 25° 15' S. lat., 33° 33' E. long. The *L.* is navigable for 60 miles, but is difficult of entrance, and the region around its lower course is very unhealthy. Nevertheless it is expected to become the outlet of the valuable but still unsettled table-lands of the Eastern Transvaal.

Lina'cese. See FLAX.

Lin'acre, Thomas, a physician and scholar of the 'New Learning,' was born at Canterbury about 1460, and became a Fellow of All Souls' College, Oxford, in 1484. Sent with De Selling on an embassy to the Pope, he studied Greek at Florence under Chalcondylas, and medicine under Hermolao Barbarus at Rome, where he formed friendships with Grocyn and William Latymer, and translated several of Galen's treatises into Latin. On his return to Oxford, he lectured on Greek and physic, became tutor to Prince Arthur, and having taken orders (1507), held successively the livings of Mersham, Hawkhurst, Hols-worthy, and Wigan, and prebends of Wells, York, and Westminster. He was also physician to Henry VII. and Henry VIII., and founder of the Royal College of Physicians (1518), of which he became first president. His death took place at London, October 20, 1524. *L.*'s learning, styled by his pupil Erasmus 'deep, searching, and refined,' is enshrined in his nine Latin translations of Galen, Proclus, and Paulus Aegineta, in a Latin grammar for the use of the Princess Mary, and in the treatise, *De Emendata Structura Latini Sermonis Libri Sex* (Lond. 1524).

Lin'coln (the *Lindum Colonia* of the Romans, hence the modern name), the capital of Lincolnshire, and a county of itself, is situated on the left bank of the Witham, 140 miles N.N.W. of London by rail. It is built on the southern slope and at the base of a hill, on the summit of which stands the magnificent cathedral, visible for many miles over the flat country to the S. One of the most beautiful specimens of Early English in the kingdom, it was founded in 1088, and is in the form of a double cross, 524 feet long, and 174 wide at the W. front, which is almost unrivalled for the richness of its carvings and tracery, and is adorned with statues of eleven English kings. At the intersection of the transept with the nave and choir rises the central tower, 300 feet high, containing the celebrated bell 'Tom of *L.*,' recast from an older one in 1834, weighing 5 tons 8 cwt., and measuring 6½ feet in diameter at the mouth. On the N. side of the cathedral are the cloisters, enclosing a quadrangle of 118 feet by 91, with a Roman tessellated pavement. *L.* has also several pre-Reformation churches, handsome county courts, a jail on the site of the castle, a post-office (1800), a corn exchange, a large semi-classic structure, with a large public hall, fine railway stations, assembly rooms, and a theatre. There are many educational and benevolent institutions. The manufactures are farm implements and machinery, portable steam engines (over 900 yearly), leather, cordage, bricks, nails, brushes, mats, &c., and there are steam flour-mills, bone mills, boat-building yards, nursery grounds, a trade in corn, wool, coal, and timber, a weekly market, and four yearly fairs—the most important, held during the last whole week in April, attracting continental and American dealers. Brayford Water forms a convenient harbour for vessels built to navigate the Witham. Pop. (1871) 26,766. *L.* returns two members to parliament. Its principal Roman antiquity is 'Newport Gate,' a central arch 16 feet wide, flanked by two smaller arches. At the time of the Conquest *L.* was one of the chief places in the

kingdom, and the seat of a large trade. William I. erected a castle here, and the town received a charter from Henry II. It was besieged in 1141 by Stephen, who was, however, here defeated and taken prisoner, was for some time John of Gaunt's residence, and was stormed by the Parliamentary troops, under Manchester, in May 1644.

Lincoln, Abraham, sixteenth President of the United States, was born in a cabin on Nolin Creek, 3 miles W. of Hodgenville, Kentucky, February 12, 1809. In 1816 his father removed to Illinois, where he took a small farm. Abraham assisted his father in rough out-door work, and had only one year's schooling. In 1825 he was a ferryman at six dollars a month. Exceptionally tall and strong, *L.* could turn his hand to any kind of manual labour—log-cabin building, boat-making, or rail-splitting. In the Black Hawk War he was elected captain of a volunteer company, and served three months, after which he started a store. Returned to the Illinois State Legislature in 1834, and having studied law, he settled at Springfield as an advocate in 1837. *L.* took an active part in local politics, and was returned in 1846 to Congress, where he supported abolition, and opposed the Mexican War. He was an unsuccessful candidate for the Senate in 1849 and 1858. In 1860 he secured the Republican nomination for the Presidency, and owing to the divided state of the Democratic party was elected in November. He received 1,857,610 votes, against 2,787,780 recorded for the three Democratic candidates. The election of so strong an Abolitionist gave violent dissatisfaction in the South, and was the signal for secession. In December 1860 S. Carolina declared its independence, a step followed afterwards by ten other States. On March 4, 1861, Mr. Lincoln was installed President, and mooted a compromise—the maintenance of the Union, and the continuance of slavery. Neither Abolitionists nor Secessionists were satisfied. On April 12, 1861, General Beauregard seized Fort Sumter, an act which decided all parties in the North for war. On April 15, Mr. Lincoln called out 75,000 militia, and on July 4 obtained a vote for 40,000 men and 400,000,000 dollars. The Four Years' Struggle which followed forms the greatest event in American history since the War of Independence. On January 1, 1863, Mr. Lincoln declared the entire abolition of slavery. In November 1864 he was re-elected President. His assassination, April 14, 1865, by J. W. Booth, an actor and a fanatical Secessionist, sent a thrill of horror through the whole civilised world. *L.*'s remains were carried in state through the principal cities of the Union, and interred at Springfield, where a beautiful monument was erected to his memory, October 15, 1874. *L.* was a noble though unadorned type of the American or New World Englishman. Earnest, honest, strong of will, tenacious of purpose, he was the very man for a crisis. The years of his Presidency were the darkest in his country's history; yet with invincible courage and unflinching hope he steered the good ship 'Union' safely through the most appalling storm that ever broke over the States. His countrymen cannot sufficiently honour his memory, as a triumphant patriot and martyr; while mankind will remember with gratitude the statesman that abolished the curse of slavery from an entire continent. See H. J. Raymond's *Life and Public Services of A. L.* (New York, 1865); A. Boyd's *Memorial L. Bibliography* (Albany, 1870); W. H. Lamon's *Life of A. L.* (1872); A. Jouault's *A. L., sa Jeunesse et sa Vie Politique* (Par. 1875), &c.

Lincoln College, Oxford, was founded in 1427 by Richard Flemming, Bishop of Lincoln, for a rector, seven fellows, and two chaplains, as a seminary of clergy who might confute the doctrines of Wycliffe. Flemming dying in 1430, the work was completed by Thomas Rotherham, his successor in the see of Lincoln, who in 1475 finished the building of the college, enriched its revenues, and gave it a body of statutes (1479). By them the fellowships were increased to twelve, and restricted to natives of the dioceses of Lincoln, York, and Wells, a limitation removed by 17 and 18 Vict. The present foundation consists of a rector, ten fellows, and fourteen scholars, and other scholarships (eight at present) are from time to time added from the proceeds of two suspended fellowships. The college presents to nine livings. In 1876 it had twelve members of Congregation and forty-four commoners.

Lincolnshire, the second largest county of England, is bounded N. by Yorkshire and the Humber, S. by Cambridge, Northampton, and Rutland, W. by Leicester and Nottingham,

and E. by the North Sea and the Wash. Area, 2763 sq. miles; pop. (:871) 436,599. It is divided into the 'parts' or districts of Lindsey in the N., Kesteven in the S.W., and Holland in the S.E. In the W. are the moors, known also as the 'L. heights,' and the S. is covered by a wide tract of the fens of the celebrated Bedford Level (q. v.). The L. wolds, or chalk downs, stretch S.E. from the Humber in a line with the coast. The moors, fens, and wolds are now in great part reclaimed by green crops and pasture. L. is watered by the Trent, Witham, Welland, Ancholme, and many smaller streams. In 1876 there were 620,024 acres under corn crops, 239,321 under green crops, 169,584 in clover, sanfoin, and grasses in rotation, and 419,730 in permanent pasture and grass; there were also in L. 62,720 horses, 202,033 cattle, 1,508,813 sheep, and 99,667 pigs. The chief crops are wheat, barley, oats, beans, peas, turnips, swedes and potatoes. Along the Trent there are rich 'warp'-lands (see WARPING). L. is famed for its breeds of horses, sheep, and cattle, and great fairs are held at Lincoln and Horncastle. Six members are returned to Parliament. Lincoln is the capital, and other towns are Boston, Grantham, Louth, and Great Grimsby. The county is particularly rich in Roman. Old English, and Danish remains.

Lincoln's Inn, so called because it belonged to the Earl of Lincoln, in the reign of Edward II. See INNS OF COURT.

Lind, Jenny. See GOLDSCHMIDT.

Lindley, John, LL.D., F.R.S., a celebrated English botanist, was born February 5, 1799, at Catton near Norwich, where his father was proprietor of a large nursery garden, a circumstance by which his taste for botany was no doubt developed. He early appeared as a botanical author in his translation of Richards' *Analyse du Fruit* (1819), which was followed next year by his *Monographia Rosarum*. Shortly after he went to London, became assistant secretary to the Horticultural Society, and was engaged by Loudon to write the descriptive portion of the *Encyclopædia of Plants*, a task which led to the consideration of the claims of the artificial and natural systems of classification, and which resulted in his becoming the warm advocate of the latter. In 1829 he was chosen Professor of Botany in University College, London, a post which he resigned in 1860. L. was the recipient of many scientific honours, and was honorary or corresponding member of almost all the foreign societies of natural science. He died at Catton, November 1, 1865. The more important of his other works are *Introduction to the Natural System of Botany* (1836, republished in 1836 under the name *A Natural System of Botany*), *Introduction to Systematic and Physiological Botany* (1832), *Flora Medica* (1838), and *Theory of Horticulture* (1844). With Hutton he published *Fossil Flora of Great Britain* (2 vols. 1831-34), with Paxton, *Pocket Botanical Dictionary* (1840), and with Moore *The Treasury of Botany* (1865). He also edited the *Gardener's Chronicle*, was the author of numerous valuable papers and monographs, notably nuptial *Orchids*, and wrote the greater portion of the botanical articles in the *Penny Encyclopædia*.

Lindsay, or Lyndsay, The Family of, is of Norman origin, the name originally being De Limesay. The first of the line in Scotland seems to have been Sir Walter de L., a baron under David I. His great-grandson acquired the territories of Crawford, in Clydesdale, marrying Marjory, sister of William the Lion, and leaving three sons—Sir David, Lord of Crawford, Sir Walter, ancestor of the Lamberton family, and William of Luffness. His grandson Gerard died childless, and the estates went to his sister, wife of Sir Henry Pinkney, an English baron, whose grandson again resigned them into the hands of Edward I.; but Crawford had already been bestowed on Alexander I. of Luffness, the first of the more recent house of Crawford. The *Lambertons*, descended from Walter, brother of the first Lord of Crawford, for four generations married heiresses, eclipsing the other branches of the family; but the male line ended with Sir William, killed in a battle with Llewellyn, Prince of Wales, in 1283. William of Luffness, brother of the first Lord of Crawford, continues the direct line of the Lindsays. His descendant, David, obtained large estates from the Bruce, others accruing to him by his marriage with Lord Abernethy's daughter. His son, Alexander, espoused the daughter of Sir John Stirling, and with her received the lands of Glenesk and Edzell, in Angus, leaving for issue Sir David of Glenesk, first Earl of Crawford. Another

son of David, Bruce's friend, was Sir William, founder of the *Byres* family. Earl David married Princess Elizabeth, daughter of Robert II. His grandson, of the same name, was the earl killed while endeavouring to heal the feud between the Ogilvies and Lindsays. He left a large family. The eldest son, Alexander, took the ancestral title; the second, Walter of Beaufort, founded the house of Edzell. Alexander, the fierce Earl Beattie, died of fever in 1454; and his son David, prime favourite with James III., was created Duke of Montrose, a title which did not survive him. David, eighth Earl, transferred the estates from his heir, the Wicked Master, to David L. of Edzell, who arranged that they should be reconveyed to the Wicked Master's son at his own decease. From Ludovic, the sixteenth Earl, childless, the title passed by royal patent to Lord John L. of Byres, High Treasurer of Scotland, an enthusiastic supporter of the Stuarts, for whose cause he suffered imprisonment. His grandson, John, became *Viscount Garmock* in 1703; and the son of the fourth Viscount, the twenty-second Earl of Crawford, proved the last of the direct line of Byres, the earldom reverting to the family of Balcarres. Sir David L. (q. v.) represented an ancient branch of the Byres family. The founder of the *Balcarres* house was John, son of the ninth Earl of Crawford, who became a Lord of Session under the title of Lord Menmuir. He acquired the estate of Balcarres, and his son was created Lord L. of Balcarres in 1633. His grandson was created Earl in 1651. Alexander, sixth Earl of Balcarres, succeeded to the earldom of Crawford on the death of George L. of Byres. See *Lives of the Lindsays* (1849), by the present Earl of Balcarres, and Jervise's *Lund of the Lindsays*.

Lindsay, or Lyndsay, Sir David, once the most popular poet of Scotland, was the son of David Lindsay of the Mount, Fifeshire, and (according to Chalmers) was born there in 1490, but David Laing (ed. of L., 1871) points out that there is no evidence in support of this statement, and considers it just as likely that the poet was born at Garmylton near Haddington, in East Lothian. He studied at St. Andrews 1505-8, but did not take his degree. That he visited the Continent at this period of his life, though positively asserted by Mackenzie, is extremely doubtful. It is more likely that he proceeded straight from the university to the court, though the loss of the Treasurer's accounts between August 1508 and September 1511 makes it impossible for us to ascertain the exact date of his earliest employment in the royal household. The first notice of his appearance is an entry (12th October 1511) in the treasury-book for 'a play coat to D. L. for the play' at Holyrood. To the infant prince (afterwards James V.) he became usher; and in *The Dreame*, his earliest poem (1528), he recounts the expedients resorted to for his charge's amusement. In 1529, however, his *Complaynt to the Kingis Grace* laments the influence of parasites and flatterers upon his former pupil; and the *Complaynt of our Lordis Pappyngo (Parrot)*, written in the following year, hotly inveighs against the dissolute manners of Church and court. James V., on becoming his own master, had made his guardian Lyon-King-of-Arms, knighting him, and granting him revenues from the lands of Luthrie, Fifeshire. His duties took L. on several important embassies to foreign courts, and some brief notes of his adventures still remain. On the death of James's young bride (7th July 1537), he composed the *Deploration of the Deith of Quene Magdalene*. His well-known *Satyre of the Thrie Estaitis*, was first performed in 1540, at Linlithgow, before a full court. This satire, by far the greatest 'Interlude' or 'Mixed Play' in English literature, is filled with scathing ridicule of the priests, and preserves for us humorous and graphic sketches of men and manners in the poet's time. The *Register of Arms*, carefully prepared by L. in his capacity of chief herald, appeared in 1542, and about 1549 the *Historie and Testament of Snyger Meldrum*, a stirring tale of Scotch chivalry, wholly free from the satirico-didactic spirit that pervades the rest of the poet's writings. Beaton's memory was satirised by him in the *Tragedie of the Cardinall*; and in 1553 he published his longest work, *Ane Dialog betwix Experience and Ane Courtour of the Miserabill Estait of the World*, commonly called *The Monarchie*, a sort of rhymed universal history, full of learning and acute reflections. The exact date of Sir David's death has not been ascertained; but Mr. Laing has proved by documentary evidence that it must have occurred before the 18th of April 1555. As a poet, L. is more remarkable for wit and trenchant

satire than for fancy. To the king he proved an invaluable friend, faithful and fearless in counsel. His strenuous attacks on abuses prevalent in his time, especially those of ecclesiastics, show him to have been a man of strong principle, and no one can reasonably doubt that had he lived a few years longer, he would have joined the Lords of the Congregation in the abjuration of Popery. His part in the work of the Reformation is only second in importance to that of Knox. L. ploughed, Knox sowed. Scotland long remembered him. During the 16th, 17th, and 18th centuries, upwards of twenty editions of his works were published. His verses were on almost every tongue. Until Burns appeared, he was in fact the poet of the Scottish people, and was appealed to as an infallible authority on the Scottish language. 'Ye'll no find that in Davie Lyndsay,' was a fatal objection to any new coined phrase which a speaker ventured to employ. The first who carefully edited L.'s poems was Chalmers (3 vols. Lond. 1806). Laing has corrected some of its errors in his edition of 1871 (2 vols. Edinb.), and is at present (1877) engaged on what, if finished, will certainly be the standard, and probably the final edition of the poet.—**Robert L. of Pitscottie**, a relative of the poet, was born about the beginning of the 16th c. He is the author of quaint, picturesque, and credulous *Chronicles of Scotland* from 1436 to 1565, beginning where Bocce left off, viz., with the murder of King James I. In the Preface, L. states that he was materially helped in his work by Lord L. of the Byres, Sir William Scot of Balwirrie, Sir Andrew Wood of Largo, John Major the historian, Sir David L., and other gentlemen. The best edition of Pitscottie's *History* is that by John Graham Dalyell (2 vols. 1814).

Line, a term applied to the 'regulars' of the British army to distinguish them from other corps. It includes all the numbered regiments, with the exception of the Life, Horse, and Foot Guards, and excludes the Royal Marines, volunteer and yeomanry corps, and fencibles.

Line, in mathematics, is that which has only one dimension; or, as defined by Euclid, is that which has length but no breadth.

Lineal Descent is descent in a right line—son, grandson, great-grandson, &c. Lineal ancestor is father, grandfather, &c.

Lin'en Manufactures. Textures of linen (Lat. *linum*, 'flax'), which comprise the manufactures from flax fibres, have been in general use among civilised communities from the earliest recorded period. The mummy cloth in which the ancient Egyptians wrapped the embalmed bodies of their dead is found to be composed of linen, and it is often in a wonderful state of preservation. Linen and the cultivation of the flax plant are also frequently alluded to in the early books of the Old Testament, and similar references are common in the works of classical authors. L. M. were, in Europe at least, the most important vegetable textile industries down to almost the end of last century, but from about 1775 the improved machinery devoted to cotton manufacture began to tell powerfully in favour of that fibre, which with extraordinary rapidity attained pre-eminent importance. In the United Kingdom the L. M. which had been generally disseminated became concentrated in special localities, and they now flourish chiefly in the north of Ireland, with Belfast as their centre, at Leeds in England, and in the counties of Forfar and Fife in Scotland, Dundee, Arbroath, Kirkcaldy, and Dunfermline being the principal towns concerned in the industry. L. M. are also prominent industries in the N. of France, Holland and Belgium; and in early times much of the linen worn in Great Britain was sent to Holland to be bleached, whence arose the name 'Holland's' Linen. L. M. embrace a wide range of textures, which are all characterised by great strength and durability. They include, of finer textures, the delicate lawns and cambrics, damasks, some of which are of highly artistic patterns and among the triumphs of the weaver's art, shirtings, and sheetings of various qualities. Diapers, drills, huckabacks, Hessians and sailcloth are also linen fabrics of a heavier class, and some of which may be made of mixed fibres or materials other than flax. The bleaching of linen, on account of the large proportion of colouring matter contained in flax, as well as from the intricate manner in which it is combined with the fibre, is a very tedious process, involving repeated 'crofting' or exposure of the fabric on grass fields. It is a prominent industry in the N. of Ireland, and in Perthshire, Scotland. Sailcloths and

heavy goods are principally woven in Dundee and Arbroath, damasks in Dunfermline, and these, with fine linens, are made in Belfast; but much plain shirting, &c., is still woven by handloom weavers in the rural villages of the country. In 1875 there were in Scotland 159 factories with nearly 3000 spindles, and 18,529 power looms, giving employment to about 45,000 persons employed in the linen industries.

The exports of linen yarn and piece goods from the United Kingdom in the year 1875 were as follows:—Linen yarn, 27,887,681 lbs.; white and unbleached plain goods, 186,763,770 yards; checked, printed, or dyed linens and damasks and diapers, 13,742,124 yards; sails and sailcloth, 4,067,278 yards. The yarn goes principally to Spain, Canary Islands, Germany, and Holland; the piece goods are most in demand in the United States, West Indies, Australia and other British Dependencies, and France; while the sailcloth is taken chiefly by Sweden and Norway, Germany and the East Indies.

Ling (*Lota molva*), a fish belonging to the Cod-family, and very abundant on the shores of Britain. It is longer than the cod proper, has two dorsal fins, one anal fin, and one barbel at the extremity of the lower jaw. The L. is from three to four feet long, and sometimes weighs as much as 70 lbs. It is of a grayish colour, with white belly and white-tipped fins. When salted and dried, it is sent into the market in the form of *stock-fish*. The L. of the American coast is *Lota compressa*, of which great quantities are caught in the Gulf of St. Lawrence.

Linga (Sansk., 'symbol'), the *phallus* or representation of the male generative power, worshipped throughout India as the emblem of the god Siva. Any erect and cylindrical object will serve the purpose, usually a mere stone. According to the Puranas, there were in early times twelve chief centres of L. worship, and these holy spots still attract numerous pilgrims. A sect of Hindus in the S. of the Peninsula, who are chiefly engaged in trade, are known as *Lingaites*. See Kittel, *Ueber den Ursprung des Lingacultus in Indien* (Mangalore, 1877).

Lingard, John, D.D., LL.D., born of humble Catholic parentage at Winchester, 5th February 1771, was sent by Bishop Talbot in 1782 to the English College at Douai, where, after a brilliant course of humanities, he entered the school of theology in October 1792. On the breaking up of the Douai establishment in 1793, L. took refuge in England; and October 15, 1794, with seven fellow-students, opened a new college at Crook Hall, near Durham, himself becoming vice-president, and acting as professor of natural and modern philosophy. A tutor in Lord Stourton's family (1793), he returned to Crook Hall (1794), was ordained priest and appointed prefect of the studies (1795), served a church in Newcastle-on-Tyne (1800), and wrote for the *Newcastle Courant* (1805) a series of letters, afterwards published as *Catholic Loyalty Vindicated*; his *Antiquities of the Anglo-Saxon Church* (4th ed. 1858) appearing in the same year. In 1808 he removed with his community to Ushaw, but in September 1811 retired to the mission of Hornby in Lancashire, where, with the exception of two visits to Rome, he continued to reside until his death, 17th July 1851. Pius VII. conferred on him the degrees of D.D. and LL.D. (1821), and Leo XII., having vainly offered him a cardinalship, sent him the gold medal reserved for cardinals and princes, whilst Lord Melbourne assigned him in 1839 a pension of £300 per annum. The first three volumes of L.'s *History of England to the Accession of William and Mary* appeared in 1819, the eighth and last in 1830 (6th ed. 1854-55). The one great merit of this work is its impartiality, the only indication of its Catholic origin being the absence of Protestant bias; its defect, that results are given, their causes left unexplored, intentionally, as L. himself tells us in the edition of 1825, where he dubs the 'philosophy of history' the 'philosophy of romance.' Still the work is one of great and permanent value, and has taken its place as the text-book in the universities of Oxford and Cambridge. Among L.'s other writings should be noticed his *Documents to ascertain the Sentiments of British Catholics in former Ages* (1812), *New Version of the Four Gospels* (1836), and *Catechetical Instructions* (1840). See the Memoir by the Rev. Canon Tierney, prefixed to the last volume of the 6th ed. of L.'s *History*.

Lingayen, a town on the N. coast of Luzon, one of the Philippines, exports rice, sugar, &c., and has a pop. of 18,000.

Linguagrossa, a town of Sicily, province of Catania, near the N.E. base of Etna, 9 miles W. of the railway station at

Taormina. It has several good churches, and in the vicinity is some beautiful scenery. Pop. (1874) 8822.

Lin'gula, a well-known genus of *Brachiopoda* (q. v.), or lower Mollusca, possessing a horny shell of oblong shape. No hinge exists, the valves or halves of the shell being approximated simply by their muscular attachments. The arms are fleshy, but are not, as in most other brachiopods, supported by calcareous loops, —the so-called 'carriage-spring apparatus.' A fleshy stalk or peduncle passes out between the beaks of the shell and serves to attach the L. to fixed objects. L. is the type of a very important family of brachiopods.

Liniments (Lat. *linire*, 'to besmear') are used in medicine for external application only. Formerly, L. were, for the most part, medicinal substances in combination with oil; but the Pharmacopœia Committee, in order to guard against mistakes, have called *strong tinctures*, employed for external use only, by the name of L. L. are applied to the affected part by means of saturated lint, painting over, or rubbing into the skin, and the object to be attained may be the alleviation of pain, the allaying of inflammatory action, the healing of excoriated surfaces or burns, counter-irritation or vesication, or the general purposes of endermic medication. The following are the L. of the British Pharmacopœia, with a general indication of their uses, and the proportion of the active ingredients contained in each. *Linimentum aconiti* (1 in 1), applied with a camel's hair pencil, relieves acute neuralgia. *L. belladonna* (1 in 1), may be employed similarly for the same purpose, or by means of rubbing, in combination with the compound camphor L. *L. opii* (1 in 2), is used in cases of rheumatism and local pains. *L. chloroformi* (1 in 2) alleviates pain, and acts as a stimulant on a tender skin. *L. camphora* (1 in 5), is a mild stimulant. *L. camphora composita* (1 in 4½), applied by means of lint soaked in the liniment, and covered with a dry napkin until redness is produced, relieves pain in tic-douloureux and rheumatism. *L. crotonis* (1 in 8) is used to produce vesication; and, in combination with olive oil, to promote the growth of the hair. *L. sinapis comp.* (1 in 40), *L. terbinthina* (1 in 1½), are employed as stimulants and counter-irritants. *L. hydrargyri* (1 in 6), *L. iodi* (1½ in 10), and *L. potassii iodidi cum sapone* (1 in 9) are employed to produce the constitutional effects of their active ingredients. *L. calcis (v. lime)* is chiefly used for abraded surfaces and burns. *Simple L.*, composed of four parts of olive oil, and one part of white wax, is used to soften the skin, and promote the healing of excoriations.

Lin'köping, a town in Sweden, in the län of Östergötland, on the Staang, 3½ miles S. of Lake Roxen, and 103 miles S.W. of Stockholm, regularly built of wood, has fine squares, and a Gothic cathedral, the longest (320 feet) in Sweden after that of Upsala. It is a bishop's see (one of the oldest in Sweden), and possesses a diocesan library of 30,000 vols. and 1500 MSS., with antique collections. L. has considerable trade. Pop. (1874) 8123.

Lin'ley, Thomas, an English musician and composer, born at Bath about 1725, studied under Faradées, a Venetian composer, and became conductor of concerts and oratorios in his native town. The marriage of his daughter to Sheridan led to his subsequently embarking in theatrical speculations. L. died in London, 19th November 1795. Along with his son, L. wrote the songs in Sheridan's *Duenna*, composed the accompaniments to the original airs in the *Beggars' Opera*, and published some exquisitely sweet and tender ballads.

Linlith'gow, or **West Lothian**, a county in the E. of Scotland, bounded W. by Stirlingshire, S.W. by Lanarkshire, S. and S.E. by Midlothian, and N. by the Firth of Forth. It extends from N. to S. 20 miles, and from E. to W. 15 miles. Area, 127 sq. miles; pop. (1871) 40,965. The coast is generally low and little broken. The greater part of L. is a fertile hill country, crossed by the Dumcross, Knock, and Kipp Hills, which culminate in Cairnnaple, 1498 feet high; but the S.W. is flat, with wide stretches of bog and heath. The chief streams are the Avon and Almond, with its tributary the Breich. The great Midlothian coal-formation stretches across the S. of L., and limestone, sandstone, and granite are abundant. The soil is generally clayey, with loam, sand, and shell-marl, and agriculture is in a very advanced state. In 1876 there were 18,203 acres under corn crops; 7226 in green crops; 13,866 under

various grasses; and 18,800 permanent pasture. The chief industries are the cultivation of corn, flax, potatoes, and garden fruits; the working of coal, iron, freestone, and limestone; and the breeding of horses and cattle. The principal towns are L. (q. v.), Bathgate (q. v.), Borrowstounness (q. v.), Armadale, pop. (1871) 2708, and Crofthead, pop. (1871) 3151; and villages, Queensferry (q. v.), Broxburn, pop. (1871) 1457, and Whitburn, pop. (1871) 1432.

Linlithgow ('the town on the grey lake'), the county town of West Lothian, 3½ miles from the Firth of Forth, and 17 miles W. of Edinburgh, with which, as well as with Glasgow, it is connected by railway and by the Union Canal, is situated on a lake (102 acres) in connection with the Avon. It has six churches, among which St. Michael's (probably founded by David I.), though partly burned in 1424, is one of the best preserved Gothic churches in Scotland. In front of the town-house stands the crown-shaped 'Cross-Well' (rebuilt in 1807), curiously adorned with grotesque figures. There are some old houses which once belonged to the Knights of St. John. More interesting, however, are the ruins of the palace (burned in 1424, and rebuilt chiefly by James III., V., and VI.), a large quadrangular pile with corner turrets, on an eminence projecting into the lake, which was once the Versailles of Scotland and the residence of the Queens-dowager, and in which James V. and Mary Queen of Scots were born. L. was chartered probably by David I., and was taken into the Court of the Four Burghs in 1368, when its customs were only second in amount to those of Edinburgh. Here the Regent Murray was murdered, 20th January 1570. The industries of L. are tanning, distilling, and brewing. It unites with Falkirk, Airdrie, Hamilton, and Lanark in sending one member to Parliament. Pop. (1871) 3690.

Linnæ'a is a genus of *Caprifoliaceæ* restricted to a single species, *L. borealis*, which plant was selected by Linnæ to bear his name—its northern home, and as some interpret, its very modest appearance, fitly representing the great Swedish botanist.

It is a graceful little creeper, with opposite ovate evergreen leaves, and fragrant bell-shaped flowers of a delicate pinky-white, produced in couples at the summit of erect thread-like stalks. In Europe, Asia, and N. America it is found pretty freely in woods of the more northern countries, reaching in Norway to fully 71°. In Britain it has been found in shady fir-woods from Aberdeen S. to Northumberland.

Linnaea borealis.

Linné, Carl von, or **Linnæus**, the celebrated botanist, was born at Raashult in Sweden, May 23, 1707. His attention was early directed to the study of plants; and when he entered the University of Lund at the age of twenty he knew little else. In 1728 he removed to Upsala, where he thought he would have more opportunity for study, and where in 1730 he read lectures on botany for Rudbeck the professor, who was now growing old. In 1732 he was commissioned to journey through Lapland and Norway. After his return he lectured for a time upon mineralogy and metal-assaying, and then in 1735 went to Harderwyck in Holland to obtain his degree of doctor of medicine. In Holland, he became acquainted with Royen, Gronov, Burmann, and Boerhaave, the last of whom secured for him the post of superintendent of George Clifford's garden at Hartecamp. While holding this post he visited England, from which he seems to have returned somewhat disappointed. In 1738 L. quitted Holland, and in 1740 was elected Professor of Medicine at Upsala. His reputation as a botanist was now established, and his subsequent years were years of increasing honour and fame. He was in constant communication with botanists in all parts of the world, who sent him the results of their travels or investigations. In 1747 he was appointed physician to the king, and in 1757 raised to the nobility. He died at Upsala, January

10, 1778. Of his numerous and important works there may be cited his *Flora Laponica* (1737); *Fundamenta Botanica* (1737); *Genera Plantarum* (1737); *Horius Cliffortianus* (1737). These were published during his stay in Holland. His later works are *Flora Suecica* and *Fauna Suecica* (1745); *Materia Medica* (1749); *Philosophia Botanica* (1751); *Musæum Regis Adolphi Frederici* (1754); a splendid publication, comprising a detailed description of the contents of the royal museum, and *Species Plantarum* (1753), undoubtedly his greatest work. The great merit of L. as a botanist lay in his power of systematising. His system of classification is, it is true, artificial in the extreme, depending chiefly upon the number of stamens and pistils, and must of necessity separate many closely allied species and genera (see BOTANY); but it introduced a more scientific method in the study of botany, and gave the science a greater impulse than the work of any other single individual. See Vogel's *Lebensbeschreibung Karl von L.'s* (1792); A. Aizelius, *Egenhändig anteckningar af L. om sig själv* (1823); Fée's *Vie de Charles de L.* (1832); and Schleiden's *Biographie* (1871).—**Carl von L.**, the son of the above, was born at Fahlun, January 20, 1741, became demonstrator under his father in 1759, and succeeded to the chair at Upsala in 1777. He died 1st November 1783. He completed (1781) *Supplementum Plantarum*, begun by his father.

Linnell', John, born in London June 1792, was a pupil of Varley the water-colourist, exhibited pictures at the Royal Academy when fifteen, and in 1808 gained the British Institution's first prize for the best landscape. Of his portraits, generally heads, on small canvas, the best known are those of Calcott, Mulready, Phillip—brother artists; Malthus, Whately, and Carlyle. In landscapes he has been most successful in the representation of homely English scenes. His great characteristics are an affectionate fidelity to nature, and a rich, sombre colouring. 'Sand Pits,' 'Crossing the Brook,' 'The Sear Leaf,' 'Timber Waggon,' 'Eve of the Deluge,' 'Christ and the Woman of Samaria,' 'The Ford,' 'Woodcutters,' 'A Coming Storm,' may be mentioned as some of his best productions. L. refuses to become an Academician.

Linn'et (*Fringilla*), a genus of *Fringillide* or Finches, represented typically by the common or brown L. (*F.* or *Linota canabina*), also known as the Greater Redfinch or Redpole.

Linnet—*Fringilla*.

The L. is common throughout Europe, and extends to the extreme of Asia. It attains a length of 6 inches. The feathers of the head in the males are tipped with crimson, and the upper parts generally are of a chestnut-brown. The wings are black, and show a narrow edging of white. The throat is grey, and the breast red; the underparts greyish-brown. The crimson-tipped feathers of the head become greyish-brown in winter; and in the domesticated bird the red colour entirely disappears. The L. has a pleasing song, and sings well in confinement. Hence it is much in request as a cage-bird. The nest is built in open places, and the eggs, numbering five, are blue, spotted with dark-brown. Nearly allied species of L. are the mealy Redpole (*L.* or *F. canescens*), and the lesser or common Redpole (*L.* or *F. linaria*). The Mountain L. or Twite (*L.* or *F. montium*) inhabits N. Europe, and prefers hilly situations.

Lino'leum, the name given to a variety of Kamptulicon (q. v.), from the fact of linseed oil forming one of its main ingredients. It is strengthened by a backing of canvas, and as a floor covering it has the repute of being durable, warm, and elastic.

Lin'seed, the seed of the flax plant, *Linum usitatissimum*, possesses several important economic applications. It is the source of L. oil, the most important oil in use for mixing painter's colours, preparing varnishes, and similar purposes. The oil is chiefly obtained by crushing and expression without the use of heat, and the yield varies from 17 to 20 per cent. of the weight

of the L. operated on. The solid residue of the oil-extracting operation constitutes L.-cake, the most valuable of all oil cakes for feeding purposes. The seeds ground to powder constitute L. meal, much used for poultices on account of its powerful emollient properties. An infusion of L. is employed in colds, and in bronchial and other inflammatory affections.

Lin'stock (Ger. *lunte*, Low. Sc. *lunt*, a 'match' or a 'smoking flame,' and *stock*, 'stick'), a pointed, forked staff, shod with iron, used to hold a lighted match in firing cannon.

Lint, a soft woolly material prepared for surgical dressing by scraping or teasing down old white linen rags. Surgery L. is now, however, chiefly prepared by machinery from a soft linen texture specially woven for the purpose. L. is the old Scotch name for Flax (q. v.).

Lin'tel (Fr. *linteau*; Sp. *lintel*, from *limentellum* or *limentum*, Low Lat. for *linen*, 'threshold'), in architecture, is the stone or wooden headpiece of a door or casement supporting the superincumbent weight.

Lin'ton, William James, a celebrated wood-engraver, was born in London, 1812, and apprenticed to G. W. Bonner. Many of his early works appeared in the *Illustrated London News*, and others in Jackson's *Wood Engraving*, the *Lake Country*, and *Deceased British Artists*, issued by the London Art Union in 1860. Modifying the method of Bewick, his work is distinguished by rich, powerful effects, gained by comparatively little labour. L. has written a *Life of Paine*, *Claribel* and other Poems, *The English Republic*, &c., and contributed to the *Westminster Review*, *Examiner*, *Spectator*, &c., mainly on social topics. Since 1867 he has lived in the United States, and now, at New Haven, Connecticut, conducts a large engraving business.—**Eliza Lynn L.**, wife of the preceding, born at Keswick in 1822, is the authoress of many novels, of which the latest and best are *Christian and Communist* (1872), *Patricia Kemball* (1874), and *The World Well Lost* (1877).

Linz (Lat. *Lentia*), a town of Austria, capital of the crown-land of Upper Austria, on the right bank of the Danube, 813 feet above the sea, 97 miles W. of Vienna by rail. It is fortified by thirty-two 'Maximilian towers' (erected 1830-36), each 105 feet in diameter and 40 feet high. The citadel, Pöstlingberg, is 908 feet high. On the Danube is the 'Hauptplatz,' 777 feet long, and across the river, to Urfahr, stretches (875 feet) an iron bridge with granite buttresses. L. has five monasteries and thirteen churches. It has extensive river traffic, and trade in hardware, linen, cloth, thread, salt, and leather; shipbuilding, tanning, and the manufacture of linens and woollens are the chief industries. The women wear peculiar yellow caps, and are famed for their beauty. By a treaty concluded here, December 13, 1645, religious liberty was granted to Hungary by the Emperor Ferdinand I. Pop. (1875) 33,384.

Li'on (*Leo*), a well-known carnivorous quadruped, the typical representative of the family *Felide*, to which the tigers, leopards, &c., also belong. The teeth are thirty in number, and include six incisors, two canines, and two molars in each jaw; six pre-molars existing in the upper, and four in the lower jaw. The fore feet have five, and the hinder feet four toes, each toe being provided with a retractile claw. In the L. a mane is developed on the head and neck of the male animals, and the tail is tufted. The entire organisation of the animal betokens the possession of immense strength. The skeleton is massive yet compact, and the bony ridges to which the muscles are attached are large and of peculiar prominence. The teeth are large, and the muscular arrangements of the jaws show a distinct fitness for their func-

Lion.

tion of crushing the bones and carcasses of prey. The structure of the tongue adapts it in the most perfect manner as an instrument to rapidly tear the flesh from the bones. The upper surface of the tongue is set with papillæ or small prominences of recurved form, and of horny nature. The average length of a full-grown male L. is about 10 feet; the height at the shoulder 4 feet. There is a remarkable difference between the sexes; the lioness being quite destitute of the remarkable mane of the male. This mane is not developed until the third year. The colour of the L. is a tawny yellow, darkest above. The ears are black, and the tuft at the extremity of the tail is also blackish. It is an extremely difficult matter to determine whether or not more than one distinct species of L. exists. Good authorities incline to the belief that several distinct species are to be found; other observers maintaining that the differences between the L. of one part of the earth's surface and another depend on climate and other conditions, and that those variations are not of sufficient value to form a basis for the specific distinction of existing lions. Thus the S. African L. has by some naturalists been named the *Leo Barbarus*, another form has been designated the Gambian L. (*Leo Gambianus*), and a third species, which certainly appears to exhibit very marked differences from other lions, is the so-called maneless L. of Guzerat; this animal—the *Leo Goor-rattensis* of naturalists—possessing a shorter mane than the ordinary Indian or African L. With regard to the reputed courage and nobility of character of the 'King of Beasts,' travellers appear to agree in attributing to the L. a very small amount of courage when brought face to face with man. He will pursue his prey, however, with skill, and exhibit great powers of endurance; and will prowl about in a very stealthy manner in search of unwary animals. The L. frequently fells its prey by a blow from the paw, and springs upon the flank or shoulders in another mode of attack—the tiger appearing to prefer the neck of its prey. The young of the L. may number three or four, and it is noteworthy that the fur of the cubs is at first marked or brindled with black stripes, somewhat after the fashion of the markings seen in the tiger. The L. has been bred with the tiger—the hybrid progeny uniting the characters of the parents. Fossil lions occur in Pliocene and post-Pliocene strata. The fossil remains of the great cave L. (*Felis spelæa*) occur in British cave deposits of an age subsequent to the Glacial Epoch.

Lion, in Heraldry, ranks as the king of beasts, and symbolises courage and command. He is borne on most of the royal shields of Europe, in various attitudes—Rampant (q. v.), Passant (q. v.), Gardant (q. v.), Couchant (q. v.), &c.—and of various colours, as the gold L. of England and the red of Scotland. More than three lions borne together are termed *lionels*, and are invariably rampant. The L. *queue fourchée* ('double-tailed') of Hiesen-Darmstadt and Bohemia, and that of Venice, winged, sitting, and bearing a book in his fore paws—the emblem of St. Mark—are instances of the fabulous treatment of this animal.

Lipari Islands, a group of seven islands and ten islets, near the N. coast of Sicily, included in the province of Messina. The largest are Lipari, Vulcano, Salina, Panaria, Stromboli (q. v.), and Felicudi. Total pop. 20,000. All are of volcanic origin, and Vulcano and Stromboli are still active. Lipari has an area of 10½ sq. miles, and a pop. of 15,000. It is hilly in the interior, rising in Monte di Guardia to a height of 1214 feet, but the plains and valleys are singularly fertile. Warm springs abound, the climate is delightful, good water is scarce, and the rain is collected on the flat roofs. The products, which are largely exported, are pumice-stone, sulphur, currants, Malmsey wine, and excellent figs. Lipari, the chief town, lies on a rocky eminence on the E. coast. It is a bishop's see (since 1400), and has a cathedral and three other churches. The harbour is good, and there is a lively export trade. Pop. (1874) 12,020. The Lipari group, variously known to the ancients as the *Ætolia*, *Vulcania*, *Hephastides*, and *Strophades*, was associated with Homeric and other traditions.

Lipensk, a town of Russia, in the government of Tambov, on the Voronezh, a branch of the Don, 200 miles S.S.E. of Moscow by rail. It has woollen industries, but derives its importance from its fine chalybeate springs. There is a beautiful park, many handsome bath-houses, a statue of Peter the Great, &c. Pop. (1870) 14,213.

Lipogram (Gr. *leipō*, 'I omit,' and *gramma*, 'a letter'), a species of writing distinguished by the omission of one or more letters of the alphabet. Such were the verses of Lasus, a Greek poet (born 538, B.C.); the *Odyssey* of Tryphiodorus, an Alexandrian Greek (circa 500 B.C.), which contained no *a* in the first book, no *b* in the second, and so on; and five novels of Lope de Vega (q. v.), each of which excluded one of the five vowels. L. is still occasionally employed in cryptography to increase the difficulty of cipher-solutions.

Lippe, usually called **Lippe-Detmold**, a principality in N.W. Germany, bounded W. by Westphalia, and E. by Hanover, Brunswick, Hiesen, and Waldeck. Area 438 sq. miles; pop. (1875) 112,442. L. is mountainous, especially in the S., where are the Teutoburger-Wald and the Weser hills, of which Kötterberg reaches 1596 feet. The Weser touches the N. boundary, and receives from L. several streams, the largest being the Werre. Thirty per cent. of the surface is covered with oaks and beeches. The main occupations are growing corn, flax, and hemp, rearing horses and cattle, and preparing salt, which is abundant in L. The people are well educated, and nearly all of the Reformed and Lutheran churches. The chief towns are Detmold (q. v.), Blomberg, and Horn. The House of L. had lands in Westphalia even in the 12th c. Bernhard VIII. (died 1663) was the first Graf. In 1613 the line split into three, L. (Detmold), Brake (extinct in 1709), and Bückeburg, or Schaumburg. L. was made a principality in 1720, entered the Rheinbund (1807), and the German Bund (1815), received a new constitution in 1836, which was much changed in 1848, but restored as before in 1853. On the 1st October 1867 L. formed a 'Militärkonvention' with Prussia.—**Schaumburg L.**, a principality N. of the above, is also hilly. Area 171 sq. miles (one fifth forest); pop. (1875) 33,133. Tillage and cattle-rearing, yarn-spinning, and linen-weaving, are the principal industries. The chief towns are Bückeburg and Stadthagen. By the constitution of 17th November 1868, the government of S. L. is representative. See Falkmann, *Beiträge zur Geschichte des Fürstenthums L.* (vols. i.-iii. 1847-69).

Lippi, Fra Filippo, an Italian painter, born at Florence about 1400, was educated at a Carmelite convent, the prior of which, observing his taste for art, permitted him to spend much time in the chapel, whose walls Masaccio was adorning with paintings. Enamoured of an artist's life, L. gave up the Church, and repaired to Ancona with the purpose of studying drawing; but while cruising about there one day with some gay companions in a skiff, he was seized by a Moorish vessel and carried off to Barbary, where he spent eighteen months in slavery. On returning to Italy he was employed in decorating many churches with frescoes and altar-pieces, and likewise contributed to the galleries of one or two of the Medici. Struck with the beauty of a nun of Santa Margherita's convent at Prato, named Lucrezia Buti, he offered to paint her portrait, and on gaining access to her, carried her off. He died (of poison) at Spoleto, 8th October 1469. Of his works, the best known are the 'Death of San Bernardo,' 'The Life of Stephen' ('The Disputation,' 'The Stoning,' 'The Death'), and 'The Annunciation.' His subjects are conventional, but vigorously treated.—His son, **Filippino L.**, broke loose from ecclesiastical trammels, and embellished his pictures freely with pagan accessories, making a special study of Roman antiquities. In his 'Peter Condemned to Death,' we are supposed to have his own portrait. On the commission of Lorenzo de' Medici he painted a chapel of Cardinal Caraffe, with a series of pictures illustrating 'Events in the Life of Thomas Aquinas.' His works are very numerous. F. died at Florence, 13th April 1505. See Vasari's *Lives of Painters*, and Lanzi's *History of Painting*.

Lippstadt ('Lippe town'), a town of Prussia, in the province of Westphalia, on the Lippe, 37 miles E. by N. of Dortmund by rail, has a large coin trade, and manufactures of machinery, beer, and brandy. Pop. (1875) 8160.

Liqueurs are sweetened and aromatised alcoholic beverages. They are prepared in a variety of ways, and into some numerous aromatic and fruity constituents enter, and they vary widely in alcoholic strength. The L. which enter chiefly into British commerce are Chartreuse, Curaçoa, Copenhagen cherry brandy, Maraschino, Ratafia de cerises, Kümmel, and Noyau, which with others will be found noticed under their own heading.

The French, who excel in the compounding of L. divide them into numerous classes under the names *Ratafias*, *huiles*, *crèmes*, *baumes*, *eaux*, *extraits*, &c. L. may properly be regarded also as including gin and other sweetened spirits, cordials, and the various beverages which pass into use under the name of British wines. Bitters and unsweetened aromatised spirits, such as Absinthe, do not belong to the class of L.

Liquid is a fluid which tends to preserve a definite volume. There is no liquid but has been either condensed to a solid or volatilised to a gas, and the great majority of liquids can be subjected to both operations. The phenomena attending the transformation of a solid into a L., or of a L. into a gas under the action of *heat* have already been considered under that heading. Here it is unnecessary to consider the other important properties of liquids, which will be found discussed under CAPILLARITY, ELASTICITY, HYDRODYNAMICS, &c., while the peculiar properties of particular liquids, such as water, mercury, oils, ethers, &c., are to be found under their special headings.

Liquidambar, a genus of monocœcious trees, now placed in the natural order *Hamamelidaceæ* or witch-hazel family. *L. altingia*, a lofty tree occurring in the mountains of India, &c., yields the fragrant balsam known as liquid storax. *L. Orientalis*, a native of Asia Minor, also yields the same balsam, which is vanilla-scented, containing much cumarin, and thus used for imparting scent to some sorts of tobacco and cigars, and for keeping moths from woollen clothing. *L. styraciflua*, or the sweet gum-tree, grows in morasses and like places in N. America. The crown of the tree attains vast dimensions; the stem is some 10 feet in diameter; the wood fine-grained; its terebinthine juice hardens on exposure to a resin of benzoin odour.

Liquidation by Arrangement. In England, a debtor unable to pay his debts may summon a general meeting of his creditors under the Bankruptcy Act of 1869, and the meeting may, by a special resolution as defined by the Act, declare that the affairs of the debtor are to be liquidated by arrangement, and not in bankruptcy; and that meeting, or a subsequent meeting, held at an interval of not more than a week, may appoint a trustee, with or without a committee of inspectors. The Act regulates procedure under L. by A.

Liquorice (*Glycyrrhiza*), a genus of herbaceous perennials, belonging to *Leguminosæ*; the popular name through the Latin, and the scientific one in the Greek, alike signifying 'sweet root.' The species from which the principal supply of L. of commerce is derived is *G. glabra*, a native of the S. of Europe, but now grown in various countries; in England, for instance, it has been cultivated for more than 300 years. The root—which supplies the extract—at a proper age for use is long, round, succulent, tough, and flexible, of a greyish-brown externally, yellow internally, odourless, with a sweet mucilaginous and slightly acid taste. For the manufacture it is sliced, and lightly boiled in water, the liquor after a time being strained, and allowed to evaporate until a residue is obtained of the proper consistence. That prepared in Spain and Italy is often formed into rolls of five or six inches in length, an inch or so in breadth, and is exported packed in bay leaves; this is the ordinary Spanish L. of the shops. Another species of *Glycyrrhiza*, named *G. echinata*, of more eastern range than the above, is employed in like manner in Italy and Russia; it yields a product rather less sweet. Refined L. is the common kind dissolved in water and again evaporated. The principal use to which L. is applied is by brewers to give 'a body' to porter.

Medicinal Properties of L.—L. is an excellent demulcent, and is used in catarrhal affections, and in irritation of the mucous membrane of the bowels and urinary passages. It is also used as an adjuvant to bitter decoctions, or irritating vegetable substances.

Li'ra (Lat. *libra*, 'a pound'), or **Lira Nuova**, an Italian silver coin of 100 centesimi, which, from being the unit of the N. Italian states, was extended in 1860 to all Italy. The L. is equal to the French Franc (q. v.).

Li'ria, a town of Spain, province of Valencia, 15 miles N.W. of the town of Valencia, has considerable trade. Pop. (1870) 8500.

Liriöden'dron. See TULIP TREE.

Lis'bon, the capital of Portugal, and one of the most beautiful harbours in the world, in the province of Estremadura, on the N. shore of the Rada de Lisboa, the estuary of the Tagus, 4 miles broad, and 18 miles from the Atlantic: It lies on the slope of seven hills, which are grandly crowned by white cupolas and palatial buildings, while in the background rise the blue peaks of Cintra. The magnificent bay, which is 19 miles long and 6 broad, narrows opposite L. to a channel of 1½ miles. The entrance to the harbour is defended by several forts. L. is divided into four quarters, Alhama, the oldest and meanest, Rocio, Bairroalto, and Alcantara, besides several large suburbs. Alhama was spared by the great earthquake of 1755, but the other parts, which are more regular and elegant, have been built since; Rocio, stretching along the shore, is adorned with many fine buildings and squares. The principal squares are the Praça do Commercio, 565 by 520 feet, open to the Tagus and enclosed on three sides by the royal library, the exchange, custom-house, &c., and the Praça do Rocio or marketplace, 1800 by 1400 feet, containing the immense statue of Don Pedro, and bordered by the monastery of St. Dominico, the old Inquisition buildings, &c. Further N. stretches the great public promenade; the business centre and one of the most beautiful streets is the Rua Augusta. L. has 64 churches, 200 chapels, and a large number of monasteries, now used for public purposes. The most notable buildings are the monastery (now a foundling hospital) of Belem (founded 1499), a structure of many styles in yellowish limestone, adorned with florid sculpture, and Palisander-wood carving; the monastery of the Heart of Jesus (1770), with a splendid white marble cupola; the church of the Patriarchs, surmounted by a gigantic dome; the marble church of St. Roque; the basilica of St. Maria; the Gothic church of Carmo; that of Vincent de Flora (the largest in L.), containing the tombs of the Braganza dynasty; the palaces of Ajuda, of Nossa Senhora das Necessidades and Bemposta; the national theatre, formerly the palace of the Inquisition; the theatre of St. Carlos, the arsenal, custom-house, and museum of natural history, &c. L. receives its water through the Alcantara aqueduct, a splendid structure 18 miles long, and traversing the valley of Alcantara with thirty-five arches, of which the largest is 230 feet high and 107 in diameter. The Gallegos (*Galicians*) labourers and carriers of water from the numerous fountains, form a distinct corporation to the number of 30,000. The principal industries are in gold and silver wares, spinning and weaving, iron-founding, and the manufacture of chemicals, steel, soap, and paper. But the commerce is of greater importance. In 1875 the imports amounted in value to £2,880,295, and the exports to £1,839,507. There entered the port in 1876, 966 British vessels of 713,943 tons, and cleared 954 of 709,189 tons. Pop., including the suburbs of Belem and d'Olivæas, 224,063. L. is supposed to have been founded by the Phœnicians. By the Lusitanians it was called *Olisippo*; by the Romans, *Felicitas Julia*. On the fall of the Roman power the native name reappeared, and survives in the mod. Portuguese *Lisboa*. L. was seized by the Moors in 712, from whom it was recovered by Alfonso I. of Portugal in 1147. An archbishopric was founded here in 1390, and L. became the Portuguese capital in 1506. It has suffered much from earthquakes, that of 1st November 1755 destroying the greater part of the city and some 50,000 lives. (See EARTHQUAKE.) During the Peninsular War, the French held L. from 30th November 1807 till the battle of Vimeira, in which Sir Arthur Wellesley was victorious, 21st August 1808.

Lis'burn (formerly *Lisnegarrah*, 'gamesters' mount': the modern name is said to commemorate a conflagration which nearly destroyed the place), a town of Ireland, in the county of Antrim, on the Lagan, 9 miles S.S.W. of Belfast by rail. Its parish church is the cathedral for Down and Connor, and contains the tomb of Jeremy Taylor. It has also a market-house, linen hall, county infirmary, and manufactures of muslin, damask, diaper, and other fine linens. There is a weekly market and two yearly fairs. L. sends one member to Parliament. Pop. (1871) 9319. The town first owed its prosperity to a settlement of French Protestants.

Lis'ieux (the *Noviomagus* of Ptolemy, Lat. *Civitas Lexoviorum*), a town of France, department of Calvados, on the Touque, 28 miles E.S.E. of Caen, has a cathedral dating from the 6th c., a 17th c. bishop's palace, now used as the prison and court-house, manufactures of linen (employing 10,000 hands; yearly

value, 13,000,000 francs), and of draperies (8000 hands; value, 20,000,000 francs), and some cotton-mills and tanneries. Pop. (1872) 12,152.

Liskeard (Celt. 'the enclosure on the height'), a market-town of England, in the county of Cornwall, 16 miles W.N.W. of Plymouth by rail, has a fine 15th c. church (restored in 1862), a new town-hall (1859), a Roman Catholic chapel (1863), &c. Tanning and the manufacture of serge are the chief industries, and in the neighbourhood are rich tin, copper, and lead mines. L. returns one member to Parliament. Pop. (1871) 6499. Two miles S. of L. is the Well of St. Keyne, immortalised by Southey.

Lisle, Claude Christophe Rouget de, a French poet who by a single song, the *Marseillaise*, has won immortality. Born 10th May 1760, L. was an officer of artillery at the time of the Revolution. The song—both words and music—was composed at Strassburg in a single night, about the beginning of 1792. The author called it *Chant de Guerre de l'Armée du Rhin*. Everywhere it soon sent a fiery rapture through the volunteers of the Republic. When Barbaroux (q. v.) the Girondist leader, and deputy for Marseille, first introduced it to the Parisians, they being ignorant of its real authorship called it *Hymne des Marseillais*, by which name it has ever since been known. L. died near Paris, 26th June 1836. The *Hymne* is now the 'National Anthem' of France.

Lismore (Gael. 'great fort' or 'enclosure'), an island of Argyllshire, in Loch Linnhe, 5½ miles N.W. of Oban, has an extreme length of 11, and an average breadth of 1½ miles. It is of great fertility, and possesses several interesting relics of antiquity. Auchindown Castle, the former residence of the Bishops of Argyll (*Episcopi Lismorienses*); Castle Rachal, an old Scandinavian fort; and a cathedral, the dean of which, James Macgregor, who flourished in the period immediately preceding the Reformation, was author of the *Dean of Lismore's Book*. See GAELIC.

Liessa, a town of Prussia, province of Posen, 138 miles E.S.E. of Berlin by rail, manufactures woollens, linens, wax, and tobacco, and has a celebrated bell-foundry. L. was the chief seat of the Iberian Brethren in the 16th c. Pop. (1875) 10,065. **Lissa**, a town of Austria, Jews.—**L.**, an island in the Adriatic, 30 miles S.W. of Trieste, belonging to Dalmatia. The fortifications of the harbour rival those of Malta. It is specially strong on the N. side, near the small town of L. Area, 19 sq. miles; pop. 6830. The Austrians gained a great naval victory here over the Italians, 20th July 1866.

Liston, John, an English actor, born in London in 1776. Originally a master in Archbishop Tennison's school, Leicester Square, he was expelled for acting with the boys. He then took to the stage, and displayed the happiest comic talent. In 1806 he obtained an engagement at the Haymarket Theatre. *Mauvorn*, *Tony Lumpkin*, and *Bombastes Furioso* were among his best impersonations, but the greatest of all was his *Paul Pry*, first performed in 1825, the memory of which is evergreen. He retired in 1837, and died March 22, 1846. His wife (*née* Tyres) was a popular singer and actress.

Liston, Robert, a celebrated surgeon, was born at Ecclesmachan, West Lothian, Scotland, October 28, 1794. He studied medicine at Edinburgh, where he settled in 1817 as a surgeon and lecturer on anatomy. His skill as an operator soon secured him a wide reputation, and in 1835 he was offered the chair of Clinical Surgery in University College, London, which he accepted. He acquired an extensive London practice, was elected a member of the Council of the College of Surgeons in 1840, and appointed one of the Board of Examiners in 1846. He died suddenly, December 7, 1847. L.'s principal works are *Elements of Surgery* (1831) and *Practical Surgery* (1837), both of which have gone through several editions.

Liszt, Franz, the greatest living pianist, was born October 22, 1811, at Rading, near Pesth, in Hungary. He began to learn the piano at the age of six, his career being guided from the first by his father. His first performance was at Oedenburg in 1820, when he played Ries's concerto in E♭. Two noblemen at Pressburg having guaranteed him an income for six years, he took lessons at Vienna, from Czerny on the piano, and from Salieri in composition (1821). In 1823 he reached Paris, after giving

many concerts, and was for long the delight of the French public. He visited London in the spring of 1824 and 1825. About 1827 he abandoned music for a time, influenced partly by disappointment in love, partly by religious and political enthusiasm; but in 1831 he returned to his profession, and in 1835 was welcomed again in Paris. He spent 1837–39 in Italy, went next through Germany to London, and visited Russia in 1843, where he had an ardent and appreciative reception. After making tours to Spain and Constantinople, and conducting the Beethoven festival at Bonn (August 1845), he settled at Weimar as musical director to the Grand Duke. He left Weimar in 1861 for Athens and Rome, and in April 1865 took orders in the Roman Catholic Church as an 'Abbé.' In 1871 he went from Rome to Hungary, and in April 1875 became Director of the Hungarian Academy of Music. L.'s chief compositions are his *Symphonisch. Dichtungen für Orchester* (fourteen in number), and the oratorios *Die Heilige Elizabeth* and *Christus*. Among his writings are *Friedr. Chopin* (Eng. trans. Boston, 1872), *Kob. Franz* (Leip. 1872), and *Wagner's Lohengrin and Tannhäuser* (Leip. 1851).

Litany (Gr. *litaneia*, 'entreating,' used first of all kinds of public prayers; Lat. *supplicationes, rogationes*), was originally a series of intercessions to be used in the Eucharistic service, a special feature of it being the pleading of the work of Christ in behalf of his Church. This explains its customary use on Sundays, which is a carrying out of the command in 1 Tim. ii. 1. The earliest use of litanies in the West was in Gaul, where it was a special custom to invoke God's mercy by processional supplications; and after the 5th c. the use of them became the distinguishing ceremony of Rogation Days (q. v.). Gregory the Great instituted a new L. for St. Mark's day (590), to be chanted by the clergy and laity going in procession in seven classes:—the clergy, laity, monks, virgins, married women, widows, the poor and children. The litanies of the Church have been divided into three classes:—(1) the Roman or Western L.; (2) the Greek; and (3) the Ambrosian or Moz-Arabic, of which the second is regarded as the standard. 'The L. of the Church of England is not an exact transcript of any ancient form, though composed of materials of very ancient date. It differs essentially from the Romish litanies by containing no invocations to angels and departed saints.'

Litchi, an excellent fruit, the produce of *Nephelium litchi*, an evergreen tree, native of S. China, Cochin-China, and Philippine Isles, but now commonly grown in India, Ceylon, and Mauritius, and belonging to natural order *Sapindaceæ*. The fruit is eaten in either a fresh or dried state, and is occasionally imported into Britain. An allied species (*N. longan*), also a native of China, yields an edible fruit called longan; it has a sweet subacid flavour, but is smaller than the L.

Litharge. See LEAD.

Lithia. See LITHIUM.

Lithic Acid Diathesis is the term used to designate the condition in which there is an excess of lithic acid either free, or in combination, or both, in the system. The urine of persons who have the L. A. D. is bright, of a dark golden or coppery colour, like brown sherry, is more acid than the urine of health, contains an unusual amount of urea, has a high specific gravity, feels pungent in the urethra in passing, and is generally scanty. The lithic acid, which is not often deposited before the urine is voided, appears as fine sand, a coarse roundish grain, but consists of separate crystals, or minute concretions of crystals, which do not disappear when the urine is warmed, and which do not render the urine turbid when it is shaken, as the lithates of ammonia, lime, magnesia, or soda do. The lithic acid crystals are readily discriminated by means of the microscope. The L. A. D. is accompanied by a tendency to feverish and inflammatory complaints, gout or rheumatism, transient and twinging pains in the limbs, and when a paroxysm of nephritic pain occurs it is generally caused by a concretion of lithic acid. Those of the L. A. D. are generally indolent, luxurious, or intemperate in their habits. Adults are peculiarly liable to it after the age of forty, but children up to puberty are liable also, and such deposits indicate a tendency to gravel disease. There is no possibility of cure but by removing the exciting causes, and the lengthened continuance of general hygienic treatment. See *The Urine and its Derangements*, by Dr. Hailey (Lond. 1872).

Lithium (symbol, L; atomic weight, 7), a comparatively rare metal, found in the minerals lepidolite, petalite, and spodumene. It is silvery white in colour, tarnishes rapidly in the air, and is readily drawn into a wire on account of its softness. It is the lightest known solid, melts at 180° C., and burns at a high temperature, with an intense white flame. Like potassium and sodium, it oxidises rapidly when floated in water; but does not melt or take fire. The principal compounds are the oxide *Lithia* (L₂O, or LHO), which is a powerful base, forming salts similar to those of the other alkali metals, and the *chloride* (LCl), which when fused may be decomposed by electrolysis, the metal appearing at the one pole.

Medicinal Properties of Lithia.—The carbonate and citrate of lithia are the only preparations used therapeutically, and both act as powerful diuretics. When urate of soda is liable to be deposited in the tissues, resulting in gouty inflammation, the salts of lithia are the most useful in eliminating excess of uric acid, for the urate of lithia is very soluble. The carbonate of lithia, a white powder consisting of minute crystalline grains, may be given in doses of from 3 to 6 grains, in 3 or 4 oz. of aerated water. The citrate of lithia, a white, deliquescent, amorphous powder, may be given in doses of from 5 to 10 grains, largely diluted. *Liquor lithia effervescent* contains of carbonate of lithia 5 grains to the 10 oz., and may be given in doses of from 5 to 10 oz.

Lithography (Gr. *lithos*, 'a stone', and *graphê*, 'writing'), the art of printing from stone a design drawn upon it or transferred to it, was invented by Aloys Senefelder, a Munich musician, towards the close of last century. The stones used in L. consist of limestone of a close even grain, susceptible of a high polish. Those obtained at Solenhofen, near Pappenheim in Bavaria, are most esteemed; inferior qualities are found in England, France, America, and elsewhere. The stones are ground and polished according to the style of work to be executed; for chalk drawings a grained surface is required, while for works in ink, a smooth polished face is communicated to the stone with fine pumice stone and water. L. depends upon the property of limestone to absorb grease and to imbibe water, upon the affinity of the former for like compounds, and upon the mutual repulsion existing between grease and water. If a grease mark be made upon a clean lithographic stone and the rest of the stone be wetted, a roller charged with printing-ink passed over the stone will only deposit ink upon the grease, and its form may then be obtained on paper by pressure. Crayons or ink are employed for tracing the design on the stone. The crayons are composed of fine wax, tallow, soap, shellac, and a small quantity of lampblack, and in addition to these ingredients, mastic and Venice turpentine enter into the ink, which is solid, and, for use, is rubbed down in water, a fine lithographic pen or hair-pencil being employed in sketching with it. Instead of drawing directly on the stone, designs are frequently executed with ink more viscid than the foregoing, on paper specially prepared with isinglass, starch, and gamboge. The stone with the paper laid on it is passed through the press, the paper is damped and removed, and the paste still adhering to the stone is washed off, leaving the ink. The first operation after drawing and transferring, is that of 'etching' with a weak solution of nitric acid in gum water. The acid fixes and sharpens the drawing, and slightly lowers the surface of the stone unprotected by grease. The stone is next washed with water, and afterwards rubbed over with turpentine, which removes the lampblack of the crayon or ink. The stone is now ready to be printed from. The surface is damped with a wet sponge, and on the application of a roller charged with printing-ink, the drawing re-appears. Paper is then laid on the stone, and an impression is obtained by the friction of a fixed scraper or roller having a backward and forward movement. Before the ink is applied for each impression the stone is always wetted, and when the printing is stopped for a time, the ink is washed off with turpentine and the acid and gum solution applied. Fresh impressions of steel engravings, woodcuts, &c., in transfer ink, may be readily transferred to and printed from stone.

Lithotint is a process of preparing a drawing on stone by a series of washes of lithographic ink applied with a brush; it is now rarely practised on account of uncertainty in printing.

Engraving on Stone in the production of maps, plans, &c., is performed by scratching lines with steel points of varying degrees of thickness through a ground of gum and lampblack

to the clean face of the stone beneath. Oil or printing-ink is then applied to the incised design, which, after the black ground is washed off, is fixed as already described.

Chromolithography (Gr. *chroma*, 'colour'), or printing in colours from stones, is a branch of L. that of late years has expanded very much. It is devoted to the reproduction of water-colour and oil paintings. As many stones are required as there are colours in the picture. Each stone receives an impression of the subject in outline, and the particular part that is to be printed is then skilfully prepared with crayons and tint-ink. Regard is paid to the proper gradations of tone and the effect of the superposition of colour, so that the combined impressions from the stones, taken in proper order, may produce a faithful and harmonious picture. Gold and silver effects in L. are obtained by dusting the metallic powders on varnish, and burnishing them when dry.

Lithology (Gr. *lithos*, 'a stone') is a subordinate section of geology, dealing with the structure and constitution of rocks, without regard to their positions.

Lithomarge is a compact clay, consisting of a hydrated silicate of alumina. It has a fine smooth texture, is very sectile, and is variously coloured white, gray, blue, yellow, and red. It occurs generally associated with magnesian minerals.

Lithophane (Gr. *lithos*, 'a stone', and *phainō*, 'I show, or I give light'), a trade name for a thin translucent porcelain plaque with an impression of a picture, sunk into it while soft by means of plaster of Paris blocks engraved in relief. L. pictures are produced largely in Germany, and are employed to decorate lanterns and windows.

Lithotomy (Gr. *lithos*, 'a stone', and *tomē*, 'cutting'), the technical name for the surgical operation of *cutting for stone* in the bladder. Unmistakable evidence of the existence of stone in the bladder can be obtained only by sounding, or exploring the bladder by means of a metallic instrument. L. was practised by the Greek and Roman surgeons, and the earliest mode is known as *Celsus' method*, or *cutting on the gripe*. By this method, the stone, after being fixed by the pressure of the fingers in the anus, was cut upon directly and extracted, a knife and hook being the only instruments used. At a later period Mariæ attempted to improve upon this method by making as small an incision as possible, and dilating the aperture, but the dilatation was due to laceration, and was more fatal than the ancient method. In 1697 Frère Jacques, a priest, introduced the lateral method, which is essentially the method now in use, he having learned it from a provincial surgeon named Pierre France. The operation, as now generally practised in this country, is essentially that introduced by Cheselden, and modified more or less according to the peculiar views of particular surgeons, as regards the direction and extent of the incision, and the instruments employed. By this mode of operating, a free opening, large enough to admit of the extraction of the stone, is made into the bladder, without laceration of the parts or injury to the rectum. An instrument, curved or rectangular, with a groove upon it, is passed into the bladder. If the staff used be curved, an incision about an inch and three-quarters in front of the anus is made, deep enough for the operator, on the introduction of the forefinger of the left hand, to feel the groove on the staff. The knife is then passed along the groove, dividing the membranous portion of the urethra and the edge of the prostate. Through this opening the left index finger is passed along the line of incision till it reaches the calculus, and the opening in the prostate may be dilated if necessary. A pair of forceps is then slid along the index finger into the bladder, and the finger withdrawn, when a gush of urine will usually take place, carrying the stone within the blades of the forceps; but, if not, the stone must be searched for, grasped in the forceps, and extracted. By the rectangular method, introduced by Professor A. Buchanan of Glasgow, the preliminary incision is unnecessary, the groove at the angle of the staff being cut upon directly. The danger of operation is principally due to unavoidable constitutional complications, or to previously existing morbid processes in connection with the formation of the calculus, or to disease processes excited by the action of the calculus on the structure of the bladder and adjacent parts.

Lithotripsy (Gr. *lithos*, 'a stone', and *tribō*, 'I grind') is the operation of breaking up the calculus into small fragments that

they may be expelled through the urethra. Between 1817 and 1820, Civiale, followed by Amussat, Leroy, and others, began constructing instruments for crushing the calculus in the bladder. By the labours of Civiale and Amussat in France, and of Brodie, Liston, and Thompson in Britain, the system has been brought to a high state of perfection. The *lithotrite* may be briefly described as a curved forceps, small enough to be passed through the urethra, and strong enough to crush the stone. It consists of two blades, worked by a rack and pinion, or by a screw. The operation may be performed at one or more sittings, and after each the bladder is washed out by injecting tepid water through a double-current catheter. See Sir Henry Thompson's *Practical Lithotomy and L.*, and *Clinical Lectures on Diseases of the Urinary Organs* (Lond. 1876).

Lithu'nia, a former grand-duchy of Poland, comprising the territory now occupied by the Russian governments of Vitebsk, Vilno, Mohilev, Grodno, and Minsk, and the Prussian circle of Gumbinnen, had an area of upwards of 100,000 sq. miles; was watered by the Düna, Niemen, Dnieper, and Bug; and consisted of L. proper (*Litua*), the duchy of Samogitia, and the four wojwodships of Lithuanian Russia. The earliest mention of L. occurs in the Chronicle of Quedlinburg (1009), from which and later Russian chronicles its inhabitants seem to have been a poor and barbarous people, tributary to Russia, and worshipping Perkunas, the god of thunder. Shaking off the Russian yoke in the 12th c., L. was formed into a grand-duchy by Ryn-gold (1235); embraced Christianity under Mindog (1252); under Gheidymin (1317) wrested from Russia Volhynia, Kiev, and Tchernigov; whilst under Olgerd (1328) it threatened Moscow in 1368, 1370, and 1373. The accession of Jagello (q. v.) to the throne of Poland in 1386 united L. with that kingdom, along with which it was partitioned between Russia and Prussia in 1772, 1792, and 1793. The Lithuanians of Kovno, Vilno, Courland, and Grodno, with those of Königsberg and Gumbinnen, and with the Samogitians (Lith. *zemajte*, 'a comer from below,' i. e., the sea) of Kovno and Augustovo, make up an estimated total of 1,620,000; while the Letts, a kindred race, scattered over Courland, Western Livonia, Vitebsk, Kovno, and Pskov, are reckoned at 980,000. For the ethnology and language of the Lithuanians, see LETTIC.

Lit'mus, a vegetable colouring or dyeing material obtained from the lichen which grows on Archil (q. v.) and Cudbear (q. v.). L. differs from these substances only in being prepared with potash or soda, and in being moulded into cakes. The blue colour of L. is instantly reddened by acids, and again restored by alkaline solutions, and owing to these properties it is in constant use by chemists and others for testing liquids, for which purpose it is now indeed principally prepared. L. paper or test paper consists of paper coated with L., and for use is prepared in books of small strips.

Litre, the French standard measure of capacity in the metric system. It is a cubic decimetre, and contains 61.027,052 cubic inches; $\frac{1}{4}$ litres very nearly equal 1 gallon.

Little Falls, a town of New York, U.S., on an acclivity that rises abruptly for 500 feet above the Mohawk River, 22 miles E. of Utica by rail. It is the largest cheese-market in the United States, and has woollen and cotton mills, and two public parks. Pop. (1870) 5612.

Little Rock, the capital of Arkansas, U.S., on the S. bank of the Arkansas river, 250 miles from its mouth, and 125 miles S.W. of Memphis by rail. It is named from its position on a cliff, 50 feet over the river; the Big Rock begins 2 miles up the river, and is a range rising precipitously to a height of 500 feet. The city has fifteen churches, a state capitol, an arsenal, a public library, a state library of 12,500 vols., two daily and four weekly newspapers, &c. Pop. (1870) 12,380.

Littleton, Sir Thomas, a famous English lawyer of the 15th c., was the son of a Devonshire gentleman. After receiving a good education, he entered the Inner Temple, and in 1455 was appointed king's serjeant. Edward IV. made him a Judge of Common Pleas in 1466, and in 1475 he was created a Knight of the Bath. He died August 23, 1481. The fruits of L.'s judicial experience were embodied in a work upon *Tenures*, which, with Coke's *Commentary*, long held the first place among legal text-books. A new edition was published by Roscoe in 1823.

Littori'na, a genus of *Gasteropodous* mollusca, including the Periwinkle (*L. littoralis*), and a nearly allied species (*L. rudis*), &c. The genus L. forms the type of a special family, *Littorinide*, in which the mouth of the shell is entire (*holostomatous*). The shell itself is spiral, of depressed shape, and the *operculum*, or plate developed on the foot, is of horny nature.

Littre, Maximilien-Paul-Émile, the greatest philologist of the French tongue, was born at Paris, February 1, 1801, studied medicine, and was received into the hospitals, but at the same time devoted himself to history and philology. In 1828, along with Royer-Collard and others, he wrote for the *Journal Hebdomadaire de Médecine*, founded (in 1837) a medical journal, *L'Expérience*, all the time, and until 1851, contributing articles to the *National* upon themes of democratic interest. From 1857 to 1859 L. applied with conspicuous success the positive method of M. Comte to the historical study of the French language, and in the latter year published his *Paroles de Philosophie Positive*. In 1862 appeared his *Histoire de la Langue Française*; in the next year was begun his *Dictionnaire* (completed 1873; with a supplement, 3d livraison 1877), which attained so immediate a reputation for exhaustive scholarship and precise definition of terms, that more than 40,000 copies had been sold by 1877. A new review, called *La Philosophie Positive*, was established by him in 1867. In 1871 he was appointed by M. Gambetta Professor of History and Geography in the Polytechnic School at Bordeaux, and on December 30, of the same year, was chosen member of the French Academy. The University of Leyden conferred upon him the honorary degree of Master of Philosophy and Doctor of Literature in February 1875. For exact, profound, philosophic knowledge of language, L. has in his own department no compeer among the present generation of Frenchmen.

Lit'urgy (Gr. *leitourgia*, the translation in the LXX. of the Heb. *abodah*, which denoted the service rendered in the Tabernacle and the Temple by the priests and Levites, cf. Numb. vii. 5, &c.; Luke i. 23; Heb. ix. 21) is the form, order, or office for the celebration of the Eucharist. The original form is of course found in the institution of the rite by Christ himself (Matt. xxvi., Mark xiv., Luke xxii.). To those familiar with the old Passover ritual the words and actions of Christ would doubtless form a new ritual, and the fact of the Church complying with the injunction of Christ to 'break bread' and 'give thanks,' implies that a certain form of L. was used. Tradition asserts that the apostles arranged a L. before they separated for their labours, but it was of a very simple kind, if what St. Gregory says be true, that they 'used the Lord's Prayer only in consecrating the Holy Oblation.' The Apostle Paul gave a definite form in his First Epistle to the Corinthians (xi.), but it is considered by some that his words 'the rest will I set in order when I come' (xi. 34), indicate that he was to give them a fuller and more perfect L. afterwards, the details of which even may be made out from his writings. As it was a recognised principle at a very early period that each bishop had authority to settle the ritual of his diocese, it is clear that the liturgical system of the Church could not have been settled at once. However, four principal forms can be traced to very early times, from which have sprung all the liturgies at present in use. These were composed for the churches of Palestine, Alexandria, Rome, and Ephesus, and bear the names of St. James, St. Mark, St. Peter, and St. John respectively. From the first has been derived, through the Syriac L. of St. James, the present L. of the Monophysites, and through those of St. Basil and St. Chrysostom the present L. of the Eastern Church. From the second is derived the present L. of the Egyptian Church. From the third is derived, through the Ambrosian L., the present L. of the diocese of Milan, and through the Sacramentaries of St. Leo, of Gelasius, and of St. Gregory, the present L. of the Church of Rome. From the fourth is derived through the L. of Lyons, the Mozarabic or Spanish L., and the L. of Britain, which was the same as that of Tours; and from the latter, through Augustine's revised L. of Britain, and the missals of Salisbury, York, &c., the present L. of the Church of England; from which again are taken the liturgies of the Scotch and American Episcopal churches. The last three differ little from each other, and are all derived from the ancient Latin L. of the Anglican rite through the 'Order of Communion' of 1547, and the Prayer-Book of 1548-52. See Blunt's *Dictionary of Doctrinal and Historical Theology*

(1872), Palmer's *Origines Liturgicæ* (1832), Freeman's *Principles of Divine Service* (1863).

Liturgy, Jewish. Prayer is so often referred to in the Old Testament as to show that it formed part both of the public and private religious exercises of the Jews from time immemorial. But it was at the time of the Babylonish Captivity that the frequent and regular use of prayer began to take the place in Jewish worship which it afterwards occupied. Assemblies of the captives seem to have gathered regularly 'by the rivers of Babylon,' and, besides reading of the Law, in fixed forms of prayer to have 'set their faces unto the Lord their God,' to seek that he would hear and forgive, hearken and do for his own sake (Dan. ix. 3, 19). Prayer was substituted for their morning and evening sacrifice and incense, or was practised oftener (*cf.* Dan. vi. 10). After the return these assemblies were continued in the Synagogue (*q. v.*). At first it was left to the conductor of each meeting to regulate the service of the synagogue, but soon a regular order was established; and at the time of Christ the L. both for the Temple and the Synagogue was as follows. 1. The Temple. First, before the offering of the sacrifice, the officiating priest called upon the people to go to prayers, which they did in a certain form. After this they recited the Ten Commandments, and then their Phylacteries (*q. v.*, Heb. *tephillin*), or four portions of the Law (Ex. xiii. 3-10, 11-16, Deut. vi. 4-9, xi. 13-21). Afterwards, at the time of offering incense, three or four prayers more were offered. Next the priests with uplifted hands blessed the people in the words of Num. vi. 24-26. After the meat and drink-offerings were made, the singing of psalms and music began; the fixed and constant psalms for the days of the week throughout the year being Psalms xxiv., xlviii., lxxxii., xciv., lxxxi., xciii., xcii., for the first day to the seventh respectively, although additional psalms and hymns were sung on certain days (*e.g.*, the songs of Moses, Deut. xxxii., and Ex. xv. on the Sabbaths), especially the Feast-days. 2. The service of the Synagogue consisted entirely of (1) Prayers, (2) Reading of the Scriptures, and (3) Expounding and Preaching. Of the forms for the prayers the oldest were eighteen (called *Shemoneh Esreh*), said to have been appointed by Ezra and the Great Synagogue. For the Reading of the Law the five books of Moses were divided into as many portions as there are weeks in the year, one of which was read every Sabbath, and half of the same every Monday and Thursday.* See Lightfoot's *Temple Service* (Works, 1684), Bingham's *Ants. of the Christ. Church* (1710-22).

Liutprand was born about 920 at Paris, became (932) one of the pages of the great French baron Hugh, 'Duke of the French,' father of Hugh Capet, and later on a deacon of the cathedral of his native place. In 948 he was sent upon a diplomatic mission to the Byzantine court, where he remained for two years studying Greek, and on his return to Italy he was obliged to take refuge with Otto I. At the German court he remained eleven years, and (958) began to write a contemporary history. In 962 L. became Bishop of Cremona, in 968 he was sent to Constantinople to negotiate a marriage with Theophano for the son of Otto, and (971) he returned upon the same mission. The next year he died, leaving behind him *Antapodosis*, *De Rebus Gestis Ottonis Magni Imperatoris*, and *De Legatione Constantinopolitana*, works which form one of the most important sources of information for the history of the 10th c. See Köpke, *De Vita et Scriptis Liutprandi* (Berl. 1842).

Livadia. See TROPHONIUS.

Liver, a large gland in the bodies of vertebrate, and of many invertebrate animals, devoted to the secretion of bile. In the lowest vertebrate—the little fish known as the *Amphioxus* or lancelet—the L. exists as a mere saccular appendage to the stomach, while in many invertebrate (*e.g.*, crab and lobster) the L. is large and of tubular structure. In the lower animals it may be represented (as in sea-anemones, sea-squirts, &c.) by cells investing the stomach. In man, the L. weighs from 3 to 4 lbs. Its transverse diameter is 10 or 12 inches; its upper surface is convex, and lies in contact with the under surface of the diaphragm or midriff. The upper surface is divided by a fold of the peritoneum or lining membrane of the abdomen into two lobes (right and left) of unequal size. The under surface is con-

cave, and lies in contact with the stomach and duodenum or first portion of the intestinal canal; this latter surface being divided by a longitudinal fissure into a large right and a small left lobe. Behind, the L. is broad and of rounded conformation, and is in contact with the aorta and with the *vena cava* and the *crura* or projecting portions of the diaphragm. Anatomically regarded, the L. may be said to lie in the regions of the abdomen known as the *right hypochondriac* and *epigastric* regions; whilst it also projects into the space known as the *left hypochondriac* region. The position of the organ varies with the posture of the body. When at rest either in the sitting or standing posture, the L. recedes behind the ribs to a considerable extent. In a deep inspiration it descends below the ribs, whilst in expiration it ascends to its normal level. When the intestines are empty the L. lies low in the abdomen, but is pushed upwards and backwards when the intestines are distended. The L. is kept in its place by ligaments of various kinds.

The *ligamentum teres* or *round ligament* of the L., appears as the remains of the umbilical vein of the fœtus; the *longitudinal*, *broad*, or *falciform* ligament is attached by one margin to the under surface of the midriff, and arises from the gland from the notch on its anterior border, extending in its course to the hinder margin of the L. Two *lateral ligaments* exist, and the *coronary ligament* serves to attach the gland to the posterior border of the diaphragm. On looking at the under surface of the L. five lobes are seen, resulting from the separation of its substance by as many fissures. The longitudinal fissure thus divides the L. from its anterior to its posterior body; this fissure being often bridged over at its front and deeper portion by a portion of L.-substance. The fissure of the *ductus venosus*, is the name given to the hinder part of the longitudinal fissure, from the fact that the ductus venosus of early life lies therein. The *portal* or *transverse fissure* runs at right angles to the longitudinal fissure, and measures about 2 inches in length. The large *portal vein* enters the L. at this point, and other large vessels (*hepatic artery* and *hepatic duct*), and the hepatic nerves are contained within this fissure. The remaining indentations in the L.-substance are the *fissure for the gall bladder* lying on the under and anterior surface of the right lobe, and the *fissure for the vena cava*. The lobes of the L. are named the *right* and *left lobes*; the *Lobus quadratus*, *L. spigelii*, and the *L. caudatus*. The right lobe, as already remarked, is larger than the left. It lies in the right hypochondrium, and is somewhat square-shaped. The left lobe is of flatter form than the right; its hinder border infringing on the cardiac or upper extremity of the stomach. The lobus quadratus is also square-shaped, and is placed in the under surface of the right lobe; whilst the L. spigelii exists at the hinder part of the right lobe, and on the under surface of the latter.

The investigation of the structure of the L. shows each of its lobes to be made up of *lobules*, each measuring from $\frac{1}{16}$ th to $\frac{1}{8}$ th of an inch in diameter. The lobules are in turn composed of many sided or polygonal cells, which vary in size from the $\frac{1}{100}$ th to the $\frac{1}{200}$ th of an inch in diameter. Within each cell, one or two *nuclei* may be contained; while the contents consist of yellow particles, the biliary colouring matter, and oil or fat-globules. They are connected by thin surfaces, and are arranged from the centre radially or towards the circumference of the lobule. The cells are the essential parts of the L., and are the sole agents in the secretion of bile. Each lobule of the organ, in addition to the cells, possesses as integral parts of its substance, numerous *biliary ducts*, minute branches of the *portal vein*, and of the *hepatic vein*, and minute *arteries*, together with *nerves* and *lymphatic vessels*. The hepatic artery is the nutrient vessel of the organ, whilst the hepatic vein returns the venous blood from the gland. The *portal vein*, on the contrary, which ramifies through its substance, is the vessel which brings a due supply of blood to the L. for the manufacture of *bile*. The latter fluid in vertebrate animals is thus manufactured from *venous* blood; the portal vein being formed by the union of four large veins (*mesenteric* (*sup.* and *inf.*), *gastric*, and *splenic*) returning venous blood from the stomach and other digestive viscera. The *gall bladder* is a sac, attaining a length of 4 inches, and a cubic capacity of from 8 to 10 drachms. It serves as a reservoir for the bile, and lies on the under surface of the right lobe of the L. The ducts which lead from the L. are three in number. The *hepatic duct* is thus formed by the two trunks proceeding from the right and left lobe respectively. This duct

* A nineteenth prayer was added to the *Shemoneh Esreh*, a short time before the destruction of Jerusalem; it is thought against the Christians. After the Dispersion, almost every country and city had their own L.

unites with the *cystic duct* in that which proceeds from the gall bladder, the two forming by their junction the *ductus communis choledochus*, or common duct, by which the bile is conveyed into the intestine. The common duct opens into the duodenum, a little below the middle of that portion of the intestinal tube. The work of the *L.* illustrates what is meant by *secretion* and *excretion*. Bile is thus manufactured or secreted by the hepatic cells, and as in this process venous blood is utilised, the conversion of this blood into bile also illustrates excretion of a waste product of the economy. Each hepatic cell is thus a minute bile-manufactory. Its contents are discharged into the minute ramifications of the hepatic duct which exists within the lobules of the *L.*, and as the smaller branches unite to form the larger ducts, the bile secreted from the various lobules is thus duly collected, and finally passes from the *L.* by the main or terminal duct already noticed. An analysis of human bile shows it to consist of 859·2 parts of water, and 140·8 parts of solids in 1000. The solids consist of a substance known as *bilin* (91·5), *fat* (9·2), *cholesterin* (2·6), *mucus* and *colouring matters* (29·8), and *salts* (7·7). The function of bile would appear to be chiefly that of assisting in the digestion of *fatty foods*, and it is also probable that this secretion delays the decomposition of food as it passes along the intestines, and also facilitates the *absorption* of fatty matters through a peculiar action of the intestinal mucous membrane. The *L.* appears to be continually engaged in secreting bile. From thirty to forty ounces are secreted daily, but the quantity is subject to great variations, and is effected, amongst other conditions, by the amount of food, and by exercise, &c.

Diseases of the L. are so numerous and complicated that nothing more can be attempted than an enumeration of some of the more definite morbid states expressed by functional disorders, lesions of texture, or of both combined. *Congestion* of the *L.* may be due to over-secretion causing engorgement of the bile-ducts; to passive congestion of the hepatic or portal veins, or to active congestion, involving the arterial capillaries. The most frequent causes are valvular disease of the heart, sudden chills, fevers, alcoholic intemperance, and inter-tropical heat. *Inflammation* of the *L.* or *Hepatitis* (q. v.) occurs in various forms, and results in several consequences. *Inflammation* of the *capsule* of the *L.* and of *Gisson's capsule* is marked by pain or pressure, more or less of inspiration. *Glandular inflammation* usually results in abscess or induration and cirrhotic degeneration, and is frequently caused by fevers and pyæmia. The *chronic*, or *diffuse form of inflammation* is expressed by simple or granular induration of the substance of the liver, sometimes called *cirrhosis*, *lob-naked*, or *gin-drinker's L.* The hepatic cells undergo fatty degeneration; the connective tissue is increased and altered in character; the vascular system undergoes great changes, and the bile-ducts are destroyed. The disease is chiefly due to the specific action of alcohol, to syphilis, and occasionally to repeated attacks of malarial fever. *Suppurative inflammation* of the *L.* is always limited to one or more isolated patches, and is rare in temperate climates. It is caused by contusions; metastatic or pyæmic inflammation; inflammation and ulceration in the gastro-intestinal canal, and in the stomach, gall-bladder or gall-ducts. *Increased secretion and diminution of bile* is chiefly caused by certain kinds of food or drink, but more especially by exposure to unusually high ranges of temperature, as in summer and autumn, and is generally associated with bilious diarrhoea. The *degenerations of the substance of the L.* are the *Amyloid* (q. v.), the *Fatty* (q. v.) and the *pigmentary* which can only be recognised by post-mortem examination; and the symptoms, which are obscure, are indicated by general ill-health, expressed by *marasmus*, *anæmia*, or *dropsy*, in some cases associated with diarrhoea, vomiting, and cardiac systolic murmur; and in cases where the health is impaired, by *ulceration of bones*, *syphilis*, *tuberculosis*, or *malarial fevers*. *Jaundice* (q. v.) comprehends a group of diseases. *Acute or yellow atrophy of the L.* is expressed by violent constitutional disturbance, pyrexia, delirium, hæmorrhages from various parts, and finally coma, and the *L.* shrinks to one-half or one-third its normal size. The chief causes are, dissolute habits, syphilis, drunkenness, miasmata, and pregnancy. Disease of the *L.* is also caused by the presence, development and multiplication of living organisms which have reached it through the circulation. See Murchison's *Clinical Lectures on Diseases of the L., Jaundice, and Abdominal Dropsy* (Lond. 1877).

Liver-Fluke, the *Fasciola hepatica*, or *Distoma hepaticum* of naturalists, which infests the liver of sheep, and causes in that animal the disease known as 'rot.' The *L.-F.* belongs to the order *Trematoda* (q. v.), a division of the class *Scolecida* (q. v.). See FLUKE.

Liverpool, the greatest seaport, and next to London the largest, wealthiest, and most populous town in Great Britain, is situated in Lancashire, on the right or E. bank of the Mersey, 5 miles from the Irish Sea, three-quarters of an hour by rail from Manchester, five hours from London, six from Edinburgh, and eight by steamer from Dublin. It is faced by the thriving town of Birkenhead (q. v.), and lies on five hills, sloping towards the river, which is crowded with shipping, and bordered by the grandest range of docks in the world. The estuary is here three quarters of a mile wide, and a system of steam ferry-boats keeps up a constant communication day and night between the two shores. *L.* now contains an unusual number of splendid buildings, but partly on account of the inequalities of its site, is rather wanting in long, broad, stately streets. In the fashionable E. end there are several fine large squares, and on the outskirts of the town are five public parks, the Prince's, the Botanic Gardens, the Sefton (opened 1872), Stanley, and Newsham, and it has been proposed to connect these by a continuous belt of boulevards. The finest street architecturally is Lime Street, in the very heart of *L.*, on one side of which stands St. George's Hall, the principal building in the city. A combination of law courts, assembly rooms, and Wall-hall, St. George's Hall (built 1836-54; cost, £329,659), is a grand Corinthian building, with an extreme length of 500 feet, and columns 40 feet high, containing a great hall 166 feet by 75, and 85 feet high from the floor to the magnificently painted and gilded ceiling. It contains one of the finest organs in the kingdom by Willis, and statues of Sir Robert Peel, Lord Derby, Mr. Gladstone, &c. In the broad space in front are equestrian statues of the Queen (1870) and Prince Consort (1866), which, together with the adjoining Wellington monument, are far above the average of British sculpture. Other notable buildings are the Western Hotel (1869-71), Lime Street, in French Renaissance style, with towers 157 feet high; the Town-hall (1749), with a fine portico and dome; the Exchange, transformed from an older one at a cost of £600,000, containing a news-room, 57 feet high and 30,000 sq. feet in area, and enclosing three sides of a square ('the Exchange Flags'), with the Town-hall on the fourth, and the Nelson monument in the centre; the municipal offices (1867) in Corinthian style, covering an area of 43,512 feet, and surmounted by a tower and spire 210 feet high; the new offices of the Gas Company, a beautiful building in the Renaissance style; the new central station of the Midland Company in Ranelagh Street. Among the many intellectual institutions are the Free Library and Museum (1857-60), presented to *L.* by Sir W. Brown, at a cost of £40,000, containing Mr. Mayer's collection of antiquities, valued at £100,000; a Free-Reading Room, cost £14,000, with a noble chamber, 120 feet long by 50, and 48 high, the gift of Mr. Pictou; an Art Gallery, cost £25,000, the gift of Mr. A. B. Walker; the *L.* Library, founded in 1753, and containing (1877) 40,000 vols.; the Athenæum Library, founded by William Roscoe; the Royal Institution, founded in 1817, attached to which there is a permanent art gallery; a Medical Institution and Library, dating from 1779; a Botanical Garden, occupying eleven acres; an Observatory, since 1766; a Polytechnic Institution, established in 1838; an Architectural and Archæological Society (1848); an Historic Society of Lancashire and Cheshire, founded (1838) by Mr. Mayer; *L.* Academy of Fine Arts; a Naturalists' Field Club; a Chemists' Association; philomathic, law, photographic, numismatic, geological, and medical societies, &c. The Sailors' Home, comprising a library, navigation school, savings' bank, &c., is the residence of some 8000 sailors every year. There are (1877) in *L.* and out-townships 262 places of worship—105 belong to the Church of England, 43 to Roman Catholics, 80 to Baptists, Congregationalists, Wesleyans, Unitarians, &c., 12 to English and Scotch Presbyterians, 1 church and 17 Dissenting chapels in which the service is conducted in Welsh, 1 Catholic Apostolic and one Greek church, and 2 synagogues, one of which is among the finest structures in the town. Only a few of the modern churches can boast of any architectural beauty. The parish church of St. Nicholas, originally 'dedicated' in 1362, was rebuilt in 1774, and its tower and lantern in 1815. Of the eight cemeteries, the only one within the town

is James's. Though without any grammar-school of old foundation, L. has two schools of a high class—the secular one of the Royal Institution, with 'high' and 'commercial' divisions, and the L. College, founded in 1840 on a distinctly religious basis. The L. Institution comprises several educational departments, a large library, a fine lecture-room, and a gallery of ancient and modern sculpture. It has a high school preparatory for the universities, and a commercial school intended for the sons of tradesmen. L. is specially munificent in its charities. Of these, the chief are the Bluecoat Hospital, maintaining and educating (1877) 350 children, the Orphan Asylum, the Seamen's Orphan Asylum in Newsham Park (1874), containing about 400 boys and an equal number of girls, Schools for the Blind and the Deaf and Dumb, Industrial Schools, the Royal Infirmary (1870, in-patients 220, out-patients 3643), the Northern and Southern Hospitals (the latter opened in 1872), Lying-in, Homœopathic, Eye and Ear Institutions, and Children's Infirmary. There are six theatres, and high-class concerts are held in St. George's and the Philharmonic Halls. The lower or maritime parts are disgraced by a species of Ratcliff Highway, riotous with singing and dancing rooms. L. has six daily and seven weekly newspapers, and four literary periodicals, besides the *Daily Telegraph* and *Shipping Gazette* and the *Journal of Commerce*. Three railway lines run through the town to the docks in tunnels under the houses; the Lancashire and Yorkshire Railway is carried above the houses on a splendid viaduct to Tithebarn Street Station. The Midland has a handsome station; but the London and North-Western (Lime Street), when finished, will be not only the largest in L., but one of the largest in the world. The great feature, however, of L. is the docks, extending (1877) over an area of 255½ acres of water, and comprising 18½ miles of quays. They present to the river an unbroken line of over 6 miles, terminating in the N. in the Canada, and in the S. in the Herculean Docks, and flanked by the Custom House, one of the finest in the kingdom, and by the tall row of the Albert Dock warehouses, erected at a cost of £358,000. There are 54 docks and basins, and all these save four have been constructed chiefly under the superintendence of Mr. Jesse Hartley, since 1812. The Canada and Herculean Docks are devoted exclusively to timber, the King's to tobacco, and the Queen's to cotton, dye-woods, jute, and other E. and W. Indian products; the George's is mainly used for export purposes; the Victoria, Clarence, and Trafalgar by steamers engaged in the Irish trade, while the Nelson, Salisbury, and Bramley Moore Docks are occupied by steamships trading in the W. Indies, the Pacific, Mediterranean, and to Dutch and German ports. The Corn Docks, capable of holding the largest vessels in the grain trade, are provided with a range of splendid warehouses, to hold 165,000 tons of corn, 10 stories high, with water-tight and rat-proof cellars, and elevation machinery worked by hydraulic power able to transfer from the ships 250 tons per hour. In 1875 the 'quantities' of timber imported were—of yellow pine, 2,060,000 cubic feet; of Quebec oak, 1,058,000; of birch, 431,000; of pencil cedar, 66,850; of mahogany, 7,000,000; of spruce deal and boards, 84,222 'standard' (of 165 cubic feet apiece); from the Baltic, 646,000 cubic feet of fir logs, and 391,400 of pitch pine. About four-fifths of all the traffic between N. America and Great Britain is carried on through L., which has also a large share of the Eastern and Australian trade. The greatest cotton market in the world, L. in 1873 received 1,807,584 bales of the 2,840,981 exported from the U.S.; 12,570,632 cwts. of the total 13,639,252 imported into England. L. is also the second largest wool market in the country. In 1873 the exports of British manufactures and produce amounted in value to £93,925,396. The chief items were cotton manufactures (£34,794,989); cotton yarn (£4,631,045); woollen manufactures (£11,299,679); linens (£4,648,362); iron (£11,350,312); hardware and cutlery (£2,626,994); haberdashery and millinery (£2,282,083). In 1875 (a bad year) there entered the port 13,424 vessels, of 6,252,267 tons; and cleared, 12,631, of 6,028,089 tons; the gross receipts of customs were £2,919,419. To the port belonged 1866 sailing vessels of 990,867 tons; and 563 steamers of 412,464 tons. Besides its enormous trade, L. has a vast passenger-traffic, no fewer than eight lines of steamers communicating hence with New York and other N. American ports, in addition to various lines for the Pacific, Mediterranean, India, &c. The Cunard Company alone has 49 vessels, of which 24 are employed in the Atlantic service. Other celebrated lines are the National (with 12 large steamers), the White Star (6), the Inman (12), the Guion (6), the Dominion (12), the Allan (20),

and the Anchor (6). There is also an extensive local steam-packet service daily to Dublin and Belfast, twice or thrice weekly to Cork, the Isle of Man, Glasgow, &c. The great centre of the passenger traffic is the famous Landing Stage, a vast pontoon dominating the Mersey, from which tenders convey their complement to the large steamers lying out in the river, and where there is a constant bustle about the steam ferryboats. This structure had just been renewed at a cost of £250,000 when it was completely destroyed by fire, 30th July 1874; a more convenient one has since taken its place, little short of a mile in length. The industries of L. are great, unless compared with its commerce. There are extensive sugar-refineries, shipbuilding yards (29 vessels of 31,806 tons were built in 1873), iron and brass foundries, engineering works, rice, flour, and saw mills, cigar factories, and manufactures of chain-cables, anchors, cordage, chemicals, soap, glass, spirits, nautical instruments, &c. The market accommodation of L. is superior even to that of the metropolis. General markets are St. John's (183 yards by 43), St. James's, St. Thomas's, and St. Martin's; there are also a cattle-market, a fish-market, and various fancy bazaars. L. sends three members to Parliament. In politics it is strongly Conservative, and has been so for at least a century and a half with but very brief intervals. A strong Irish and alien element exists; nowhere, unless perhaps in Manchester, is Orangeism advocated more ardently. The merchant princes are, as a rule, men of old family, not only long connected with L. itself, but claiming descent from the landed families of Lancashire. Pop. in 1800, 77,708, in 1831, 205,572, in 1861, 443,938, in 1871, 493,346 (including W. Derby and Birkenhead, 650,510). The first part of the name L. has been the subject of endless conjecture. A traditional theory is that the place received its name because the 'pool' was haunted by the 'Liver' or 'Lever,' a bird of which next to nothing is known, but which is identified with the one figuring in the town's armorial bearings. The true origin is probably the Welsh *Llŷr-pŵl* ('the sea pool'). Such at least is the form of the name in the first authentic charter of the place, which was granted by Henry II. in 1173. In 1313, when the ports contributed to the navy, L. is at the bottom of the list with one bark and six men. Two centuries later Leland says, 'Lyrpole alias Lyverpoole, a paved town, hath but a chapel,' although 'is smaale custom payd that causit marchaunts to resort.' In 1565 it had only 138 householders and cottagers. During the Civil War L. suffered three sieges, and by the end of the 17th c. its population had increased to 5714. With the opening of the 18th c. a great change took place. By 1709 the shipping had grown to 84 vessels of 6000 tons, and with the construction of the first dock by the excavation of the ancient 'pool' began the foreign trade. In 1757 the first stage coach to London was started, performing the journey in four days. The pop. increased from 25,700 in 1760 to 77,708 in 1800. The staple commerce of the town during the latter part of the 18th c. was what is euphemistically called 'the African trade,' in other words the slave trade. The rapid advance of L. in later times has been in great measure due to the development of the trade in cotton, and the revolution consequent upon the application of steam-power in the industrial arts. L. is the birthplace of W. Roscoe, the historian, and of Mrs. Hemans, and the adopted town of John Gibson, the sculptor. See *Pictorial Memorials of L.* (enlarged ed. 1875).

Liverpool Plains, a pastoral district in the N. of New South Wales covering an area of 16,900 sq. miles. Discovered by Oxley in 1818, they were by him named after Lord Liverpool. Water is scarce, and the land consequently ill adapted for tillage, but it supports immense flocks of sheep.

Liverpool Ranges, in New South Wales, is an offshoot of the great Australian Cordillera (see AUSTRALIA), to which it runs nearly at right angles. The length of the L. R. is 150 miles, and its average height 3000 feet, culminating in Mount M'Arthur (5000 feet). The range is exceedingly precipitous, but its most remarkable feature is Mount Wingen, which, though not a volcano, is in a state of constant combustion, caused by the spontaneous ignition of beds of coal which lie beneath the surface.

Liv'ry (Fr. *livrée*, Lat. *liberatio*), a term originally applied to the costumes worn on state occasions by the retainers of the Frankish kings, now signifies the peculiar dress by which the servants of a particular gentleman are distinguished. L., indeed, in feudal times, included whatever money, victuals, or

clothes were periodically *delivered* by a lord to his officials or domestics, but principally denoted outward tokens of distinction, as the '*roba æstivalis*' and '*hiemalis*,' mentioned in the Wardrobe Book of Edward I. as worn by the servants of the Court. The wearing of L. by the general adherents of an individual, which had long contributed greatly to the maintenance of private feuds, was restricted to menials by statutes of Edward III. and Richard II.; but the wearing of L. by all fraternities and '*les gentes de mestere*,' or trades of the cities throughout the kingdom, was expressly sanctioned by a statute in the seventh year of Henry IV. Under the second and third Edwards a distinctive L. was adopted by each of the craft-gilds of the City of London that had obtained a charter and the enrolment of its ordinances in the Mayor's Court. The *Livery Companies*, as these were hence called, acquired at that time an influence that proved lasting, for till the Reform Act of 1832 the freemen of the ninety-one trade-gilds of London were the sole constituents of the members of Parliament for the City.

Livery of Seisin, in English law, is a delivery of possession of lands or tenements. In Scotch law, see INFECTMENT.

Livingston, Edward, an American jurist, was born at Clermont, New York, May 26, 1764. His father was judge of the Supreme Court of New York. He graduated at Princeton College in 1781, and began practice as an advocate in New York in 1785. He sat in Congress 1794-1801, and became district attorney and mayor of New York in 1801. In 1803 embezzlements having been made from the state funds under his charge, he resigned the office, handed over all his property, and removed to New Orleans. Here he obtained much success as a jurist. He revised the civil code of Louisiana in 1823-24, and drew up a criminal code in 1826, which was published in Philadelphia in 1833. The latter, though not adopted anywhere in its entirety, has had great influence on the penal legislation of many countries. L. sat in Congress 1823-29, was Secretary of State, 1831-33, and Minister at Paris 1833-35. He died at Rhinebeck, New York, May 26, 1836. See L.'s Life, by C. II. Hunt (1864), and his *Complete Works on Jurisprudence* (2 vols. New York, 1873).

Livingstone, David, M.D., LL.D., the great missionary traveller, was born at East Kilbride, in Lanarkshire, 19th March 1813. Employed in early youth as a 'piecer' at the Blantyre cotton-mills, he acquired some knowledge of classics at an evening school, and later by hard work in summer was enabled during several winters to study medicine and theology at Glasgow. In 1838 he was admitted a licentiate of the Faculty of Physicians and Surgeons, and in 1840 was ordained as a medical missionary, and sent by the London Missionary Society to Port Natal, where he became acquainted with the Rev. Robert Moffat, whose daughter he married subsequently. In the earliest years of his service as a missionary in the Bechuanaland country he sent much valuable information to Petermann's *Mittheilungen* and the London Geographical Society. He made his essay as an explorer by the discovery of Lake Ngami, 1st August 1849, and later crossed the continent in his 'great journey' from the Zambezi to the Congo, arriving at Loando in June 1854, after eighteen months travelling. In September following he began to retrace his steps, proceeding by Linyanti, the Portuguese settlement of Zete, and the course of the Zambezi, arriving at its mouth, 20th May 1856. The Victoria gold medal of the Geographical Society had been awarded to him in 1855, and on his return to England the publication of *Missionary Travels and Researches in S. Africa* (1857) gained him a European renown. In 1858 he returned to Africa, and with Mr. C. Livingstone, Dr. Kirk, and Mr. Rae, aided by the Governments of England and Portugal, he started on an expedition which lasted five years, and during which he explored the Zambezi and Shiré, and discovered Lakes Shirwa and Nyassa. On his return to England he published *A Narrative of an Expedition to the Zambezi* (1865; new ed. 1875). Setting out for the last time under the auspices of the Geographical Society, and accredited as Her Majesty's Consul to the chiefs of the interior, L. devoted himself to the discovery of the sources of the Nile (q. v.). Striking the Rovuma river, he rounded the S. end of Nyassa, crossed the river Loangwa, touched the S. end of Tanganyika, explored Lake Moero (q. v.), discovered Bangweolo (q. v.), and fell back to Ujiji in greatly impaired health. A rumour meantime had reached England of his having been killed by natives, and an

expedition, under Mr. Edward D. Young, went out in a search for him that was fruitless. Later, however, letters were received from L. dated May 1869. Amid terrible hardships, aggravated by repeated illnesses, and the desertion of all his men save three, L. made his way roughly by the course of the Luamo river to the Lualaba, as far N. as the Bagenya country, but was unable to procure canoes, and returned to Ujiji prostrated and desponding. Here he was found by Mr. Henry M. Stanley, representing the New York *Herald*, in the autumn of 1871. After a voyage together round the N. of Tanganyika, in an unrewarded search for the outlet, L. accompanied Mr. Stanley on his return as far as Unyayembe, and then alone resumed the search for the Caput Nili. Returning by Tanganyika to Bangweolo, which he meant to explore, he traversed the N. and E. shore, and crossed the Chambeze. But the terrible journey through the marshes was too great a strain, and after a severe illness he died at Chitambos village, Ilala, 4th May 1873. A relief expedition sent out by the Geographical Society under Lieut. Cameron was only in time to meet the party returning with the embalmed body at Unyayembe, 16th October. The body was taken to England, and interred in Westminster Abbey, in April 1874. Besides having unusual power of observation and endurance, L. showed great tact and resource in dealing with savage, refractory natives. A cool, sensible man of business, he was nevertheless animated by a high Christian spirit, and a noble desire to put down slavery, which he called 'the great open sore of the world.' The immense value of his additions to our knowledge of Central Africa is a little apt to be underrated on account of his unimpassioned, though lucid narrative. See his *Last Journals*, edited by Rev. H. Waller (2 vols. Lond. 1874); and Stanley's *How I Found L.* (Lond. 1873).

Livius, Titus, was born at Patavium (Padua), B.C. 59. He spent most of his life at Rome, but returned to his native city before his death in A.D. 17. He was married, and had at least two children. He enjoyed the favour of Augustus, and his reputation was so high, that a Spaniard travelled from Cadiz to Rome for the sole purpose of beholding him. He commenced his career as a rhetorician, and wrote on rhetorical subjects; but his great work is the *Annales*, or *History of Rome*, extending from the foundation of the city to the death of Drusus, B.C. 9. It occupied 142 books, of which 35 (the first 10, and 21-45 inclusive) have come down to us, along with *Epitomes*, or summaries of the whole, with the exception of two, framed shortly after the appearance of the history itself. After the 5th or 6th c. the history was divided into *decades*, or groups of 10 books each—books 1, 21, and 31 opening with a brief preface, and severally marking the commencement of an important epoch. The first, third, and fourth decades are entire, and also one half of the fifth. Of the remainder, we possess nothing but inconsiderable fragments. The first decade embraces the period from the foundation of the city till B.C. 294. The second, which is lost, embraced the period from B.C. 294 to 219, and comprised an account of the extension of the Roman dominion over the whole of Southern Italy and a portion of Gallia Cisalpina; of the invasion of Pyrrhus; of the First Punic War, &c. The third extends from B.C. 219 to 201, and comprehends the whole of the Second Punic War, and the contemporaneous struggles in Spain and Greece. The remaining extant portion extends from B.C. 201 to 167, and traces the progress of the Roman arms in Cisalpine Gaul, Macedonia, Greece, and Asia, ending with the triumph of Æmilius Paullus. Niebuhr is confident that L. did not begin his historical labours till he had attained the age of fifty, and had not completed his plan when he died. In the earlier portions of his work his authorities were chiefly Ennius, Fabius Pictor, Cincius Alimentus, and Calpurnius Piso; and from the commencement of the third decade he depends almost exclusively on Polybius. He aimed, not at a critical history of Rome, but an interesting and attractive story of the Roman state. He was accused by Asinius Pollio of *Patavinitas*, or provincial peculiarities of expression, but this cannot now be detected. His style is almost faultless. It flows on in 'a calm, strong, clear, sparkling, deep, and unbroken current; the diction shows richness without heaviness, and simplicity without tameness.' L. was deficient in knowledge of the world, of military art, jurisprudence, political economy, and geography. He owes his great fame as a historian, not to industry or accuracy, intellectual insight or philosophic breadth, but to the nobility of his theme,

and to the marvellous power and skill with which he wielded the Roman tongue. The best editions of *L.* are, text only—*Madvig* (8 parts 1866); *Weissenborn* (6 vols. Teubner, 1871); with explanatory notes—*Drakenborch* (7 vols. 1746; reprinted, 15 vols. Stuttg. 1828); *Weissenborn* (10 vols. 1867). Seeley's edition of *Book I.* (Macmillan, 1871) contains an excellent historical introduction.

Livius Andronicus, the earliest Roman dramatist and poet, was a native of the Greek colony of Tarentum, and flourished about 240 B.C., in which year his first drama was exhibited. He was for some time a slave at Rome, engaged in the instruction of his master's children, but was afterwards restored to freedom. The titles and fragments of at least fourteen of his dramas have come down to us. They all treat of Greek subjects, and are to a great extent imitations of Greek dramas. *L.* wrote also a Latin *Odyssey* in Saturnian verse and hymns.

Livny, a town of Russia, government of Orel, 253 miles S. of Moscow by rail, has six churches, and considerable trade in corn and cattle. Pop. (1870) 12,975.

Livonia (Ger. *Lieland*, or *Liefland*), a government of Russia, and one of the Baltic provinces, is bounded N. by Esthonia, E. by Lakes Peipus and Pskov, S. by Witebsk and Courland, and W. by the Gulf of Riga. Area 18,150 sq. miles; pop. (1870) 1,000,876. Lakes occupy one-fifteenth, and forests five-elevenths, of the surface, which along the coast is flat and sandy, but inland rises in fertile and well-wooded uplands, Munia-Mäggi ('egg-mountain'), attaining an elevation of 1057 feet. The *Aa* and *Embach* are the chief rivers. Rye, barley, hemp, flax, and linseed yield good crops; chalk, gypsum, alabaster, marble, and flint are extensively quarried; and there are numerous brick-kilns, glass-houses, and saw-mills. The government includes the islands of Oesel, Mohn, and Runö. Riga (q. v.) is the capital. Seventy-three per cent. of the inhabitants are Protestants, and fifteen per cent. belong to the Greek Church. Russians, Poles, Swedes, and Germans occupy the towns; Esthonians (about 410,000) the N., and Letts (360,000) the S. A remnant of the aboriginal Livonians (some 2000) still lingers in N. Courland. They belong to the Finnic family, and their language, retained in considerable purity, has been fully treated in *Sjögren's Livische Grammatik und Wörterbuch* (2 vols. Petersb. 1861), and was first made known to Western Europe by shipwrecked Bremen merchants (1158), and in 1201 Bishop Albrecht founded at Riga the Order of the Sword (*Schwertritter*), associated (1237) with the Teutonic Knights (q. v.). *L.* formed with Esthonia a Swedish province (1660-1721), and was ceded to Russia by the Peace of Nystadt. See *Eckardt's Livland* (vol. i. Leips. 1876), and *Anders' Beiträge zur Statistik Livlands* (Riga, 1876).

Lièvre (Lat. *libra*), an old French coin, valued at twenty sous, now superseded by the franc.

Lix'viation (from Lat. *lix*, 'ashes'), in chemistry, is the separation by washing of the soluble ingredients in a mixture from the insoluble.

Lixu'ron, a town of Cephallonia, one of the Ionian Islands on the W. shore of the Gulf of Argostoli, 38 miles N.W. of Zákyntho, has manufactures of coarse carpets and cottons, and considerable trade and shipping. Pop. (1870) 5031.

Lizard (Fr. *lézard*, Lat. *lacerta*), a name given to all the species of *Lacertilia*, in the class *Reptilia*. In this order the halves of the lower jaw are united by bone, the limbs are well developed, though in a few genera one or both pairs may be absent. The body is covered with scales. The vertebrae of the back are concave in front and convex behind, and the heads or *capitula* of the ribs are simple. The sacrum may be unrepresented; when present, its vertebrae do not exceed two in number. The teeth—save in some extinct lizards—do not spring from sockets. A urinary bladder exists, and the aperture of the *Cloaca* (q. v.) is transverse. Movable eyelids exist in the majority of the lizards, and a distinct breast-bone is developed. The classification of the *L.* is still a matter regarding which various opinions exist. Some authorities simply divide the order into families, others subdividing the group in a primary manner by the structure of the teeth or tongue. Thus the *Pleurodont* lizards are those in which the teeth are set in ridges on the sides of the jaw-

bones; the *Acrodont* lizards being those in which the teeth are attached to the upper surface of the jaws. By the conformation of the tongue the lizards are divided into *Brevilingua*, in which the tongue is short and thick, and capable of protrusion only when the mouth is open; and into *Fissilingua*, or those in which the tongue is cleft at its tip and protrusible through the jaws. Fossil lizards first occur in the Middle Permian rocks, and many singular extinct forms are known. The genus *Lacerta* includes the most familiar species of *L.*, the sand *L.* (*L. agilis*), and green *L.* (*L. viridis*), the former common in Britain, and the latter in Jersey, belonging to this group. The viviparous or scaly *L.* (*Zootoca vivipara*), also common in Britain, retains the eggs within the parent body until the young are hatched. It is olive-brown above and orange below. Black spots vary the colour of the male. The *L. ocellata*, or eyed *L.*, is found in S. Europe. Its colour is bright green, a series of azure spots adorning the sides. The green *L.* is of a uniform green hue, and the sand *L.* is brown above and white beneath.

Lizard.

Lizard Point, the most southerly headland of England, in Cornwall, 19 miles S.E. of Penzance, and on the E. side of Mounts Bay. It is the *Promontorium Damnonium* of the Romans, presents bold serpentine cliffs to the sea, and supports two lighthouses, each 222 feet high, with fixed lights visible for 20 miles. Off the coast are the Stags and other rocks.

Llama (*Auchenia*), a genus of Ruminant quadrupeds belonging to the family *Camelidae* or Camels (q. v.), but distinguished from the latter by the absence of humps, and by the toes being separate. The *L.* inhabits S. America, the best known form being the *A.* or *L. Paco*—the Alpaca (q. v.) of commerce. Other three kinds of llamas, known respectively as the vicugna, Guanaco (q. v.), and yamma, are known, but it is highly doubtful if they are to be reckoned distinct species. The *L.* attains a length of 4 or 5 feet. Its neck is very long, but its head closely resembles that of the sheep. It has the curious habit of ejecting a quantity of acrid saliva when irritated in any way. The yamma is brown, has slender legs, and was formerly used as a beast of burden by the Spaniards in S. America. The vicugna has a very delicate fur. It is a wild wary animal, and of all the species appears to be least susceptible of domestication.

Llama.

Llandaff ('the Church on the Taff'), a city of S. Wales, in Glamorganshire, beautifully situated on the Taff, 3 miles N.W. of Cardiff by rail. Though called a city on account of its giving title to a bishop and having a fine cathedral, it is only a straggling village with 700 inhabitants.

Llandud'no ('Church of St. Tudno'), a watering-place of N. Wales, in Caernarvonshire, a little S. of Great Orme's Head, at the estuary of the Conway, 40 miles W.S.W. of Liverpool by rail. The Welsh Brighton, it is handsomely built with terraces, parades, &c. Pop. (1871) 2762. A walk of six miles skirts the grand limestone cliffs of the Great Orme (Welsh *Gogarth*), round which a carriage drive was being constructed in 1875. The vicinity is rich in beautiful scenery and quaint antiquities. See *Handy Guide*, by J. Price, M.A. (1875), and *Smith's Archaeology of the Great Orme's Head* (1875).

Llanell'y ('church of Elian'), a seaport of S. Wales, in Caernarthenshire, 10 miles W.N.W. of Swansea by rail, at the

confluence of the Lledi with the Burry estuary, was a mere village at the commencement of the present century. It is now a rapidly increasing place, with a town-hall, custom-house, floating basin, and four docks, one of them capable of admitting ships of 500 tons. In 1875 there entered 1155 vessels of 98,478 tons, and cleared 1501 of 135,292 tons; and there were 91 ships of 13,313 tons belonging to the port. The customs revenues were £2993, and the value of exports (coal, iron, &c.), £70,797, the chief import being copper ore from Cornwall. The Cambrian Copper Works, with iron, tin, and lead foundries, and an extensive pottery, employ a large proportion of the inhabitants. L. joins with Caermarthen in returning one member to Parliament. Pop. (1871) 15,281.

Llangoll'en ('St. Collen's church'), a market-town of N. Wales, in Denbighshire, 9 miles S.W. of Wrexham by rail, on the Dee, which is here crossed by a four-arched bridge of the 14th c., has manufactures of flannel and woollen, breweries and collieries, iron-works and limestone quarries in the neighbourhood. Pop. (1871) 5987. The beautiful *Vale of L.* contains the ruins of *Caer Dinas Brân*, on a conical hill 910 feet high, and of *Vale Crucis Abbey*; the *Pillar of Eliseg*, the oldest inscribed British monument; and the *Cysylltaw Aqueduct*, with nineteen arches, 126 feet high and 1007 long, constructed by Telford (1808) to carry the *Ellesmere Canal* across the Dee.

Llanidloes ('Church of St. Idloes'), a market-town of N. Wales, in Montgomeryshire, on the Severn, 12 miles S.W. of Newtown by rail, has flannel and woollen manufactures, and in the neighbourhood are slate and stone quarries and twenty lead mines. L. joins with the five other Montgomery boroughs in sending one member to Parliament. Pop. (1871) 3428.

Llanos (Sp. 'plains,' from Lat. *planus*, 'level'), the name given to the northern and western parts of the great Orinoco plain in S. America, which is only 192 feet above the level of the sea. There is little wood in the L., though *Mauritia* palms and some shrubs are found along the rivers, where cotton, silk, and tobacco have now been introduced. The tropical climate renders the region in one season a barren desert, in another a field of rich, waving grass, like the savannas of N. America.

Llerena, a town of Spain, province of Badajoz, 55 miles N. of Seville. It has linen, woollen, and leather industries. Pop. 6000. Near L. a battle in 1806 routed a French force, 11th April 1812.

Llorente, Don Antonio, a Spanish author, born 30th March 1759 at Rincón-del-Soto (Aragon), educated at Tarragona and Salamanca, and became a priest in 1779. In 1782 he was appointed vicar-general to the Bishop of Calahorra, and during this period composed a number of indifferent dramas. In 1785 he became one of the dignitaries of the Inquisition, and in the course of the next few years turned his attention chiefly to historical study. Driven from court for political reasons for a number of years, he only recovered his place in 1806, when he was appointed canon of the church and chancellor of the university of Toledo. L. hailed the French invasion of Spain with enthusiasm, and upon the abolition of the Inquisition (1809), and the suppression of the monastic orders, he was appointed in the first instance to examine the historical archives, and in the second to look after the confiscated property. In 1817 he took up residence in Paris and published his greatest work, *Historia crítica de la Inquisición de España* (4 vols.), which along with his *Portraits Politiques des Papes*, secured his expulsion from France in 1822. He died at Madrid, 5th February 1823. The works of L. are of enduring interest, owing to the opportunities which he enjoyed for examining historical documents, but though written with sufficient clearness, they have been condemned for an absence of precision and conscientious accuracy. See L.'s *Noticia Biográfica*, o *Memorias rara la Historia de su Vida* (Par. 1818).

Lloyd's, the merchants' and underwriter's subscription rooms on the first floor of the London Exchange, so called from Lloyd's coffee-house, formerly the head-quarters of underwriting. The underwriter's association is managed by a committee of twelve. It is in constant communication with agents all over the world, who report arrivals and departures of ships and casualties. About £40,000,000 is annually insured here. The subscription varies with the different classes of members. *Lloyd's List* (founded 1716, published daily since 1800), contains the latest shipping news. *Lloyd's Register of British and Foreign Shipping* is an

annual and valuable publication, issued at Lloyd's Register Office of British and Foreign Shipping, 2 White Lion Court. The admirable organisation of L.'s intelligence department has virtually made it 'the focus and centre of the world's sea-borne trade and commerce.' Several kindred societies have been established on the Continent. The Austrian Lloyd's was founded in Trieste in 1833 by C. L. von Brück. It is the agency for the Mediterranean and Levant steamers; and, in addition to the insurance business, has a literary or scientific department with printing and publishing works. The journal *Giornale del Lloyd Austriaco* was begun in 1835. The North German Lloyd's (*Nord-deutscher Lloyd*) at Bremen is important in connection with American steamers and emigration. See F. Martin's *History of Lloyd's and of Marine Insurance in Great Britain* (Lond. 1876).

Loach (*Cobitis*), a genus of Teleostean fishes, belonging to the family *Cyprinidae* or that of the carps. The body is somewhat long, and the scales small. The skin has the power of secreting and exuding a glutinous secretion, similar to that seen in the eels and blennies. The head is small, and the teeth are deficient. The common L. is the *Cobitis barbatula* of naturalists. Its average height is 4 or 5 inches, and its colour is a greyish-yellow, variegated with brown. It is a bottom-feeder, and appears to subsist on worms and insect-larvæ. The Scotch name of 'beardie' and the specific name *barbatula* have reference to the barbules or filaments which depend from the mouth. Another species is the *C. fossilis* or lake L., found in many European lakes and rivers.

Loading. Under the contract of affreightment, the ship-master and owner are bound to see that due preparation is made and care taken of the goods in loading and unloading. Tackling must be supplied, sufficient to guard against injury.

Loadstone, or **Magnetic Iron Ore**, a black coloured mineral having the composition Fe_3O_4 , and possessing magnetic properties. See IRON and MAGNETISM.

Loam (Ger. *lehm*, allied to Lat. *limas*, and Eng. *slime*), is a variety of soil consisting of from 20 to 50 per cent. of clay intimately mixed with sand, limestone, and organic matters. Such soils lack the tenacity of clay, are much more fertile than sand, and are peculiarly adapted in virtue of their loose texture for the cultivation of crops.

Loan. The Roman law draws a distinction in the contract of L. between *mutuum* and *commodate*; the former being applied to the L. of subjects which are perishable, or which may be estimated by weight, number, or measure; such as grain or fruit; the latter applies to a L. which must be individually returned to the owner, as a horse or a picture. In *mutuum*, if the subject be destroyed or injured, the loss falls on the borrower. In *commodate*, the property remaining with the lender, loss or injury to the subject falls on him. See BORROWING.

Loan Societies. These are regulated by the Act 3 and 4, Vict. c. 110. Persons desirous of forming a loan society, or who have formed one for making loans to the industrious classes, must have the rules certified by the barrister appointed to certify the rules of saving banks. The rules are to be entered in a book kept by the officer of the society.

Loando. See SÃO PAULO DA LOANDO.

Loan'go, a state of W. Africa, extending from the Okanda or Ogowa river near the equator to the river Congo. The coast is low-lying and fertile, but is flanked by the terraced ranges of the Sierra Complida, rising out of vast forests. The government is despotic, polygamy prevails, and the religion consists of rude superstitions. There is some trade in ivory, wax, palm oil, &c. In the towns and villages slight industries are carried on in basket-working, grass-cloth weaving, mat-dyeing, and canoe-making.—L., the capital, lies near L. Bay, 135 miles W. of the Congo, and has a pop. of 15,000.

Loasa'cem, or the **Flowering Nettle Family**, consists of about seventy known species of small shrubs or herbs, and sometimes twining climbers, all restricted to the warm parts of America. The order does not include any plants of special qualities beyond those possessing stinging hairs, but several have been brought into cultivation for their showy flowers, such as species of *Blumenbachia*, *Loasa*, *Ilaikea*.

Löb'au (Wend. *lubi*, 'low-lying'), a town in the kingdom of Saxony, 12 miles E.S.E. of Bautzen by rail, has three churches,

a fine *rathhaus*, an iron tower (erected in 1854 on the Löbauer Berg), mineral baths, dye-works, and a considerable trade in cloth, linen, hosiery, and 'L. diamonds,' a kind of rock crystals. Pop. (1875) 6226.

Lobelia, a genus of perennial herbs, belonging to *Campanulaceæ*, and named after Mathias L'Obel, a Flemish botanist. It includes about 200 acknowledged species, widely spread over the greater part of the globe, but chiefly abundant in N. America, S. Africa, and Australia. There are also several species within the tropics both in the New and in the Old World, but none in Northern Asia, and the few that reach Europe are strictly Western or Mediterranean. The British flora contains two; one subaqueous in mountain lakes, the other limited to a single English locality. A considerable number are highly ornamental, and are much cultivated both under glass and in the open air, as *L. cardinalis* and *L. splendens*, whilst *L. Erinus*, a low-growing trailing species, is in high repute as a bedding plant. The acrid qualities of the genus are most strongly represented in *L. inflata*, a N. American species sometimes called Indian tobacco, its flavour and the symptoms following its administration, through the phases of violent vomiting, stupor, convulsions, and death, being somewhat similar to those effected by tobacco in equivalent doses. An ether tincture is employed by the medical faculty as an antispasmodic, and is in vogue among homœopaths.

Lo'bos Islands (Span. *lobo*, 'a seal'), three islets in the Pacific Ocean, 12 miles off the coast of Peru, to which country they belong. They abound with seals, and contain valuable deposits of guano.

Lob'ster (Old Eng. *loppestre*; allied to the Lat. *locusta*?), a name given to various genera of Crustacea (q. v.), belonging to the order *Decapoda* (q. v.), and to the section *Macroura* ('long tailed') of that order. The common *L. (Homarus marinus)*, the most familiar example of this group, attains the length of a foot or more, and is of a deep bluish black colour, finely mottled with lighter markings. Twenty segments or joints exist in the lobster's body; these being disposed so as to give six to the head, eight to the thorax or chest, and six to the abdomen. The head and chest are united, as in all crustacea, to form a *cephalothorax*. Every segment of the body bears appendages; those of the head being modified to form eyestalks, feelers, and jaws; those of the thorax to form walking-limbs, and *maxillipedes* or 'jaw-feet.' The rudimentary feet belonging to the abdomen or tail, are used by the female for carrying the eggs. The female when laden with eggs—or 'in berry'—has many thousands of developing eggs attached to the tail. The eggs are placed in this position by the L. bending the tail so as to receive the eggs as they pass from the generative apertures. The latter exist in the female at the base of the last pair of walking-legs; those of the male, at the base of the third pair of legs. The sexes may be distinguished thus: the male has the appendages of the first joint of the tail in the form of horny filaments; the female, in the form of soft filaments. The young L. does not undergo a *metamorphosis* in passing from the egg to the adult state, like the young crab. Nearly allied to the common L. is the spiny L. (*Palinurus vulgaris*), also known as the sea crayfish, in which the claws and feet are smaller than in the L.; and the colour a purple brown mottled with white spots. The shell bears many prominences and angularities. Both of these lobsters are captured in great quantities around the British coasts; the spiny L. being more common on the S. coasts of Britain. The Norway L. (*Nephrops Norvegicus*) attains a length of 8 or 9 inches, and is of more slender make than the common L. It is of a beautiful light brown hue, mottled with bright red markings. See Dr. A. Wilson's *Zoology* (Edin. 1877).

Lob'worm (*Arenicola piscatorum*), a species of marine worms, belonging to the family *Arenicolidae*, and to the order *Enantia*. It is also known by the name of 'Lug-worm,' is much used by fishermen for bait, and is common around the British coasts. It burrows into the sand as the tide ebbs, passing the *debris* of its burrow through its body, and throwing out the material thus excavated on the surface of the sand in the form of the well-known rope-like coils. The L. resembles a large earth-worm, with a rounded and enlarged head-extremity. It has a few bristles along the sides of the body; and eyes and jaws, so prominently seen in some marine worms, are both wanting. The

colour is a dark-brown. The gills occur in the form of thirteen tufted organs along the sides of the body.

Lo'cal Author'ity is the Scotch *nomen juris* indiscriminately applicable to the sanitary local authorities of Scotland in districts whether rural or urban. According to the English Act of 1872, which is incorporated with the Consolidation Act of 1875, England is divided into districts called respectively (1) urban sanitary districts, and (2) rural sanitary districts, which are respectively subject to the jurisdiction of local authorities, called urban sanitary authorities and rural sanitary authorities. It was also enacted, as regards urban sanitary authorities, that (1) the authority for boroughs constituted such either before or after the passing of the Act, should be the mayor, aldermen, and burgesses, acting by the council; (2) the Improvement Commissioners should be the authority of Improvement Act districts constituted such before the passing of the Public Health Act of 1872, and having no part of its area situated within a borough or local government district; and (3) the local board should administer the sanitary laws in local government districts, constituted such either before or after the passing of the Act, having no part of their areas situated within a borough, and not coincident in area with a borough or Improvement Act district. Improvement Act districts are those districts where commissioners by local Acts are entrusted with powers of town government and rating. The English guardians of the unions are the sanitary rural authorities, as well as the administrators of the local poor law.

By the 5th section of the Public Health (Scotland) Act, 1867, it was provided that (1) the town-council should be the L. A. to execute the Act in places within the jurisdiction of any town council, and not subject to the jurisdiction of police commissioners or trustees; and (2) the police commissioners or trustees exercising the functions of police commissioners under any general or local Act, should be the L. A. within the places subject to their jurisdiction. By this provision the town councils of all royal and parliamentary burghs and the police commissioners of police burghs constitute, severally, the urban L. A. in Scotland. The municipal authorities also of those urban districts which have by a local Act provided for themselves a municipal government, are, in virtue of office, the L. A. By the same Act the parochial boards of the parishes of Scotland are the local authorities of their respective parishes, or of such parts thereof as are not under the jurisdiction of a town council, or police commissioners, or trustees exercising the functions of police commissioners. The special duty of the L. A. is the administration of the Public Health Acts, and the general supervision of all matters relating to the public health. See *Manual of Public Health*, by Michael, Corfield, and Wanklyn, edited by Ernest Hart (Lond. 1874); and *The Sanitary System of Scotland*, by Sheriff Spens (Edin. 1876).

Locha'ber Axe, an axe with a broad blade and long handle, which was the old weapon of the Scotch Highlanders.

Lock (Old Eng. *loc*), a well-known apparatus, used for fastening doors, drawers, &c., the essential part of which consists of a bolt intended to be shot backwards or forwards by means of a key. In some cases the bolt, when shot outwards, catches in a fixed staple; in others a staple enters the L., and is there retained by the bolt. Every one is familiar with the nature of a key; the stem is called the *shank*, and the projecting piece, which throws the bolt, the *bitt* or *web*. The shank is either hollow or solid; when hollow, the key slips on to and rotates round a *drill-pin* fixed to the lock-plate, and when solid, the shank is carried a little beyond the web, and the upper part of the key-hole in the inside plate acts as a socket for it. Solid shanked keys are only used in locks that open from either side.

The invention of locks is ascribed to the Egyptians, and it is singular that the same form of door-L. used in Egypt upwards of 4000 years ago, as testified by sculpture on a temple at Karnac, still obtains in Egypt and Turkey. It is wholly made of wood. The construction and principle of action will be understood from the accompanying cut. The body of the L. is seen at *a a*; *b b* is the bolt with a horizontal slot for the passage of the key, and three vertical holes for the reception of as many headed pins, *c, c, c*, which drop from the upper part of the body of the L. into the bolt, holding it fast, when pushed into its staple. To enable the bolt to be withdrawn, the key *d d*, a straight piece of wood with three pegs upon it corresponding in position to the

holes, is passed into the bolt-slot and pressed upwards. The pins are in this manner dislodged by the pegs of the key, which with the bolt may then be drawn back.

Egyptian Lock.

account of its size and weight, a key of the above description. Locks similar to the Egyptian kind are in use in the Faroe Islands and Cornwall.

In England the L. and key manufacture has its chief department in S. Staffordshire, where it has flourished since the 17th c. Wolverhampton, Willenhall, Wednesfield, Walsall, and neighbouring villages are each noted for special varieties of locks. In the simplest and cheapest form of English L., the bolt is thrown by the web of the key acting in the *talon* or semi-circular recess cut in the centre of the lower side of the bolt. At the end of the same side there are two notches with a convex junction, and between these the bolt travels on a stud, a rude spring on the upper side keeping the bolt in position when shut or open. In such a L. no protection is afforded against moving the bolt with any bent instrument. For this purpose *wards*, thin pieces of metal fastened edgewise to the lock-plate in concentric form around the drill pin or socket, are introduced, and the web of the key is cut with corresponding clefts to pass them. The Romans seem to have used wards in their locks, and the intricacy of those of mediæval age is remarkable. Additional security is obtained by the use, in conjunction with fixed wards, of a movable lever or *tumbler* with a projecting pin which falls into one or other of two notches cut on the upper side of the bolt, and prevents it being moved till the tumbler be raised by the key. The invention of the single-tumbler L. occurred in the 18th c. In 1778 Mr. Barron produced a L. with two tumblers which required to be raised together to a certain height before the bolt could be moved. This L. is the parent of the most secure English locks now made. The wards which were present in Barron's L. have been discarded, but his principle of the many tumblers has been retained, and, in the hands of Messrs. Chubb and other L.-makers of world-wide celebrity, it has been considerably improved and modified. In Barron's L. a slot was made in the centre of the bolt for the passage of the two tumblers, but in the improved tumbler-locks a single *stump* is fixed to the bolt, and a *gating* is cut at unequal heights in the tumblers which are pressed down by springs. As the bolt cannot be moved unless the gating of all the tumblers coincide, making a clear passage for the stump, the bit of the key is necessarily cut into irregular steps to lift the tumblers to different heights. When free to move, the bolt is thrown by the terminal step of the key. Chubb's *detector* L., the subject of several patents since 1818, contains a spring which renders inactive any tumbler that may be raised too high in an attempt to pick the L. This is instantly disclosed on an application of the proper key, and by simply turning the key as if to overlock the bolt, the tumbler comes into play again. Tumbler-locks admit of being enormously multiplied by varying the relative position of the tumblers, reducing the height at which the gating is placed, and by using drill-pins of different diameters. Bramah's L., patented 1784, is yet universally appreciated. Its peculiar feature is an inner rotating barrel with a stud at the back to throw the bolt, but which cannot be moved unless the *sliders* of different lengths, fitted in it, are adjusted to certain positions by slits in the key. A countless number of changes can be rung on the position of the sliders, and on this ground Mr. Bramah claimed that his L. could not be picked. It was long regarded as inviolable, but in 1851, Mr. Hobbs, an American locksmith, succeeded in picking it, as well as the locks of Chubb and other makers. This feat gave rise to a celebrated controversy by which English L.-makers greatly profited. For details of Mr. Hobbs and other American locks, Coterill's and Mordan's English locks on the

Bramah principle, puzzle locks and the numerous other varieties, see Tomlinson's manual on *The Construction of Locks*, and E. B. Denison's (Sir E. Beckett) *Locks* (Edin. 1857) may be consulted with advantage. See also an interesting paper by Mr. Chubb in *Trans. of the Institute of Civil Engineers* (1851), and Mr. Price's treatise on *Safes, Locks, and Keys* (1856).

Lock, in internal navigation, is the part of a canal or river, included between two floodgates, by means of which a vessel may be taken from a higher to a lower, or from a lower to a higher level. By opening the upper gate, the water in the L. is brought to the same level as the water in the higher part of the canal. After the vessel is floated into the L., the upper gate is closed, the water in the L. lowered till it corresponds in level with the water in the lower part of the canal, and the lower gate is then opened so as to allow the boat to pass over. The first locks were constructed at Venice in 1481. In the beginning of the 17th c. the French applied them with success in the construction of canals, which now became a useful means of internal communication. The gates of locks are now very generally opened and shut by hydraulic machinery. See CANAL, DOCK.

Lock, in firearms, is the apparatus by which the powder is ignited. The earliest form was the matchlock, which first appeared towards the end of the 14th c., as an improvement upon the original method of lighting the powder in the touch-hole with a slow match held in the hand. The Nürnberg wheel-lock, which struck fire through the friction of a toothed wheel against a piece of flint or iron pyrites, was introduced in 1517, and was a decided improvement; but both it and the Spanish *snaphaunce* were superseded about 1690 by the *flint-lock*, which continued in general use till the introduction of the percussion caps of the present century. The percussion lock has undergone various modifications, especially in the application of the principle to breech-loading arms. See BREECH-LOADING ARMS, GUN, FIREARMS, &c.

Locke, John, an English philosopher, was born at Wrington, Somersetshire, 29th August 1632, educated at Winchester, and afterwards obtained a reputation for learning at Oxford, specially studying philosophy and physic. In 1665 he acted as secretary to Sir Walter Vane, on a mission to the Elector of Brandenburg; but during the greater part of his after life, though receiving several offers of diplomatic employment or church preferment, he remained a simple country gentleman, spending much of his leisure in the house of Lord Shaftesbury, whose life his medical skill had saved. In 1673 political persecution deprived him of a studentship at Oxford, and drove him to Holland, where was published the first of his admirable *Letters on Toleration*. He had no inconsiderable part in the secret preparations made in that country for the action of the Whig leaders at home. Returning to England after the Revolution, he twice occupied political posts for brief periods, but resigning all such duties on account of ill-health in 1700, he lived in retirement with Sir Francis and Lady Masham, at Oates in Essex, where he ended an upright, noble life on the 28th October, 1704. L. in his *Essay concerning Human Understanding*—begun as early as 1670, published in 1690—laid the foundation of modern empiricism and materialism. Aroused to inquiry by the writings of Descartes, he was not long in becoming dissatisfied with that philosopher's conclusions. Descartes maintained the mind to be a thinking being independent of anything material: L. would almost grudge it the name of a faculty, a mere capacity for receiving sensations. His position is indicated in the well-known words, *Nihil est in intellectu quod non fuerit in sensu*, to which the equally celebrated rejoinder of Leibniz was—*Nisi intellectus ipse*. For L. there are no innate ideas; the appeal to universality as proving the existence of such is vain, for no principle indubitably admitted true by all has yet been discovered. If an idea be innate, the mind must recognise it; but does a child recognise, for instance, that 'it is impossible for a thing to be and not to be?' The mind is originally a blank sheet, wherein experience writes all we know. It gains all its ideas by means of *sensation* or *reflection*—either through perception of external objects by the special senses or by bestowing attention on its own internal operations. *Simple* ideas are received from elsewhere: by a single sense (e.g., the idea of sound), by several senses (e.g., extension), by reflection (e.g., idea of will), or by sensation and reflection together (e.g., idea of unity). *Complex* ideas are combinations of simple. The qualities of external

bodies are *primary* or *secondary*. The first are such as are inseparable from the object, as extension, solidity, &c.; the second are merely powers of producing sensations in us by means of primary qualities. To this class belong colour, sound, &c. The notion of substance arises from the recognition of recurring simple ideas in certain fixed combinations. L. held ideas to be the only things immediately known, but the correspondence of these with external realities he failed to establish; for to be consistent with himself, he was bound to deny the possibility of comparison. By his preference for subjective reality over objective, it can easily be seen how he made way for the idealism of Berkeley, and the scepticism of Hume. Of L.'s other writings the most considerable are *Treatises of Civil Governments*, *Thoughts Concerning Education*, *Reasonableness of Christianity*, *Examination of Malebranche's Opinion that we see all things in God*, *A Discourse of Miracles*, *Memoirs of Lord Shaftesbury*, *Of the Conduct of the Understanding*, supplementary to the *Essay*, and several vindications of his system from attacks of contemporaries, notably those of Bishop Stillingfleet. Several editions of L.'s works have been published; the best is that in 10 vols. (Lond. 1801 and 1812). Lord King, a descendant of L.'s sister, wrote a life of the philosopher from the family papers (Lond. 1829; new ed. 1858), but the first complete biography is that by H. R. Fox Bourne (2 vols. Lond. 1876).

Locked-Jaw. See TETANUS.

Lock'erie ('the town of Loki,' a memorial of a Danish occupancy), a market-town of Scotland, in Dumfriesshire, and a junction on the Caledonian Railway, 10 miles E.N.E. of Dumfries. It has the largest and latest lamb fair in Scotland (second Thursday in August), at which as many as 40,000 lambs are occasionally on show. A weekly market is held on Thursday. Pop. (1871) 1960.

Lockhart, John Gibson, an English author, was born in the manse of Cambusnethan, Lanarkshire, 1794. Educated at Glasgow university, he obtained a Snell Exhibition, took first-class honours at Balliol College, Oxford, in 1813, and was called to the Scotch Bar in 1816. At the bar he failed, and on the institution of *Blackwood's Magazine*, he joined the rank of contributors, writing wittily and wickedly on a variety of subjects. In 1820 he married Sir Walter Scott's eldest daughter. He wrote, along with Professor Wilson, *Peter's Letters to his Kinsfolk*, which give lively pictures of society of his time. In 1821 appeared his novel of *Valerius*, a Roman story, one of the finest of its class in English literature; in 1822 *Adam Blair*; in 1823 *Reginald Dalton*, and his spirited translation of *Ancient Spanish Ballads*. In 1825 he undertook the editorship of the *Quarterly Review*, into which his pen distilled bitterness for many years. His great work, the *Life of Scott* (7 vols. 1837-39), written with delicacy and accuracy, will live when people have forgotten that he had anything to do with politics. His other works are *Matthew Wall*, a novel (1824), *A Life of Burns* for Constable's Miscellany (1828; 5th ed. 1854), and *A Life of Napoleon* (1829). He died at Abbotsford, 25th November 1854. L. was highly cultured, and literary ardour sometimes flashed with rare brilliancy; but an unbridled passion for satire narrowed the range of his sympathies, and repressed the action alike of his imagination and his intellect. See Dr. R. Shelton Mackenzie's *Memoir of J. G. L.*, prefixed to an edition of the *Noctes Ambrosianæ* (New York, 1855).

Lockport, a city of New York, U.S., on the New York Central Railway and the Erie Canal, 18 miles from Niagara Falls and 8 from Lake Ontario. It is named from its double tier of five canal locks, by which boats are passed up and down the 'mountain ridge,' a height of 60 feet. L. has a large trade in grain and fruit (\$1,750,000 worth yearly of apples alone), and manufactures of 'holly waterworks,' engines, steam-dredges, lathes, patent medicines, &c. Near it are large quarries of blue limestone. There are three daily and six weekly (one German) newspapers. Pop. (1870) 12,426.

Lockyer, Joseph Norman, F.R.S., a living astronomer and spectroscopist, was born at Rugby, May 17, 1836. In 1857 he entered the War Office, and in 1870 was appointed Secretary of the Royal Commission on Scientific Instruction and the Advancement of Science. In 1869 he became a Fellow of the Royal Society, from which he received in 1874 the Rumford

Medal. As Director of the Government Helios Expedition he visited Sicily in 1870 and India in 1871. As a physicist he is widely known for his discoveries in spectrum analysis. The most important of these, discovered about the same time by Jansen, is the method for observing the solar prominences without the aid of a total eclipse, which L. proposed in 1866 and applied in 1868. His chief works are *Elementary Lessons in Astronomy*; *Contributions to Solar Physics* (1873); *Spectroscope and its Applications* (1873); *Primer of Astronomy* (1874). He has besides published various papers and memoirs, and is the editor of *Nature*.

Locle, Le, a frontier town of Switzerland, canton of Neuchâtel, 38 miles N.N.E. of Lausanne, and 6 miles S.W. of La Chaux de Fonds by rail, has a very large manufacture of watches. Pop. (1870) 10,333.

Lo'cri, a people of ancient Hellas, divided into the three tribes of the L. Ozolæ, dwelling to the N. of the Gulf of Corinth, and the L. Epineimidiæ and L. Opuntii, on the shores of the Eubæan Sea. The two last claimed to be Autochthons, and are mentioned by Homer (*Il. ii.* 527-535); the L. Ozolæ first appear in history during the Peloponnesian War, but are believed to have founded L. Epizephyrii (683 B.C.), a town of Magna Græcia, on the S.E. coast of the Bruttian peninsula, 13 miles N. of the promontory of Zephyrium (*Capo di Bruzzano*), and 4 miles from the modern Gerace (q. v.). This city, famous as possessing the first written code of laws in that of Zaleucus (circa 660 B.C.), after a long alliance with Syracuse against Rhegium, submitted to Rome in the early part of the 3d c. B.C., but revolting to Hannibal (215) was not recovered by the Romans until 205. It existed as a *civitas* as late as the reign of Valentinian II. (A.D. 375-392), and was probably destroyed by the Vandals in the 5th c.

Lo'cus, in geometry, is the curve described by a point, or the surface generated by a line, moving in a given manner. Thus, if a point move so that its distance from two given points is the same, it describes a right line, which bisects perpendicularly the line joining the two fixed points. Similarly the ellipse is the L. of a point, the sum of whose distances from two fixed points is constant; and the hyperboloid of one sheet the L. of a right line which rests upon three fixed lines.

Lo'cus Delicti, an expression of criminal law, denoting the place where a crime was committed.

Lo'cus Poeniten'tiæ, a legal phrase denoting the time allowed to withdraw from a bargain. The general rule of law is that both parties are legally bound at the same time; and that, until the contract is finally ratified, either may retract. This rule may, however, be modified by *Rei Interventus*.

Lo'cust (*Locusta*), a well-known genus of *Orthopterous* insects, having simple and short antennæ, large wings and wing-covers, and no projecting ovipositor. They have been noted from the most remote antiquity for their powers of destroying vegetation. The most familiar form is the Migratory L. (*L. migratoria*), attaining a length of 2 or 2½ inches, and which occurs in S. Europe, Asia, and N. Africa, but especially in S. Africa. Vast multitudes of these insects pass over large areas, devastating the districts, and consuming the entire vegetation. They possess great powers of flight, and as the hinder legs are very long, they are able to take leaps of considerable extent. In the mouth, mandibles, and maxillæ, or larger and smaller jaws, adapted for biting, occur. Locusts undergo an incomplete metamorphosis, the young coming from the egg in a form closely resembling that of the perfect insect—this latter fact possessing a distinct bearing upon their rapid increase and development. The natives of S. Africa light large fires during the flight of locusts, and thus contrive to obtain great quantities of them, as they fall to the ground stifled by the smoke and heat. The young locusts, destitute of wings, are able to march swiftly over a large district, and cross small streams, and deep trenches, on the bodies of their drowned neighbours. Gordon Cumming, in speaking of the L.,

Locust (*Locusta*).

says 'Locusts afford fattening and wholesome food to man, birds, and all sorts of beasts; cows and horses, lions, jackals, hyenas, antelopes, elephants, &c., devour them.'

Locust Tree is applied in different countries to various distinct species of Leguminosæ. The carob tree of the Mediterranean region (*Ceratonia Siliqua*) bears the name from its being supposed to be the 'locusts' used by St. John as his wilderness food, this supposition imparting also the further name of St. John's Bread. It is a small tree of 20 to 30 feet, with pale red wood, yellow flowers, and pods containing much sweet mucilage; they are now used largely as food for domestic animals, and are sold in small shops as sweets for children. The L. T. of the W. Indies (*Hymenæa Courbaril*), was so called by the early Spanish voyagers from a fancied likeness of fruit to the above. It grows to a colossal size, is of remarkable longevity, and yields excellent timber as regards hardness and weight. The seeds of the woody legume are enclosed in a sweet mealy pulp much relished by the natives. The false acacia (*Robinia Pseud-Acacia*) is the L. T. of N. America. It was early introduced into Europe, and in parts of the Continent is now as wild-looking as its ally the native laburnum. It is one of the best trees for improving poor ground. The strong, hard, and durable wood is useful for a variety of purposes, as axle-trees, tree-nails, for turning, &c. The Honey L. T. of America is a *Gleditsia*. It is also known as the Sweet L. and Black L. It is a native of the Alleghany valleys and the basin of the Mississippi, reaches a height of 75 feet, and has small greenish spikel flowers. The seeds are surrounded with a sweet pulp, from which sugar has been made.

Lode (from the verb to 'lead'; the form is also seen in lodestone and lodestar), a technical mining term for a metalliferous mineral vein.

Lodève (anc. *Luteva*), a town of France, department of Hérault, 30 miles W.N.W. of Montpellier by rail, has manufactures of cloth, ropes, soap, &c., and a trade in wood, wines, dyestuffs, and wool. L. is the birthplace of Cardinal Fleury. Pop. (1872) 8791.

Lodged, in Heraldry, is applied to an animal of the chase, like *couchant* to a beast of prey, to signify that it is *lying down*.

Lodgers and Lodging Houses. 14 and 15 Vict. c. 34 is by the preamble 'to encourage the establishment of well-ordered lodging houses for the labouring classes.' With the approval of the Secretary of State, it may be adopted by any parish having a population of 10,000. The Act provides for the levying of rates for the construction of L. H., and for the constitution of councils and commissioners. A *Common Lodging* is defined by the Act to be a house (not being a licensed victualler's) let wholly or in part at a rent not exceeding 3s. 6d. per week. The keepers of these must register them, and they are liable to be inspected by an officer of the Board of Health. The law of LANDLORD AND TENANT (q. v.) applies generally to the relationship of householder and lodger. The furniture of any room let as a lodging is *hired* by the lodger. See **HIRING**.

Lodging-Money, an allowance made to soldiers in certain cases in lieu of barrack-accommodation. The amount paid in this way in 1876 was £30,000 for the regular, and £90,000 for the reserve forces.

Lo'di (a corruption of the Rom. *Laus Pompeia*), a town of Italy, province of Milan, on the Adda, 20 miles S.E. of Milan by rail. It has a cathedral of the 12th c., other churches, rich in marbles, frescoes, and wood-carvings, industries in majolica, silks, linens, &c., and a great trade in Parmesan cheese. Pop. (1874) 19,088. After the passage of the long narrow bridge of L., under full fire of the Austrian batteries, Napoleon won the memorable victory that secured him the possession of Lombardy, 10th May 1796.

Lo'di, the name of the Mohammedan dynasty that preceded the Moguls at Delhi. It was of Afghan origin, and had previously established itself at Lahore in the Punjab. In 1450, Belol L. drove the last of the Sayyids from Delhi; his brother conquered Behar; but his son, Ibrahim, was completely defeated and killed at the first battle of Paniput, in 1526, by Baber, the founder of the Mogul Empire.

Lodz (Russ. *Lodsi*), a town of Russia, government of Petrokov, 87 miles S.W. of Warsaw by rail, called the 'Manchester

of Poland,' has extensive manufactures of cotton and woollen cloth. Upwards of 15,000 operatives are employed in both manufactures. Fifty years ago L. had only a few hundred inhabitants; in 1870 its pop. was 34,328.

Löss (Ger. *löss*, from *lösen*, 'to loosen'), a fluviatile deposit of fine arenaceous calcareous clay. The L. of the Rhine valley may be taken as a typical example. It is a yellowish grey unstratified loam, attaining in some places a thickness of several hundred feet, and abounding in terrestrial and freshwater shells. Similar deposits are found in the valleys of other great rivers in Europe, and the fine powdery structure of the L., which renders it very liable to be washed away, indicates that the whole valleys must have been covered with still water. It is more recent than any other rock in its neighbourhood, and near Basel caps hills 1200 feet above the sea. The central portions of Europe must then have been depressed at a comparatively recent geological period; and as the land rose, the L. became uncovered, and subsequently deeply cut by the rivers which now flow through the valleys. Consequently these L. deposits form in many places high banks on both sides of rivers. L. deposits fill the lower valleys of the Nile, Mississippi, and Missouri.

Lofoten, less correctly **Lofoden**, the largest group of islands belonging to Norway, stretches 140 miles along the coast of Norway, from which it is separated by the Vestfjord. The surface is wild, with sharp cliffs, here forming frightful breakers on the shore, there towering in jagged peaks to the snow-line. Area, 212 sq. miles; pop. (1875) 22,000 (including Vesteraalen group). Owing to the cold climate, which changes little from summer to winter, trees are scarce, and tillage is only possible in a few spots. Cattle keeping is more successful, but the shoals of cod that yearly (especially in February and March) spawn on the coasts are the chief source of livelihood. Over 4000 boats and 20,000 men are employed in fishing. The average yield is 20,000,000 fish, worth £220,000.

Log is the apparatus used at sea for determining the rate of a ship's progress. It consists of a sector-shaped piece of wood, of 5 or six inches radius and a quarter of an inch thick, loaded round the rim so as to float perpendicularly with about two-thirds of its mass immersed, and its apex pointing upwards. To it is fastened one end of the *log-line*, which is wound round a reel in the stern part of the ship. When about to be used, the L. is flung overboard, and the length of line run out in a given time observed. This length is measured by knots placed along the line at such distances from each other that the number run out in half a minute gives at once the nautical miles or *knots* per hour. A ship's *L.-book* is the journal in which the various particulars regarding the vessel's progress, latitude, longitude, &c., are entered as often as they are ascertained.

Lo'gan, John, was born at Soutra, Midlothian, in 1748. After studying at Edinburgh University, he became for a time tutor in the family of the Sinclairs of Ulbster. In 1770 he edited the poems of his friend Michael Bruce, then three years dead, adding to these several original compositions. One of the poems in the volume was the well-known *Ode to the Cuckoo*, claimed by L., but by not a few ascribed to Bruce (q. v.). In 1774 L. was appointed minister of South Leith church. This charge he laboured in for many years with much success, preaching sermons whose effect, when ultimately edited and published by Blair (2 vols. 1790; 5th ed. 1807), was astonishing. In 1781 he produced his *Poems and Elements of the Philosophy of History*, and three years later a tragedy entitled *Kunnimede*, which failed on the boards of the Edinburgh theatre. In London, whither he had gone to carry on literary work, he died, 28th December 1788. L. was a graceful and natural poet, and the finest sermon writer among the Scottish clergy of the 18th c.

Logan, Sir William Edmond, a celebrated Canadian geologist, was born at Montreal, 23d April 1798. He graduated at Edinburgh, and in 1818 went to London, where he entered the bank of his uncle. In 1829 he became director of copper-smelting works at Swansea, Glamorganshire, where he soon began to direct his study to geology. His researches among the coalfields attracted the attention of De la Beche, at that time the director of the English Geological Survey. In 1841 L. returned to Canada, and upon the formation of the Canadian Geological Survey was nominated its director. He began op-

rations in 1843, and by his subsequent researches, especially among the ancient Laurentian deposits, established a world-wide reputation as a geologist. At the Paris Exhibition of 1855 he was presented with a gold medal, and the succeeding year was made a knight. L. died at Castle Malgwyn in Pembrokeshire, June 22, 1875.

Logania, *ceæ*, a small natural order of exogenous plants, consisting of a heterogeneous group of trees, shrubs, and herbs, ranging over the tropical regions of the New as well as of the Old World, with a few extra-tropical species in the southern hemisphere and in N. America. The species number nearly 200, several of which are highly poisonous. See STRYCHNOS, NUX VOMICA, IGNATIUS' BEAN, WOORALI, and UPAS.

Logarithm. The L. of a given number is the power to which another given number must be raised in order that it may equal the former. Thus in the equation $N = ax$, x is the L. of N to base a . By changing a , we change the value of the L. of the same N , and pass to a new system of logarithms with the new value of a for its base. Whatever the system, the L. of its base is unity, since $a = a^1$; and this is the definition of the base. For instance, let us take $a = 2$. Then from $1 = 2^0$, $2 = 2^1$, $4 = 2^2$, $8 = 2^3$, $16 = 2^4$, &c., we obtain at once $0 = \log. 1$, $1 = \log. 2$, $2 = \log. 4$, $3 = \log. 8$, $4 = \log. 16$, &c. In this way we may construct a rough table of logarithms, which evidently increase in arithmetical progression as the numbers increase in geometrical progression. Thus writing the natural numbers in a line, we may set underneath them the numbers of which, according to our present system, they are the logarithms:—

log.	0	1	2	3	4	5	6	7	8	9	10
num.	1	2	4	8	16	32	64	128	256	512	1024

These of course give the logarithms of a very few of the numbers; but they will be sufficient to indicate the practical value of logarithmic tables. All we can determine about the L. of any other number not in the lower line is between what whole numbers it lies. For instance the L. of 29 must be somewhere between 4 and 5, the L. of 1000 somewhere between 9 and 10. The great value of logarithms lies in their following properties; by their means we substitute addition for multiplication, subtraction for division, multiplication for involution, and division for evolution. For example, it is required to multiply 16 by 32. From one table we get the logarithms (4 and 5) of these numbers, then run one eye along the line of logarithms till we find the number (9) which equals the sum of these. Under 9 we find its corresponding number 512, which is therefore the product of 16 and 32. The various properties of logarithms are simple deductions from the law of indices, and may be generally proved thus. Let $M = a^m$, $N = a^n$, or $m = \log. M$, $n = \log. N$ to base a . Then $M \times N = a^m \times a^n = a^{m+n}$ or $(m+n) = \log. (M \times N)$; $M \div N = a^m \div a^n = a^{m-n}$ or $(m-n) = \log. (M \div N)$; $M^p = a^m \times a^m \times a^m$ to p times $= a^{pm}$, or $pm = \log. (M^p)$. To all bases, $\log. 1 = 0$ since generally $1 = a^0$; and $\log. 0 = -\infty$.

The theory of logarithms, and the methods for finding numerical values to any given base, depend upon the expressing of ax in a convergent series of convergent powers of x . This series is as follows—

$$ax = 1 + Ax + \frac{A^2x^2}{1 \cdot 2} + \frac{A^3x^3}{1 \cdot 2 \cdot 3} + \frac{A^4x^4}{1 \cdot 2 \cdot 3 \cdot 4} + \dots$$

where A is some determinate function of a . To find it, put $x = \frac{1}{A}$; then

$a^{\frac{1}{A}} = 1 + 1 + \frac{1}{1 \cdot 2} + \frac{1}{1 \cdot 2 \cdot 3} + \dots = e$ suppose a fixed finite quantity. Hence $A = e^A$ or $A = \log. a$ to base e . This base e , whose value is 2.718281 to the sixth decimal place, is the base of the natural system of logarithms. This system is also known as the Napierian, from the name of the discoverer and first tabulator of logarithms, Napier of Merchiston, near Edinburgh. It is the system which occurs constantly in the higher analysis; but as a system for calculation it is inconvenient. Our common logarithmic tables are constructed upon the system whose base is 10; so that $2 = \log. 100$, $3 = \log. 1000$, and so on. The formula given above for ax may be written

$$ax = 1 + x \log. a + \frac{x^2 \log. a^2}{1 \cdot 2} + \frac{x^3 \log. a^3}{1 \cdot 2 \cdot 3} + \dots$$

where, it is understood, $\log. a$ is calculated to base e . From this

series we can find the number of a given L., provided we know the Napierian L. of the base. Given the number to find the L. requires another formula, which is easily proved, and may be found in any ordinary text book of algebra. It is

$$\log. (1+x) = M \left(x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \frac{x^5}{5} - \dots \right)$$

where M is the modulus of the system. In the Napierian system it is unity; and for any other, is the reciprocal of the Napierian L. of the base. The *logarithmic curve* is a transcendental curve having the general equation $x = e^{ay}$. The *logarithmic spiral* has the polar equation $r = e^{\theta}$. It has several remarkable properties, and is interesting as being the path which would be pursued by a body under the action of a central force varying inversely as the cube of the distance.

Loggia (Ital. 'lodge,' Fr. *loge*) a term applied, in Italian architecture, to a vaulted hall open on several sides, like the L. de' Banchi in Genoa or the L. de' Lanzi in Florence; to an open arcade along the side of a building, as the L. of the Vatican, adorned with the pictures of Raphael; or to a Belvedere (q. v.) built upon a flat roof.

Logic is the science of inference. Knowledge divides itself into two parts:—first, a part discovered immediately by direct consciousness; second, an indirectly known part, reached by proofs and reasons. With this second and larger part L. has to do. Inference is carried on by means of three statements, each of which contains two names and the verb 'is.' The names, or terms, coupled by the verb, make a *proposition*; and three propositions make an argument, or *syllogism*. These three italicised words indicate the parts of logical doctrine. If the process of inference consist in comparing two or more general propositions synthetically, and thus forming a third proposition or conclusion of less general import, it is named deductive reasoning; but if the process be one of generalisation, a passing from individual facts to laws, it is then named inductive reasoning. As having to do with the forms of reasoning upon every subject, L. has been defined as 'the science of sciences,' and the 'art of arts.' It is not merely speculative but practical; it teaches the true value of words, guarding against ambiguities of thought and expression, especially proving serviceable in the exposure of all fallacies. The father of L. is undoubtedly Aristotle. His six treatises entitled the *Organon* discuss what is now called formal L. Under the name of Analytic, and applied L. under the name of Dialectic. The term 'L.' was not applied to the contents of these books till five hundred years after Aristotle's death. See DEDUCTION, INDUCTION, SYLLOGISM, &c.

Logographers (Gr. *logographoi*, 'prose writers') was a name given by Thucydides to the early Greek historians from Cadmus of Miletus to Herodotus, and afterwards applied generally to the old chroniclers before Herodotus. The L. translated into unmetrical language the legends, genealogies, theogonies, and mythological fables of the Epic poets. These rude beginnings of historical writing displayed no logical connection, and were compiled less with a view to state truth than to give pleasure. The word meant also 'writing speeches,' and was applied, generally as a term of reproach, to those who lived by writing speeches for others to deliver. In Latin, it was applied to 'an accountant,' and logography is a method of printing in which a type represents a word, instead of forming a letter.

Logomania, or **Disease of the Faculty of Language**. It frequently happens, in connection with cerebral lesions, that, although the ideas are clear and distinct, and the faculty of speech but slightly impaired, it is impossible to represent the ideas in words by their appropriate symbols. A patient, suffering from hemiplegia, understood thoroughly the nature of the questions asked, and the appropriate answers, and was able to articulate 'yes' and 'no' distinctly, but could not represent the idea by its appropriate symbol. Sometimes L. seems to depend on a defect in memory, variously represented. In some cases the defect is in regard to names or dates, in others to substantives, or to parts of words. Cerebral lesions, as the result of fever, or organic disease of the brain, may so affect the memory as to obliterate acquired languages, and it occasionally happens that the foreign or acquired language is used with greater fluency

than the native language. Cases of true L. are extremely rare, and they depend more frequently on functional disorder than on organic disease.

Log'os (Gr. 'word'). After the Captivity, the Jews finally abandoning their tendency to lapse into Polytheism and also their anthropomorphic notions about Jehovah, came to regard him as a pure, pervading spirit, between whom and the material universe there could be no direct contact. Hence in interpreting their old books, they began to personify his attributes as the instruments of this contact. God made the world, and communed with men by his Word (Memra), by his Angel or Messenger, by his Wisdom (cf. Prov. viii. 22-31). The Law was delivered 'by the disposition of angels' (cf. Acts vii. 53), or by one, the angel of the Law (cf. Gal. iii. 19), but the ordinary representative of God was the Memra or Divine Word. Meanwhile, according to Plato, the universe, which was the expression of the idea of God, was not fashioned by the supreme thinker, but by his active thought, the L., the Demiurge (q. v.). And while the Hebrew teaching proper held by the personification of the Divine Wisdom, the Greek conception of the L., as a subordinate deity, was incorporated with Hebrew thought at Alexandria, especially by Philo (q. v.). In the Platonic L. Philo found the means of reconciling the Jewish Scriptures with Gentile philosophy, toning down the Pantheistic conception of God held by the latter, and explaining away the narratives of the former, in which God is represented in form, thought, and action as a man. The L., according to Philo, was 'a second or delegated God,' 'the first-born son of the Eternal Father,' 'the express image of his person,' 'the word of God by whom the world was made.' There was, however, another current of thought among the Jews at this time, and that was the expectation of the Messiah (q. v.). At first this took the form simply (1) of the hope of entire deliverance from all foreign dominion, and the restoration of the nation to the position of power and prosperity which it enjoyed in the golden age of the reign of David. With the more spiritual-minded—e.g., the Essenes—the expectation took (2) the form of looking for the fulfilment of the prophecy of Malachi, that the Lord himself would come to establish his kingdom; while the Philonic school (3) identified it with the L. idea. These different forms of the Messianic expectations are traceable in the four Gospels. The first two permeate the first three Gospels, and the third pervades the fourth, being most distinctly expressed in the introduction. Only the word goes a step beyond Philo, and identifies the Divine Word with Jesus of Nazareth: in him 'the Word was made flesh' (John i. 14). See Milman's *Hist. of Christianity* (1840), Hunt's *Essay on Pantheism*, Works of Philo, Bryant's *Philo-Judeus* (1797), Liddon's *Bampton Lectures* (1867).

Logroño, a town of Spain, capital of a province of the same name on the Ebro, 60 miles E.N.E. of Burgos by rail. It is well built, has a theatre, several educational and literary institutions, and a brisk trade in wine, olive oil, and fruits. Pop. 11,239. L. is the *Julia Briga* of the Romans.

Log'wood, the wood of *Hæmatoxylon* (Gr. 'blood-wood') *Campechianum*, belonging to the natural order *Leguminosæ*. It is the most valuable and extensively used dyewood of commerce, and is obtained from the W. Indian islands and Central America. The tree attains a height of from 20 to 40 feet, with a diameter of 18 inches, but as only the heart-wood is of value for tinctorial purposes, the billets imported are about 3 feet long, and 6 to 8 inches in diameter. The heart-wood is exceedingly hard and dense, having a deep brown, but when freshly cut a bright red colour. In order to extract its tinctorial principle the wood is chipped or rasped down by powerful machinery. The colouring matter—*Hæmatoxylum*—is readily extracted either by alcohol or by boiling water. The infusion, obtained with boiling water, has a fine deep purplish-red colour, which may be varied by treatment either with acids or alkalies. L. is chiefly employed in calico printing, in which with appropriate mordants it yields a great number of shades of red, violet, lilac, grey, and a fine velvety black. It is also used in the dyeing of silk and wool, and both on account of its cheapness and the ease with which it can be worked, it is a favourite material with dyers. L. is also used in the manufacture of ink, both black and red.

Medicinal Properties of L.—L. is a mild, unirritating astringent, and is used in cases of atonic dyspepsia, passive hæmorrhages, chronic diarrhoea, and dysentery. *Dosage* of L. is given in doses of from 1 to 2 oz., and the *extract* in 10 to 30 grains.

Loahardugg'a, a small town in Chota Nagpur, Bengal, British India, 113 miles N.W. of Calcutta, has given its name to the *district* of L., which has an area of 12,044 sq. miles; pop. (1872) 1,237,123. The chief town is Ranchi, with a military cantonment at Dorunda—the home of the hill tribes of Coles and Oraons, who have formerly given trouble. There are two tea plantations and some coal-mining. The only manufacture is shell-lac and lac-dye; the staple crop is rice. The Anglican and German missions had obtained 27,511 converts in 1874.

Loigny, a village of France, department of Eure-et-Loir, 18 miles N.W. of Orleans, was the scene of a defeat of the left wing of the French army of the Loire, after severe fighting, by the Grand Duke of Mecklenburg, commander of the right wing of the army of Prince Friedrich Karl, 2d December 1870.

Loire (the *Liger* of the Romans), the largest purely French river, rises in the Cevennes, flows N.W. and W. through the centre of France to the Bay of Biscay, receiving from the right the Loir, and from the left the Allier, Cher, Indre, and Vienne. It is 700 miles long, has a rapid course, and is navigable for 450 miles. Shifting sandbanks, shallowness in summer and ice in winter, retard the navigation, and its lower course is provided with high embankments and a lateral canal (since 1838) to guard against inundations. The basin of the L. comprises one-fourth of 'the garden of France.' The river put a check to the German operations, and formed the basis of the French army to the close of the war of 1870-71.

Loire, a department in the S.E. of France, bounded N. by Saône-et-L. and Allier, S. by Haute-L. and Ardèche, E. by Rhône, and W. by Puy-de-Dôme. Area, 1838 sq. miles; pop. (1872) 550,611. It is traversed from S. to N. by the L. and by the Paris-à-Agen Railway, is watered in the W. by the Lignon, and touches the Rhône in the S.E. Bordered on the N.E. by the Monts du Lyonnais, and on the S.W. by the Monts du Forez, it has extensive iron and lead mines, and the richest coal-fields of France. There are also quarries of marble, porphyry, granite, and flint, and manufactories of silks, iron, and steel wares, flint-glass, &c. Some 355,000 hectolitres of wine are annually produced, almost entirely in the region of the Rhône. Of many mineral springs the chief are at St. Alban, Montrbrison, Sail-les-Bains, and Roanne. The chief town is St. Etienne.

Loire, Haute, a central department of France, bounded N. by Puy de Dôme and Loire, S.E. by Ardèche, S.W. by Lozère, and W. by Cantal. Area, 1917 sq. miles; pop. (1872) 308,732. The surface is broken by three volcanic offshoots of the Cevennes, Mont Méyène in the S.E. attaining a height of 5763 feet, and is watered by the Loire and its tributary, the Allier. The climate is one of extremes, and agriculture is in a backward state, stock-rearing being the principal industry. There are manufactures of lace, silk, blond, paper, and cloth; and coal (1,140,000 tons yearly), marble, lead, building-stone, &c., are extensively raised. Three branch lines of the Paris-à-Lyon Railway traverse the department. The chief town is Le Puy.

Loire-Inferieure, a maritime department in the W. of France, bounded N. by Morbihan and Ille-et-Vilaine, E. by Maine-et-Loire, S. by Vendée, and W. by the Bay of Biscay. Area, 2654 sq. miles; pop. (1872) 602,206. The surface is flat and monotonous, marshy along the coast, and is watered by the Loire, with its tributaries the Erdre (joined by a canal to Vilaine) and Sèvre, and by several streams flowing into the Lac de Grandlieu (15 sq. miles). The climate is mild and moist, the soil fertile, but badly cultivated, one-half being under tillage, one-fifth heath, one-sixth in pasture, and the remainder vineyards (yielding annually 22,000,000 gallons of an inferior wine), oak-forests, &c. There are manufactures of cotton, linen, glass, leather, paper, &c.; extensive herring and sardine fisheries; and rich iron, coal, marble, and granite deposits. Three railways and two canals traverse the department. The chief town is Nantes.

Loir-et, a central department of France, bounded N. by Seine-et-Oise and Seine-et-Marne, E. by Yonne, S. by Cher, and W. by Loir-et-Cher and Eure-et-Loir. Area, 2614 sq. miles; pop. (1872) 353,021. It is intersected in a N.W. direction by the Loire, and by the Plateau d'Orléans, a range of

hills nowhere exceeding 800 feet. The climate is mild, the soil fertile and well cultivated, one half of the surface being under crops (wheat, barley, maize, &c.), one quarter forest, and the remainder pastures and vineyards (yielding 5,300,000 gallons of wine annually). Cattle rearing is an important industry, and there are manufactures of sugar, vinegar, brandy, porcelain, &c., and a trade in grain, spirits, honey, cattle, and wool. Four canals and three lines of railway traverse the department. The chief town is Orleans.

Loir-et-Cher, a central department of France, lies on both sides of the Loire, and is bounded N. by Eure-et-Loir, S. by Indre, W. by Indre-et-Loire and Sarthe, E. by Loiret and Cher. Area, 2452 sq. miles; pop. (1872) 268,801. It is watered by the Loir in the N., the Cher in the S., and in the centre by the Loire and its tributaries. The surface is flat, and the soil singularly rich to the N. of the Loire, but in the S. are the partly sandy, partly marshy plains of Bologne. The products are wheat, hemp, wine (980,000 hectolitres, valued at ten millions of francs), fruits, and vegetables. The chief town is Blois.

Loja, or **Loxa**, (1) a town of Spain, province of Granada, on the Xenil, 34 miles N.N.E. of Malaga, has considerable manufactures of wool and paper. On the hill above the town are the remains of a Moorish castle. Pop. 17,500.—(2), a town in the republic of Ecuador, S. America, 250 miles S. of Quito, near which are gold, quicksilver, and coal mines, marble quarries, and extensive woods of Cinchona trees, producing excellent Peruvian bark. Pop. 10,000.

Lokeren, a town of Belgium, province of E. Flanders, on the Durme, an affluent of the Scheldt, 11½ miles E.N.E. of Ghent, and 25 miles W. of Malines by rail. It has an important corn trade, and manufactures of cotton, linen, damask, laces, &c. Pop. (1874) 17,971.

Lo'ki, in Scandinavian mythology, the representative of the evil principle, was born of a giantess, and was fair of face, with a deceitful soul. By the giantess Anguboda ('anguish-boder') he produced three monsters, Hel (q. v.), the wolf Fenrir ('ruin'), and the Snake of Midgard. His ill deeds, especially the death of Balder, provoked the Æsir, who pursued him till they caught him in a waterfall. Taking his two sons, Vali and Nafli, they changed one to a wolf, which killed the other; then they bound L. upon three great stones with his son's entrails, which hardened to iron. Skadi hung a snake above him, whose venom should poison his face; but Sigyn, his faithful wife, according to the *Younger Edda*, stands over him, catching it in a basin. Whenever the overflowing drops touch him, he starts, shaking the world with earthquakes, till Ragnarök, when all chains shall break, and L. shall rise with the giants to fight the last battle with the Æsir on the plain of Vigrid.

Lokmān, an Arabian sage of unknown antiquity, whose name has been given to a collection of fables, commonly used as a text-book for students of Arabic. Of Indian origin—many of them appearing in the *Panchatantra*—these passed into Arabia through Greek and Syriac channels, probably in the 15th c. Tasteless in themselves, and corrupt in style, they have yet been translated into Latin by Erpenius (1615), into German by Olearius, French by Tannegney, Spanish by Ascensio, Danish by Rask, &c., while of countless editions may be mentioned those by Freytag (Bonn, 1823), Helot (Par. 1847), and Derrburg (Berl. 1850).

Loligo, a genus of *Cephalopoda* (q. v.), or Cuttlefishes, including those forms popularly named 'Squids,' and belonging to the family *Teuthidae*. The L. has ten arms, two being longer than the others, and provided with suckers at their extremities only. The body is long, and has two triangular posterior fins. *L. vulgaris* and *L. media* are very common species.

Lolium. See DARNEL and RYE-GRASS.

Lolland, or **Laa'land** ('low land'), an island of Denmark, lying in the Baltic, before the S. entrance to the Great Belt, S. of Seeland, E. of Langeland, and W. of Falster. Area 457 sq. miles; pop. 63,953 (including the neighbouring islets). The surface is low and flat, with great forests of oak and beech, and willow fences. The chief town is Nakskov.

Lollards were a religious sect which arose about the beginning of the 14th c. at Antwerp. The name has been derived

from the Low-German *lollen* (comp. Eng. *lull*, in lullaby), and is supposed to denote mumbfars or chanters of prayers. They spread quickly both in Germany and the Netherlands, and their name covered a great religious movement in England, which lasted for more than a century. In England, however, the name L. got mixed up with a native word *Lollers*, meaning 'loungeurs,' 'idle vagrants,' and was used by orthodox churchmen as a term of scorn and insult for the followers of Wiclif. Hence the Wiclifites sometimes threw back the word at their assailants, declaring them to be the real 'lollers.' (See *Note to the Shipman's Prologue*, l. 1173. Skeat's *Chaucer*: Clarendon Press Series, 1874.) In 1382, with John Wiclif at their head, the heretics of this name were impugning within the Catholic Church of England the doctrine of transubstantiation, until a royal writ ordered the instant banishment of all favourers of Wiclif. His death was a great blow to their progress, for it then ceased to be an organised movement. But out of 'the floating mass of opinions which bore the name of Lollardry, one great faith gradually evolved itself, a faith in the sole authority of the Bible as a source of religious truth.' At the same time (1395) a petition, which represented their views to Parliament, bore strong denunciations against clerical wealth, and professions of disbelief in priesthood, pilgrimages, and image-worship. Under Richard II. the L. were protected and encouraged; Henry IV. and Henry V. persecuted them, 'and so utterly had Lollardism been extinguished, that not one of the demands touches upon religious reform, when John Cade led a revolutionary population' (1451). But it passed into Scotland, and smouldered there all through the 15th c., finally breaking out into something like a premature Reformation among the gentry of Ayrshire in the year 1494. For an account of the L. of Kyle, see John Knox's *History of the Reformation*.

Lombard Architecture, from its grandeur and solidity of construction, is the most important species of Romanesque (q. v.) architecture in Italy. Of this style there are some specimens in Switzerland, but the chief in Italy include the cathedral of Modena (1099-1184), the cathedral of Novara, which, with churches of St. Zeno in Verona, St. Michele in Pavia, and St. Ambrogio in Milan, is of the 11 c., and the cathedral of Parma, of the 12th. They are distinguished by highly artistic cross vaultings, by insulated towers, and by their substituting for classical ornamentation designs of a romantic and realistic kind, and are usually of brick, sometimes with a marble coating.

Lombard League, a league of the cities of N. Italy, formed in 1167 to oppose the ambition of the Emperor Friedrich. Verona and its neighbours were the first that banded together. Milan, Cremona, &c., soon joined them, and in 1176 they won a great victory at Legnano. By a second peace, that of Constance in 1183, the L. cities were allowed to administer their own laws, and to make peace and war on their own account. Thus they became virtually independent, and soon showed great intellectual and commercial vitality, but at the same time an unfortunate disregard for each other's welfare, which in the long run made them the prey of petty despots.

Lombard, Peter the, was born, it is supposed, at Lunello, studied at Bologna, Rheims, and Paris, where he so distinguished himself in a course of theological study that he became (1159) bishop, holding the office, however, only for one year. L. is the author of *Sententiarum Libri IV.* (ed. princ. Ven. 1477; mod. ed. Par. 1841). For a long time this book formed the chief handbook in theological study, its merits consisting not in originality but in clear definition and good classification. L. died about 1164.

Lombards, **Longobar'di**, or **Langobar'di** (from *parta*, *barte*, 'a battle-axe'), a warlike Suevic people which about the beginning of our era dwelt on the E. bank of the Lower Elbe, though legend places their earliest home in Jutland. Already in the 4th c. famine forced many to migrate, and after long struggles with various Teutonic and Slavonic nations, they overran the lands of the Danube (especially Pannonia), and embraced Arian Christianity. In 512 they overthrew the Heruli, in 566 the Gepidae at Asfeld, and crossing the Julian Alps (568) under Alboin (q. v.), son of their king Audoin, they seized N. Italy (henceforth called Lombardy), fixing their capital at Pavia. After Cleph (573-575), the third king, thirty chiefs ruled, each over a district, for ten years,

till Autharis, son of Cleph, was chosen king (585-90). He established a constitution placing the old Roman population and the L. under equal laws, and leaving the cities essentially independent. His widow, the Bavarian princess Theodelinda, married Duke Agilulf of Turin, who died in 615. She was devoted to Gregory the Great, and did much to spread Catholicism among the L. Ariovald (died 636) and Rothari (died 652) were the next kings, the latter famous for the system of laws promulgated (22d November 643) by him under the title 'Edictum,' which, as developed by his successors, was long after the foundation of the revived study of law in the Middle Ages. A series of Catholic kings begins with Aribert (died 663), nephew of Theodelinda, whose line (except from 662 to 671, when Grimoald, Duke of Beneventum, ruled), held the throne till 702. After a ten years' struggle Liutprand (q. v.) became king (713-44), but when his successor Aistulf (749-56) sought to follow out his plans, he was forced by Pippin the Short to yield the conquered Exarchate. (See EXARCH.) Desiderius (756-74) ravaged Romagna and advanced against Rome, when Pope Adrian I. called for help on Karl the Great, who took Pavia, put Desiderius in a convent, and made Lombardy a part of the Frankish kingdom, retaining its former laws. A rebellion of certain Lombard dukes in 776 led to their deposition and the establishment in their stead of counts (Comites). In S. Italy the Lombardic principalities, Beneventum, Capua, and Salerno survived the northern kingdom for 200 years. The L. soon mixed with the other inhabitants, forming a Romance people, and in the 10th c. their Teutonic dialect had disappeared, without leaving any literary traces. The kings of the L. wore the famous Iron Crown (q. v.). See Flegler, *Das Königreich der L. in Italien* (Leipzig, 1851); Abel, *Der Untergang des Lombardenreiches in Italien* (Göttingen, 1858).

Lombardy, a territory of N. Italy, between the Alps and the Apennines, including eight provinces (see ITALY), and bounded W. by the Adriatic and the Tierno, which separate it from Piedmont, and E. by Lago di Garda and Venetia. Area, 8,940 sq. miles (pop. 1875) 3,553,913. The N. is an Alpine mountainland, with small fertile valleys, affording fine pasturage; the S. an extremely fertile and well-cultivated plain, drained by the Po, with its tributaries the Ticino, Lambra, Adda, Oglio, and Mincio, and provided with a complete system of artificial irrigation. Wheat, maize, rice, and millet are the prevailing crops; and apples, cherries, melons, oranges, citrons, figs, and peaches are also cultivated. The dairy farms yield yearly 'Parmesan' cheese and butter to the value of £935,000, while the silk production is worth as much as £3,500,000 per annum. In 1875 the population numbered 626,058; sheep, 157,959; goats, 82,491; cattle, 120,691; horses, 80,943; mules, 12,793; and asses, 25,390. The cottons manufactured are worth £950,000 annually; linens, £320,000; and hardware, £240,000. L. was part of the kingdom of the Franks from their conquest of the Lombards (q. v.) in 774 to 888, from which date it was mainly in the possession of the German emperors till the rise of the Republic of Milan (q. v.) in 1150. Two powerful leagues (see LOMBARDO LEAGUE) were formed by the cities, the first of which won Friedrich Barbarossa in 1176, the second Friedrich II. in 1225; and after their dissolution the importance of Milan was still considerable under the Viscontis and Sforzas (q. v.). In 1535 it came under Karl V., and after the Spanish War of Succession fell to Austria in 1713. In 1797 it became part of the Cisalpine Republic (q. v.), in 1805 of the kingdom of Italy, and in 1815 again fell under the hated domination of Austria; but by the Peace of Zürich (10th November 1859) L. was ceded to Napoleon I., and by him to Sardinia.

Lombards, in the middle ages, was the name applied to the Italian bankers and brokers (chiefly of Lombard origin), whose influence was at its height in the 12th c. Lombard Street in Paris was once the financial centre of France, as Lombard Street in London still is of England.

Lombok, one of the Sunda Islands, in the Malay Archipelago, between Bali and Sumbawa. Area 1850 sq. miles, pop. 250,000, mainly Mohammedans. The coasts are lined by volcanic mountains enclosing a low, fertile, interior plain, in which cotton and rice are extensively cultivated. The capital is Mataran; the seaport Ampanam, much frequented for provisions.

Lomond, Loch (Gael. *Leoman* or *Leamhan*, 'the loch of the elm'), the largest lake in Scotland, lies between Dum-

barton, Perth, and Stirling, is 24 miles long, 22 feet above the level of the sea, and has an area of 45 sq. miles. The narrow N. end is singularly grand, over-shadowed by Ben Lomond, Ben Vorlich, and lesser mountain masses, while the widely expanded southern extremity (7 miles broad) is famed for its rich beauty, fairy archipelago, and woody banks. The loch receives the Endrick and many smaller streams, and is drained by the Leven into the Clyde.

Lom'za, a government of Poland, Russia, is marshy in the N., but mountainous in the S., and is drained by the Bug (its S. boundary), with its affluent the Narev. Area, 4667 sq. miles; pop. (1870) 456,429.—**L.**, the capital, on the Narev, 76 miles N.E. of Warsaw, was once one of the chief towns of Poland and the seat of the Diet. Pop. (1870) 10,340.

Lon'don, the metropolis of the British Empire, the most populous and wealthy city in the world, lies on both banks of the Thames, about 50 miles from the sea, in lat. 51° 31' N., and long. 0° 6' W. About three-fourths of L. is in the county of Middlesex, the remainder being chiefly in Surrey, but portions are also in Kent and Essex. In addition to the cities of L. and Westminster, the metropolis comprises the parliamentary boroughs of Marylebone, Chelsea, Finsbury, Hackney, Tower Hamlets, Lambeth, Southwark, and Greenwich, each of which returns two members, the City returning four. The City of L. proper stands on one square mile of ground, is divided into 108 parishes, and has a night population of 70,000, mainly composed of those who take care of the great public offices and warehouses, and their families. During the business hours of the day its population is about 1,000,000. It is governed by the Lord Mayor (chosen annually), twenty-five aldermen, four sheriffs, and 268 common councilmen. The election of the Lord Mayor is vested in some 7000 liverymen, the members of the eighty ancient city guilds. The revenue of the corporation in 1875 was £655,319, and its expenditure £592,244. The city of Westminster is nominally governed by the dean and chapter, but virtually by a high steward and high bailiff chosen by them. The remaining districts of L. are governed by local officers, all attempts to substitute a great central administration for the entire metropolis having hitherto failed. The main thoroughfares run like the river from W. to E. One continuous road extends from Shepherd's Bush by Bayswater, Oxford Street, Holborn, Chancery, and Whitechapel and Mile-End Roads to Stratford-le-Bow, a distance of 12 miles. Nearly parallel to it, but joining it at Chancery, is the great thoroughfare from Hammersmith and Kensington, receiving tributary streams of traffic from Fulham, Brompton, and Chelsea, by Hyde Park, Piccadilly, the Strand, Fleet Street, and Ludgate Hill. The longest continuous line of streets from N. to S. is one of 10 miles from Stamford Hill by the Kingsland Road and Bishopsgate Street, across L. Bridge by the Borough and Clapham Roads to Balham. Many of the streets in the older parts of the town, in Spitalfields, Clerkenwell, and Holborn, are narrow, mean, straggling, and irregular; others, particularly those in the W. and S.W. districts—Mayfair, Tyburnia, Kensington, and Belgravia—spacious, regular, and stately. In the city is a greater proportion of stone buildings than elsewhere, and its streets are massive and imposing. The houses are mainly built of brick, originally light in colour, but which soon become discoloured by the all-pervading smoke. Many of them are consequently painted and plastered, and stuccoed. The monotonous regularity of Bloomsbury and Marylebone is relieved by a variety of handsome squares and crescents. Among the more important lines of traffic is the City Road from the Bank to Islington, the extensive northern district, and thence westwards by the New Road to Paddington. Several wide thoroughfares extend from the line of Oxford Street to the N., of which the more important are the Edgware Road, which leads to Hendon, and the Tottenham Court and Hampstead Roads, which extend to the suburbs of Camden and Kentish Town. The entire outer circle of the Metropolis beyond the ugly lines of dingy streets is covered with fine villas, the suburban population being a very large portion of the inhabitants. To the N. lie the suburbs of Kilburn, Hampstead, Highgate, Holloway, and Dalston; to the W., Hammersmith, Brompton, and Chelsea; to the S., Clapham, Brixton, Camberwell, Sydenham, and Blackheath; to the E., Bromley, Bow, and Stratford.

Streets, Bridges, &c.—Among the finest streets are Queen Victoria Street, Cornhill, and King William Street in the City;

and, in the West End, Regent Street, Bond Street, and Oxford Street—the fashionable shopping streets—Whitehall with its stately architecture, and Piccadilly and Pall Mall of Club-house fame. The most handsome street of dwelling-houses is Portland Place, a broad continuation of Regent Street towards Regent's Park. Some of the open spaces, such as Belgrave, Eaton, Eccleston, and Grosvenor Squares, and Lincoln's Inn Fields, the home of lawyers, are large and airy, and lined with noble buildings. The chief centres of traffic are the spaces in front of the Royal Exchange and the General Post-Office in the City; Charing Cross, Oxford Circus, and Hyde Park Corner in the West End; the Angel at Islington in the N., and the Elephant and Castle, where the main roads from the river bridges meet and again diverge in all directions, in the S. From January to December the traffic of the City is incessant; but W. of Temple Bar the influence of the London season asserts itself; and in May, June, and July, when the noble and wealthy residents invade it by thousands, the West End presents its liveliest appearance. Under the direction of the Metropolitan Board of Works, which consists of thirty-six members, gigantic changes are continually taking place in street geography. Holborn Viaduct, and the magnificent Thames Embankment, a wide river-boulevard now completed on the N. from Blackfriars to Westminster, and from Albert Bridge to Chelsea Hospital, and on the S. from Westminster to Lambeth, are among the latest and greatest of these improvements. With the two splendid approaches from Charing Cross and the City, the Embankment has already cost £4,000,000. New thoroughfares from Oxford Street to Shoreditch and from Tottenham Court Road to Charing Cross, sweeping away miles of old lanes and alleys, are in projection. The river is crossed by L., Southwark, Blackfriars, Waterloo (the longest, 2456 feet), Westminster, Lambeth, Vauxhall, Chelsea, Albert, Battersea, and five railway bridges. No stream in the world in an equal space is spanned by such colossal and magnificent structures. E. of L. Bridge communication is effected by numerous ferries, and the Thames Tunnel at Wapping. The Thames Subway, from Tower Hill to Tooley Street, 25 feet below the bed of the river, was opened in 1870, and two additional Subways are in course of construction. An agitation is now being carried on for the formation of a great new bridge in the E.

Public Buildings, &c.—L. is full of superb public buildings, a list or description of which would occupy enormous space. On account of the excessive flatness of the ground, and the density of their surroundings, they are much obscured from public view, and few show to the best advantage. Among them are the royal residences—Buckingham, Kensington, and St. James's Palaces—the Houses of Parliament at Westminster, a 'dream in stone,' built from Barry's design, 1840, at a cost of £2,000,000, the largest Gothic building in the world; the Foreign and other Government offices in Whitehall; Somerset House, a spacious quadrangular building with 3600 windows (built 1776) in the Strand; the new Law Courts in progress (1877) at Temple Bar; the Bank of England (covering eight acres); Guildhall (built 1411–31, restored 1789 and 1866), and the Royal Exchange (opened 1844) in the City. Near the Docks are the Mint, Custom-House, and the historic Tower (built 1078). Of the 600 Episcopal churches, the most famous are St. Paul's Cathedral (q. v.), Westminster Abbey (q. v.), St. Bartholomew's, Smithfield (founded 1102, restored 1865), the Temple Church (built 1185), and St. Saviour's, Southwark. Several of the new Ritualistic churches are ambitious and handsome. There are about 1000 Dissenting chapels, among the largest of which are the Tabernacle (Baptists) at Newington Butts (holds 4400 people), the City Temple, Holborn (Congregational, opened 1874), and Christ's Church, St. George's Road, Lambeth (Congregational, opened 1876). There are 100 Roman Catholic churches, the principal being St. George's Cathedral in St. George's Fields, but a much grander cathedral is projected at Westminster. The Jews' synagogues number twenty-five. There are about 100 hospitals and infirmaries, including St. Bartholomew's, St. Thomas' (a palatial building), Guy's, The L., the Middlesex, Charing Cross, and the Foundling Hospital, and about 1000 charitable institutions are maintained at an annual cost of £6,000,000. Bethlehem Hospital (Bedlam) for the insane is in St. George's Fields, Surrey. Enormous Lunatic Asylums are at Colney Hatch and Hanwell. Medical schools are attached to all the great hospitals. The College of

Surgeons, with its fine Museum, is in Lincoln's Inn Fields, the College of Physicians in Pall Mall, East. Chelsea Hospital is for army pensioners. Greenwich Hospital, formerly for naval pensioners, was converted in 1873 into a Royal Naval College.

Schools, Museums, &c.—In December 1876 there were, besides upwards of 700 Endowed Schools and Collegiate Institutions, 225 'Board' Schools with accommodation for 146,074 pupils, and 894 'Voluntary' Schools with accommodation for 287,116 pupils. The School Board is composed of fifty-one members. Westminster, St. Paul's, Merchant Taylor's, and the City of London Schools, and Christ's Hospital (revenue £65,000, accommodation for 1200 Blue-coat boys) are historically famous. The University of L. is the subject of a separate article. The British Museum, Great Russell Street, Bloomsbury (founded 1753, built 1823–50), is the great literary and antiquarian storehouse of the nation. The Museum of Science and Art at South Kensington (opened 1858), with a branch at Bethnal Green (1872), forms the nucleus of national, technical, and artistic education. There are some 50 large public libraries. A National History Museum is in course of construction at Kensington. The National Gallery in Trafalgar Square (founded 1824, enlarged 1876) has, besides many fine works by foreign masters, the finest collection of paintings of the English school. There are 44 public and private galleries. At Burlington House, Piccadilly, the Royal Academy Exhibitions are held. Soane's Museum of Pictures and Curiosities is in Lincoln's Inn Fields. The Grosvenor Gallery, New Bond Street, was opened in 1877 for annual exhibitions. The collections at Dulwich Gallery and Hampton Court are very interesting.

Places of Amusement.—The finest concert rooms are St. James's and Exeter Halls. The first is splendidly decorated, and is used for classical and orchestral concerts. At the latter (which holds 4000 people), the oratorios of the Sacred Harmonic Society are given. It is also used for religious meetings. The Royal Albert Hall, Kensington (opened 1871), holds 10,000 people. Miscellaneous entertainments take place at the Crystal Palace, Sydenham (of world-wide celebrity), the Alexandra Palace, Muswell Hill, and the Royal Aquarium, Westminster (opened 1876). There were forty-five theatres in 1877, about half of which were in the neighbourhood of the Strand. At the Royal Italian Opera, Covent Garden, and Her Majesty's Theatre in the Haymarket, operas are produced during the season with unsurpassed magnificence. A new Opera-House, to which it is proposed to attach a National Training School for music, is in course of construction on the Thames Embankment. The old legitimate stage of Drury Lane is now chiefly used for spectacular pieces. The Haymarket, Prince of Wales, Vaudeville, and Court are among the best comedy theatres. Melodrama has its home at the Lyceum, Adelphi, Princess, and Olympic; farce and burlesque at the Strand, Criterion, and Folly; opera bouffe at the Opera Comique and Alhambra. There are many singing saloons or 'music halls.' Notwithstanding the inferior class of the performances, several, such as the Oxford, Metropolitan, and Canterbury, are fitted up with much splendour.

Clubs, Hotels, Markets, &c.—The Athenæum, Carlton (Conservative), Reform (Liberal), The Army and Navy, and Travellers, are a few of the finest of the L. Club-houses, which numbered 91 in 1877. Among the best and largest hotels are 'The Langham,' Portland Place; 'Westminster Palace,' Victoria Street; 'The Alexandra,' Hyde Park Corner, and the 'Inns of Court,' Holborn. Most of the great railway termini have hotels attached to them, 'The Midland' being the largest. Those at Charing Cross and Canon Street are also noteworthy. Stafford House, Green Park; Holland House, Kensington; and Montagu House, Whitehall; are a few of the many hundred splendid private residences. No city has more numerous or extensive markets. Some of the largest are those at Islington (cattle), Covent Garden (fruit and vegetable), Smithfield and Columbia (meat), Thames Street (coal), Billingsgate (fish), Bermondsey (leather), and Mincing Lane (corn).

Courts of Law, Prisons, Cemeteries.—The Courts of Law, which give employment to about 3000 barristers and 5000 solicitors, are at present scattered in Westminster, Lincoln's Inn, and the City, but are all shortly to be united in the great new Palace of Justice in the Strand. Solicitors' chambers are chiefly about Lincoln's Inn Fields, and those of barristers in the Inns of Court, which comprise the Inner and Middle Temples, and Gray's and Lincoln's Inns. There are

about fifteen police courts throughout the Metropolis, and the police force exceeds 10,000 men. There are fifty-three stations in connection with the fire brigade, which is worked with great efficiency. The chief prisons are at Newgate (where executions take place), Millbank (the largest), Pentonville, Holloway, and Horsemanor Lane in the borough. There are on an average 100,000 paupers (indoor and outdoor) connected with the various workhouses. The largest cemeteries are at Highgate, W. Brompton, Kensal Green, Norwood, and the Necropolis at Woking.

Parks and Public Monuments.—In the beauty and number of its public parks and gardens London is unapproached. Hyde Park and Kensington Gardens together are 600 acres in extent. The former contains the Serpentine, an ornamental sheet of water, and Rotten Row (*Route du Roi*), an excellent drive from Apsley House to Kensington Gardens, where, during the season, the largest and most brilliant display of equipages in the world is to be seen. Regent's Park (472 acres) contains the fine gardens of the Royal Botanic and Zoological Societies. Those of the Horticultural Society, famous for flower shows, are at S. Kensington. The other parks in the W. End are St. James's (91 acres), and the Green Park (60 acres). In the S. lies Battersea Park (180 acres, with beautiful gardens), and Southwark Park; in the N. Finsbury Park, and in the E. end Victoria Park (290 acres). The suburbs boast of many delightful parks and recreation grounds, such as Greenwich, Richmond, and Bushey Parks, Hampstead and Putney Heaths, Clapham and Tooting Commons, and Kew Botanical Gardens. The public monuments of L., though numerous, are not as a rule striking or highly artistic. 'The Monument,' near L. Bridge (202 feet high), was erected in 1667 in commemoration of the Great Fire of L. Next to it the most lofty columns are the monuments to the Duke of York and Lord Nelson. The Guards (Crimea) Memorial in Waterloo Place is a fine work. The Albert Memorial in Hyde Park, though somewhat marred by excessive gilding, is an elaborate, beautiful, and finely-proportioned structure. See Cole's *Royal Parks and Gardens of L.* (1877).

Trade, Commerce, &c.—Besides its political pre-eminence, L. is also a grand commercial emporium. In 1877, 142 public and private banks had their head offices here. The magnitude of their transactions may be estimated from the weekly returns of the Clearing House, often amounting to £100,000,000, and having reached £1,000,000,000. There are some 1250 stock-brokers, 80 head life-assurance offices, and about as many fire offices. The warehouse trade of L. is most extensive, and only equalled by Manchester. The chief articles of manufacture are watches, jewellery, ironmongery, furniture, carriages, and instruments of all sorts; but to a greater or less extent every manufacture of the kingdom is carried on. The ale and porter breweries are numerous and enormous. Printing and publishing has here its unrivalled seat. About 300 weekly, fortnightly, and monthly newspapers are published. According to the census of 1871 the book trade employed 35,000 persons, the building trade 106,000, and the production of articles of dress 230,000. There were 50,000 Government officials, including civil, army, and navy services, 6000 clergymen, 10,000 physicians and druggists, 27,000 authors and students, 16,000 artists, musicians, and actors, 20,000 teachers, and 253,000 domestic servants. The food and drink of the public was supplied by 2500 bakers, 1700 butchers, 2600 grocers, 2000 wine merchants, and 6700 publicans. The Royal Arsenal at Woolwich occasionally employs as many as 14,000 hands. For the conveyance of the inhabitants, besides private carriages, 8000 cabs and 1500 omnibuses are in constant use. Hundreds of little steamers ply continually on the river. There are 16 great termini of the leading railway lines, and nearly 200 minor railway stations. The underground lines of the Metropolitan and District Railways form a complete circle of the centre of the Metropolis. In 1875 they carried 44,000,000 passengers. Numerous tramway lines extend towards the suburbs in all directions. There are 28 wet docks which enclose about 350 acres, the principal being the London, St. Catherine's, E. India, W. India, Victoria, and St. Catherine's on the Middlesex side, and the Commercial and Grand Surrey in Surrey.

In 1875, 43,995 ships of 8,804,000 tons entered the port, and 17,817 ships of 5,233,000 tons cleared. In the same year the exports were £57,923,927, or more than one-fourth of the entire exports of the United Kingdom. The custom duties were £9,940,139, exceeding one-half of the total of the United King-

dom, and being more than three times greater than those of Liverpool. The value of the merchandise stored in L. has been estimated to exceed 500 millions sterling. The current prices of many commodities are cheaper than in other towns, but the luxurious ideas of a wealthy community render L. a most expensive place of residence for the middle classes who court society. House rents and the proportionate taxes are exceptionally high.

The healthiness of L., its death rate in 1875 (23·7 per 1000) being less than that in any of the ten next largest towns in England, is partly due to favourable conditions of climate and situation, but also in great measure to its admirable sanitary arrangements. In 1858 a vast scheme for interceptive drainage over an area of 117 sq. miles was introduced at a cost of £5,000,000. The length of sewers is 82 miles. The water supply, to the extent of 130,000,000 gallons daily, is obtained from the New River, the Thames, and the River Lea. Twenty companies supply about 20,000,000 cubic feet of gas per diem. The town is well paved and the wooden and asphalt pavements now so general have greatly lessened the noise in the streets. The soil is mainly composed of clay. Less rain falls than in most parts of England. The wind is most frequently from the S.W. The most objectionable characteristic of the weather is the L. fog, which hangs about the city periodically during the winter in dense black masses, and occasionally turns day into night.

History.—L., the *Colonia Augusta* of Tacitus, was an important place in the time of the Romans. Its name is derived from the British *Llyn-Din*, the 'fort on the marsh,' or lake, which was Latinised into *Londinium*. Originally the chief town of the Trinobantes, it became after the Teutonic invasion the capital of the kingdom of the East Saxons. Since the building of the Tower by William the Conqueror, at least, it has been the metropolis of England. Throughout its history L. has suffered many and dire disasters. The plague often visited it with terrible severity. 50,000 of its citizens are said to have died from this scourge in 1348, 30,000 in 1407, 30,000 in 1603-4, and 100,000 in 1665. In 962 and 1057 great fires desolated the city, and in 1666, when 13,200 houses were burnt and 200,000 people rendered homeless, it was literally reduced to ruins. But on each occasion a new and fairer city has sprung from the ashes of the past, and its prosperity has increased till it has become the most stupendous city in the annals of the world. Its history is in a great sense the history of the English people. Here their kings have reigned, their statesmen ruled, their poets lived, their martyrs bled. And its greatness must continue to run parallel with the greatness of the empire. Not depending like other towns upon one or a few sources of prosperity, it could bear almost imperceptibly the decay of its most important manufacture, the failure of its most lucrative trade. Nothing short of tremendous national disaster can injure it. During the last century the increase in size and population has been enormous. The inhabitants in 1801 numbered 864,845. In 1871 the Registrar-General's District of 122 sq. miles showed a pop. of 3,251,804, and the Metropolitan Police District of 687 sq. miles a pop. of 3,883,092. In 1877 the latter was estimated at 4,200,000. The number of inhabited houses is about 550,000, and the annual value of property £20,000,000. See Stow, *Survey of L.* (1598, enlarged by Strype, 1720); Allen, *History of L.* (4 vols. 1829); Timbs, *Curiosities of L.* (1855); Norton, *History and Constitution of L.* (3d ed., 1869); W. J. Loftie, *In and Out of L.* (1876); James Thorne, *Handbook to the Environs of L.* (1876).

London, a city and port of entry in the Dominion of Canada, province of Ontario, on the river Thames and the Great Western Railway, 114 miles W.S.W. of Toronto, and 61 E. of Sarnia. It lies in a fertile, well-wooded district, is the seat of the Anglican bishop of Huron, and of a Roman Catholic bishop, has seventeen churches, a hospital, a lunatic asylum, two daily and six weekly newspapers, and several benevolent and educational institutions, including Hellmuth and Huron Colleges. L. is a great railway centre, and there are large machine-shops, breweries, oil-refineries, foundries, &c. Many of the streets and squares are named after those of the city's great namesake. A Westminster and a Blackfriars' Bridge cross the Thames. Pop. (1871) 15,826.

London, Laws of. The city of London is under the jurisdiction of its municipal corporation. The right to elect aldermen (see ALDERMAN) and common councilmen for the several wards

is by statute declared to belong to every freeman of the city occupying a house of the yearly value of £10. The liverymen of London are so called because they formerly wore liveries or badges peculiar to each company. They are chosen from among the freemen of the different guilds or incorporated trades. 30 and 31 Vict. c. 134, provides for the better regulation of the traffic in the city and liberties, and makes provision for the greater security of persons passing along the streets. Cattle are not to be driven through the streets between ten in the morning and seven in the evening, except by permission of a commissioner of police. The metropolis, for the purposes of police and registration, includes the cities of London and Westminster and borough of Southwark, with suburban parishes to the distance of 6 miles from the central point of St. Paul's Cathedral. The metropolitan police district extends to any place within the limits of the Central Criminal Court, that is 10 miles from St. Paul's, or 15 miles from Charing Cross. The Metropolis Water Act, 1871, makes further provision for supplying London with water.

London Clay, the highest subdivision of the Lower Eocene formations, is a dark-coloured clay containing nodules of iron-stone. It is very persistent over a large area at and around London, attaining its maximum thickness in Kent and Essex, where it exceeds 450 feet. L. C. abounds in fossils, plant and animal, including birds, reptiles, and fishes, chiefly *ganoid*. The fruits, which occur in rich variety, indicate a sub-tropical climate.

London Conferences. Plenipotentiaries of the Great Powers have met in London in conference as follows:—

- In 1826—On the Affairs of Greece.
- „ 1830—On Disputes between Belgium and Holland.
- „ 1840—On Disputes between Turkey and Egypt.
- „ 1864—On the Schleswig-Holstein Question.
- „ 1871—On the Black Sea Treaty of 1856.

Protocols were signed in London in 1851 (*re* Schleswig-Holstein), and in 1877 (Eastern Question). The 1877 protocol became invalid almost immediately after signature, by the outbreak of war between Russia and Turkey.

London University was founded February 11, 1826, by the exertions of Lord Brougham, Thomas Campbell, and others, and the building in Gower Street was opened October 1, 1828. The name of this institution was altered to University College by royal charter, November 28, 1836, on which date the University of London received a charter as an examining body, with a chancellor and thirty-six fellows appointed for life. New charters were granted in 1837, 1858, and 1863, with supplement, 1867. King's College (incorporated 1829, opened 1831), was originally a rival establishment, but is now in connection with L. U. The early charters empowered the University to grant degrees to students of University College, King's College, and various minor schools; but since 1863 its examinations in art, medicine, law, surgery, music, and literature have been open to all comers, and it also grants certificates to women. The charter of University College was annulled by Act of Parliament in 1869, whereby the College was re-incorporated with additional powers, and divested of its proprietary character, its principal purpose being to qualify students for the L. U. degrees. It had forty-six professors in 1877. Medical schools are attached to King's College (hospital founded 1829), and University College (hospital founded 1833). The government of the University is vested in the Senate, which consists of the Chancellor, the Vice-Chancellor (elected annually), and the thirty-six Fellows. The Convocation is composed of the graduates of two years' standing and upwards. The University has returned one member to Parliament since 1868. The first examination took place in Somerset House in 1838, from which time till 1876, 16,152 candidates had undergone, and 9743 had passed the matriculation examinations which are necessary before a candidature for any degree. These examinations are held in January and July, and last five days. The subjects are classics, modern languages, English history and literature, geography, mathematics, natural philosophy, and chemistry. In 1876, 486 candidates out of 1071 passed the matriculation examinations, 59 obtained the degree of B.A., 11 M.A., 22 B. Sc., 5 D. Sc., 13 L.L.B., 23 M.B., and 11 M.D. The total number of candidates for all the examinations was 1977, the largest in the history of the University. The new building at Burlington House, containing the Examination Hall, was opened by the Queen in 1870. The senate of

the University resolved (July 1877) to take steps to obtain a new charter to admit ladies to all the degrees.

Londonderry, a county of Ireland, province of Ulster, is bounded N. by the Atlantic and Lough Foyle, S. by Tyrone, W. by Donegal, and E. by Antrim and Lough Neagh. Area, 522,315 acres; pop. (1871) 173,906. It has a cliffy coastline, except towards Lough Foyle, and is hilly, save in the vale of the Bann, which drains Lough Neagh, and forms the eastern boundary. The greatest heights are in the S., as Sawel (2236 feet), White Mountain (2000), and Slieve Gallion (1800). Besides the Foyle and Bann, the chief rivers are the Roe and Faughan. The prevailing rocks are mica, slate, and primitive limestone, and those E. of the river Roe are overlaid by a deeper tract of basalt, similar to that in Antrim, but with a reverse dip. Despite the broken nature of the surface, agriculture is more advanced here than in more favoured parts of the country. In 1876 there were 189,212 acres under crop (oats, wheat, potatoes, and turnip), 219,200 under grass, 6588 in plantation, 97,781 waste, bog, and water. L. had (1876) 114,252 cattle, 45,102 milch cows, 21,680 horses, 34,291 sheep, 38,058 pigs, and 4894 goats. There is some salmon-fishing. Great quantities of eggs are exported, and the leading industry is the manufacture of linen, now mainly carried on in large works. L. sends two members to Parliament. The capital is L., and other towns are Coleraine, Newton-Limavady, Magherafelt, Portrush, and Derry. The territory, anciently in great part the possession of the clans O'Loughlin and O'Neill, was, on the English occupation, granted to and is still retained by the corporation of London, with the exception of certain portions assigned to city companies.

Londonderry, capital of the preceding county, is finely situated on the left bank of the Foyle, at its outlet in Lough Foyle, 176 miles N.N.W. of Dublin, and 94½ N.W. of Belfast by rail. The four leading streets radiate from the square called the Diamond, and the city has extended greatly beyond the old walls, which now form a pleasant promenade. The notable buildings are the cathedral (1633), on a hill, with a spire 179 feet high, a modern Roman Catholic cathedral, the town-house, surmounted by a cupola, the court-house, with an Ionic portico, and the free grammar school or Foyle College. The Bishop's Gate, a triumphal arch (1789) commemorates the raising of the siege of 1689, and a Doric column 90 feet high supports a statue of the Rev. George Walker, governor of the city during the siege. L. has a county infirmary, a lunatic asylum, other benevolent institutions, Gwyn's School, and Magee College, founded in 1865. An iron bridge 1200 feet long connects L. with the large suburb of Waterside. New quays and graving docks have been constructed at a cost of £160,000. In 1875 there entered the port 1429 vessels, of 273,392 tons, and cleared 905, of 204,249 tons. Steamers ply to America, Liverpool, Fleetwood, Glasgow, &c. The main industries are flax-spinning, distilling, brewing, flour-milling, iron-founding, tanning, and shirt-making. Flax markets are held every Thursday. L. has one weekly and three bi-weekly newspapers, and returns one member to Parliament. Pop. (1871) 24,328. *Daire-Calgach* ('the oak wood of Calgach,' i.e., 'the fierce warrior') was the pagan name used long before St. Columba erected his monastery here in 546. It lingered on till the 10th or 11th c., when it began to be superseded by *Derry Columbkille*, which continued till the time of James I., whose charter, granted to a company of London merchants, imposed its present name. (See Joyce's *Irish Names of Places*, 1st series, 1869.) During the Revolution the gates were closed against James II., who in person for a time conducted the siege that began on April 18, 1689. The miserably weak walls, defended only by a few old guns and destitute even of a ditch, sheltered a host of Protestant fugitives, who died in the streets of hunger and fever, while the general cry was 'No surrender.' The defence was conducted with such stubborn heroism that Hamilton, the king's general, at last turned the siege into a blockade. After upwards of 100 days had elapsed, and when only two days' food remained, an English ship with supplies broke the boom across the river (28th July), and the besiegers withdrew.

Londonderry, Robert Stewart, second Marquis of, was born at Mount Stewart in County Down, June 18, 1769, educated at Armagh and St. John's College, Cambridge, entered the Irish Parliament in 1791, became member of the English Parliament (1794), and Lord Castlereagh (1796), when his

father was raised to the Marquisate of Londonderry. In 1798 L. was nominated Chief Secretary for Ireland, and during his period of office the Catholic insurrection was repressed without mercy. He supported the proposal of union between Great Britain and Ireland with great eloquence. When Addington succeeded Pitt (1801), L. became President of the Board of Control. In 1805 he was War and Colonial Minister; in 1807 in the Cabinet of the Duke of Portland; he was again War Minister in 1809, on account of the Convention of Cintra and the Walcheren expedition he was attacked by Canning, and the affair ended in a duel between the two ministers. In 1812 L. was Foreign Secretary, represented England at the Congress of Vienna (1814), at Paris (1815), at Aix-la-Chapelle (1818). In 1821 he became Marquis of L., but committed suicide in a fit of madness at his country seat in Kent, 12th August 1822. L. would have been a great diplomatist, owing to his personal attractions and his capacity for business. As a statesman he failed to win either the gratitude or respect of the majority of his countrymen, because of his obdurate narrowness in the direction of a repressive governing system. See his *Memoirs and Correspondence* (8 vols. 1848), edited by his brother, Charles W. Stewart Vane, third Marquis of L.

Long, George, an English scholar of note, was born at Poulton, Lancashire, in 1800, educated at Macclesfield School and Trinity College, Cambridge, graduated B.A. 1822, was elected a Fellow, and accepted a professorship in the University of Virginia, U.S. In 1833, having returned to England, he began to superintend the issue of the *Penny Cyclopædia*, in 1837 he was called to the bar, after which he delivered a course of lectures on Jurisprudence and Civil Law, and became Professor of Greek and Latin in the University of London. Besides important contributions in the field of antiquities, law, and geography, L. is the author of a *History of France and its Revolutions* (1849); *Decline of the Roman Empire* (1864-74); edited *Cicero, Caesar*, and *Sallust*, and has written several translations of conspicuous merit, of which the most important are his *Selections from Plutarch's Lives*, and the *Thoughts of the Emperor Marcus Aurelius Antoninus*. L., on the recommendation of Mr. Gladstone, was elected to receive £100 a year from the Civil List (1873).

Long, Loch, a narrow inlet with steep shores, which stretches first N. by W., then N.N.E., from the Firth of Clyde to Arrochar (18 miles), separating Argyll from Dumbarton.

Long'an (*Chelium Longan*). See LITCHI.

Longfellow, Henry Wadsworth, born at Portland, Maine, U.S., February 27, 1807, graduated at Bowdoin College, and after spending a few months in his father's law-office, became Professor of Modern Languages in Bowdoin, with the privilege of spending three preparatory years in Europe. After studying in France, Spain, Italy, and Germany, he began his professorate in 1829. He was appointed Professor of Modern Languages and Literature at Harvard in 1835, and spent the following year in European travel and study, cultivating a knowledge of early Scandinavian literature. Resigning his chair in 1854, he travelled in Europe 1841-42, and 1868-69, on the latter occasion receiving the degree of D.C.L. from Oxford University. His first contributions to literature appeared in the *United States Literary Gazette* and the *North American Review*. In 1833 he published an *Essay on the Moral and Devotional Poetry of Spain*, in 1835 *Outre Mer*, in 1839 *Hyperion* and *Voices of the Night*, in 1842 *Ballads and Poems on Slavery*, in 1843 *The Spanish Student*, a play; in 1845 *The Poets and Poetry of Europe*, in 1847 *Evangeline*, in 1849 *Kavanagh*, in 1850 *Seaside and Fireside*, in 1851 *The Golden Legend*, in 1855 *The Song of Hiawatha*, in 1858 *Miles Standish*, in 1863 *Tales of a Wayside Inn*, in 1866 *Flower de Luce*, 1867-70 his translation of Dante, in 1869 *New England Tragedies*, in 1871 *The Divine Tragedy*, in 1872 *Three Books of Songs*, in 1874 *The Hanging of the Crane*, and in 1875 *The Masque of Pandora and Other Poems*. L. has also edited *Poems of Places* (2 vols. 1877), a collection illustrative of the scenery of England and Wales, for the Golden Treasury series. In the promise of youth, L. was hailed as the national poet; but the title must wait for a greater man. He has written much that will endure; some of his lyrics are perfect; and all his poetry is brimful of life, and love, and truth. It lacks, however, that intellectual vigour and subtlety without which imagination cannot attain its highest flights. His prose style is sensitive and

delicate. *Hyperion* has no plot and little incident, but is filled with brilliant, ever-shifting pictures and fine reflections cast in a poetic mould. *Kavanagh*, its companion volume, a love story, is written with exquisite simplicity and purity.

Longford, an inland county of Ireland, province of Leinster, is bounded N. by Leitrim and Cavan, E. and S. by Westmeath, and W. by Roscommon. Area, 421 sq. miles; pop. (1871) 64,501. Between the Clonhugh range (912 feet) in the N. and Slieve Gauldry (650 feet) in the S. extends the valley of the Camlin (20 miles), a tributary of the Shannon, which, 7 miles below the point of junction, enters Lough Ree. The climate is mild and damp; the soil, a deep loam, overlying clay-slate in the N. and stratified limestone in the S. In 1876, there were 72,853 acres under crop (oats and potatoes), 130,678 in grass, 3391 in plantation, and 50,215 waste, bog, mountain, &c. L. had (1876), 6497 horses, 2993 asses, 59,995 cattle (19,228 milch cows), 33,223 sheep, 22,279 pigs, and 8076 goats. Grazing and dairy-farming, with some linen and woollen manufactures, are the staple industries. L. is traversed by two branch railways and by the Royal Canal. It returns two members to Parliament, and the chief towns are L., Ardagh, and Granard. Among the antiquities are the ruins of a round tower, seven castles, and fifteen abbeys.

Longford (Irish Gael. *Long-phort*, 'the fortress'), the chief town of the preceding county, on the Camlin, 76 miles W.N.W. of Dublin by rail, has a fine Roman Catholic cathedral, with an Ionic portico and a tower 200 feet in height, the jail and court-house of the county, barracks (occupying the site of the ancient castle of the O'Farrells), and a Protestant Hall (1862). L. has tanyards and breweries, and carries on a trade in corn, bacon, butter, &c. Pop. (1871) 4375.

Longicornes, a group of Beetles or Coleoptera, in which the antennæ or feelers are very long. There are four joints in the tarsi, whence these beetles are included in the *Tetramerous* section of the order. The L. are represented by many typical genera and species. They are chiefly plant-eaters, and attain their largest size in S. America. The genera *Cerambyx* and *Trachyderes* exemplify this sub-order.

Longinus, Dionysius Cassius, the greatest philosopher of his age, was born about A.D. 213 at Athens, where his education was specially cared for by his uncle Phronto, a teacher of rhetoric. From an early age L. visited many countries in company with his parents, and he was for a long time the pupil of Anthonius Saccas and Origen at Alexandria. On his return to Athens, he devoted himself with the utmost zeal to the work of teaching in the departments of philosophy, criticism, rhetoric, and grammar; and the most distinguished among his many pupils was Porphyrius, the celebrated antagonist of Christianity. After spending much of his life in this manner at Athens, L. went to the East, where he became the Counsellor of Queen Zenobia of Palmyra, whom he advised to throw off the Roman yoke. This advice cost him his life; for when Aurelian took and destroyed Palmyra, A.D. 273, he put the old philosopher to death. L. was highly distinguished for his extensive knowledge—Eunapius called him a 'living library,' and a 'walking museum'—but still more so for his critical insight, and sound judgment. He had drunk deeply of the spirit of Plato; and, though a pagan, his amiable disposition kept him from hostility to the new faith. He was the author of numerous works, of which a considerable part of the treatise *On the Sublime*, conspicuous in ancient literature for its excellent style and exquisite criticism, alone has come down to us. The most recent editions of it are those of Weiske (Leip. 1809), and Egger (Par. 1837).

Longipenna'tæ, a group of Natatorial or swimming birds represented by the gulls and terns (*Laridæ*), petrels (*Procellariidæ*), &c. The wings are of great length, and the hinder toe is free. The front toes are united by a web. The bill is strong and often hooked.

Longirostr'es, a group of *Grallatores* (q. v.) or wading birds, represented by the snipes, woodcocks, ruffs, &c. The bill is long, slender, highly sensitive, and grooved for the protection of the nostrils. Its entire structure adapts the L. for groping in shallow waters in search of food.

Long Island, the detached south-eastern portion of New York State, is bounded N. by Long Island Sound, E. and S. by the Atlantic, W. and N.W. by the Narrows, New York Bay, East

River, and Hell Gate. Area, 927,900 acres; pop. (1870) 540,225. It is 118½ miles long from the Narrows to Montauk Point in the E., and 23 in extreme breadth, is indented in the E. for 22 miles by Peconic Bay, and along the S. shore for 90 miles by a series of inlets from 2 to 5 wide, which are partly within sandy spits, and afford supplies of scale and shell fish and seaweed for manure. A central range of hills (384 feet) extends nearly the whole length of the island, but the rest of the surface is mostly level, as in the Great Hempstead Plains. The soil, though in great part sandy, is easily cultivated and productive. L. I. has forests of oak, hickory, chestnut, and in the sandy tracts, of pines. It is traversed (1876) by 422 miles of railway. There are many bathing-places, and the chief towns are Brooklyn, Flushing, Hempstead, Huntingdon, Oyster-Bay, and Brookhaven. Discovered by the Dutch in 1609, it received from them its name of 'Lange Eylandt.' Actual settlements began about 1640, and the territory passed to the English with New Amsterdam in 1662. By the Battle of Brooklyn, or of L. I., the first pitched battle in the War of Independence, Washington was forced to evacuate the island by a greatly superior English force, 26-28th August 1776.

Long Island Sound, an arm of the Atlantic separating Long Island from Connecticut, is 115 miles long and about 25 in extreme width. A chain of small islands stretches across its seaward entrance. With valuable fisheries, it is a great thoroughfare for steamers and coasting vessels. The improvements at Hell Gate (q. v.) are designed to make the Sound a safe, ready channel to New York for the largest vessels.

Longitude. See LATITUDE AND LONGITUDE.

Long'ton, a town of England, in Staffordshire, on a small branch of the Trent, 2 miles S.E. of Stoke by rail. It is in the district of the Potteries, and has extensive manufactures of china and earthenware. A place of recent growth, it was incorporated as a municipal borough in 1865. Pop. (1871) 19,748.

Long Vacat'ion, in Law, a period during which judicial proceedings are intermitted, extending, at common law, from August 10 to October 24, in Chancery to October 28.

Loni'go, an old town in N. Italy, province of Vicenza, on the Frasine, 12 miles S.W. of the city of Vicenza. It has a large trade in horses and grain; at the yearly March fair there are sometimes as many as 2000 horses. Pop. (1874) 9185.

Lons-le-Saunier, the chief town of the department of Jura, France, on the Vallière, 60 miles S.E. of Dijon by rail. It is picturesquely girt by high mountains, the lower slopes of which are clad with vines. There are copper and iron foundries, and a trade in horses, cattle, grain, cheese, &c. The celebrated salt-springs yield 20,000 ctr. yearly. Pop. (1872) 9427. L. is the ancient *Ledo Salinaris*.

Lo-o-Choo, **Lu-Tchu**, or **Lieu-Kieu**, a group of thirty-six islands stretching from Japan to Formosa, in 26°-27° 40' N. lat., 126° 10'-129° 5' E. long., and tributary to Japan. The largest, Tsju San ('middle island') is about 60 miles long and 12 broad; others are Sannan in the S. and Sanbok in the N. Nawa, the chief port of Tsju San, is open to foreign commerce. The islands enjoy a magnificent climate, and are highly cultivated and very productive. Among the productions are tea, rice, sugar, tobacco, camphor, fruits, and silk. The principal manufactures are cotton, paper, porcelain, and lacquered ware. The people, who are small, seem a connecting link between the Chinese and Japanese.

Loodia'na (*Ludhiana*, from the Lodi tribe of Afghans), the chief town of the district of the same name in the Punjab, British India, on the S. bank of the Sutlej, but 8 miles from the present bed of the river, and a station on the railway, is 1102 miles N.W. of Calcutta. Mohammedans are exceptionally numerous, consisting partly of the court of an exiled Afghan monarch, and partly of weavers from Cashmere. There are large manufactures of shawls, including the Rampoor chuddar scarves, stockings, and gloves; the carpentry also is famous. Besides these articles there is a large trade in grain. The principal building is the fort, where the Europeans took refuge when the mutineers in 1857 were for a short time in possession of the town. Pop. (1868) 39,983.—The district of L., which is bounded N. by the Sutlej, has an area of 1368 sq. miles; pop. (1868) 583,245. The soil is neither fertile nor well irrigated. Wheat, gram, millet, and Indian corn are the staple products;

but cotton and sugar-cane are also grown. The trade is considerable, being valued at about £360,000 both for exports and imports.

Looking-Glass, See MIRROR.

Loom (Old Eng. *lōma*, furniture). A machine with which weaving is performed by interlacing two sets of threads or yarns, one, the *warp*, running lengthwise, the other, the *weft* or *woof*, transversely. In plain weaving, the essential operations successively performed at the L. are the raising of the alternate threads of the warp and the depression of the others, the conveyance of the weft through the decussation or *shed* so made, and beating home the weft thread to the web. The European hand-L., which to a large extent during the present century has been displaced by the power-L., has a rectangular framework of four upright posts, strengthened by cross ties. In the middle of the opposite ends of the frame two rollers are placed; round one, the *yarn-beam*, the warp is wound; while the other, the *cloth-beam*, is made to take up the fabric as it is woven. The warp is extended between these two beams, and to preserve a proper degree of tension, the former is converted into a friction roller, by means of a weight attached to a cord, which is wound several times round the beam, and the latter is provided with a ratchet-wheel. On passing from the yarn-beam, the warp is crossed by two or three rods, which preserve the *lease* or plane of separation of the threads. Through loops in the middle of vertical cords, called *healds*, the warp threads are next drawn. In plain weaving, two healds are employed, and are suspended one in front of the other from a pulley by a single cord. Each heald is connected with a separate treadle, and since the threads passed through one heald alternates with those passed through the other, the shed of the warp is readily effected. Close to the healds an oscillating frame, called the *lay*, *lathe*, or *batten* is suspended. Its form and parts are shown by the annexed diagram. R is called the *reed*, and between its dents the warp-yarn passes from the healds; S is a kind of shelf, called the *shuttle-race*, for the passage of the shuttle from one side of the warp to the other; and PP are pieces of wood, called *pickers*, which are connected by a cord having a peg attached, and which by a sudden jerk of the cord are caused to travel along wires, and impart a rapid motion to the shuttle. The shuttle, as here illustrated, is a wooden implement with pointed ends, and running on rollers, and in an oblong cavity in its upper surface is placed a bobbin surrounded by weft yarn. As the shuttle travels along its race, the yarn is given off freely by the revolving bobbin through a hole in the side. Previous to 1738 the shuttle was thrown by hand. In that year J. Kay, of Bury, invented the picker contrivance, besides improving the shuttle race, and modifying the shuttle, which attained so great a speed through these improvements, that it received the name of 'fly-shuttle.' The producing power of the hand-L. was more than doubled by Kay's invention. When the shed of the warp is made by depressing one of the treadles, a smart pull at the picking peg causes one of the pickers to drive the shuttle with great velocity to the opposite end of its course; the weft given off during its passage is then beaten home to the web by pulling the batten forward. The depression of the other treadle reverses the shed, the shuttle is made to retrace its course, and the shot weft is again beaten home; by a repetition of these movements the cloth is woven, and as it is wound on its beam, pins projecting from the ends of two pieces of wood called *temples* take hold of the selvages of the cloth and keep it stretched to its proper width.

The invention in 1785 of a power-L. by Edmund Cartwright, an

English divine, eventually led to the successful adaptation of machinery to weaving. His invention clearly demonstrated the practicability of mechanical weaving, and the energies of other practical minds being enlisted in the enterprise, several improvements and additions followed, and thereupon weaving by power became a reality. The principal parts of a power-L., divested of its framing and motive parts, are shown in the accompanying cut. The warp W wound round the beam B passes over a roller

Essential Parts of Power-Loom.

R, and partly over and partly under the rod *r* (two of which are seen); the yarn is then carried through the healds H, H, which make the shed, and allow of the shuttle S being driven along the shuttle-race by a sort of hammer actuated by a lever moving through a small arc of a circle. L is the upper bar of the lathe with the reed below, and the cloth *c* is stretched by the temples *t*, and then wound on its beam B'. It will thus be seen that the power-L. embodies the same principles as the common hand-L., and in addition to the actions of raising and depressing the warp, throwing the shuttle, beating home the weft, unwinding the yarn, and taking up the cloth, the power-L., by a beautiful contrivance, instantly throws the parts out of gear when the weft thread breaks or runs out. See WEAVING.

Loon. See DIVER.

Lo'pe de Vega. See VEGA.

Loopholes, in Fortification, are small openings in walls, stockades, &c., through which muskets may be fired.

Lophius, a remarkable genus of Teleostean fishes, of which one species the *L. piscatorius*—popularly known as the 'scad-die', 'wid-eab', or 'fishing-frog'—is frequently cast up on British coasts after storms. This genus is included in the special family *Lophidae*, which forms one of the subdivisions of the *Acanthopteron* fishes. The L., which varies in length from 2 to 4 feet, has an immense head, and wide mouth. The pectoral fins are well developed, and a very large gill-opening is also seen. The head is provided with three or more filaments said to be used by the fish in the capture of prey, L. burying itself in the mud, and imitating the movements of worms by moving the filaments so as to attract smaller fishes to the spot. No scales are developed, and the colour is brown above and white beneath.

Lophobranchii, a subdivision of Teleostean fishes, represented by the *Hippocampidae* or sea-horses, and by the pipe-fishes (*Syngnathidae*). They have gills in the form of tufts borne on the branchial arches, and the gill chamber is covered in by the *operculum* or 'gill cover,' which is attached to the head save at one point, where an aperture exists to permit the escape of the water used in respiration. The scales are of the 'ganoid' type, and exhibit a hard and horny consistence, but the skeleton is imperfect, being chiefly composed of cartilaginous material. An air-bladder exists, but it possesses no 'pneumatic duct' or outlet. See also SEA-HORSES and PIPE-FISH.

Lophornis, a genus of Humming-birds, of which the *L. ornatus*, or tufted coquette of N. Brazil, is a familiar example. The spangled coquette is another species, known scientifically as the *L. Regina*; others are the *L. Gouldii* and the *L. Helena*. These birds have a most brilliant plumage.

Loquat is the adopted Chinese name for the fruit of *Eriobotrya Japonica*, a tree of considerable size, closely related to the Medlar. It is native of Japan and S. China, whence it has been imported for cultivation into India, and now for a long time past has been grown in S. and W. Europe; it has also reached

Australia. The fruit is oval, about the size of a plum, and produced in clusters. The flavour is subacid—something like that of a sharp-tasted apple.

Loranthaceæ, or **Mistletoe Family.** See MISTLETOE.

Lorca (anc. *Illurci*, 'the town with fine water,' from the two Basque words *illia*, 'a town,' and *ura*, 'water,'), a city of Spain, province of Murcia, on the Sangonera, 50 miles W. of Carthagena. It has an old Moorish castle, and manufactures of silks, soap, dye-stuffs, leather, paper, &c. Near L. are important lead mines. Pop. 40,000.

Lord (Old Eng. *hlaf-ord*, from *hlaf*, 'loaf,' and either *ord*, 'origin,' or *ward*, 'warder'), and **Lady** (Old Eng. *hlæfdige*, either 'she who looks after the loaf,' or a corruption of *hlaf-weardige*, the fem. of *hlaf-weard*), 'honorable appellations with which our ancient and yet continued custome, that our *Lords* and *Ladies* doe vse to carue and serue their guests at the table, which in other countries is altogether strange and vnusual, doth well accord and correspond' (Verstegan, *Restitution of Decayed Intelligence*, 1628). Lord Mayor's Procedure Act. See MAYOR'S COURT OF LONDON PROCEDURE ACT.

Lord of the Manor. See MANOR.

Lord Ordinary. See COURT OF SESSION.

Lord's Day. By 29 C. II. c. 7, no person, under a penalty of 5s., is allowed to *work* on the Lord's day, except the work be one of necessity or charity, nor to use any boat, nor to expose any goods for sale, except meat in public houses, and milk and mackerel at certain hours. There is also an unrepealed statute of Charles I., prohibiting certain amusements on Sunday. One of William IV. prohibits the killing of game on Sunday or Christmas-day. By 34 and 35 Vict. c. 87, no prosecution for an offence under 29 Charles II. c. 7 can be instituted except by written consent of the chief police officer of the district, or of two justices of the peace, or of a stipendiary magistrate, having jurisdiction in the place where the offence was committed. It is a popular error to suppose that documents executed on Sunday are invalid. There are several old statutes of the Scotch Parliament unrepealed against work and amusement on Sunday; that of 1693 even enjoins every presbytery to name an informer and prosecutor of offenders for the district. The spirit of the age is probably too much opposed to these Acts to allow of their being enforced. See APPRENTICE, DESUETUDE; see also Scotch law FORBES MACKENZIE ACT.

Lord's Supper is the partaking of bread and wine which our Lord, at the Passover-meal at which he was present with his disciples the night before his crucifixion, appointed them to do in remembrance of himself (Matt. xxvi., Mark xiv., Luke xxii.), and which is observed as a sacrament of the Church under this and other names, e.g., Eucharist (q. v.), Mass (q. v.), &c. Like the Jewish Passover the L. S. was at first associated with a common meal representing the communion of Christians with their Saviour, and their brotherly communion with one another. Both together were called the Supper of the Lord, the Supper of Love (see AGAPÆ). So long as the L. S. proper was connected with the Agape, it was of course observed daily like the latter, and afterwards was held to constitute an essential part of divine service every Sunday. In some churches, however, e.g., the Roman, Alexandrian, and Spanish, a daily observance was kept up as late at least as the 4th c. The Judaizing Christians only observed it once a year, at the feast of the Passover (see EASTER); and others held that it ought only to be taken at stated seasons after due preparation.

The Church from the first attached great and mysterious importance to the bread and wine used in the rite as symbols of the body and blood of Christ. The Fathers in their writings laid great stress on the mysterious connection between the Logos and the elements, corresponding to that between the two natures of Christ, which led them to speak of a real participation of the body and blood of Christ. This idea was sometimes misunderstood, and gave rise to superstitious views, as, e.g., the fear of spilling a drop of the consecrated wine, so that those who wished to partake of the L. S. at home had to content themselves with the bread; which was the first step towards administering the L. S. in one

kind. In the writings of the Fathers, too, there occurs the idea of a Sacrifice. This idea grew with the development of the hierarchy, 'because the ancient world generally could not conceive of divine worship without sacrifice; and with sacrifice the L. S. presented several points of analogy. There was, first, the prayer, which had always been regarded as spiritual sacrifice (*cf.* 1 Pet. ii. 5); then the gifts of the church members, especially the consecrated bread and wine, came to be regarded as offerings to God, and were indeed called offerings, oblations; and both were compared with the sacrifices and first-fruits of the Old Testament. Further, from the 3d c. to the 8th c. the doctrine of the *Consubstantiation* of Christ's body and blood with the elements was generally held. Even during this period some writers spoke of a real change from the one into the other, but the true doctrine of Transubstantiation (q. v.) was first propounded (830-832) by Paschasius Radbertus, according to whom the elements were no more than a mere veil which deceives the senses. He was opposed by Ratramnus, who distinguished between the sign and the thing represented by it, pointing out the true nature of a *mystery* to be, that through it the mind rises from the visible to the invisible, and supposing indeed a *conversio* of the bread and wine into the body of Christ, but only in an ideal sense. By the middle of the 11th c. Transubstantiation had been so generally adopted as the orthodox doctrine of the Church that Berengarius (q. v.) was condemned by several councils for calling it in question, and in consequence of the controversy raised by him, the phrase 'to partake of the body and blood of Christ' was interpreted in the grossest way. The doctrine was finally made an article of faith by Pope Innocent III. (1215). Along with this doctrine had grown the sacrificial ideas referred to above, which had been fully developed by the scholastic theologians, and had taken shape in the doctrine of the sacrifice of the Mass (q. v.). By the institution of Corpus Christi-day by Pope Urban IV. (1264), this doctrine was expressed in its grossest and most literal form.

The Reformers all made common cause against the doctrines both of Transubstantiation and the Mass, but they differed widely in their opinions as to the real nature of the rite of the L. S. Different interpretations of the words used by Christ at the institution ('This is my body') were advanced by Carlstadt, who held that Christ used the words in pointing to his body; by Zuinglius, who asserted that the rite had been instituted by Christ merely as an act of commemoration, and whose view has since been adopted by the Socinians, Arminians, and Mennonites; by Ecolampadius, whose interpretation differed only grammatically from that of Zuinglius, his opinion being that it is not the expression, but the idea itself which is to be understood figuratively; and by Schwenkfeld, who made the words out to have this meaning, 'My body which is given for you is the very thing I distribute among you, namely bread, a veritable meal, and the efficacious means of preserving eternal life.' Luther was opposed to all these opinions, adhering strictly to the letter of Scripture, from which he deduced the doctrines of Consubstantiation, or the *real presence* of Christ's body and blood in the elements of bread and wine, and of the *ubiquity* of His body. According to Calvin, on the other hand, the *believer* alone who partakes of the elements; artakes in a spiritual manner of Christ's body, which is in *heaven*. The Quakers hold that in consequence of their intimate and spiritual union with Christ they may dispense with the participation of His body. See Hagenbach's *Lehrbuch der Dogmengeschichte* (Eng. Trans. 1864), and Gieseler's *Lehrbuch der Kirchengeschichte* (Eng. Trans. 1855).

Lords, House of. See PARLIAMENT.

Lor'elei, or Lurlei (Old Sax. *lure*, 'loud,' and *leia*, 'rock'), a steep rock on the right bank of the Rhine, between St. Goar and Oberwesel, 440 feet high, and now pierced by a railway tunnel. It is celebrated for a remarkable echo, and still more for the nix, or water-maiden, who by her magic song lured the unwary fisherman to his destruction in a neighbouring whirlpool. This legend, of disputed antiquity, forms the subject of Heine's exquisite *volkslied*, *Die L.*

Loret'o, less correctly **Loretto**, a city in the province of Ancona, Central Italy, on a hill commanding beautiful views of the sea and the Apennines, 20 miles S.W. of Ancona by rail. It consists of little more than a single long street, full of booths for the sale of rosaries, images, &c., and is greatly infested by beg-

gars. Pop. (1874) 8083. Nearly half a million pilgrims yearly resort hither to visit the sanctuary of Our Lady of L. (*Domus Lauretana*) designed by Bramante, and containing the *Casa Santa* (according to tradition) in which the Holy Family dwelt at Nazareth. In the legend the Santa Casa was rescued from the infidels by angels, who bore it first to the coast of Dalmatia in 1291, and thence to its present site near Recanati, in 1299, where it was deposited on ground belonging to a certain widow Laureta (hence *Lordo*). Externally the Chiesa della Casa Santa has no great architectural beauty. The campanile, designed by Vanvitelli, is a lofty, richly-decorated structure. The chief bell, weighing 11 tons, was presented by Leo X. in 1516. The Casa Santa, a simple brick building, encased in a high marble screen enriched with bas-reliefs by some of the greatest Italian artists, stands in the centre of the church under an octagonal cupola, covered with exquisite frescoes. The church is also decorated with many fine pictures, sculptures, mosaics, bronzes, and silver lamps. Its treasury was formerly one of the richest in the world, but was drawn upon heavily by some of the popes, especially Pius VI., and by the French during the occupation of 1796.

L'Orient ('the East'), a naval and mercantile port of France, department of Morbihan, at the confluence of the Scorff and Blavet in the Bay of L., 35 miles W.N.W. of Vannes by rail. It is strongly fortified, and the chief buildings are the church of St. Louis, the Lyceum, Observatory (131 feet), Bourse, and School of Artillery, &c. In 1874 there entered the port 92 vessels of 12,214 tons, and cleared 217, of 23,552. The value of imports (naval stores and colonial wares) was £131,121; of exports (corn, wine, brandy, fish, &c.), £25,359. The sardine fishery, ironfounding, shipbuilding, and the making of steam-engines are the chief industries. Pop. (1872) 24,088. L. owes its origin and name to the establishment here of docks and magazines by the French E. India Company in 1666.

Lor'imer (Fr. *lormier*, from Lat. *lorum*, 'a thong'), a name formerly given to the makers of the iron articles used for the trappings of horses. The London guild of Lorimers was incorporated in 1712. In Scotland they were included in the general class of hammermen.

Lor'is, a genus of Lemurs (q. v.), or lower *Quadrumania* (Monkeys), represented by the *L. gracilis*, or slender L., and other species. The slender L. occurs in the Eastern Archipelago, is active in its movements, and feeds on fruits, birds, eggs, &c. It is about 10 or 12 inches long, the tail is rudimentary, and the muzzle short and pointed. The colour is a greyish brown, tinted with white below, the fur round the eyes is darker. An allied species is the slow-paced L.

Lorraine (Ger. *Lothringen*), a German duchy which became a French province in 1766, and included the departments Moselle, Meurthe, Meuse, Vosges, and part of Bas Rhin, but, of which Germany regained in 1871 the greater part of Moselle and the N.E. part of Meurthe, in all 2406 sq. miles, with 490,459 inhabitants. By the Treaty of Verdun (843) Lothar I. (q. v.) received a narrow territory stretching from the Mediterranean to the N. Sea, called after him Lotharingia. In 855 the Karoling Lothar II., his second son, obtained as his share the lands between the Scheldt, Rhine, Maas, and Saône, the so-called Lotharingian kingdom (Lotharii regnum). After his death it became an object of contention between the French and German Karolings. Otto I. gave it (953) to Bruno (q. v.), archbishop of Köln, who in 959 had to divide it into Lower L. (Lotharingia Mosana or Ripuaria), between the Rhine, Maas, and Scheldt, and Upper L. (L. Mosellana), between the Rhine and Moselle as far as the Maas.—**Lower L.** passed through the hands of several houses. From 1248 its dukes took their title from Brabant (q. v.), and on the death of Duke Philipp in 1430 it fell to Burgundy.—In **Upper L.** the family of Frederick of Bar, the first duke, became extinct in 1046, when its lands were given in fee to Graf Albrecht of Elsass. The last of his family by male succession, Karl II., having died in 1431 as Constable of France the Emperor Sigismund gave the Duchy to Karl's daughter Isabella and her husband René (Renatus) of Anjou (titular King of Naples, and father of the English queen, Margaret of Anjou), the descendants of whose daughter Jolanthe, married to her cousin Friedrich, Graf of Vaudemont, were the Dukes of L. till 1735. Henri II. seized Metz, Toul, and Verdun in 1552,

and from 1642 all L. was under France till its restoration at the Peace of Ryswick to Leopold Joseph Karl, whose son, Franz Stephen (q. v.), at the Peace of Vienna in 1735, in return for the right of succession to Tuscany, resigned his insecure possession to Stanislas Leszczyński, on whose death (1766) it fell to France, according to the treaty.

Lorraine, Claude. See CLAUDE GELÉE.

Lor'y, the name given to various kinds of *Scansorial* or climbing birds, belonging to the family *Psittacidae* or parrots, and inhabiting New Guinea, Borneo, and the Moluccas. The wings are of moderate length, and have their second and third quills longest. The tail is rounded, and of moderate size; the bill is smaller than in the parrots and cockatoos. The purple-capped L. (*Lorius domicellus*) has a scarlet plumage, the top of the head being of a rich purple, the breast yellow, and the wings green on their upper parts, mingled with violet on the sides. The average length is 11 inches, the tail being very short. The L. feeds on seeds, &c., and is readily domesticated, although it never learns to speak with the facility of the parrot.

Los Angeles, the chief town in the region known as 'semi-tropical' California, on the Los Angeles River, 30 miles from its mouth, and 350 miles S.S.E. of San Francisco, to which city it is being constructed (1877) the S. Pacific Railway. The place where gold was first discovered in 1833, L. was made the capital of California by the Mexican Congress in 1836. It has a Catholic college, two hospitals, three daily, one semi-weekly (Spanish), and five weekly (one German) newspapers. Pop. (1870) 5728.

Lossi'ni (Ger. *Lussin*), an island in the Gulf of Quarnero, an inlet of the Adriatic, belongs to the Austrian Küstenland, is 19 miles by 3, and has a pop. of 10,600. The chief town, L. Piccolo (pop. 5200), with a harbour capable of admitting the largest vessels, carries on a trade in grain, olive oil, fish, wine, &c.

Lost Property. See FINDING, LAW OF.

Lot, a department in the S.W. of France, surrounded by Corrèze, Cantal, Aveyron, Tarn-et-Garonne, and Dordogne. Area, 2012 sq. miles; pop. (1872) 281,404. L. is a calcareous plateau, the E. of which is occupied with offshoots from the mountains of Cantal. The rivers Dordogne and L. cross it from E. to W., forming two main valleys, with numerous branches. L. is essentially agricultural. Its fertile soil yields abundance of *cereals*: wheat, rye, maize, &c., to the value of 21,000,000 francs yearly, and large quantities of chestnuts, truffles, and mushrooms. Flax, fruits, and tobacco are also cultivated. The silk production is important. The chief town is Cahors.

Lot, a tributary of the Garonne, in S. France, rises in the Cevennes, in the department of Lozère, from which it flows westward with a very winding course, till it falls into the Garonne at Aiguillon, in the department of Lot-et-Garonne. It becomes navigable at Entraigues, and is 272 miles long.

Lot-et-Garonne, a department in the S.W. of France, part of old Guienne, is bounded N. by Dordogne, S. by Gers, W. by Gironde and Landes, E. by Lot and Tarn-et-Garonne. Area, 2067 sq. miles; pop. (1872) 319,289. In great part a cultivated plain, L. is watered by the Garonne, Lot, and Baize. Agriculture is well advanced, and is gradually reclaiming the wastes and marshes. Cereals are raised to the value of 37 million francs; other products are tobacco (3 million francs), hemp of the first quality, good wine, flax, rape, vegetables, and fruits, especially the *pruneaux d'Agen*. There are twenty iron mines, large iron and copper works, and manufactures of cotton, linen, and silk tissues, machinery, paper, tobacco, brandy, glass, &c. L. is traversed by the Canal Latéral à la Garonne, and by the Paris à Agen and Bordeaux à Cette Railways. The chief town is Agen.

Lo'thian, the name of a fertile, well-cultivated district in Scotland, extending along the S. side of the Firth of Forth, and including the counties of Haddington, Edinburgh, and Linlithgow. It was called by the Anglian settlers *Lothene*, and was known to the Gael as *Lethad*. A Latinised form is *Loidis*. The name was afterwards extended to the whole S.E. of Scotland, which formed the 'Earldom of L.' See Skene's *Celtic Scotland*, vol. i. pp. 240-41; also article SCOTLAND.

Lo'tions or Wash'es are external fluid applications, consisting of various medicinal substances in solution in water or

other menstria. The pharmacopœial L. are the *Hydragryi flava*, and *nigra*, or the *yellow* and *black wash* used for venereal sores.

Lotoph'agi (Gr. 'lotus-eaters'), according to the ancients, were a peaceful race inhabiting Cyrenaica, on the northern coast of Africa, and living on the fruit of the Lotus (q. v.), which when strangers had once tasted they forgot all thought of home and friends, as did two of the companions of Ulysses (*Od. ix.*). They form the subject of a poem by Tennyson.

Lot'tery (from Gothic, *hlauts*, 'a lot,' through the Italian *lotteria*), a game of hazard in which small sums are ventured on the chance of obtaining more, and in which the prizes are drawn by lots. Early in the middle ages it was common for Italian merchants to dispose of their goods by lot. The L. is said to have been first used for increasing the revenue by the Genoese, but the custom rapidly spread throughout Europe. The first L. in England was in 1569, and the proceeds were applied to the repair of the harbours and other public works. A state L. was annually licensed by Parliament from 1709 to 1823. The *Lotteries Nationales* of France yielded an annual revenue, between 1816 and 1828, of 14,000,000 francs. In 1870 Prussia derived 1,339,500 thalers from its lotteries; Saxony, 800,000 thalers. The home of the L. now, however, is Austria.

Law regarding Lotteries in Great Britain.—Lotteries were rendered illegal by Act of Parliament in 1826. By an Act of William IV. the advertisement in Great Britain of foreign lotteries is prohibited. Law regarding Gaming (q. v.) applies to lotteries.

Lo'tus is a name now restricted to a genus of Leguminosæ, consisting of some fifty species of herbs and under-shrubs, having representatives in the Old and New World, and in the N. and S. hemispheres. A common European species is *L. corniculatus*, or the Birdsfoot Trefoil. If we refer back to the earliest list of plants cultivated in an English garden, namely, that of Gerard, published in 1596, we find therein three plants under the name L.—one of these belongs to the genus above mentioned, another to the modern *Melilotus*, and the third, (*L. arbor*, 'Nettle Tree') is the *Celtis Australis*. This last was the L. of the ancients, as we have the figure evidence of an early manuscript of Dioscorides. The attributes of sweet, pleasant, and wholesome, which, according to Herodotus, Dioscorides, and Theophrastus, were combined in the food whereon the Lotophagi fed, are united in the fruit of the *Celtis*. With the *Celtis* may be joined species of *Zizyphus*, also surmised to have been a Lotophagian delicacy. The fruits of both are at present largely used by the natives of the countries bordering the Mediterranean. *Nitraria tridentata*, a native of the plains of W. and Central Asia, has also been supposed to be the true L. tree of the ancients. Its fruit has a salt flavour. The sacred L. or Pythagorean bean, is different from any of the above, being a water plant with large, fragrant, and beautiful rose-coloured flowers, a native through a wide range in S. and E. Asia and the neighbouring islands. There can be little doubt that it formerly grew also in Egypt, and was held in veneration by the Egyptians as it is by the Hindus. The white and the blue L. of the Nile are species of *Nymphaea*, and will be found referred to under WATER LILY.

Lot'ze, Rudolf Hermann, a living German philosopher and physiologist, born 21st May 1817, at Bautzen, studied medicine and metaphysics at Leipsic, where he was appointed extraordinary Professor of Philosophy in 1842. In 1844 he became Professor of Philosophy at Göttingen, where he still remains. Though of the school of Herbart, L. has an independent place, and in the struggle between transcendentalism and materialism he has distinguished himself as a powerful opponent of the latter. His works are *Gedichte* (1840); *Metaphysik* (1841); *Allgemeine Pathologie und Therapie* (1842); *Logik* (1843); *Ueber den Begriff der Schönheit* (1845); *Ueber Bedingungen der Kunstschönheit* (1847); *Allgemeine Physiologie* (1851); *Medicinische Physiologie* (1852); *Mikrokosmos* (1856-64); *Streitschriften* (vol. i. 1857); *Geschichte der Ästhetik in Deutschland* (1868).

Zizyphus 18.

Lou'don, John Olaudius, a botanist and horticulturist, was born at Cambuslang, Lanarkshire, April 8, 1783. As a landscape gardener he went to London in 1803; he settled on a farm at Tew Park, Oxfordshire, in 1809, where he established a kind of college for instructing young men in the principles of farming. After 1828 his life was chiefly devoted to the publication of works upon agricultural and botanical subjects. The more important of these are *The Encyclopædia of Gardening* (1822); *of Agriculture* (1825); *of Plants* (1829); *of Cottage, Farm, and Villa Architecture* (1832); and *Arboretum et Fruticetum Britannicum* (8 vols. 1838), his last and greatest work. L. was also the editor of *The Gardener's Magazine*, *The Magazine of Natural History*, *The Architectural Magazine*, and *The Suburban Gardener*. L. died at Bayswater, December 14, 1843.

Loughborough, a market town in Leicestershire, England, on a feeder of the Soar, and on a canal between the Soar and Trent, 115 miles W. by N. of London by rail, has a fine old church, dating from the 16th c., several chapels, and a rich educational institution called Burton's School, founded in 1495. L. has manufactures of stockings, cottons, woollens, shoes, and bobbin-net lace. Pop. (1871) 11,456.

Loughrea (Irish Gael. *Loch-riabhach*, 'grey lake'), a market town of Galway, Ireland, on a small lake of the same name, 38 miles N. of Limerick, has two churches, and a Catholic friary and nunnery (the former founded in 1130), and some manufactures of beer, linen, and leather. Pop. (1871) 2669.

Louis I. (properly *Hiludwig*, surnamed *the Pious*), third son of Karl the Great and Hildegard, was born about 778. In infancy he was made king of Aquitania, and educated under the tutelage of Wilhelm the 'Snub-nosed' at Toulouse. He was made the colleague of Karl in 813. His sympathy with learning was healthy and strong. L. started with the best intentions of having a refined court, and a people every class of which should be elevated higher than he found them. By his wife Hermingard L. had three sons, Illothar, Pippin, and Hludwig. After her death in 819 he married Judith, who bore him Karl. The greater part of his reign is taken up with the jealousies and quarrels of his children, upon whom he severally had bestowed kingdoms, partition after partition following in rapid succession. In 840 L. died at Engelenheim, after which Karl's empire was split up. L. was 'a clerically southerner of the gentler type, a pure unselfish devotee, a grave man,' but, says Kitchin, 'his virtues were dangers.' He forgave where a more prudent man would have crushed. See Kitchin's *History of France* (vol. i. 1873).

—**L. VI.**, surnamed *Le Gros*, son of Philippe I., was born in 1078. His father, according to the custom of the Capetian Kings (q. v.), made him joint king in 1100, though the royal power was exercised within very narrow limits. To the very gates of Paris the feudal lords exercised sway, and their act of homage on the king's first succession to a fief was about the only mark of obedience offered him. L. at once set himself to restrain the power of the baronage, reduced Bouchard de Montmorency, defeated the Comte de Ronci, and negotiated Montlehery out of the hands of Guy Troussell. In 1108 King Philippe died, and L., after being crowned at Orleans, renewed his warfare, until in 1111 the serfs lent their assistance against the oppression of the barons. L. fostered a system of justice wherever he appeared, defended the poor, and helped the Church, and gave privileges to the chief cities of the royal domain. In 1119 L. received a severe repulse at Brenneville from the English, being at the time when he fought in behalf of William Clito, grandson of the Conqueror. Five years later, when Henry of England and Henrich of Germany threatened him with war, L. obtained the assistance of his more powerful lords, and though there was no fighting, 'men began to regard him as the central figure of all France.' Still later his rights and powers were felt and recognised from N. to S. A great grief overcame him (1131) by the death, through accident, of his son Philippe, whom he had associated with him on the throne two years previously. Before L.'s death proposals were made to him by Guillaume of Aquitaine to marry his son, Louis *le Jeune*, to his daughter Eleanor, and by this union the formal independence of Aquitaine came to an end. L. died in 1137. He was a man of lovable character, frank, cheerful, and unassuming, whose assiduity and vigour did much towards arousing the sense of national unity realised in later reigns. See Kitchin's *History of France* (vol. i. 1873). —**L. VII.**, son of the preceding, was born in 1119, and crowned

as his father's associate in 1131, his education being attended to by the monks of St. Denis, from whom 'he sucked in prejudice and feebleness.' In 1135 he married Eleanor, the daughter of Guillaume of Aquitaine, and was crowned sole king (1137). He quarrelled next year with Innocent II., asserting his right to name the Archbishop of Bourges. The quarrel was only cemented after L. had attached the lands of Theobald of Champagne and burnt the parish church of Vitry, by his promising to the Pope to do penance in a crusade. Much enthusiasm prevailed, and (1147) the French army was prepared. But the crusade was a failure. 'One thing alone came out of it.' The Germans joined in it, and 'the French learnt to look on L. as at least the equal of Konrad the Emperor.' On his return from the East, L. divorced his wife, who, with her dowry of Poitou and Aquitaine, married Henry of Anjou (see Henry II.). After Henry's ascent to the English throne, 'the great controversy between England and France took shape.' By the year 1160 a great part of what is now France acknowledged the supremacy of Henry. In the same year L. married Ala, daughter of Theobald of Blois, by whom (1165) he had a son. L. supported Becket against Henry, and (1172) assisted his sons to revolt. In 1179, when affected with paralysis, he recommended the crowning of his son Philippe at Rheims, and 'of all the hereditary crowns in Europe the French became the most firmly established.' L. died at Paris, September 1180. See Kitchin's *History of France* (vol. i. 1873). —**L. IX.**, *Saint*, son of Louis VIII., was born at Poissy, 25th April 1215, and succeeded to the throne in 1226. Nearly all the great lords refused to attend his coronation, and, being refused the release of all noble prisoners, they formed a confederation hostile to Blanche, the queen-regent. A war was carried on against her till 1231, when the treaty of St. Aubin du Cormier 'may be said to close the great troubles of the king's minority.' At the same time, by the treaty of Meaux, Raynond VII. ceded to the king all lands and domains on the French side of the Rhone, and made terms which involved the absorption of the south into the kingdom of France. In 1234 L. married Marguerite, a daughter of Raymond Berenger, Comte de Provence, who was only twelve years of age. In the struggle which went on between Gregory IX. and the Emperor Friedrich II., L. remained wisely neutral, and declined to accept the bribe of the imperial crown for his brother Robert of Artois. L. wished his brother Alphonse to become Lord of Poitou and Auvergne (1241), but the barons rebelled, and Henry III. of England assisted them. At Taillebourg the English king and his allies received a severe check, and a second battle, fought at Saintes, broke up the coalition. An attempt of Raynond VII. to reassert the independence of the south, ended (1244) in renewed submission. 'Thus ended the last coalition of the barons against the king.' In the same year, during an illness, L. took the cross, and (1248) set sail for Egypt, landed (June 1249) at the town of Damietta, and for several years distinguished himself in war with the Paynim. Upon his return (1254) he devoted himself to good offices, made peace between rival barons, built hospitals and penitentiaries, founded churches and nunneries, and 'ruled the land as it had never before been ruled, until security brought plenty, the returns of the royal domains doubled, arts flourished, and learning was held in honour.' L. again took the cross (1267) and set out for the East (1270), but died of dysentery upon landing. L. was a man of deep religious convictions, a fearless warrior, a lover of justice, and 'the most loyal man of his age.' See Joinville, *Histoire de Saint Louis*; Guillaume de Nangis, *Gesta S. Ludovici IX.* (best ed.; and *Recueil des Historiens* by Daunon and Naudet, Par. 1840); and Kitchin's *History of France* (vol. i. 1873). —**L. XI.**, son of Charles VII. and Marie of Anjou, was born at Bourges, 3d July 1423. In his seventeenth year he headed the 'Praguerie,' a conspiracy against his father, and was sent to govern Dauphiné. At Dieppe and the Rouergue (1442) he did good service against the English, and at the river Birse he defeated a body of free-lancers (1444). In 1445 he again intrigued against the king, and attempted to revive the Praguerie. At Rheims (1461) he was consecrated to the kingly office. At once L. set the towns against their princes, deprived his father's ministers of their offices, showed the clergy that he meant to curb their power, made a royal progress through his kingdom, and (1463) imposed a series of arbitrary taxes. The 'League of the Public Weal,' consisting of five hundred lords, arose against his 'bad government' in 1464, an indecisive battle was fought at

Montleheri (16th July, 1465) in which the king showed great bravery, and after which he secured Paris. The Peace of Conflans was signed between L. and the nobles (October 5th), and he was 'left sitting desolate in his fair city of Paris.' In the course of two years he successfully broke the treaty, divided the Leaguers, and recovered Normandy. He also convoked the States-General at Tours, April 6, 1468, at which, though it was determined that the king could not dismember the realm, a commission was appointed 'to remedy abuses and to order the course of laws.' Continuing to cultivate the friendship of the nobles, L. (in 1468) reduced Brittany, and in order to make headway against the Duke of Burgundy, he went to negotiate with him at Péronne, placing himself unreservedly in the Duke's power. His trick failed, and he was compelled to sign a peace on the base of the Treaty of Conflans, by which he was degraded before the whole country. The treaty was, however, declared not to be binding upon the king by an Assembly of Notables (1470); war was waged upon the duke, but he, owing to the birth of a dauphin, and having obtained from an Assembly of his States permission to establish a standing army, besides promising his daughter in marriage to the Duc de Guyenne, remained uncrushed, but sued for peace, November 1472. Two years later, Edward IV. of England crossed to assist the Duke of Burgundy, but was bought off, a truce being at the same time renewed with Charles the Bold, who died (1477). L. had now brought down all the ill-affected houses, the estates of Burgundy recognised him as liege lord, Franche-Comté was taken, and Picardy welcomed him. Mary of Burgundy married Maximilian of Austria, and French aggrandisement was checked at the battle of Guinegate (1479). L. suffered defeat, but made peace (1482) with Maximilian at Arras. He died at Plessis-lez-Tours, 31st August 1483. L. is 'the true founder of the French monarchy in its later form, as the government of a nation ruled by absolute power.' He was a subtle, cold-hearted, selfish man, who scrupled at nothing to gain his ends; he was, besides, superstitious, untruthful, and vindictive; mean-looking and physically weak; 'one of the few men destined to do really great things, and yet not himself to be great.' Chastellian calls him 'the universal spider,' from his matchless capacity for intrigue. *Continues Mémoires*. See Sismondi, *Histoire des Français* (vols. xiv. i.; Michelet, *Histoire de France* (vol. vi.); Kitchin's *History of France* (vols. i. and ii. Lond. 1873-77).—**L. XIth**, eldest son of Henri IV. and Marie de' Medici, was born at Fontainebleau, 27th September 1601, married to Anne of Austria (1610), but was kept in strict tutelage until the next year, when he was assisted to freedom by Luynes. In 1620 L. marched against the Huguenots of Normandy, against whom he acted with surprising vigour, and the same year he made peace with his mother at Angers. Another campaign was led by him (1621-23) against the Huguenots of the South, but without much credit. By the year 1624 he had fallen into the hands of Richelieu (q. v.), who governed him and guided the empire thenceforth. L. called an Assembly of Notables to Fontainebleau (1625), where it was determined that the clergy would bear the cost of putting down the Huguenots, whilst the king's revenue was left free for foreign war. A plot in favour of L.'s brother was detected and put down next year, and (1627-28) L. showed a dauntless spirit in the long siege of La Rochelle. He set out for Italy (1629), where he triumphed over the Spanish at Casale, and returning to Languedoc crushed the Calvinist rebels and extinguished their liberties. Next year he sent Richelieu into Italy with an army, giving him the title 'lieutenant-general representing the king's person.' The queen-mother, who held by the Spanish party, was disgusted at the Cardinal's predominance, and (1630) asserted her sway over L., but it lasted for a brief time, Richelieu shortly afterwards being created duke, peer, and governor of Brittany. In 1635 L. established the French Academy and a royal printing-press. Three years before, he declared the Duc de Lorraine a rebel, and Lorraine subject to the French crown. The royal pretensions to 'imperial honour as the successor of Charlemagne' were also pushed forward in these years. Again L. had an opportunity of showing his courage (1636) after the dissipation of the French armies and the threatening of Paris by the Spaniards and Netherlanders. In 1638 he became a father after twenty-four years of married life, and in 1642, though in ill-health, he took the command of an army on the Spanish frontier. L. died May 14, 1643, at St. Germain-en-Laye. He played but a subordinate part in the

ruling of home and foreign affairs, but he realised to the end that the policy of Richelieu tended to the greatness of his kingdom. It is his most distinguished merit that in the midst of endless intrigues he remained faithful to his minister. See Richelieu's *Mémoires*; Marius Topin's *Louis XIII. et Richelieu* (Par. 1876); Kitchin's *History of France* (vol. iii. 1877).—**L. XIV.**, eldest son of the preceding, was born 16th September 1638, at St. Germain-en-Laye. He was poorly educated, owing to the troubles of the Fronde, in which he took a share, and in his eighteenth year was governed by Mazarin (q. v.), as his father had been by Richelieu. In 1658 he was deeply in love with Marie Mancini, a niece of Mazarin's, but in the following year he signed the 'Treaty of the Pyrenees,' condemning himself to a marriage of state which exalted high the dignity of the French crown, only to plunge it in the end into the troubles and disasters of the Succession War. He married the Infanta Maria Theresa of Spain in 1660. Next year Mazarin died, having previously instilled into L.'s mind many lessons in autocracy, teaching him to discard first ministers and favourites, and 'to cultivate his strong natural talent for dissimulation.' L. at once showed how he profited by the advice. Statesmen were turned into chief clerks, and the king began to plod through the work of government each day. He threw aside Fouquet and advanced Colbert to the comptroller-generalship of finance. In three years France had peace; and art, commerce, and the French fleet sprung into importance. The taxation was lightened and yet the royal treasury was filled to overflowing. The nobility were taught that the court was the only gate to preferment, and to it they crowded from all parts of the country. 'Nec pluribus impar' was the motto taken by L. when he found himself indeed the sole and central influence in France. In 1665 Philip IV. died, and L., on the pretext that the dowry assigned to his wife had never been paid, and 'transferring customs of feudal lordship to the successor of royalty,' laid claim to Flanders. Two campaigns followed; the first in the Netherlands in 1667, the second in Franche-Comté in 1668. In both districts the French were victorious, but a league, known as the Triple Alliance, between England, Holland, and Sweden, made L. pause. He signed the Peace of Aix-la-Chapelle, 2d May 1668, under which he kept what he had won in the Netherlands, and gave up Franche-Comté. His irritation at Holland induced a renewal of the war in 1672, when 100,000 men, led by Turenne and Condé, marched against 25,000 men headed by William of Orange. L. marched with the French army. Five of the 'Seven Provinces' were overrun or paralysed. The Dutch were in despair, and sought peace. But the French king insisted on the establishment of Catholicism and a French Protectorate. Despair at once gave way to fiery indignation. The Dutch opened the Muiden sluice, and put their country under water. Alarmed by L.'s condition, a league was made in August 1673 between the Emperor, Kings of Spain and Denmark, the Elector of Saxony, and the Duc de Lorraine. L. abandoned Holland, but reconquered Franche-Comté. Not till August 10, 1678, was the Dutch War brought to a close by the signing of the Peace of Nimwegen, which was dictated by France at the expense of Germany and Spain, Holland having become the accomplice of L., and Charles of England his paid agent. In 1680 the city of Paris voted to L. the title of 'Le Grand,' and preachers, artists, poets, and courtiers vied with each other in heaping up the language of adulation. During these years L. had attached himself to several mistresses, the most prominent of whom were the Duchess de la Vallière and Madame de Montespan. In 1683 he privately married Madame Scarron (better known as Madame de Maintenon), who, though she was never publicly acknowledged as his wife, exercised immense influence over him. 'For two and thirty years,' says Kitchin, 'she was lord of France.' The first fruits of her bigoted Catholicism were seen in the system of religious persecution now inaugurated. The Jesuits gained the ascendancy over the king's mind, the Jansenists were suppressed, and against the Huguenots, though they were quiet and industrious citizens, an ordinance recalling the Edict of Nantes was signed and sealed, 18th October 1685. It has been calculated by Sismondi that owing to the persecution consequent upon the revocation, 300,000 Huguenots left the country, and carried their art and industry elsewhere. But by 1688 William of Orange had become the moving spirit in a fresh coalition—the League of Augsburg, which practically roused Europe against France. Not till 1697,

by the Treaties of Ryswick, were England, Holland, Spain, the Emperor and the empire satisfied that they had curbed in some measure the ambition of L. But the peace France applauded 'as bringing her much needed rest, and as another proof of her monarch's moderation and greatness.' L. was allowed to keep Strassburg, but all that he had annexed beyond Elsass since the Peace of Nimwegen had to be abandoned. Besides, he was compelled to acknowledge the Prince of Orange to be king of England. Before the end of the century the elements of another great war began to reveal themselves. By the death of Charles II. of Spain the vacant throne fell to L.'s grandson, Philippe of Anjou. After protesting, however, to the European Powers that the French and Spanish crowns should never be united, L. drew up a patent securing to the Duc and his sons all their rights to the French throne, and proceeded to treat Spain as if it were a department of his own kingdom. A great alliance of the Powers followed, and in 1701 the War of the Spanish Succession commenced between L., the emperor, the Dutch, and the English. But since 1660 France had been gradually drained of resources till she had reached the point of exhaustion. Half her wealth was said to have perished, and amidst the royal magnificence the people were dying of starvation. Not till 1714 did the War of Succession come to an end, and that after the theatre had shifted from Italy to Belgium, and from Germany to Spain, England being the greatest gainer by the contest. L.'s ambition had conducted his country to a pitch of unexampled misery. 'There was no credit, no revenue, no circulating medium, no freedom of commerce.' Nor did religious persecution cease. It became more terrible by the use of *lettres de cachet*, and its pitiless indiscriminate was shown (1710) by the destruction of Port Royal, which occasionally sheltered the Jansenists. With age L.'s religious fervour increased, and he died at Versailles, 1st September 1715, in ecstasies of pious excitement. Many estimates have been made of his character, which, though it reckoned among its qualities selfishness, ostentation, and deceit, also included firmness of purpose, an unwearied capacity for toil, and a belief in his own destiny, which, viewed in the light of the events of his career, may be said to have amounted to greatness. His intolerance in religion was the result of ignorance: 'he had the faith of a charcoal-burner, so ignorant was he of the veriest rudiments of Christianity.' See Voltaire's *Siècle de L. XIV.*; Kitchin's *History of France* (vol. iii. 1877).—**L. XV.**, third son of Louis, Duke of Burgundy, and Marie Adelaide of Savoy, was born at Versailles, 15th February 1710. On his deathbed L. XIV. instructed the child to remember the obligations he owed to God, to try to keep peace with his neighbours, and to keep down expenditure; and in his fifth year the crown came to him. Whilst the regency was entrusted to Philippe, Duc de Orleans, Cardinal Fleury became the king's tutor, and Villeroy his governor. In 1723 L. was declared to be of age. In 1725 he married Marie Leczinski, daughter of the ex-king of Poland. Through the influence of Fleury, the court for a time was regulated upon principles of economy and simplicity, but in 1743 Fleury died, and L., who declared he would thenceforth have no First Minister, handed over his government 'to a series of boudoir conspiracies and female revolutions worthy of the most degraded of oriental courts.' First of all, L. fell under the spell of the Duchesse de Châteauroux, who stirred up his ambition for arms until he joined his army then operating in Flanders. An illness overtook him at Metz, and as he was supposed to be dying his mistress was banished. He recovered, and was present at the battle of Fontenoy (10th May 1745), where he showed 'plenty of spirit and bravery.' The next favourite of the king was Madame d'Étiolles, or, as she was entitled, de Pompadour, under whose influence the royal life was devoted to the chase and the salon. He declined to get through any business. 'No magistrate or burgher could get audience.' Louis XIV. had been hard of access, but his successor was inaccessible. By the year 1764, when Madame de Pompadour died, France had lost many fleets and colonies. To her succeeded Du Barry (q. v.), a woman of low extractions, with the result that a new internal policy was adopted, the Parliament of Paris being broken up, and its members dismissed. L. died May 10, 1774. He was the 'true destroyer' of the absolute monarchy of France. See Kitchin's *History of France* (vol. iii. 1877).—**L. XVI.**, grandson of the preceding, was born at Versailles, August 23, 1754, married in 1770 Marie Antoinette, daughter of

Maria Theresa of Austria, and succeeded to the throne May 10, 1774. L. started his career with the best intentions, and called to his councils Maurepas, who intrusted the finances to Turgot. Just as Turgot was applying extensive plans of reform, L. recalled the Parliament of Paris, which, consisting of nobles, lawyers, and financiers, opposed every great change, and the king had to dismiss his ministers in 1776. Jacques Necker was next appointed 'to stop the mouth of the starved giant Revolution with proper budgets;' but being suspected of leaning towards a constitutional monarchy, he was compelled to resign in 1781. Two years later, at the end of the war of assistance to America, republican ideas had become predominant in the army and among the young nobles. The king drifted away from his good intentions, and, under the queen's influence, the court was given up to frivolity. Calonne, who succeeded Necker, was compelled in 1787 to suggest financial reform; but the king having called an Assembly of Notables, he was treated as a traitor and dismissed, being succeeded by Cardinal Laurence de Brienne. In the same year all the Courts and Parliaments of France called for the States-General, but L. showed no disposition to grant constitutional liberties, and did not convoke a sitting until distress in the country and the absence of funds compelled him, May 5, 1789. There then sat at Versailles 291 nobles, 270 clergy, and 578 of the Third Estate, which latter usurped the chief power in behalf of reform. On the 23d June 1789, L. complained of their conduct, but made a formal declaration of concessions. About the same time the Bastille was destroyed by the Parisian mob, and 'with its fall fell the old régime in France.' On the 14th July L. made fresh concessions in the Assembly, and promised to remove his troops from Paris and Versailles, the nobility took fright and fled, the citizens of Paris were driven by want to desperation, and, August 6, 1789, compelled L. to go into imprisonment at the Tuileries. There he remained strictly watched until the 20th of June 1791, when he made an unsuccessful effort to escape. An amnesty was granted by the Assembly to those concerned in the flight, and freedom was restored to the king, the Revolution being declared at an end. The new Assembly, at first inclined to support the amended constitution and the king, became alarmed at the autocratic attitude of the queen; the emigrant nobility and the foreign sovereigns prayed for new decrees, and forced the ministry to resign. The defeat of French troops in the Austrian war made them suspect treason, and new insurrections in Paris were the result. On the 7th November 1792, it was determined to try the king at the bar of the Assembly, and on the 11th and 26th of December he appeared in person to answer the charge of establishing his tyranny by destroying the liberty of the French people. On January 16, 1793, pressed by the Parisian mob, the Assembly, by a vote of 387 against 334, determined that L. should be executed, and on the 21st January the sentence was put in force. L. was a timid, good-natured man, with no will of his own, who always managed to do the wrong thing during an important crisis, but whose natural disposition, had it been guided beneficially from without, instead of being dominated by the will of Marie Antoinette, leant towards gentleness and peace. See the *Histories of the French Revolution* by Thiers, Michelet, and Louis Blanc; Ernest Semichon's *Les Réformes sous Louis XVI.* (Par. 1876); Kitchin's *History of France* (vol. iii. 1877).—**L. XVIII.** (Louis Stanislas Xavier), younger brother of Louis XVI., was born at Versailles, 17th November 1755, married (1771) Marion Josephine Louisa, daughter of Victor Amadeus III. of Sardinia. In 1793 he proclaimed his brother's eldest son King of France, and two years later, upon his death, adopted the title for himself. As an exile his wanderings were many, until he settled down upon a property in Buckinghamshire in 1807. On the 24th of April 1814 L. landed at Calais to assume the crown he had so long claimed, and made a public entry into the capital on May 3d. He pledged himself to constitutional principles, maintaining that representative government should be carried out by a Senate and Chamber of Deputies, that taxes should be voted and imposed by them, that ministers should be responsible and judges irremovable, that liberty of worship and of the press should be guaranteed, and that civil and military employments should be open to all. On the 4th of June, with some slight alterations, the new charter was promulgated, and it remained for three reigns the fundamental code of government in France. After Waterloo the Chamber of Representatives, which was now

'more counter-revolutionary than all Europe, and more royalist than the king,' entertained a design for the annulment of the Constitutional Charter. L. dissolved it in September 1816, and a new election returned a Parliament more moderate and in harmony with popular feeling, but the assassination of the Duc de Berry in 1820 created another reaction in favour of repressive laws and arbitrary prerogative. In 1823 L. sent troops into Spain to assist the restored Bourbon dynasty. He died at Paris, September 16, 1824. L. was a man of some culture, and had learnt by experience to be patient and brave amidst excitement. That he did not give to France the constitutional régime which he promised was less his fault than his party's, as he undoubtedly perceived the impossibility of maintaining a rule in the country upon any conditions less binding. See M. Guizot, *Mémoires pour servir à l'Histoire de mon Temps*, and Du Bertrand, *Régne de L. XVIII.*

Louis d'Or, an old French gold coin, first struck in 1640 during the reign of Louis XIII., and superseded in 1795 by the twenty franc piece. Formerly the L. d'O. was current all over the Continent.

Louisiana, one of the United States of America, is 298 miles long from E. to W., and 280 wide from N. to S., and is bounded N. by Arkansas, S. by the Gulf of Mexico, E. by Mississippi state, from which it is separated partly by the river of that name, partly by the Pearl River, and W. mainly by the Sabine, separating it from Texas. Area, 41,346 sq. miles; pop. (1870) 726,915, of whom 36,4210 were coloured people. The land slopes from hills in the N.W., 240 feet high, towards the Mississippi and the Gulf, and along the lower course of the great river is protected by embankments, which are occasionally broken through by floods, submerging hundreds of thousands of acres. The Mississippi after receiving the Red River from the N.W. flows into the heart of the state, which includes the whole of its delta. Many minor rivers water L., and the coast is honey-combed with salt lakes (largest, Pontchartrain), bayous, and estuaries. The chief formations are alluvial and diluvial, the deposits of the delta being about 60 feet deep, and of marvellous fertility. A Tertiary tract in the N. and N.W. contains lignite, coal iron, lead, gypsum, and rock salt of the finest quality. The chief products of L. are sugar, cotton, rice, wheat, barley, buckwheat, figs, oranges, Indian corn, sweet potatoes, and tobacco. Like Florida, L. is a land of flowers. About one-fifth of the area is too marshy for cultivation, and much of it is covered with lofty cypress trees, festooned with Spanish moss. Other forest trees are ash, hickory, black walnut, magnolia, oak, chestnut, acacia, sycamore, cedar, maple, cotton-wood, and wild orange. In 1874 the yield of sugar was 102,923 hogsheads, and 90,000 hogsheads of molasses; of cotton, 495,000 bales; of Indian corn, 8,110,000 bushels; of rice, 12,007,380 lbs.; of potatoes, 54,000 bushels; of tobacco, 35,000 lbs. of excellent quality. In 1875 there were 75,000 horses and mules, 87,070 milch cows, 168,650 working oxen and other cattle, 63,100 sheep, and 210,035 hogs. In amount of commerce L. is second only to New York among all the states. In 1874 the value of its domestic products exported was \$93,478,513; of its imports, \$14,548,056; while the coastwise and foreign commerce was not far below \$400,000,000. In 1875 L. was traversed by 641 miles of railway. New Orleans is the capital, and other towns are Baton Rouge, Shreveport, and Monroe. La Salle, descending the Mississippi in 1682, took possession of the country in name of Louis XIV., giving it the name L. It was settled by the French in 1699, relinquished in 1717, became the basis of John Law's gigantic Mississippi bubble, was secretly ceded by France to Spain in 1762, reverted to France by the treaty of Idefonso in 1800, and was finally sold by Napoleon I. to the United States for 60 million francs, and made a state in 1812. L. took an active part in the Civil War, and has since been the scene of much riot and bloodshed, arising from the disfranchisement of many of those who sympathised with the Confederacy, but still more from the election of negroes to the legislature, the strife for power, and the prevalence of bribery.

Louis-Philippe, eldest son of the Duc d'Orleans, was born in the Palais Royal, Paris, 6th October 1773, educated under the Comtesse de Genlis, adopted republican principles at the period of the first Revolution, and took the field at the head of a regiment of dragoons in 1790. On 6th November 1792 he was with Dumouriez at the battle of Jemappes, and in February 1793 at

the bombardment of Maestricht, but in April took refuge in the camp of the Imperialists. Upon the death of his father L. joined his sister in Switzerland, travelled (1795) in Germany, Sweden, and Norway, and (1796) crossed to the United States with his two brothers. Four years later he took up his residence at Twickenham, subsequently at Palermo, where he married the Princess Marie Amelie, daughter of Ferdinand IV., the dispossessed king of Naples, and in 1814 returned to France, when he took his seat in the Chamber of Peers. Until 1827 he lived in retirement, though keeping up an intimacy with the Liberal leaders. L. was called to the throne upon the abdication of Charles X., August 9, 1830, accepting the charter under which the sovereignty of the people was acknowledged. Notwithstanding his programme of constitutional government and peace with foreign powers, outbreaks occurred at Paris and Lyons (1831 and 1834), and the Legitimists tried to provoke a war in La Vendée. Secret societies sprang up; and in 1836, by the discharge of an 'infernal machine,' L.'s life was threatened in the streets of Paris. Thereafter the 'laws of September' were passed, and the stability of L.'s position became less assured, owing to the rivalries of those who had elected him. In 1836 his government was involved in difficulties through the failure of an expedition in Algeria, and by the appearance of Louis Napoleon at Strassburg. The announcement of the Quadruple Treaty (1840) roused universal indignation in France, and further diminished L.'s popularity. In the same year Paris was fortified, another attempt made upon the king's life, and the remains of Napoleon I. removed from St. Helena. Misunderstandings between France and England, in connection with the occupation of the Society Islands and the marriage of the Queen of Spain, arose in 1843 and 1846. In 1847 the Socialists were at the height of their propagandist activity, and their demand for reform was refused by L. in his speech from the throne (28th December). On the 22d of February a revolution broke out, and on the 26th, L. with his queen and party arrived at Harfleur en route for England. L. passed the remainder of his days at Claremont, where he died, 26th August 1850. See L. Blanc, *Histoire de Dix Ans*; Granier de Cassagnac, *Histoire de la Chute du roi Louis-Philippe* (2 vols. 1857); Guizot's *Mémoires*, and Boudin's *Histoire de Louis-Philippe* (1847). L.'s remains were conveyed from England and interred in the family burial-place at Dreux, June 1876.

Louisville, the largest and chief commercial city of Kentucky, U.S., situated at the falls of the Ohio, 90 miles S.W. of Cincinnati. The streets, from 60 to 120 feet wide, are laid out at right angles, and are mostly bordered with trees. The business parts have recently been much improved, and over 1000 new buildings were erected in the year ending June 1875. L. is the centre of five railways, has eleven lines of street railway, ninety-eight churches, of which nineteen are Roman Catholic, including the cathedral, many fine public buildings, three hospitals, various other charities, a public library of 70,000 vols., four theatres and an opera-house, and twenty-six newspapers, five daily (two German). In education ranking next to Boston, it has a University, a Medical College, Kentucky School of Medicine, and eighty-four public and private schools. In 1874 the value of the business was officially returned at \$250,000,000. The staples are tobacco (manufactured and in leaf), Kentucky whiskies, provisions, and breadstuffs. L. is the fifth pork-packing city in the United States, and its manufactures are iron wares, oak, sole leather, cement, gas and water pipes, tobacco, malt liquors, woollen goods, bagging, farm implements, &c. Pop. (1871) 100,753, (estimated 1876) 165,984. Settled in 1775, the town was named after Louis XVI.; it lent aid in the War of Independence.

Louls, a town of Portugal, province of Algarve, 10 miles N.W. of Faro, is surrounded by a Moorish wall, has a ruined Moorish castle, and manufactures baskets of aloe thread. Pop. 12,000.

Louse (*Pediculus*), a genus of insects, by many entomologists made the type of a special order—that of the *Anoplura*—characterised by the absence of wings, by the fact that the young undergo no metamorphosis in passing from the egg to the adult state, and by the presence of a suctorial mouth. By other authorities the genus is included in the order *Hemiptera* (q. v.), or that represented by the various kinds of bugs. The body is large, and of oval shape, and consists of nine segments. The

thorax is small, and indistinctly jointed, and the antennæ are filiform, and five-jointed. The eyes are simple and minute. The tarsi are two-jointed, and the terminal joint is hook-like. Schiödt of Scandinavia describes the manner in which the *L.* sucks blood, and states that this is effected by means of the pumping-action of the sucking stomach. One of these insects placed on this observer's hand was watched in its movements.

'At the top of the head under the transparent skin, between and a little in advance of the eyes, a triangular blood-red point appears, which is in continual movement, expansion and contraction alternating with increased rapidity.' The whole digestive system is next observed to be filled with blood in this manner. The modified *labium*, or lower lip, can be retracted into the upper part of the head. Three varieties of lice infest the skin of man, the *Pediculus capitis*, *P. corporis*, and *P. pubis*. The first deposits its eggs on the stem of the hairs, and is found chiefly on children. Leuwenhoeck estimated that two females, conjointly, might produce eighteen thousand in two months. *P. corporis* chiefly infests adults and elderly persons. It is larger, flatter, and whiter than the *P. capitis*, and its ova are agglomerated and deposited among the body-clothes. The insect causes extreme itchiness of the skin when it comes to feed, and the irritation and scratching give rise to papulæ, which may become pruriginous and pustular. This disease, named *Lousiness* or *Phthiriasis*, has been described by ancient and modern medical authorities.

Louth (Irish Gael. *Lugh Magh*, 'the field of Lugh'), the smallest county of Ireland, in the province of Leinster, is bounded N. by Armagh and Carlingford Lough, S. by Meath and the Boyne, E. by the Irish Sea, and W. by Monaghan and Meath. Area, 201,601 statute acres; pop. (1871) 70,511. It is level and fertile, unless in the peninsula of Carlingford, where continuations of the Mourne Mountains rise to a height of over 1900 feet. *L.* is watered by the rivers Dee, Clyde, Fane, &c., is (1876) to the extent of 96,980 acres under tillage, 76,037 in pasture, 4335 in plantation, and 24,208 in waste, bog, mountain, &c.; excellent crops are raised of wheat, oats, barley, potatoes, &c. In 1876 *L.* had 11,202 horses, 39,346 cows, 47,880 sheep, and 15,652 pigs. Dundalk is the capital, and other towns are Drogheda, *L.*, and Ardee. The county, which now returns two members to Parliament, was formed by King John in 1210. It is rich in remains, including sculptured crosses (at Monaster-boyce), round towers, abbeys, &c.

Louth, a town of England, in Lincolnshire, on the Ludd, at the E. foot of the Wolds, 25 miles E.N.E. of Lincoln, and 140 miles N. of London by rail. It has a fine parish church dating from the 14th c., with a spire 300 feet high, a grammar school founded in the reign of Edward VI., a new corn-exchange, a large carpet factory, iron foundries, farm implement works, tanneries, malhouses, bone-mills, lime-kilns, and brick-fields. There are four yearly fairs, and various periodical markets for corn, fat stock, sheep, and general produce. Pop. (1871) 10,500. In the vicinity are remains of *L.* Abbey, founded in 1139.

Louvain (Flem. *Leuven*, Ger. *Löwen*, from *loo*, 'a bushy height,' and *ven*, 'a swamp'), a city of Brabant, Belgium, on the Dyle, 15 miles E. by N. of Brussels by rail, which was in the 14th c. the capital of Brabant, with 200,000 inhabitants (15,000 cloth-weavers), but is now a quiet place, with a pop. (1875) of 32,582. It has a very beautiful Gothic town-hall, (1448), and a fine Gothic church (St. Peter's), also of the 15th c. The halls built in 1317 as warehouses for the cloth-weavers' guild were in 1607 given to the University (founded 1426), which had in the 16th c. 6000 students, and was held the first in Europe. It was suppressed during the French Revolution, but re-established in 1817. *L.* has extensive brewing, founding, and dyeing, and within its district are numerous rice and flour mills, the latter preparing 220,000,000 lbs. annually. A canal passing Mechlin connects it with the Scheldt.

Louvièrs, an old town of France, department of Eure, 15 miles N. of Evreux, is the centre of a cloth-manufacturing district. Other industries are yarn-spinning and the making of machinery, cards, nails, and leather. The first cloth manufactory in France was established here in 1681, and the first cotton factory in 1789. Pop. (1872) 10,189.

Louvois, François Michel Le Tellier, Marquis de, minister of Louis XIV., was born at Paris, 18th January 1639.

His father was Chancellor, and obtained for him the post of Secretary of State. Louis, pleased with his young minister's efforts in the direction of army reform, gave him full scope for his plans, and the result was a military organisation which triumphantly stood the test of war in 1667 and the following years. It was *L.* who negotiated the famous capitulation of Strassburg to the French in 1681. Energetic and able, he was yet vain and overbearing, and, though the right-hand man of Louis, was no favourite of the people. Eventually he obtained almost absolute power over state affairs, and only the influence of Madame de Maintenon prevented his making the king his slave. It was *L.* who instigated Louis to the persecution of the Protestants, and plunged France into useless and prolonged war. Louis, fearing yet obeying him, was at last persuaded to dismiss him; but ere this could be done, the disgraced minister died of apoplexy, 16th July 1691. See Chamlay's *Mémoires pour servir à l'Histoire de F. M. Le Tellier, Marquis de L.*; and Camille Rousset's history of *L.*'s administration from original documents (4 vols. Par. 1861-63).

Louvre. See LANTERN.

Lowat, Simon Fraser, Twelfth Lord, born at Urray, Ross-shire, in 1667, studied at King's College, Aberdeen, and in 1694 obtained a commission in the Tullibardine regiment. On the death of his cousin, Hugh, Lord *L.*, in 1696, he claimed the headship of the Fraser clan, and, baffled in an attempted elopement with the daughter and heiress of his kinsman, forced a marriage on her mother, the dowager Lady *L.* Outlawed for this offence, he fled to the exiled court of St. Germans, whence in 1703 he returned to Scotland on a Jacobite mission. Having discharged this, by disclosing to the Duke of Queensberry the details of a real or fictitious plot, he hastened back to Paris, was seized and sent to the Bastille, only obtaining his liberty in 1703 by entering the Jesuit college at St. Omer. Back again in Scotland in 1715, he recovered his forfeited lands and title by an opportune espousal of the Hanoverian cause, to lose them again in '45, when, sending his eldest son to join the Pretender, and himself remaining inactive, he was, notwithstanding, arrested, tried by his peers, March 7, 1747, and beheaded on Tower Hill, April 9. See Hill Burton's *Lives of Lord L. and Duncan Forbes of Culloden* (Lond. 1847).

Love-Apple. See TOMATO.

Love-Bird, the name given to several species of smaller *Psittacidae* or parrots, from the affection which they seem to display towards each other. A common species is Swindern's *L.-B.* (*Psittacula Swinderniana*), which attains a length of 4 or 5 inches. The colour is a light green on the head and body. The neck is encircled by a black ring, a yellow tint appearing below the latter. The tail shows scarlet and black hues. The *L.-B.* is found in the tropical regions of the world generally. It is readily domesticated, and becomes exceedingly tame.

Love'lace, Richard, a Cavalier poet, son of Sir William *L.*, was born in Kent, 1618, and educated at Charterhouse and Gloucester Hall, Oxford. A zealous Royalist, and a favourite at court, he became a colonel of Charles I., and was imprisoned (1642) for presenting petitions to Parliament in favour of the king's restitution. In 1646 he served in the French army, and was wounded at Dunkirk. News of his death caused Lucy Sacheverell, the Lucasta (*lux casta*, 'chaste light'), who gave her name to his published volume of poems, to marry another; and *L.*, disconsolate and penniless, for his fortune was squandered in the king's service, died miserably in Shoe Lane, London, 1658. One of his songs, written while in prison, contains the famous stanza beginning—

'Stone walls do not a prison make,
Nor iron bars a cage.'

Besides the poems already referred to, published in 1649, *L.* wrote *The Scholar*, a comedy, and *The Soldier*, a tragedy. See *Poems of L.*, edited by W. C. Hazlitt (Lond. Smith, 1864). For the best selections from the poems of *L.* and his contemporaries, see Morley's *The King and the Commons* (Bayard series).

Lover, Samuel, an Irish novelist and song-writer, was born in Dublin in 1797. He was originally a successful miniature painter, and became Secretary to the Royal Hibernian Society of Arts. The Duke of Wellington and Lord Brougham were

among his sitters. His first literary work of importance was *Legends and Stories of Ireland* (1832, 2d series 1834). In 1837 he removed to London, where he produced his *Irish Sketches* in 2 vols. In 1839 he published *Songs and Ballads*, including *Rory O'More*, *Molly Bawn*, *The Angel's Whisper*, &c., several of which he afterwards expanded into tales and operas. The amusing and vastly popular *Handy Andy* appeared in 1842, and the *Treasure Trove* in 1844, both illustrated by himself. About this time he gave in London a series of performances called 'Irish Evenings,' successfully continued in the provinces and in America, and in 1848 a second entertainment founded on his American experiences. He compiled the *Lyrics of Ireland* in 1858, and published *Metrical Tales and other Poems* in 1859. He died July 6, 1868. L. had genuine lyrical power, and few writers have more happily illustrated the bright and genial side of Irish character. His *Life and Unpublished Works*, by Bayle Bernard, appeared in 1874.

Lo'vitz, a town of Russia, government of Warsaw, on the Bzura, 45 miles W.S.W. of Warsaw by rail. It has six great horse fairs, and was long a residence of the Polish primates. Near it is the fine old castle of Nieborov. Pop. 6136.

Low Archipelago, or **Paumotu's**, an archipelago of seventy-eight small coral islands in the S. Pacific, the centre of the group being in 19° S. lat., 141° E. long. Their total area is 4125 sq. miles, and the pop. only 8000. The islands were discovered by De Quiros in 1606, and France established a protectorate over them in 1846. An active pearl shell fishery is carried on around them.

Lowe, Sir Hudson, an English lieutenant-general, was born at Galway, Ireland, 28th July 1769, served in the Peninsular War, and in Naples and Sicily, was the first governor of the Ionian Islands, took part in the battle of Bautzen, and carried to London the news of Napoleon's abdication. He was the governor of St. Helena during Napoleon's captivity, and his conduct towards the illustrious exile has been commented on with undue severity by French writers. In 1825 he was made military commander of Ceylon, and in 1830 published a defence (in French) of his conduct at St. Helena. He died in London, 10th July 1844. A *History of the Captivity of Napoleon at St. Helena*, compiled from L.'s journal and letters, appeared in 3 vols. 1853.

Low The Right Hon. Robert, M.P., was born at Bingham (1811), educated at Winchester and University College, Oxford, elected Fellow of Magdalen (1835), called to the bar (1842), and emigrated to Australia, where he took a distinguished position as lawyer and politician. In 1852 he was returned to the English parliament for Kidderminster, became secretary of the Board of Control the same year, Paymaster-General (1855), and Vice-President of the Education Board (1859), when he was elected member for Calne. L. took up strong ground against the Reform Bill of Mr. Disraeli in 1867, and a published volume of his speeches during that and the previous session remains the most caustic and trenchant body of argument urged against the measure. In 1868 L. was returned for the university of London, and became Chancellor of the Exchequer in Mr. Gladstone's government. His budget for 1871, recommending a new scale of succession duties and the imposition of a tax on lucifer matches, was one of the most immediately unpopular in the record of English finance. Both suggestions had to be recalled. In 1873 L. was made Home Secretary, but went into opposition with his party in 1874. L. has received honorary degrees from Oxford and Edinburgh. Since the return to power of the Conservative Government, he has delivered many speeches showing a formidable power of critical acumen, and has contributed articles to the *Fortnightly Review* upon Owen's College and the Gothenburg system. L., though a finished classical scholar, is never weary of decrying the utility of classics; and as a statesman has impaired, if not destroyed, the influence of a shrewd and discerning intellect by a disagreeable brusqueness of demeanour and a total want of tact.

Lowell, James Russell, an American poet and essayist, born at Cambridge, Massachusetts, February 22, 1819, was educated at Harvard, and commenced the practice of law in Boston, soon, however, renouncing everything in favour of literature. In 1841 he published a volume of poems, entitled *A Year's Life*, in 1844 another collection of *Poems*, in 1845

Conversations on some of the Old Poets, in 1848 a third series of *Poems*, *The Vision of Sir Launfal*, *A Fable for Critics*, and the *Biglow Papers*. The latter, written in Yankee dialect, from first page to last sparkling with sarcasm and pungent humour, were attacks upon the upholders of slavery, written in the heat of war. Several years after he attempted a second series of *Biglow Papers*, but confesses that by failure he for the first time understood what inspiration is. In 1855 L. succeeded Longfellow as Professor of Modern Languages in Harvard College. He produced *Fireside Travels* (1864), *Under the Willows* (1868), *The Cathedral* (1869), and two volumes of delightful essays entitled *Among my Books* (1870, second series 1876). He edited the *Atlantic Monthly* (1857-62), and the *North American Review* (1863-72). While in this country he received the degree of D.C.L. from Oxford, and that of LL.D. from Cambridge (1872-74). In 1877 he was appointed United States minister at Madrid. L. writes usually with sustained freedom and vigour; sometimes, however, descending to commonplace, and occasionally to bombast. His poems are stronger, and more dramatic in style than those of Longfellow; but he does not possess the fine sense of beauty of form and the purity of language that characterize his brother-poet. He is a thoughtful, careful prose writer. Probably it would be true to say that he is too much of a critic ever to be a great poet.

Lowell, a city of Massachusetts, U.S., on the Merrimack, near the mouth of the Concord River, 26 miles N.W. of Boston by rail. It is the chief seat of the cotton manufacture in the United States, the converging point of six railways, and had (1876) twelve incorporated manufacturing companies, with a capital of \$16,000,000, 80 mills, 678,521 spindles, 15,189 looms, employing 10,000 women and 6000 men, and producing per week 2,660,000 yards of cotton cloth, 60,000 of woollen cloth, 37,000 of carpeting, 2500 shawls, and 16,800 dozens of hosiery. There are also eleven private companies for the manufacture of various textiles, besides extensive iron and engineering works. L. has twenty-six churches, two hospitals, two public libraries, various benevolent institutions, three daily and four weekly newspapers. A system of public waterworks was completed in 1873 at a cost of \$1,500,000. Pop. (1870) 40,928.

Lowestoft (Dan. 'the place of the beacon-fire'), the most easterly town of England, on the coast of Suffolk, at the mouth of the Waveney, 24 miles S.E. of Norwich, and 16 S. of Yarmouth by rail. It is a fashionable watering-place, and has an esplanade and a good harbour formed by two piers, 600 and 400 yards respectively, each supporting a lighthouse. There are oil and flour-mills, and shipbuilding yards, but the great industry is the mackerel, sole, and especially the herring fishery. In 1875 there entered the port 751 vessels of 96,214 tons, and cleared 193 of 19,115 tons. Pop. (1871) 15,246. See Nall's *Great Yarmouth and L.* (1866).

Lowth, Robert, D.D., an eminent English Hebraist, born at Buriton, Hants, November 27, 1710, passed from Winchester to New College, Oxford (1730), took his M.A. (1737), and as Professor of Poetry (1741) delivered his *De Sacra Poesi Hebraeorum Praelectiones* (Oxf. 1753; Eng. trans. 1787; Ger. 1793; French, 1812), of which Moses Mendelssohn published a full analysis in his *Bibliothek der schönen Wissenschaften* (1756). Successively rector of Ovington in Hants, archdeacon of Winchester (1750), and rector of E. Woodhay (1753), L. received a doctor's degree from the university of Oxford (1754), and from Lord Hartington the bishopric of Limerick, which he exchanged for a prebend of Durham and the living of Sedgfield. Made Bishop of St. David's in 1766, he was translated to Oxford in the same year, and to London in 1777, and died at Fulham, November 3, 1787. He was the author of a *Life of William of Wykeham* (1738), *A New Translation of Isaiah* (1778; Ger. trans. 1779-81), &c. See the memoir prefixed to the *Sermons and other Remains of Bishop L.* (Lond. 1834).

Loxodromic Line is a curve which cuts every member of a system of lines of curvature of a given surface at the same angle. A ship sailing towards the same point of the compass describes such a line which cuts all the meridians at the same angle. In *Mercator's Projection* (q. v.) the L. lines are evidently straight.

Loyalty Islands, a group of five thickly-wooded coral islands in the S. Pacific, to the E. of New Caledonia, lying be-

tween 20°-22° S. lat., and 167°-169° E. long. The largest island, Lifu, measures 37 miles by 15, and the area of the whole group is 1354 sq. miles. The inhabitants are Melanesians, and many of them have been converted to Christianity by the Roman Catholic missionaries, who have long laboured among them. The L. I. belong to France.

Loyola, Ignatius, properly **Don Inigo Lopez de Ricalde**, the founder of the Society of Jesus, belonged to the house of L., one of the noblest families of Spain, and was born in 1491. Educated at the court of Ferdinand, Inigo was deeply imbued with the spirit of chivalry and the thirst for renown in the profession of arms. He also displayed from his earliest years great religious fervour, but the circumstance that directed the whole of the intense ardour and overwhelming enthusiasm of his character into a religious channel was his being severely wounded in both legs at the defence of Pampeluna (1521), of which wounds he was never completely cured. Deeply versed in the romances of chivalry from his boyhood, he now in his confinement devoured the lives of the saints and of Christ, and his naturally sensitive feelings being spiritualised by his illness and excited by his reading, he believed himself to be inspired to follow in their footsteps, and to vie with them in their austerity and self-denial. And the more the conviction grew that he could never again shine in military service, the clearer did the idea become, and the stronger the resolve, that he would be a soldier of Jesus Christ, and fight under his banner. As soon as he was able he left his home, and repairing to Montserrat, hung up his arms before an image of the virgin, resolved to achieve renown like that of the saints he admired. Being greatly distressed at this time by a sense of sin, he devoted himself to the severest penances; but besides finding these beyond his strength to endure, he felt that they did not bring him peace, or only for short intervals, so that he concluded he was alternately under the influence of a good and of a bad spirit. One day the conviction came to him like waking from a dream, that the torments he felt for the sins of his past life were assaults of Satan, and he determined to yield to them no more. He was further comforted by other visions he had, namely of Christ, of the Virgin Mary, of the mysteries of the Trinity and of the Creation, of the God and the man in the host, &c. After a visit to Jerusalem, on his return to Spain (1524) he was accused of heresy and attempting to teach others and get them to join him in his spiritual exercises. The consequence was that he was enjoined by the universities of Alcalá and Salamanca to study theology for four years before trying to expound points of doctrine, and he proceeded to Paris to acquire that education which, although an interruption to his plans at the time, was doubtless the means of rendering his work and his fame really permanent. At Paris he founded the Order of Jesus (See JESUITS), with which the rest of his life is identified. He died 31st July 1556, and was canonised by Gregory XV. in 1622. See Genelli's *Life of St. Ignatius* (Eng. trans. 1871); Ranke's *Die Röm. Päpste* (Eng. trans. 1847).

Lozange, in Heraldry, is a sub-ordinary, being a four-sided diamond-shaped figure less elongated than the Fusil (q. v.). The field is *lozengey* when divided into such figures by crossed diagonal lines.

Lozenges. The following are the L. of the British Pharmacopœia: tannic acid, bismuth, catechu, iron, ipecacuanha, morphia, opium, chlorate of potash, and bicarbonate of soda.

Lozère, a department of France, surrounded by the departments Cantal, Haute Loire, Ardèche, Gard, and Aveyron. Area, 1996 sq. miles; pop. (1872) 135,190 (many Protestants). L. is highly mountainous. In the S.E. are the Cévennes, separated by the Tarn from the Monts de la Lozère (Signal de Finiel, 5582 feet), which gave the department its name, the Monts de la Margeride (highest point, 4569 feet), occupying the N. E., and extending into Haute Loire, the Monts d'Aubrac (Champ de la Roche, 4359 feet) on the N.W. Most of these are volcanic, and rich in iron, lead, silver, copper, and antimony. The N. is drained by the Truyère, and the N.E. by the Allier, which for 12½ miles is the E. boundary. Vines, mulberry, olive, and chestnut trees are cultivated, but the soil in general is unsuited for tillage. Wool and cattle from the hill pastures are the chief articles of trade. The chief town is Mende.

Lubbock, Sir John, Bart., M.P., F.R.S., &c., was born in London, April 30, 1834. By profession he is a banker, and has

been for several years Hon. Secretary to the London Bankers. In 1865 and 1868 he contested West Kent unsuccessfully in the Liberal interest, but in 1870 was returned for Maidstone. Though he has taken a leading part in certain financial and educational measures, it is chiefly as a man of science that he is generally known. He has been President of the Ethnological and Entomological Societies, of the Anthropological Institute, and of the Royal and Linnæan Societies. As an author, he is widely known through his *Prehistoric Times, as Illustrated by Ancient Remains, and the Manners and Customs of Modern Savages* (3d ed. 1870), *The Origin of Civilisation, and the Primitive Condition of Man* (1870), *The Origin and Metamorphosis of Insects* (1874), and *On British Wild Flowers considered in Relation to Insects* (1874), besides his *Monograph of the Thysanura and Collembola*, and over fifty memoirs in the *Transactions* of the various societies of which he is a member.

Lübeck (? Slav. 'the place of the linden tree,' or 'of the beloved'), a small free-state in N. Germany, consisting of the city of L., with the surrounding district, and some scattered portions in Holstein and Lauenburg. Area, 109 sq. miles; pop. (1875), 56,912 (chiefly Protestants). By the revised constitution of 1851 L. is governed by a senate of 14 life members and a municipality of 120 chosen for six years. The Budget for 1876 shows a revenue and expenditure equal to £128,838; debt at the beginning of 1876, £1,240,667. L., with Hamburg and Bremen, furnishes two infantry regiments of the Imperial army. It entered the Zollverein May 15th, 1868, and in 1871 the German Empire.—The free-town of L. lies on the river Trave, 9 miles from its mouth at Travemünde, and 37 N.E. of Hamburg by rail. It is an old-fashioned town with three suburbs and four gates, yet the streets are wide, especially Königstrasse and Breitestrasse. Prominent buildings are the Gothic Marienkirche (1304), with spires 409 feet high; the Cathedral, founded by Heinrich the Lion in 1173, completed 1334, with towers 394 ft. high; the Jacobikirche (14th c.); Peterskirche (1300); Katherinenkirche, with rich art treasures; and the Rathaus, with the archives of the Hansa. L. has numerous educational and benevolent institutions, and a public library of 50,000 vols. The industries, chiefly manufactures of sugar, tobacco, leather, beer, and brandy, are comparatively unimportant, but the trade, especially with the Baltic ports, is extensive. In 1876 there entered the ports of L. and Travemünde 2537 vessels, of 436,100 tons; cleared 2520, of 433,900 tons. The chief imports are iron, coal, soda, corn, butter, wood, tar, linseed, hemp, wines and spirits. These amounted in 1875 to £9,721,800, and the exports to £8,015,800. Pop. (1875) 44,799. L., which first appears under the Wendish Prince Gottschalk (1043-66), was removed to its present position in 1143 by Adolf II., Count of Holstein, who gave it up to Heinrich the Lion in 1158. In 1226 it was declared a free-town by Friedrich II., after which it became the head of the Hansa. Its power and wealth decreased greatly from the 16th c., and suffered severely from the Thirty Years' War. Taken and sacked by the French, 6th Nov. 1806, it bore their oppressive rule till 1813, when it was liberated by Bernadotte. See Becker, *Geschichte der Stadt L.* (3 vols. 1783-1805); *Urkundenbuch der Stadt L.* (4 vols. 1854-70).

Lublin (Slav. 'the place of the linden tree'), a Russian government in the S.E. of the old province of Poland, between the Bug and Vistula. Area, 6260 sq. miles; pop. (1870) 659,483. It is watered mainly by the Wieperz, a branch of the Vistula, is hilly in the S., and covered in the N. with dense forests. The chief products are hemp and flax, and at Irena are great iron works.—L., the capital, on the Bistritz, in the midst of marshes, 96 miles S.E. of Warsaw. It is the most important town of Poland next to Warsaw, with a cathedral of the 13th c., eleven churches, a priest's college, two hospitals, a fine town-house, a national theatre, woollen and linen factories, and a trade in cloth, grain, and Hungarian wine. There are three yearly fairs, each of which lasts a month. Pop. (1870) 20,789, of whom half are Jews.

Luca'nus. See STAGBEELE.

Luca'nus, M. Annæus, son of Annæus Mela, a Roman knight, and a brother of the philosopher Seneca, was born at Corduba (Cordova) in Spain, A.D. 39. He was brought, when very young, to Rome, where he received instruction in philo-

laphy and literature. The Emperor Nero raised him to the offices of *questor* and *augur*; but the increasing poetical reputation of L. excited the jealousy of the tyrant, who forbade the poet to recite his productions in public. L. took part in the conspiracy of Piso against Nero's life, and on its detection stained his name by turning informer, and by denouncing his own mother. Notwithstanding his base betrayal of his accomplices, he was condemned to death, on which he ordered his veins to be opened, and died A.D. 65, repeating his own description of a soldier expiring from his wounds. L. is the most eminent epic poet of the silver age, and next to Virgil in Latin literature. He was the author of numerous works, but his only extant poem is the *Pharsalia*, an epic in ten books, the last of which is imperfect. Its subject is the civil war between Cæsar and Pompey, and it details, in chronological order, the events of that struggle from the passage of the Rubicon to the siege of Alexandria. The *Pharsalia* has been extravagantly lauded, and unduly depreciated. The pedantry, affectation, and turgidity by which it is marred are only too apparent; its learning, vigour, lucidity, and originality, however, prove that with longer life the poet would have done work worthier of his powerful genius. Among modern editions of L. may be mentioned Weber (3 vols. 1821-31), and Weisse (1835). The best English translation is by Rowe.

Lucarne', or Lucayne' (Fr. *lucarne*, from Lat. *lucerna*) in architecture, a Dormer (q. v.) or garret window.

Lucc'a, a former duchy in N. Italy, exactly corresponding to the modern province of the same name, and lying between Tuscany, Modena, Nassa, and the Gulf of Genoa. Area, 576 sq. miles; pop. (1874) 280,399. The duchy founded by the Lombards became independent in 1055, passed again under a duke (the famous Castruccio Castracani) in 1327, and later (1370) was formed into a republic. With Tuscany it became part of the kingdom of Italy in 1860. The country is singularly fertile, yielding grain, wine, oil, and fruits, and is better cultivated than is usual in Italy. The Luccesi contribute largely to the itinerant class throughout Europe.

Lucca, the capital of the province of L., N. Italy, in a fine plain on the *Arno*, 15 miles N.E. of Pisa by rail. It is girt by well-preserved fortifications, and has a cathedral of S. Martin's, in Romanesque style, built 1060-70, restored and adorned with a rich façade by Guidetto in 1204. Several other buildings (S. Frediano, Palazzo Pubblico, &c.) are important specimens of middle age architecture. Matteo Civitali (1435-1501), one of the most graceful sculptors of the Renaissance, produced many of his finest works here. L. *l'industriosa* is noted for its silk industry, introduced from Sicily in the 14th c. It has also manufactures of woollen goods, oriental fex, linens, cottons, paper, and glass. L. is supplied with water by a splendid aqueduct of 452 arches, 3 miles long, erected 1823-34. About 15 miles N., in a hilly district, are the celebrated mineral baths of L., with springs varying from 86° to 129° F. Pop. (1874) 68,204. The Roman *Luca*, and an important municipium, L. was the scene of a conference between Cæsar, Pompey, and Crassus, B.C. 56.

Lucena (Basque, *Lucea*, 'the long town'), a town of Spain, province of Cordova, in a romantic hill region, 45 miles S.E. of Cordova. It is famed for its horses and apricots. Here Boabdil, King of Grenada, was captured, 21st April 1483. Pop. 13,100.

Lucera, a town of S. Italy, province of Foggia, on a lofty plain, 10 miles N.W. of Foggia. It has a Romanesque cathedral, ruins of a mediæval castle, a valuable library, and many rare antiquities. Its trade is in agricultural products. Pop. (1874) 14,014. The ancient *Luceria*, regarded as the key of Apulia, and first heard of during the Samnite wars, was made a Roman colony B.C. 314, and had temples of Apollo, Ceres, Hercules, &c.

Lucerne' (Ger. *Luzern*), a central Swiss canton, bounded N. by Aargau, S. by Unterwalden, W. by Bern, and E. by Schwyz and Zug. Area, 587 sq. miles; pop. (1870) 132,338. It is mainly mountainous, reaching a height of 7040 feet on the S. border, and is watered by the Reuss, Wigger, &c., enclosing the lakes Sempach, Baldegg, and the upper part of L. One-fifth of the surface is covered with forest, and the valleys are very fertile. L. carries on more cattle-rearing than any other Swiss canton, having as many as 2100 cattle for every 21 sq. miles.

The inhabitants, though Teutonic, mainly belong to the Roman Catholic church, there being only 3823 Protestants. L. sends seven members to the National Council, and is governed internally by a Great Council of 100 members. See *Pfyster, Der Canton Luzern* (2 vols. St. Gall, 1857-59).

Lake of L. (Ger. *Vierwaldstätter-See*, 'lake of the four forest cantons'), is bounded by Uri, Unterwalden, Schwyz, and L., is of irregular shape, 25 miles long from L. to Flüelen, and 15 wide from the extremities of the inlets Alpna and Küssnacht. Other inlets are the bays of L. and Buochs and Lake of Uri; the greatest depth is 510 feet. The Reuss flows through the lake, which receives several smaller rivers. L. lies between the Rigi and Pilatus, and has magnificent scenery.

Lucerne, the capital of the canton of L., beautifully situated on the Reuss, where it leaves the lake with the swiftness of a mountain torrent, 35 miles S.W. of Zürich by rail. It is enclosed by walls and nine watch towers dating from 1385, and the river is spanned by four bridges, adjoining one of which stands the picturesque old Wassethurm, containing the archives, and (according to tradition) giving name to the town from having been a lighthouse (*Lucerna*). L. has a hof-kirche of the 17th c. with a famous organ; the Lion of L., a monument by Thorwaldsen, erected (1821) in memory of 26 officers and 760 soldiers of the Swiss guard who fell in defence of the Tuileries, 10th August 1792; one of the chief Swiss arsenals, a town-hall with fine carved work of date 1605. There is some industry in silks, cottons, gloves, flax, hemp, &c. Pop. (1870) 14,524.

Lucerne, is a well known and important fodder plant, botanically distinguished as *Medicago sativa*, though there is some doubt whether it is more than a form of *M. falcata*, induced by long cultivation. It is common through Europe, has now become naturalised in the United States, and is cultivated in Australia, &c. L. is not only early in its growth, but quick in its vegetation through the whole summer and autumn, and is capable of withstanding unimpaired the autumn frosts, thus affording four good cuttings between May and November. Horses are fond of it, and it suits them either mixed or alone. It requires a deep soil, and if rich and calcareous so much the better. The far penetrating roots render the plant particularly fit for fixing embankments, or hindering the washing away of soil subject to occasional inundations.

Lu'cia, St., one of the British W. India Islands, in the Windward division of the Caribbees, lying between St. Vincent and Martinique. Area, 248 sq. miles; pop. (1871) 31,610, of whom only 837 are whites. It is of volcanic origin, rising to a height of 3000 feet in luxuriantly wooded mountains, and is famed for its rich romantic scenery. The climate is unhealthy, and there are many poisonous insects and serpents. The chief exports are sugar, rum, and molasses. A great increase is perceptible in the agricultural industry. In 1861 the planters numbered 413, and in 1871, as many as 1210. The increase in the class has mainly arisen from field-hands purchasing small parcels of land, and acquiring cattle or wind sugar-mills. A third of the crop for 1870 was raised by these petty proprietors. In 1874 the total exports amounted to £146,858, the imports to £133,006; the tonnage of vessels that entered and cleared was 28,647, exclusive of coasting trade. In the same year the revenue was £21,131, the expenditure £24,268, and the public debt £18,000. Capital, Castries, with 3500 inhabitants.

Lu'cian was born at Samosata, the capital of Commagene in Syria, about 120 A.D. His parents were in poor circumstances. He was apprenticed to an uncle who was a statuary, but, having been severely beaten for breaking a marble tablet, ran away home. He then devoted himself to study, and after wandering for some time in Ionia, practised as an advocate at Antioch. Thereafter he travelled as a professor of rhetoric through Greece, Italy, and Gaul, and returned to his native country when about forty years of age. He seems now to have become engrossed in the production of those numerous witty attacks on the religion and philosophy of his time, to which he owes his fame; but he still indulged his love of travel by visiting Achaia and Ionia, and also Paphlagonia, where he endeavoured to expose the false oracle of the impostor Alexander, who in revenge made, though unsuccessfully, an attack upon his life. In his old age, he was appointed, probably by the Emperor Commodus, procurator of part of Egypt. No reliance can be placed on the statement of Suidas,

that L. was torn to pieces by dogs as a punishment for his impiety; and Gesner's demonstration that he was not the author of *Philopatris* frees him from the charge of apostasy. His unsparing critical spirit, and his relations to the old heathenism and to the Christian faith are well represented in Landor's *Imaginary Conversation between L. and Timotheus*. The writings of L. have been classed under the following seven heads: 1. the Rhetorical; 2. the Critical; 3. the Biographical; 4. Romances; 5. Dialogues; 6. Miscellaneous Pieces; 7. Poems. The most notable of the Romances are *Lucius or the Ass*, and the *True Histories*. The fame of L., however, rests chiefly on his Dialogues, which have been arranged in three classes, those which are directed against the heathen mythology, as *The Dialogues of the Gods*; those which attack the ancient philosophy, as *The Sale of Lives*, *The Fisherman*, or *the Revivified*, and *The Banquet*, or *the Laphthæ*; and those which simply 'catch the living manners as they rise,'—general satires on the follies and vices of mankind—as *Timon the Misanthrope*, *The Dialogues of the Dead*, *The Icaro-Merippus*, or *Above the Clouds*, *Charon, the Dream*, or *The Cock*, *Twice Accused*, *Loves*. Among the editions of L. may be mentioned those of Hemsterhuis, finished by Reitz (Amsterdam, 1743); and of Bekker (1853). The best English translation is that of Dr. Franklin, which is incomplete.

Lu'oid Interval consists not in a mere cessation of the violent symptoms of a disorder, but of an interval in which the mind, having thrown off the disease, has recovered its general habit. The party must be capable of forming a sound judgment of what he is doing, and his state of mind such that any indifferent person would think him able to manage his own affairs. Such is the legal definition of L. I. About one-third of maniacal cases are intermittent, and the paroxysms may be marked by very regular intervals of two or three days, a week, a month, or a year, but short intermissions must be distinguished from those longer periods of complete recovery which are designated L. I. See Collinson *On Lunacy*.

Lucifer'ians, a sect of early Christians who received their name from Lucifer, bishop of Cagliari, a contemporary of Athanasius, and a vehement and fanatical upholder of orthodoxy. 'As he believed that the Catholic Church was defiled by the re-admission of unworthy ecclesiastics, he became the founder of a separate party, the L., who regarded themselves as constituting the only pure Church.' See Neander's *Kirchengeschichte* (Eng. trans. Bohn, vol. iv. p. 76).

Lucifer Matches. See MATCHES.

Luci'na, a genus of Lamellibranchiate (q. v.) Mollusca, forming the type of the family *Lucinidae*, in which the shell is orbicular, the hinge teeth number one or two, and the foot is usually long and cylindrical. The mantle is open in front, and respiratory tubes or *siphons* are developed. In addition to L. the family is represented by such genera as *Kellia* and *Diplodonta*.

Luck'enwalde, a town of Prussia, province of Brandenburg, on the Nuthe, 32 miles S.E.W. of Berlin by rail. Besides its cloth manufacture, which is the largest in Prussia, there are wool spinning, dyeing and fulling industries, saw-mills, oil-mills, breweries, distilleries, &c. Pop. (1875) 13,857.

Luck'impore (*Lakhimpur*, 'the town of the goddess Lakshmi'), the chief town of the district of the same name, in Assam, British India, a few miles N. of the Brahmaputra, 46 miles N.W. of Sebsaugor.—The district of L., which extends on both sides of the river, is the extreme N.E. limit of British territory. Area, 3145 sq. miles; pop. (1872) 121,267. In addition, the L. hills, chiefly occupied by the Singpho and Abor tribes, have an area of 8343 sq. miles, but no census has been taken. The tea plant is indigenous here. The Government first established a tea garden in 1834, which was made over to the Assam Company in 1839. But the industry did not flourish until 1852. In 1874 there were 11,680 acres under cultivation in the L. district, yielding 1,812,000 lbs. of tea; there were 84 Europeans and more than 10,000 natives employed, of whom the great majority are imported from Chota Nagpore. The headquarters of the industry are at Debrogurh, the largest town in the district.

Luck'now (*Lakhnau*, 'the hill of Lachhman'), the capital of the province of Oude, British India, situated mostly on the right or W. bank of the river Gumti, 610 miles N.W. of Calcutta; pop. (1869) 284,779, of whom 41 per cent. are Mahomedans. Its his-

tory goes back to an early Hindu period, but its greatness only dates from 1775, when the Nawab Vizier, Azaf-ud-Dowlah, removed his seat of government here from Fyzabad (q. v.). L. is the fourth largest city of India. The imports in 1870 were valued at £747,500, chiefly grain, cotton, salt, sugar, and leather; the manufactures are gold lace-work, brocades, embroidered slippers and caps, and clay models. L. is the terminus of three railway lines, and the river is navigable for large boats. There is not a single building of stone, and many old structures were cleared away after the events of 1857. The finest buildings now standing are the Inambara; the mausoleum of Azaf-ud-Dowlah, erected at a cost of one million sterling, as a famine relief work, and now used as an arsenal; the Jumma Masjid, which was never finished; the Chattr Manzil Palace, now a club and library; and the public gardens of the Kaiser Bagh. Other spots connected with the story of the Mutiny are the ruins of the Residency, with its memorial cross; the Alum Bagh and the Secunder Bagh. There are now four bridges over the river, here 900 feet wide. The chief thoroughfares are the Outram, Aminabad, and Canning Roads, and the Strand. The cantonments, which lie to the S., cover an area of 12 sq. miles. A magnificent hospital has been recently erected and endowed by the Rajah of Bhubiampore, the first of the Oude talookdars. In May 1857 the Sepoys rose in mutiny, with a few exceptions; the Mohammedan population and the large landholders took their part. The foresight of the chief commissioner, Sir Henry Lawrence, prevented a general massacre, but after a disastrous reconnaissance, the Europeans were driven back into the Residency and besieged for three months. At last they were relieved by Havelock and Outram (25th September), only to be again surrounded, until they were delivered by Sir Colin Campbell (17th November). The city was soon evacuated by the British, and not retaken till 19th March 1858.—The district of L., which lies on both banks of the Gumti, has an area of 1392 sq. miles; pop. (1869) 970,625. The staple crops are wheat, barley, rice, millets, and pulse.

Lucret'ius, Ti'tus Ca'rus. Our only account of the life of the great philosophical poet of Rome is derived from Saint Jerome's translation of the *Chronicle of Eusebius*. It is therein stated that L. was born B. C. 95, that he was thrown into a state of madness by a love potion, that in lucid intervals he composed several books, which were revised by Cicero, and that he committed suicide, B. C. 51. The late origin and obvious improbability of these statements appear to justify their rejection, and their existence is amply accounted for by the conjecture, that to the opponents of his philosophy, madness and suicide would seem the fitting doom of an atheist. The only work by which L. is known to us was given to the world about B. C. 57. It is entitled *De Rerum Natura*, and is a didactic poem in six books, composed in heroic hexameters, and addressed to C. Memmius Gemellus. Its practical purpose is to liberate human life from the terrors of superstition by showing 'that there is nothing in the history or actual condition of the world which does not admit of explanation without having recourse to the active interposition of divine beings.' Like his master Epicurus, L. adopts the atomic theory of Leucippus, and, starting from the position that 'nothing is formed out of nothing by divine agency,' he finds in 'atoms' the original substances from which all things are produced, and into which they are resolved, and the first two books of the poem are devoted to the statement and elucidation of the atomic philosophy. The third and fourth books explain the nature of the soul, show that soul and body live and die together, and account for the universal belief in the existence of the departed. The fifth and sixth books seek to explain, apart from the divine agency, the formation of the universe, the origin of life, and the most striking phenomena of nature. On the Romans of his own time the work of L. made little impression, and Virgil alone of his countrymen seems to have felt his power. His high position in ancient literature is now universally acknowledged, and is perhaps given less to the philosophical and moral teacher, than to the intense feeling, and the grandeur, dignity, and freshness of the poet. Among the best modern editions of L. may be mentioned those of Wakefield (4 vols. 1813); Forbiger (1828); Lachmann (1850). That of A. J. H. Munro (Camb. 1866), with notes and an English translation, is one of the noblest works of English scholarship. The *De Rerum Natura* has been translated into English verse by Creech and Good, and into English prose by Watson.

Lucull'us, the surname of a plebeian family of the Licinia gens, of which *L. Licinius*, consul, B.C. 151, was the first to attain distinction. The most illustrious of the family was *L. Licinius*, grandson of the preceding, born about B.C. 109. By distinguished services in the Social War, he attracted the attention of Sulla, whom he accompanied as quæstor on the outbreak of the Mithridatic War, B.C. 88, and whose favour he so completely won by his ability and fidelity, that the great dictator appointed him his literary executor, and the guardian of his son. *L.* returned to Rome (B.C. 80) to discharge the duties of the ædileship, to which he had been elected in his absence, and became successively prætor (B.C. 77), and consul (B.C. 74). When the contest with Mithridates was renewed, *L.* obtained the conduct of the war, and in a series of campaigns (B.C. 74-68) frequently attacked, and finally annihilated, the great army of his opponent, destroyed his fleet, drove him back into his own kingdom of Pontus, laid waste the country, reduced the wealthy and important cities of Amisus, Eupatoria, and Sinope, pursued his fugitive foe into the dominions of Tigranes, put to flight, with the loss of only five men, the host of the Armenian king, before Tigranocerta, and renewed this victory on the banks of the Arsianus. The brilliant career of *L.* was at this stage (B.C. 67) interrupted by the mutiny of his troops, caused by his severe discipline, or by his unsympathetic indifference, and fomented by his enemies at Rome, especially the Equestrian order, whose bitter hostility he had roused by checking their exactions as farmers of the revenue. *L.* was (B.C. 66) superseded in his command by Pompey, and returned to Rome, where, after three years' opposition he succeeded in obtaining the triumph he had so well earned. He now almost wholly retired from public affairs, and passed the remainder of his life in idleness and luxury. On his gardens, villas, parks, and fish-ponds, he freely lavished the wealth he had amassed as proconsul in Asia and during his campaigns in the East; and the splendour of his feasts is illustrated by the fact that a single supper in the hall of Apollo at Rome was said to cost the sum of 50,000 denarii, or about £1770. He found worthier objects of his munificence in the collection of a splendid library, and in the patronage of men of letters. He died about B.C. 57, and his funeral oration was pronounced by his brother Marcus, through life his affectionate friend, and after the decay of his mental powers, the manager of his affairs.

Lud low (Old Eng., 'the people's hill'), an old town of England in the county of Salop, on the Tern, 27 miles S.S.E. of Shrewsbury by rail. It has a parish church dating from the reign of Edward III., a free school founded by Edward IV., the ruins of one of the finest and strongest of the Welsh border castles, a museum of local antiquities, a town-hall, market-house, and a new cattle-market (1862), in excavating which was discovered the foundation of a large ecclesiastical building. A statute fair is held in May, and eight others (for cheese, hops, and general produce) during the year. *L.* has maltings, paper and flour mills, &c. Races take place in midsummer. Pop. (1871) 6203. *L.* sends one member to Parliament. The noble castle of *L.* was long a royal residence, and later of the lord presidents of the marches. Milton's *Comus* was first 'presented' here (1634) before the Earl of Bridgewater, then president of Wales.

Ludlow, Edmund, born at Maiden Bradley in Wiltshire, England, about 1620, studied at Trinity College, Oxford, and entered the Temple, but having joined the life-guards of the Earl of Essex as a volunteer, fought at Edgehill (1642), and was taken prisoner at Wardour Castle in 1644. Soon exchanged, he was present at the second battle of Newbury, became high sheriff and member for Wiltshire (1645), actively promoted 'Pride's Purge,' was one of the king's judges, and voted for the abolition of the House of Lords. 'Firm as brass or oak timber,' he made himself obnoxious to Cromwell, who sent him to Ireland (1650) as lieutenant-general of the horse. Thence he retired to Essex (1655), and, having refused to take the oaths to Richard Cromwell, he joined the Wallingford House party, and held a brief tenure of supreme power in Ireland, but on the Restoration fled to Vevey in Switzerland, where he died in 1693, his reappearance in London (1689) having been met by a proclamation of arrest. His *Memoirs* (3 vols. Vevey, 1698-99) appear in Guizot's *Collection des Mémoires relatifs à la Révolution d'Angleterre* (Par. 1823).

Ludlow Beds, the highest member of the Upper Silurians, is specially developed near the town of Ludlow (q. v.), where it is distinguishable into three groups—the Lower L. shales, the Aymestry limestone, and the Upper L. sands and shales, capped by red tilestones, which pass into the true Devonian and contain layers full of fish-bones (hence called bone-beds). The fossils are many and characteristic.

Lud'wig I., Karl August, King of Bavaria, eldest son of Maximilian Joseph, was born at Strassburg, 25th August 1786, studied at the University of Landshut (1803), travelled in Italy and Switzerland (1804-5), and married the Princess Theresa of Sachsen-Hildburghausen (1809). *L.* succeeded Maximilian (12th October 1825), and, after subscribing to the constitution, put in operation several measures of a liberal tendency, abolishing the censorship in the case of non-political journals, suppressing the state lottery, reducing public expense. At the same time he beautified Munich by many noble architectural works, and encouraged art in all its branches. After the revolutionary year of 1830 *L.* became more reactionary and Conservative in his tastes, but in 1847 the unfortunate influence exercised over him by Lola Montes, whom he created Countess of Lansfeldt, withdrew him from affairs of public moment. His people revolted, and he was compelled to resign in favour of his eldest son Maximilian, 20th March 1848. *L.* died at Nice, 29th February 1868. He is the author of three volumes of *Gedichte*.—**L. II.**, grandson of the preceding, and son of Maximilian, was born at Nymphenburg, 25th August 1845, succeeded his father in 1864. The man who has probably exercised most influence upon him is Wagner, the composer. He is known to be highly endowed with artistic talent, and is suspected (by the Ultramontanes) of liberal tendencies, but he has so persistently held himself in retirement that it is not easy to ascertain what kind of man he is.

Lud'wigsburg, a town of S. Germany, in Würtemberg, 9 miles S. of Stuttgart by rail, the chief military depot of Würtemberg, has a garrison of 4000 soldiers, an arsenal, a gun-foundry, and a military academy. The great Schloss contains portraits of the kings of Würtemberg. *L.* was founded in 1706 by Duke Bernhard Ludwig as a rival to Stuttgart. Total pop. (1875) 14,709.

Luff, a nautical term applied to the weather edge of a fore-and-aft sail, or to the roundest part of a ship's bow. To *L.* is to sail nearer the wind.

Lugano (Ger. *Lauis*), a town of Switzerland, canton of Ticino, on the W. shore of the Lake of *L.*, 38 miles N.N.W. of Milan, is much frequented by tourists on account of its beautiful situation and fine climate. *L.* has some silk industry, and a great cattle-market in October. Pop. (1870) 6024.

Lake of L. (Ital. 'the hollow'), on the S. declivity of the Alps, belongs partly (½th) to the Swiss canton of Ticino, partly to the Italian province of Como. Length, 14 miles; breadth, 2½ miles; area, 19 sq. miles. Its steep banks are famous for their picturesque beauty.

Luganskij Savod, a town of Russia, government of Jekaterinoslav, on an affluent of the Donetz, 185 miles E. of Jekaterinoslav, has a large library, and has had since 1795 a government cannon foundry. Pop. (1870) 10,049.

Lugg'age. See under CARRIERS—Carriers, Wharfingers, and Warehousemen, Law Regarding. Scotch law, see NAUTÆ, CAUPONES, STABULARII.

Lugger, a small lightly-rigged vessel with two or three masts, a running bowsprit, and *lug-sails*, which are square, and bent upon yards obliquely slung on the masts.

Lu'go (the *Lucus Augusti* of Ptolemy), the capital of the Spanish province of the same name, on the Miño, 51 miles E.N.E. of Santiago, is well built, with massive walls surmounted by a promenade; has nine churches, and a cathedral of the 12th c. It carries on a trade in cloth, silk, and leather, and in the neighbourhood are celebrated Roman sulphur baths. Pop. 8246.—**L. (Lucus Diana)** a town of Italy in the province of Ravenna on the Secino, 14 miles W. of Ravenna by rail, lies in a marshy and densely wooded district, but is well built, and has a great fair in August. Pop. 8664.

Lu'gos, a market-town of Hungary, comitat of Krassó, 34 miles E.S.E. of Temesvár, has a gymnasium, a Minorite monas-

tery, and fine barracks, is the seat of a Greek bishop, and carries on a lively trade in wine, silk, and leather. Pop. (1869) 11,654. L. was the last rallying point of the insurgent Hungarian government and army in 1849.

Lug'worm. See LOBWORM.

Lu'ni, or Lovi'ni, Bernardino, a painter of the Milanese school, was born at Luini, on Lake Maggiore, 1470. Some say he studied under Da Vinci; he was at any rate his most distinguished imitator. In aerial effects, the management of shade, and freedom of touch many surpassed L., but none in point of design and colouring. Many of his pictures have passed for Da Vinci's. His son was likewise a painter of note. B. L. died subsequently to 1530. Among his chief works are 'Herodias' at Florence, and 'Christ disputing with the Doctors' and 'Vanity and Modesty,' in the National Gallery, London.

Luise', Augusta Wilhelmine Amalie, Queen of Prussia, daughter of Duke Karl of Mecklenburg-Strelitz and mother of the present German Emperor, was born 10th March 1776 at Hanover, where her father was then governor. On the 24th December 1793 she married the Crown-Prince Friedrich-Wilhelm (afterwards King Friedrich-Wilhelm III.), ascended the throne with him in 1797, and as queen won the highest love and respect of the people through her high-mindedness and patriotism. Sorrow for the humiliation of Prussia helped to shorten her life. She died on a visit to her father at Strelitz, 19th July 1810.

Luke (Gr. *Loukas*, an abbr. of *Loukanos*), the reputed author of the third Gospel and the Acts of the Apostles, seems to have attached himself to the apostle Paul at Troas on his second missionary journey (Acts xvi. 10). He was also with him on his third journey (Acts xx., xxi.); and he accompanied him to Rome (Acts xxviii. 15; Philem. 24; 2 Tim. iv. 11). L. is generally allowed to have been the 'beloved physician' of Col. iv. 14. Indication of this being found in the technical language used in L. iv. 38 and Acts xiii. 11. He is also generally supposed to have been a scholar, and was probably a Gentile. At any rate his style is more classical than that of the other evangelists. According to the preface, the writer undertook to compile a gospel which would represent apostolic tradition more fully and accurately than had been done before. The date of the composition of the gospel has been variously fixed from about 60 A.D. to the middle or end of the 2d c.; and the place variously given as Cæsarea, Alexandria, Rome, Achaia, Macedonia, and Asia Minor.

Lullutporé' (Lalatur), the chief town of the district of the same name in the N.W. provinces, British India, 93 miles N. from Sangor; pop. (1872) 8976.—The district of L., was only formed in 1858, chiefly from forfeitures after the Mutiny; area, 1947 sq. miles; pop. (1872) 212,661. It forms a high plateau, with many hills and jungles. The crops are wheat, barley, millets and pulses.

Lull'y, Raymond, an eccentric theologian and philosopher of the 13th c., was born at Palma, Majorca, 1235. As a youth he led a somewhat loose life in the army, but suddenly taking to science and devotion he graduated at Paris, and proceeded on a mission to Africa, whither he imagined Christ in a vision had commanded him to betake himself. Single-handed he carried on an attack against Mohammedanism, thrice being driven to Europe, and thrice returning, at last falling a martyr to his enthusiasm at Bougie, Algeria, 30th June 1315. His name in philosophy is principally associated with his *Ars Lullia*, afterwards designated by disciples, of whom Giordano Bruno was the chief, the *Ars Magna*. This was a scheme by which all ideas were made capable of formal arrangement, and reasoning could be carried on by a mechanical process. L. became a student of alchemy, and was accused of sorcery. His entire works were published at Mainz in 10 vols. (1721-42). L. was also a poet. His *Obras rimadas* were first published by Rosello at Palma in 1859. See Helfferich, *Raymund L. und die Anfänge der Catala-nischen Literatur* (Berl. 1858).

Lumba'go is a rheumatic affection of the muscles in the lumbar region, characterised by the occurrence of sharp pains in the loins on rising from the recumbent position or from sitting. It is distinguished from inflammation of the kidneys by the absence of pain in the groin, and of nausea, and vomiting. L. may be caused by violent straining, by exposure to cold when the

body is heated, and is induced by a constitutional tendency. The treatment varies with the intensity of the affection. Diaphoretics, as Dover's powder, in 10 grain doses, and the warm bath at bedtime may remove a slight attack. The best local application for those who suffer habitually from L. is 7 parts of *linimentum belladonnae* and 1 part *chloroform*, sprinkled thinly on impermeable piline and applied to the painful part. Counter-irritants are often serviceable, and an instrument called the heated hammer is also recommended. The hammer is heated over a spirit lamp to about 200° Fahr. and brought into contact with points of the skin over the painful parts. Electro-galvanic currents generally afford relief, and frequently remove the disease entirely.

Luminos'ity, Animal and Organic. See PHOSPHORESCENCE ANIMAL.

Lump'sucker (*Cyclopterus lumpus*), the 'cockpaddle' of the Scotch, a peculiar Teleostean fish, belonging to the family *Discoboli*, a group allied to the *Gobies* (see GOBY). The body is short and deep. The back is arched, and bears two dorsal fins. The pectoral fins are well developed, but the two ventral fins unite to form a sucker, borne on the lower surface of the body, and by means of which the fish is enabled to adhere firmly to fixed objects. The body is of a steel-blue colour above and on the sides, and of a beautiful rosy pink on the under surface. No scales exist, but rough bony granules are scattered over the skin.

Lu'nacy, Law Regarding. See IDIOTS and LUNATICS, LAW REGARDING.

Lu'nar Caus'tic is the term applied to fused crystals of nitrate of silver, which is applied externally to poisoned wounds, pustules, ulcers, erysipelatous inflammations, polyypi, &c. *Mild* caustic points, made by fusing nitrate of potash, in various proportions, with nitrate of silver, are used by oculists and others.

Lu'nar The'ory is the mathematical analysis of the perturbations to which the moon is subject. These perturbations, and the resulting inequalities, are due almost wholly to the varying relation between the mutual attractions of the sun and earth, and of the sun and moon. Here then exists what one might almost call an experimental solution of the famous problem of three bodies. When the moon is in syzygy, i.e., when it is either new or full moon, there is evidently a force due to the sun tending to increase the distance between the earth and moon, since the nearer body is attracted with a greater force than the further off one. When the moon is in quadrature, the sun's attraction resolved along the line connecting the earth and moon acts with the earth's attraction, so that there is a tendency to diminish the moon's distance from the earth. On the whole, however, the sun's attraction tends during one lunation to draw the moon away from the earth, but this action tending to diminish the earth's influence over the moon, and thus lengthen the moon's orbital period, evidently varies with the sun's distance, attaining a maximum in winter when the earth is in perihelion, and a minimum in summer when the earth is in aphelion. Consequently the moon is sometimes in advance of, and sometimes behind her mean position; and the amount by which she is displaced, as far as this cause is concerned, is called the moon's *annual equation*. This inequality was detected by Tycho Brahe, and never exceeds 10' in amount. Since the orbital velocity of the moon is greater, the smaller her distance from the earth, it follows that there must be retardation in passing from quadrature to syzygy and acceleration in passing from syzygy to quadrature; but this retardation and acceleration are modified by another solar influence, namely, the tangentially resolved portion of the sun's attraction—or rather the difference between this tangential force, and the attraction which the sun exerts upon the earth resolved in the same direction. Its effect is acceleration in passing from quadrature to syzygy, and retardation in passing from syzygy to quadrature. This tangential effect is, therefore, contrary to the radial, but it is the greater of the two, so that the moon's velocity is greatest in syzygy, and least when near quadrature. This inequality, discovered also by Tycho Brahe, is called the moon's *variation*, and attains a maximum value of 32'. The *parallactic inequality*, which never exceeds 2', arises from the fact that at full moon the ratio of the distances of the sun from the earth and moon respectively is greater the ratio of the distances of the sun from the moon and

earth at new moon, so that the resulting perturbation upon the moon is smaller. Though small it is important as having afforded an indirect method for calculating the sun's distance. Other inequalities, which can merely be mentioned here, arise from changes in the inclination of the orbit, from the revolution of the modes and the position of the perigee, and from variation of the eccentricity both of the moon's orbit and the earth's. (See *Acceleration of the Moon*, under ACCELERATED MOTION.) The oblateness of the earth also produces slight inequalities which are useful as affording a means for measuring this oblateness. Of the planets Venus is the only one which produces a sensible perturbation.

Lunatic. See INSANITY.

Lunatic Asylums. The earliest retreats for the insane, mentioned in history, were the sacred temples of Egypt, where the highest development of moral treatment was practised for the restoration of reason. In mediæval Christian times, conventual establishments were used for similar purposes; and to certain places where miraculous cures of nervous affections were said to have been accomplished, such as Gheel and St. Suaire, lunatics were sent by their friends to be cured of their disorders. In Oriental countries, maniacal lunatics were considered to be possessed of devils, and were treated accordingly; but, in general, the insane, to the present day, have been regarded as under the special protection of God, and treated with kindness. The 'Vagrant Act' (1744) contains the earliest provisions, made in England, for the safe custody of lunatics, but the justices were empowered to chain them. In 1763 a committee of the House of Commons investigated the condition of houses in which the insane were kept; and, in consequence of their unfavourable report, the first Act was passed, in 1773, for the regulation of private asylums and 'madhouses.' L. A. situated in London, or within an area of 7 miles, were licensed, and inspected by the College of Physicians, and a medical certificate was required for the admission of patients. Those in the provinces and Wales were licensed by the justices, who also appointed inspectors. In 1828 an Act was passed by which the Secretary of State was empowered to appoint fifteen commissioners annually for the licence and visitation of houses previously licensed by the College of Physicians. All admission, removals, and deaths were to be reported to the commissioners, and the L. A. were to be visited by a medical man, who had a resident medical officer. In 1843 power was granted to the commissioners to visit county asylums also, and, in consequence of their unfavourable report, an Act was passed, in 1845, by which eleven commissioners were appointed, five of whom were to be unpaid members, and six (three of them being physicians and two barristers) were to be paid officials. In 1853, another Act was passed making further provision for the care and treatment of lunatics. From the passing of the 'Vagrant Act,' in 1774, various enactments were made regarding proper accommodation for pauper lunatics, and in 1846 it was found to be absolutely necessary to enact stringent regulations for the building of county L. A. By this Act boroughs and counties are compelled to provide, within a certain period, the requisite accommodation for pauper lunatics. According to the Acts the term *asylum* means 'any lunatic asylum erected under the provisions of any Act for the erection or regulation of county or borough L. A.' The laws regarding the admission and detention of the insane are of a very stringent nature, and the supervision of the insane, while confined in L. A., is equally precise. L. A. were formerly little better than prisons, and generally much worse; but within recent years great advances have been made, and, for incurables, they are now comfortable homes, and, for curables, hospitals for skilled and humane treatment. The effect of liberal arrangements, although attended, in the first instance, with increased cost, has been found to be least expensive, as the recoveries are much greater than formerly, and the period of detention shorter. Private L. A. for the middle and higher classes are, in appearance and arrangements, made to resemble as closely as possible private dwellings, and the utmost possible liberty is granted to those mentally afflicted.

Lunawara, the capital of a native state of the same name, in the Rewa Kanta Agency, India, 4 miles E. from the confluence of the Mahi and Panam Rivers, about 350 miles N. of Bombay; pop. (1872) 9662. It is a walled town, founded in

1434, and well situated for defence and for trade. The houses are two or three storeys high, with carved wooden balconies; and the whole is overlooked by the palace. It is inhabited by many artisans and traders.—The state of L., which is irregular in shape, has an area of 388 sq. miles; pop. (1872) 74,813; revenue, £12,800, but one-third of the land is alienated in feudal grants. Tribute is paid both to the Gaekwar and to Scindia, under British guarantee. The ruling family are Rajputs.

Lund (Scand. 'a grove'), an old irregularly-built town of S. Sweden, in the län of Malmöhus, 11½ miles N.E. of Malmö by rail, and 26 miles N.E. of Copenhagen. It is beautifully situated on a wide plain with fine gardens, and fields of tobacco, wood, and madder. L. has a university (founded 1668), with 500–600 students, and a library of 120,000 volumes, a fine cathedral (St. Lawrence), and several charitable institutions. Cloth, tobacco, leather, and sugar are manufactured. Pop. (1876) 10,193. L. (Lat. *Londinum Gothorum*) was an important place from the earliest times. After 1048 it became the see of a bishop, who from 1104 to 1553 was primate of all Scandinavia.

Lundy (Scand. 'grove island'), an island in the mouth of the Bristol Channel, 11 miles N.N.W. of Hartland Point, is 2½ miles long by 1 broad. Pop. (1871) 144. Precipitous granite cliffs allow but one landing-place—on the eastern side. L. has a lighthouse near the S. end of the isle, at a height of 567 feet above the sea; and the ruins of the castle of Morisco, a pirate in the reign of Henry III. This castle was held for Charles I. by Lord Say and Sele in the Civil War. See J. R. Chanter's *L. Island: a Monograph* (Lond. 1877).

Lüneburg, formerly a separate duchy, now forms part of the province of Hannover (q. v.).—L., the old capital, on the Ilmenau, 28 miles S.E. of Hamburg by rail, has a fine Fürstenhaus and Rathhaus, and four churches of the 14th and 15th c., and manufactures linens and cottons, tobacco, sugar, and paper. In the neighbourhood are large lime, gypsum, and salt works. From 1267 to 1369 L. was the residence of the dukes of Braunschweig-L., and in 1367 it entered the Hansa. Pop. (1875) 17,532. Near L. the Russians and Prussians defeated the French in 1813.

Lunel, a town of France, department of Hérault, 15 miles E.N.E. of Montpellier by rail; has manufactures of cloth, absinthe, and liqueurs, and a trade in Muscatel wine, grain, raisins, &c. In the neighbourhood are some caves, containing remarkable fossil bones. Pop. (1872) 6973.

Lunette, in Fortification, a detached bastion with two faces and two flanks, chiefly used where the faces can be so placed that the glacis may receive flank defence from the fortress to which the L. belongs.

Lu néville, a town of France, department of Meurthe, at the confluence of the Meurthe and Vezouse, 200 miles E. of Paris by rail. It is one of the largest cavalry stations in France, the castle of the dukes of Lorraine having been converted into barracks. Its manufactures are thread, calicoes, gloves, wax-candles, ovens, fayence, playing-cards, and conserves. Pop. (1872) 11,929. The Peace of L. fixed the Rhine as the frontier of France, 8th February 1801.

Lungs. See RESPIRATION, ORGANS OF.

Lungwort, a small genus of Boraginaceæ, some species of which were formerly grown in gardens, partly as ornament, and partly as furnishing a domestic medicine. The popular name, as also the scientific interpretation, *Pulmonaria*, indicate the use to which it was applied. *P. augustifolia* is a native in S. England; but *P. officinalis* is only in Britain a remnant of former cultivation; both are widely distributed through Europe. Bullock's L., is *Verbascum Thapsus*, the name arising from bygone use of the plant in cattle complaints. A fine foliaceous lichen (*Sticta pulmonaria*) having its underside covered with round white or yellow pits, has received the name of Tree L., from being a popular remedy in diseases of the lungs.

Lupercalia, one of the most ancient Roman festivals, celebrated every 15th of February, in honour of Lupercus, the god of fertility. The Luperci (priests of Lupercus) met in the Lupercal, a sacred enclosure on the Palatine, where Romulus and Remus were said to have been nurtured by the she-wolf. Goats and young dogs were sacrificed; and thereafter the

Luperci, covering parts of their body with the skin of the slaughtered goats, and holding in their hands thongs cut from the hides, ran through the crowded parts of the city, striking all whom they encountered, especially women, the blow being believed to possess a purifying and fertilising power. This shepherd-festival was always observed in commemoration of the founders of the city.

Lu'pine (*Lupinus*), is an extensive genus of Leguminosæ dominant in the New World, although fourteen species come from S. Europe. Several of these are a good deal grown on poor sandy ground as a green manure, to plough in, and so improve the soil; their annual duration, quick growth, and abundant herbage rendering them exceptionally useful for this purpose. They also furnish a useful fodder, and their lentil-like seeds, after the bitter principle (*Lupinin*) has been removed through boiling or soaking in salt water, become edible. Different perennial species are sown to bind shifting sand, their roots running to a great depth and ranging over a large area. As garden plants the L. has long held a prominent place, and the botanical exploration of W. America from California to Chili, has led to the introduction of numerous handsome additions—all hardy, elegant, and easily grown.

Lu'pus, or **Wolf**, is the term applied to a disease of the skin, and is suggestive of its destructive nature. L. occurs under three forms:—1. As a superficial affection of the skin, not attended by ulceration, but accompanied by important and destructive changes in its tissue (*lupus non-exedens*). It appears as a red patch on the skin, covered by a fine, branny, epidermic desquamation, having the appearance of a thin cicatricial tissue, and it may involve the greater part or the whole of the face; or it may leave a firm, white, smooth, depressed cicatrix like that of a burn, along the anterior margin of which there is a spreading, elevated ridge composed of soft bluish-white or reddish tubercles. 2. As a slowly ulcerating disease (*lupoid ulcer*), which usually occurs about the face or neck, or the extremities of elderly people. 3. As a disease of rapidly destructive character, eroding superficially, and destroying the tissues deeply (*lupus exedens*), which may begin with or without the existence of a tubercle on the skin. It is most commonly situated on the nose, and the ulcer is at first covered by a thick scab which, when the scab separates, extends and often rapidly destroys one or both alæ, the tip, and the columna of the nose. The ulceration may cease for a time, or it may go on eroding one-half of the face. *Treatment*: In *L. non-exedens*, the avoidance of stimulants of all kinds, the use of a bland diet, the employment of the preparations of arsenic in combination with iodine, and the local application of glycerine with carbolic acid, will be the most likely means of cure. *Lupoid ulcer* is a grave affection, and should be treated with chloride of zinc. The treatment of *L. exedens* must have reference to the constitutional condition, strumous or syphilitic.

Lur'cher, a breed of dogs forming a cross between the greyhound and shepherd's dog. The body is like that of a stout greyhound, the hair short and coarse; and the tail long. The L. is intelligent and faithful. It has, however, been generally employed in the illegal pursuit of game, and is accordingly held in no great favour by sportsmen. It is singularly active, and possesses great powers of endurance, the scent being especially delicate. The colour is usually dark grey.

Lur'gan (Irish Gael. *lurgá* or *lurgan*, 'the shin,' applied to any long, low ridge), a town of Ireland, county of Armagh, 20 miles S.W. of Belfast by rail, has large manufactures of linens, muslins, and damasks. There are also breweries and a tobacco manufactory. 'L. twist' is not unknown to fame. Pop. (1871) 7766. There are upwards of thirty places of this name in Ireland.

Lusa'tia (Lat. form of the Ger. *Lausitz*; Fr. *Lusace*), a district of Germany, inhabited partly by Germans, partly by Wends, formerly divided into Ober-Lausitz (now part of Saxony and Prussian Silesia) and Nieder-L. (now S. Brandenburg). L. was inhabited in the earlier Middle Ages by the Slavic *Lusici*, came under Brandenburg in the 13th c., was divided between Bavaria and Bohemia in 1320, and submitted to Matthias Corvinus in 1467. In 1620 the Kurfürst Johann Georg of Saxony seized it in the Emperor's name, and in 1635 received it from him as a Bohemian fief. Prussia obtained all L. in 1815, except a small part, which remained to Saxony, and is now the circle of Bautzen.

Lus'trum (Lat. *luo*, 'I expiate'), the purification of the Roman people in the Campus Martius by one of the censors, on the conclusion of the census, consisted in the sacrifice of a boar, sheep, and bull (*suovetaurilia*). The first L. is said to have been performed by Servius (B.C. 566), the last took place in the reign of Vespasian (A.D. 74). From the census occurring once in five years, the term L. came to be applied to that period of time.

Lute, a musical instrument of the guitar kind, once common in Europe. See GUITAR.

Lu'ther, Martin, son of a miner, was born at Eisleben, in what is now known as Prussian Saxony, 10th November 1483, was trained with much severity at home, and at a school in Mansfeld, from which he was sent to Magdeburg (1497) and Eisenach (1498) to finish his elementary education. In his eighteenth year L. went to the University of Erfurt to qualify as a lawyer, but his tastes led him to the study of philosophy and theology. By accident he came across a complete edition of the Bible, which to his amazement he found included much more than the gospels and epistles used in the lectionaries. A great part of his leisure was employed in mastering the contents of the newly-discovered volume. Having completed his college career, and taken the degree of M.A., L. gave up thoughts of law, and after the depression of a nervous fever had reduced his mind to gloom, he entered the Augustinian monastery at Erfurt (17th July 1505), contrary to his father's wishes. Here he led a life of extreme austerity, praying and fasting sometimes for entire days, but without finding the peace after which his soul panted. Two years later he was consecrated a priest, and with the encouragement of Staupitz, vicar-general of the monastery, continued his study of the Bible and St. Augustine. It ended in his adoption of the belief that forgiveness of sins is obtained through faith in Christ, and not by penance and ceremony, that events happen through the exercise of a predestinating will, and that salvation is, therefore, possible only to those elected to the endowment of faith. In 1508 L. obtained the chair of philosophy at the University of Wittenberg, and in 1509 added to his labours, preaching and biblical exegesis. A visit to Rome (1510) on behalf of the Augustine monastery at Wittenberg, had a great effect upon the subsequent course of his thoughts. His eyes were opened to the corruption of the Church in all its grades, and he went home with his mind fervently turned towards thoughts of reform. His opportunity arrived in 1517. 140 X., being in want of money, sent out indulgences for sale throughout Europe. An agent, Tetzel, arrived with them at Wittenberg, and began to drive a trade in sin-pardoning. L.'s indignation knew no bounds. On the 31st October 1517, the day before the festival of All Saints, he nailed upon the door of the palace church a thesis, containing ninety-five propositions, in which he denied that the pope had the power of forgiving sins. The popular mind was ready to receive the new message of reform, and the writing on the church door immediately passed into universal discussion. Tetzel replied with counter-propositions, and L.'s conventual brothers made an effort to restrain his vehemence. In August 1518 his *Resolutions* were published in justification. At the end of the year he was summoned to Augsburg to meet Cardinal Cajetan, the papal legate. Being asked to retract his heretical opinions, without even the form of discussion, L. declined. Then a second legate, Miltitz, a German, tried to win him over by flattery but failed. During 1519 Eck, Emser, and Alveld all disputed with him, but the noise of the Reformation only grew louder. Further study had shown L. that the views he had adopted from St. Augustine were one with those of Wiclif and Huss, who had been denounced from Rome as heretics. His quarrel, therefore, gathered more strength, and his invectives against Rome increased in vigour. In August 1520 appeared his pamphlet addressed *To the Christian Nobles of the German Nation*, of which copies were issued both in Latin and German. The arguments were of the most politic sort, urging the superiority of the secular over the spiritual arm, asking why Germany should beggar herself by sending annates to Rome, and advising a larger independence for national churches. The Pope issued a Bull of excommunication against him in September 1520. On the 10th of December L. marched to the margin of the Elbe at the head of the professors and students of the Wittenberg University, and burned the Bull along with the books

of Canon Law. 'His burning the Bull,' says Seeböhm, 'against himself was a personal act of defiance. His burning the Canon Law books was a public declaration that the German nations ought not to be subject to the jurisdiction of Rome.' About the same time the Elector of Saxony determined to support L., though having consulted Erasmus, he asked him to cultivate a more gentle spirit. L.'s 'gentle spirit' was manifested in his *Against the Bull of Antichrist*. 'Now,' wrote Erasmus, 'I see no end of it but the turning upside down of the whole world.' On the 18th April 1521, Karl V. held his first Diet at Worms, one of the subjects of discussion appointed being 'the books and descriptions made by Friar Martin against the Court of Rome. The which Friar Martin, of the Elector of Saxony and other princes, is much favoured.' L., provided with a safe-conduct, was summoned to appear in his own defence. He left Wittenberg, April 2d, depositing in the hands of a friend what he called 'a good book for the laity,' a volume of wood-cuts explained by himself, depicting the 'contrast between Christ and the Pope.' All along the road to Worms public excitement ran high. People knew the risk he incurred of being led to the stake like a heretic, as Huss had been, and he knew it himself. But, as he expressed himself afterwards to the Elector of Saxony, 'the devil saw in my heart that, even had I known that there would be as many devils at Worms as tiles upon the house-roofs, still I should joyfully have plunged in among them!' Standing before emperor, electors, archbishops, bishops, and nobility, he acknowledged the authorship of his books, exclaiming at the end of his defence, 'I am bound by the Scriptures which I have quoted; my conscience is submissive to the Word of God; therefore I may not and will not recant, because to act against conscience is unholy and unsafe. So help me God! Amen.' Every effort to get him to submit failed. On the 26th of April he was ordered by the Emperor to leave Worms. 'He left Worms the hero of the German nation. He single-handed had fought the battle of Germany against the Pope. He had hazarded his life for the sake of the Fatherland.' An imperial edict was issued against him, but L. was hidden in the castle of the Wartburg for ten months, where he occupied himself with translating the Bible into German, and where occurred the famous scene in which he assailed with an ink-bottle what seemed to him an apparition of the devil. During this interval the progress of the revolutionary ideas which L. had done so much to assist did not flag. Frenzied leaders arose from the masses and headed political riots; the peasants, groaning under centuries of tyranny, demanded vengeance against the princes who held them in bondage. Churches were wrecked, and fanatics prophesied strange things. L. left the Wartburg, and declining to sanction a political revolt, mercilessly condemned the revolutionists for fighting against the civil power. His indignation against them burnt with such strength that he went the length of advising a slaughter of the peasantry during these years—advice which forms the least creditable episode of his life. In 1525 L. separated himself still further from the Roman communion by marrying Katharina von Bora, a nun who had thrown aside her vows. During the same year his disgust at the *via media* adopted by Erasmus in the affairs of the Reformation led to a complete breach between them, which was vigorously embodied in the *De Servo Arbitrio*. By 1529 he had also quarrelled with Ulrich Zwingli, on the question as to the true nature of the Lord's Supper, a quarrel which ended in the Reformed Church of Switzerland being established on a basis antagonistic to Lutheranism. In 1530 the Diet of Augsburg assembled, L. remaining in close proximity whilst Melancthon submitted a statement of the articles of faith afterwards known as the Augsburg Confession. By this event L.'s labours were conducted to a crisis; the chief work of the Reformation had been accomplished. The Elector of Brandenburg, the Elector Palatine, Duke Georg of Saxony, and Duke Ulrich of Würtemberg were all Protestants. L. died at Eisleben, 18th February 1546. He possessed in the highest degree all the qualities essential to the Reformer. He was fearless to the last degree, inflamed with a passionate conviction of the divine truth of his mission, rising to the point of dogmatism in behalf of the objects about which his mind was made up. Through the very exuberance of his strong nature, his language sometimes degenerated into coarseness, but the predominant elements of his disposition were tenderness, sympathy, and humour. In force, fire, grandeur of soul, he is the greatest of the many conspicuous figures of the Protestant Re-

volution. But L. wrought another great change, besides the religious one, which ought not to be overlooked. His hymns, pamphlets, and translations created a common literary dialect for all Germany. To L. more than to any other is it owing that 'High German' became the standard or classic dialect of the people. Luther's 'Bible' carried into every German home, gradually turned the once powerful 'Low German' speech into a patois. Something was lost in this change, but much was also gained. The German nation, otherwise so much divided, secured through this unity of language a unity of hope and sentiment which enabled it to survive political disintegration, and prepared the way for the triumphs of 1866 and 1870. Of the numerous editions of L.'s works, perhaps the best is that of Walch (Halle, 24 vols., 1740-51; reissued with enlargements, in 67 vols. (Ger.) 1826-57, and 23 vols. (Lat.) 1829-61). See Förstemann's edition of the *Tisch-Reden* ('Table-Talk,' Leips. 1844); De Wette's edition of L.'s letters (Berl. 1825); Michelet's *Mémoire de L.*; Worsley's *Life of M. L.* (1856); Seeböhm's *Era of the Protestant Revolution* (1875).

Lutherans is the historical designation of the followers of Luther, and is still popularly employed to describe those who accept the creed of the great reformer in theology and church government. *Lutheranism* prevails in Germany, and is the state religion in Denmark, Sweden, and Norway, but has received modifications in all of these countries.

Luton, a town of Bedfordshire, England, on the Lea, 35 miles N.N.W. of London by rail. It is the chief seat of the straw hat and bonnet trade in England, and has a handsome corn-exchange (opened 1870), a new strawplait-exchange (cost £6000), large straw hat factories, engineering works, iron-foundries, steam saw and flour mills, &c. Fairs are held in April, October, and September. Pop. (1871) 17,317.

Lütt'ringhausen, a town of Rhenish Prussia, 20 miles S.E. of Düsseldorf, has manufactures of woollens, linens, cottons, ducats, &c. Pop. (1875) 9493.

Lütz'en, a small town of Prussia, province of Saxony, gives name to two battles fought in the vicinity. The Imperialists, under Wallenstein, were defeated here by Gustavus Adolphus, who fell in the encounter, November 10, 1632. The second battle of L. (May 2, 1813) was the first great conflict between Napoleon and the allied Russian and Prussian forces, and resulted in a victory for the former, by which he regained Saxony and the Elbe.

Luxembourg, François Henri de Montmorency, Duc de, posthumous son of Comte de Bouteville, was born at Paris, 8th January 1628. Brought up for the army, he accompanied his relative, Prince de Conde, as aide-de-camp in Spain and Flanders, and in the French civil wars fought against Mazarin, who took him prisoner at the battle of Rethel. He married the heiress of the Luxembourg house, 1661, taking her name. In the campaign of 1667 he served in Flanders under Turenne as a volunteer, and in the year following was lieutenant-general in Franche-Comté under Condé. In December 1672 he did a rather notable thing, marching over the ice with 3000 men from Utrecht to Werdan and thence to Swammerdamm, which he burnt. After the death of Turenne he was made a marshal (1675), and in 1676 horribly devastated Breisgau, and compelled the Duke of Würtemberg to evacuate Mömpelgard, which he sacked. In 1677 he beat the Prince of Orange at Mont-Cassel, took St. Omer, and compelled the Prince to raise the siege of Charleroi. After the Peace of Nimwegen, he was imprisoned in the Bastille on a charge of sorcery through the agency of the Minister Louvois, who was jealous of his power. After fourteen months L. was released, and in 1690 again obtained a command in Flanders, defeated the Prince of Waldeck at Fleurus 1st July, the Prince of Orange (now William III. of England) at Steenkerk 4th August 1692, and again at Neerwinden 29th June 1693. He closed the campaign on the 12th of October with the conquest of Charleroi. L. died 5th January 1695. Of a weak frame, L. possessed an active, quick, and piercing genius for war. See Paurain, *Histoire Militaire du Duc de L.* (Haag. 1756); *Mémoire pour servir à l'Histoire du Maréchal de L., écrite par lui-même* (Haag. 1758); Kitchin's *History of France* (vol. iii. 1877).

Luxembourg, a grand duchy in the S.E. of Belgium, was a member of the German Confederation from its formation in

1815, since the Treaty of London of 1867 a neutral country, connected with the House of Orange-Nassau, through personal union, but included in the Zollverein (q. v.) of Germany. Area, 1592 sq. miles, pop. (1871) 197,528. The country is in the rugged, woody region of the Ardennes, and is watered by the Moselle (forming the E. border), the Our, the Sure, and its tributaries. The surface is pretty rich in grain and pasture; the chief minerals are coal, iron, copper, lead, marble, and freestone. Other products are wine (Moselle), timber, oak-bark, cork, cheese, paper, flannels, gloves, &c. German is the speech of the people, but French is the language of the upper classes (some 4000) and of the legislature. L., by the constitution of 1868, is governed by a chamber of forty-one deputies, elected by the cantons for six years, and by a stadtholder (Prince Henrik), nominated by the king of the Netherlands. In 1875 the revenue was 6,783,000 francs, the expenditure 6,787,102, and the public debt 12,000,000 francs. The army consists of one battalion of chasseurs (500 men and 13 officers) and a corps of gendarmes.—L., a province in the extreme S.E. of Belgium, is bounded S. by France, N. by Liege, W. by Namur, and E. by the grand duchy of L., and by Rhenish Prussia. Area, 1705 sq. miles; pop. (1873) 206,069. It is the largest, but least populous, province of Belgium, is hilly and woody, has much horse and cattle rearing, and large mineral industries. Arlon is the capital, and the people are mostly Walloons.

History.—The old countship of L., named from the Lutzelburg, was first held by Siegfried from 963. The original family died out with Konrad II. in 1136, and L. passed by female descent to Heinrich I., Duke of Limburg. Heinrich III. became Emperor as Heinrich VII. in 1309, founding the L. imperial line. L. was made a duchy by Karl IV. in 1354, passed to Burgundy in 1443, to Austria in 1477, to Spain in 1555, to Austria again on the Peace of Utrecht, 1713, and to France in 1795. By the Peace of Vienna it was annexed to the Netherlands as a grand duchy, still remaining a state of the German Confederation, the capital being occupied by a Prussian garrison. On the Revolution of 1830, Belgium received the greater part of L., but the Treaty of London (1867) secured a more equal division, the neutrality of the grand duchy, and the withdrawal of the Prussian troops. See König, *Das Luxemburger Land* (Dirkirk 1850).

Lux'emburg (properly *Lützelburg*, 'the little castle'), the picturesque capital of the Grand Duchy of L., on the Alsette, 30 miles N. of Metz by rail. It lies partly on a rocky hill 200 feet high, at the base of the scarped sides of which has risen the Lower Town, with broad streets and modern buildings. The Lower Town is spanned by four great viaducts. The chief building is the cathedral, and the industrial products are wax, leather, spirits, beer, &c. There is a large trade in gold and silver wares, china, vinegar, and hats. L., formerly one of the strongest fortresses in Europe, was, in accordance with the conditions fixed by the London Conference of May 7-11, 1867, evacuated by the Prussian garrison in the same year, and finally dismantled in 1870. Pop. (1875) 15,954.

Lu'zon, the largest of the Philippine Islands (q. v.), and the most northerly of the group, has an area of 51,300 sq. miles, and a pop. of 2,500,000, including the savage inhabitants of the interior. Of volcanic origin, and subject to destructive earthquakes, it is traversed from N. to S. by several ranges of mountains, which attain a height of 7000 feet, and are clad with luxuriant forests of ebony, cedar, iron-wood, cocoa, citron, bread-fruit, tamarind, and other trees, enveloped in a maze of climbing plants and parasites. The products are rice, wheat, maize, sugar, hemp, tobacco (a monopoly yielding \$5,000,000 yearly profit), ginger, pepper, vanilla, hemp, mother-of-pearl, amber, coral, tortoise-shell, &c. There is abundance of fish and game, and the island is free from beasts of prey. Tagals and Bisayers of Malayan race are the chief inhabitants. The black people of the interior are believed to be aborigines. Many Chinese have settled here, but comparatively few Spaniards. The chief town is Manila (q. v.).

Lu'zula, a genus of plants closely related to the rushes (*Juncus*), but with more grass-like foliage, which is always more or less beset with long flexuous white hairs. There are about 40 species distributed through the temperate and cold regions of the world. Of these seven are British, and one (*L. campestris*) may be seen in abundance in spring in poor pastures,

grass plots, and heathy wastes, its clusters of flowers forming a blackish head, rendering it conspicuous amongst the short herbage. *L. sylvatica*—the wood-rush—is a handsome species, frequent in upland woods.

Lycaon'thropy (Gr. *lukos*, 'wolf,' and *anthropos*, 'a man'), wolf-madness, is a form of delusional insanity. Many examples of L. are on record, although it is comparatively an extremely rare disease. Paulus Aegineta says:—'Those labouring under L. go out during the night, imitating wolves in all things, and lingering among sepulchres until morning. You may recognise such persons by these marks; they are pale, their vision feeble, their eyes dry, tongue very dry, and the flow of the saliva stopped; but they are thirsty, and they have incurable ulcerations from frequent falls.' This remarkable disorder was prevalent in Europe in the 14th and 15th centuries. See Calmeil, *De la Folie*; Arnold, *On Insanity*.

Lycaon, a genus of carnivorous mammals, belonging to the Canidae or dog family, are represented by the hunting dog (*L. venaticus*) of S. Africa, in which the characteristics of the dog appear to be united with those of the hyena. The L. attains a large size. It commits great havoc amongst sheep and cattle in S. Africa. The colour is a reddish brown, variegated with black and white patches. The ears are large and prominent, and the tail bushy.

Lycaonia was a bare and dreary district of Asia Minor, extending from the ridges of Mount Taurus on the S. to the Cappadocian Hills on the N. Its inhabitants were characterised by lawless habits, and spoke a rude dialect (Acts xiv. 11). The chief town was Iconium.

Lyceum (Gr. *Lykeion*), a gymnasium with covered walks in the eastern suburb of Athens, near the river Ilissus, named after the neighbouring temple of Apollo Lyceus. Here Aristotle walked and taught—hence his disciples were called Peripatetics. During the Middle Ages the name was given to the higher schools, in which the Aristotelian philosophy was taught. After the abolition of the scholastic philosophy, it continued to be the official name of Latin or grammar schools, but in Germany, after 1812, it was generally abandoned in favour of 'gymnasium.' In Würtemberg and Baden, however, the name still survives, along with 'gymnasium;' in the former country it denotes a lower; in the latter, a higher grade of classical instruction than is denoted by gymnasium. In France, schools for higher or secondary instruction are still called *Lycees*.

Lychn-Gate (Old Eng. *lic-gætt*, 'corpse-gate'), a porch at the entrance of a churchyard where a funeral procession halts, while the priest advances from the church. Ancient examples are common in Wales and Cornwall, rare in Scotland and the E. of England.

Lychnis, a genus of Caryophyllaceæ occurring in the temperate regions of the three northern continents, and consisting of about thirty species. Of the five belonging to the British flora, the red and the white campion and the ragged robin are common plants, while *L. Alpina* is all but confined to the Clova mountains in Scotland, and *L. viscaria* is distinctly local. The corn cockle is by some botanists placed in this genus, by others it is separated as monotypic under the name *Githago* or *Agrostemma*. The derivation of L. is from the Greek for flame-like, and perhaps the applicability is fairly illustrated by the scarlet L. (*L. chalcedonica*), and the rose campion (*L. coronaria*), both garden plants of the past rather than of the present era.

Ly'cia, a country on the southern coast of Asia Minor, traversed by spurs of the Taurus range, and watered by the Xanthus (*Elisken*) and Limyrus. Its earliest inhabitants, the Solymi and

Lychnis Alpina.

Termila, were probably of Semitic origin; while the Lycians (*Leka* in Egyptian inscriptions of the 14th c. B.C.), who entered from Crete, belonged to the Zendic subdivision of the Iranian branch of the Indo-European family. The widespread worship of the 'Lycian' Apollo, the myth of Bellerophon (q. v.), and the present remains of the six cities of the Lycian Confederacy—Xanthus, Patara, Pinara, Olympus, Myra, and Tlos—all indicate a high antiquity. In historic times L. became subject to the Persians (546 B.C.), Macedonians (333), and Romans (188), who made it over to the Rhodians. Restored to temporary independence, it was ravaged by Brutus (42 B.C.), and finally annexed by Claudius (41–54 A.D.) to the prefecture of Pamphylia. See the works of Sir Charles Fellows (q. v.), Spratt, and Forbes, *Travels in L.* (Lond. 1847), and Bachofen, *Das Lykische Volk* (Freib. 1862).

Lycopodiacæ, a natural order of the plants often called for convenience 'fern-allies,' consists of about 240 species, growing in all countries of the globe, from the Tropics to the Arctic circles. By far the largest portion, namely, those constituting the genera *Lycopodium* and *Selaginella* (numbering conjointly 220 species), have a general close resemblance; but others, as *Isoetes* and *Psilotum*, to the superficial observer bear little or no relationship. The essentials are that the whole have their capsules situated in the axils of the leaves or of the scales of a cone-like structure, thereby differing from ferns on the one hand, and the pillworts on the other. The leaves also, diverse though they are, are always simple and unbranched, and are penetrated by only one fibro-vascular bundle. The shoots and the roots give an example of true dichotomous branching. The details of germination are not at present satisfactorily ascertained. Seven species inhabit Britain, of which the five belonging to *Lycopodium* are to be found on heathly moory ground from low levels to 4000 feet altitude; the single representative of *Selaginella* grows in boggy soil, and *Isoetes* is an aquatic.

Lycurgus, the Spartan legislator, is said by Aristotle to have lived B.C. 884, but is placed by Xenophon more than 200 years earlier. Sparta was in a state of anarchy when King Polydectes, brother of L., died, leaving his queen with child. The unnatural mother proposed to L. to kill the rightful heir, if he would agree to share the throne with her. He expressed assent, but when a boy was born, proclaimed him king and became his guardian. The king died young, and thereafter L. set out on a journey, which he did to have extended through Crete, Asia Minor, Egypt, and even into Libya, Iberia, and India. On his return to Sparta he undertook, at the request of all parties, to reform the constitution of the state. He did so, with the sanction of the oracle at Delphi, and on the condition that no change should be made by his countrymen on the remodelled polity before his return. He then withdrew to pass his days in voluntary exile, and the place and time of his death remain unknown. A temple was erected in his honour at Sparta, and yearly sacrifices were offered to him as to a god. Though we are not warranted in denying to L., as some have done, an historical existence, it cannot be doubted that much of the foregoing narrative is of a legendary character, and that his legislative work at Sparta was the subject of serious, though quite intelligible exaggeration.

Lydgate, John, an English poet, was a native of Suffolk, and was born not later than 1370. He studied at Oxford, Paris, and Padua, became a priest of the Benedictine monastery of Bury St. Edmunds in 1397, and established there a school of rhetoric or literature, which acquired a wide renown in his lifetime. He died in the reign of Henry VI. 'L.,' says Morley, 'was well read in ancient lore, mathematician also and astronomer, as well as orator and poet; a bright, pleasant, and earnest man, who wrote clear, fluent verse in any style then reputable, but who was most apt at the telling of such moral stories as his public liked.' His three chief works are *Troy Book*, *The Storie of Thebes*, and *Falls of Princes*. The first is a metrical adaptation from the French, the second a 'Canterbury Tale' in imitation of Chaucer, and the third is founded on Boccaccio's Latin work, *De Casibus Mistrum Virorum*. His *London Lickpenny* is a satire not yet forgotten.

Lydia, a country on the western coast of Asia Minor, which included Ionia (q. v.), was watered by the Hermus, with the Pactolus and other tributaries, and by the Cayster, and was traversed by the Tmolus and Messogis ranges. Its earliest

inhabitants, the Pelasgic Mæonians, were gradually conquered by the Lydians, a Semitic race allied to the Carians, who were ruled successively by the Atyadæ, the Heracleidæ (1200–700 B.C.), and the Mermnadæ, Gyges (q. v.) and Croesus (q. v.) belonging to the last-named dynasty. With Croesus' defeat in 546 L. passed to Persia, and its cities—Sardis, Magnesia, Thyatira, &c.—dwindled into insignificance. See Dr. C. von Scherzer's *Smyrna* (Vienna, 1873).

Lydian Stone, or **Touchstone**, a hard flinty jasper, velvet-black in colour. It is used for testing the purity of gold and silver by comparing the tracing left on it with that left by a known alloy.

Lyell, Sir Charles, Bart., a celebrated English geologist, was born at Kinnordy, Forfarshire, February 14, 1797. He studied at Exeter College, Oxford, where he graduated M.A. in 1821. While at Oxford he attended the lectures of Dr. Buckland upon geology, and ere long he directed his whole energies to the study of this infant science. Visiting the Continent in 1824, he collected geological facts which afterwards proved of great value, and these observations he supplemented on a more extended tour in 1828–30. In 1830 the first volume of the *Principles of Geology* was published, and was followed by the second and third in 1832 and 1833 respectively. In 1831 L. was appointed lecturer on geology in King's College, London, and his lectures at once disclosed the wide philosophical grasp of the principles of the science, and the capacity for sifting the non-essential from the essential, which he possessed in such a marked degree. His *Principles of Geology* ran through numerous editions and underwent continual alterations. In the sixth edition he suppressed those chapters on the more purely technical branch of the science, reproducing them in an amplified form in his *Elements of Geology*, which after several editions was published in a more condensed and complete form as *The Student's Manual of Geology* (1871). The great alterations which the *Principles* underwent are the best evidence of Lyell's complete freedom from bias in favour of any preconceived theory, and of his readiness to accept, after careful consideration of its merits, any new explanation of imperfectly understood phenomena. The tenth edition, which appeared after the publication of Darwin's *Origin of Species*, was wholly recast so as to incorporate the theory of natural selection in his system. The last edition was published in 1872. L. constantly urged upon geologists the vast importance of observation. He himself paid frequent visits to the Continent, and twice made journeys to America, the scientific results of which are embodied in his *Travels in North America*, 1841–2, and *A Second Visit to the United States*, 1845–46. Excepting the *Principles*, the most important of his works is his treatise *On the Geological Evidences of the Antiquity of Man* (1863), in which he first gave his adhesion to the Darwinian hypothesis. L. also wrote numerous memoirs and papers for scientific journals. His scientific honours were numerous and varied. He was twice president of the Geological Society, in 1836 and 1854; and received the Wollaston Medal in 1866. The Royal Society awarded him the gold medal in 1833, and the Copley Medal in 1858. He presided over the British Association at Bath in 1864, and was president of the Geological Section on four separate occasions—in 1838, 1840, 1849, and 1859. In 1848 he was knighted, and was created a baronet in 1864. L. died at London, February 27, 1875, the last and greatest of those veterans of science who by their united labours have made geology what it is.

Lyly, John, an English dramatist, was born in Kent about 1553, and took a degree both at Oxford and at Cambridge. In 1579 he published the once famous *Euphues*, or *The Anatomy of Wit*. To this work he added next year a second part, *Euphues and his England*. *Euphues* takes the form of an Italian story, abounds in wit and wisdom, and on account of its peculiar style has given our language the word euphuism, used to denote a pompous and affected phraseology. L. has another claim to remembrance—as an Elizabethan dramatist. He wrote nine plays, chiefly upon classical subjects,—seven in prose, one—*The Woman in the Moon*—in blank verse, and one—*The Maid's Metamorphosis*—in rhyme. A pamphlet written against Martin Marprelate, entitled *Pap with a Hatchet*, or *A Fig for my Godson*, or *Crack me this Nut*, is generally ascribed to L. He died in November 1606. An exact reprint of *Euphues* is published by Arber.

Elymus Grass (*Elymus*), a genus of coarse grasses allied to the barley, and met with in different countries of the north temperate zone. The common L. G. (*E. arvensis*) is natural to sandy seashores, where, from its vigorous growth and widely-spreading roots, it is of important service in binding the drift-sand. By the Dutch it is systematically planted for this purpose. On the British coast it is more frequent in the north than in the south. See BUNCH GRASS.

Lyme Grass.

Lyme Regis ('the king's haven'), a seaport and favourite watering place of Dorsetshire, in England, at the mouth of the river Lym, 5 miles S. by E. of Axminster, the nearest railway station. The neighbourhood is picturesque and geologically interesting. The harbour or 'cobb' is of great antiquity, and the town, noted for its salt-works before the Norman conquest, was one of the oldest parliamentary boroughs in England, but lost its franchise in 1568. Pop. (1871) 2333. Here the Duke of Monmouth set up his standard in 1685.

Lymington, a watering place in Hampshire, England, on the W. bank of the river L., a little above its entrance into the Solent, and 25 miles S.W. of Southampton by rail. It is a suburb to Southampton, and has large salt works (of great antiquity), and shipbuilding yards. Steamers ply hence to Portsmouth, the Isle of Wight, Cowes, &c. Pop. (1871) 5356. L. sends two members to Parliament.

Lymph, the name given to a fluid found in animals, usually contained within certain vessels known as *lymphatics* (q. v.), and also found within the intercellular spaces of the tissues and organs. L. may be held to represent in greater part the serum or liquid part of the blood, which has exuded through the walls of the blood-vessels, and come in contact with the tissues. It thus performs a *nutritive* function in nourishing the tissues, and furnishing fresh material for the blood. L. itself is a clear fluid, and in its analysis exhibits a close identity with blood.

Lymphatics and Lymphatic Glands, are vessels and glands concerned in the transmission and elaboration of *lymph* (q. v.). They are found in all parts of the body, with the exception of the placenta, umbilical cord, nails, hair, and outer skin. They begin their course in the tissues, and probably originate in the interspaces of the membranes. The smaller L., like the smallest capillaries or blood-vessels, have very ill-defined walls, lined by epithelial cells. Larger L. present a close resemblance to veins in their structure, having an outer coat of fibro-cellular tissue, and a second coat of the same material provided with a thin layer of muscular fibres. A layer of longitudinal elastic fibres lined by epithelium, forms the inner lining of the vessels, whilst well-developed *valves*, as in veins, are found in the interior. The valves are simple pouch-like dilatations of the inner wall of the vessel, and give the L. a beaded appearance when the vessel is full, by causing constrictions at the points of attachment of the valves. Lymph is propelled towards the *thoracic duct* chiefly by the pressure exercised by muscles on the walls of the L. This compression forces the lymph upwards in the case of the vessels which ascend from the lower parts of the body, since the valves prevent any retrograde movement of the fluid, and permit the fluid to move in one direction only. L. in the course of their distribution pass sooner or later into L. G., in the groin, arm-pit, and like situations. Each gland consists of a network of tissue, supporting a finer (*retiform*) tissue, within the meshes of which *lymph-cells* or *lymph-corpuscles* are found.

Lymphatic Glands, are vessels and glands concerned in the transmission and elaboration of *lymph* (q. v.). They are found in all parts of the body, with the exception of the placenta, umbilical cord, nails, hair, and outer skin. They begin their course in the tissues, and probably originate in the interspaces of the membranes. The smaller L., like the smallest capillaries or blood-vessels, have very ill-defined walls, lined by epithelial cells. Larger L. present a close resemblance to veins in their structure, having an outer coat of fibro-cellular tissue, and a second coat of the same material provided with a thin layer of muscular fibres. The valves are simple pouch-like dilatations of the inner wall of the vessel, and give the L. a beaded appearance when the vessel is full, by causing constrictions at the points of attachment of the valves. Lymph is propelled towards the *thoracic duct* chiefly by the pressure exercised by muscles on the walls of the L. This compression forces the lymph upwards in the case of the vessels which ascend from the lower parts of the body, since the valves prevent any retrograde movement of the fluid, and permit the fluid to move in one direction only. L. in the course of their distribution pass sooner or later into L. G., in the groin, arm-pit, and like situations. Each gland consists of a network of tissue, supporting a finer (*retiform*) tissue, within the meshes of which *lymph-cells* or *lymph-corpuscles* are found.

Lynchburg, a city of Virginia, U.S., on the S. bank of the James River and on the Kanawha Canal, 90 miles W. by S. of Richmond by rail. It has forty tobacco factories, several iron-

foundries, machine shops, cotton and flour mills, splendid water-power, an hospital, three daily and three tri-weekly newspapers. Pop. (1870) 6825.

Lynch Law, an American name for the trial and punishment of offenders without legal authority; in other words it is mob-law, or the law which irresponsible men 'take into their own hands.' Various explanations of the name are given, the most common tracing it to a farmer known as 'Judge' Lynch, who was long an informal referee in Virginia.

Lyndhurst, John Singleton Copley, Lord, an English lawyer and statesman, was born at Boston, U.S., 21st May 1772. His father, J. S. Copley (q. v.), an artist, removed to England in 1774. L. was educated at Trinity College, Cambridge, where he became Second Wrangler (1794), and Fellow (1797). Being called to the bar, L. chose the Midland Circuit, but until 1817, when, in company with Wetherell, he defended Watson and Thistlewood against the charge of high treason, he had not acquired much standing. In 1818, however, he was appointed Chief-Justice of the county palatine of Chester, entered Parliament in the Tory interest for Yarmouth (though he had previously been a Liberal in politics), became Solicitor-General (1819), Attorney General (1823), Master of the Rolls (1826), Lord Chancellor (1827), and Lord Chief Baron of the Exchequer (1835). In 1841 he accepted the Chancellorship for the third time. During the last ten years of his life he did not speak a great deal, but after his eightieth year he astonished the Upper House by the vigour of his reflections upon the Russian War, university reform, and other subjects. L. died in London, October 12, 1863. L. is recognized as one of the ablest and most clear-headed lawyers of the century. See Campbell's *Lives of the Lord Chancellors of England*.

Lyne'doch, Thomas Graham, Lord, the ablest of Wellington's lieutenants, was born at Balgowan, in Perthshire, Scotland, in 1750. He lived quietly as a country gentleman till the age of forty four, when the death of his wife affected him so deeply that he resolved to travel, in the hope of finding some solace for his grief. After serving as a volunteer under Lord Hood in the S. of France, he returned to Scotland, raised the first battalion of the 90th regiment, of which he was made colonel in 1794. He conducted the blockade of Malta, which the French were forced to surrender in 1801, served under Moore in Spain, and afterwards under Wellington with signal distinction. At Barossa, Vittoria, San Sebastian, and the passage of the Bidassoa, his brilliant and resolute genius proved irresistible. In 1814 L. was appointed commander of the forces in Holland, and raised to the peerage with a pension of £2000 a year. He died 18th December 1843. See Murray Graham's *Memoir of Lord L.* (1868, 2d ed., 1877).

Lynn, a seaport of the United States, in the State of Massachusetts, 10 miles N.E. of Boston by rail, and 1½ miles from the N. shore of Boston Harbour, first settled in 1629, and incorporated as a city in 1850, has twenty five churches and a fine city hall. The chief industries are the making of ladies' boots and shoes, and of kid and morocco leather, the former involving £200,000 capital, the latter £100,000. L. has three weekly newspapers. The harbour is good for small craft. Pop. (1870) 28,233.

Lynn (Celt *lyn*, 'a deep pool') **Regis**, or **King's Lynn**, a seaport of England, county of Norfolk, on the Great Ouse estuary, 99 miles N.E. of London by rail. It has four churches, eleven Dissenting chapels, numerous schools and benevolent institutions, three banks, and four newspapers. The town has been much improved in recent years, and since 1850 over 4000 acres of the sands to the N. have been reclaimed from the sea. In 1875 there entered the harbour (which can hold 300 ships) 804 vessels, of 120,448 tons; cleared, 63, of 60,992 tons. The chief exports are wool, corn, and manufactured goods; imports, corn, wine, hemp, coal, timber, linseed, tallow, cork, and tobacco; and industries, iron-founding, shipbuilding, brewing, and the manufacture of tobacco, cork, and rope. L. sends two members to Parliament. Pop. (1871) 17,266.

Lynx (*Lynx*), a genus of Carnivorous mammalia, distinguished by the presence of tufts of hair on the ears, and by a short and rudimentary tail. The common L. (*L. virginicus*) in-

habits Europe and N. Asia. It attains a length of 3 or 4 feet; the colour is variable, but is usually a dark grey tinted with red, and variegated with dark spots and patches on the body and limbs. The fur is highly valued. The head is large, and the hair of the cheeks is especially developed. The southern or Leopard L. (*L. pardinus*) is found in S. Europe. The tufted ears are prominent in this L., and the reddish fur is covered with small black spots, the presence of which has given origin to the name *pardinus* or 'leopard-like' L. In N. America, the Canada L. (*L. Canadensis*) represents the genus. Its colour is dark grey variegated with black. The length is 3 feet. It is often known as 'Le Chat'—a name given to it by the French settlers—and as the 'Peeshoo.' The booted L. (*L. caligatus*) is so named from the black colour of its legs. It occurs in Asia and Africa, and is of a yellowish-grey colour.

Lynx.

the presence of which has given origin to the name *pardinus* or 'leopard-like' L. In N. America, the Canada L. (*L. Canadensis*) represents the genus. Its colour is dark grey variegated with black. The length is 3 feet. It is often known as 'Le Chat'—a name given to it by the French settlers—and as the 'Peeshoo.' The booted L. (*L. caligatus*) is so named from the black colour of its legs. It occurs in Asia and Africa, and is of a yellowish-grey colour.

Lyon, the second largest city of France, and chief town of the department of the Rhone, situated at the confluence of the Rhone and Saône, 220 miles N.N.W. of Marseille, and 316 S.S.E. of Paris by rail. It extends from the heights of Croix-Rousse S. along the narrow tongue of L., and between the two rivers, with the annexed towns of Vaise on the right bank of the Saône, and Guillotière on the left bank of the Rhone. It is the first manufacturing town of France, the seat of an archbishop, and the headquarters of the seventh military division, and a fortress of the first rank. Eighteen forts defending it have a circuit of 16 miles. The Saône is spanned by fourteen bridges, the Rhone by eight, and the fine quays, 45 kilometres in extent, are ornamented with magnificent trees, and flanked by elegant houses. The Rhone is here navigable for steamers. L. has many fine squares, the most remarkable of which are Bellecour, one of the largest in Europe, and the Place des Terreaux, where the guillotine stood in 1794. Most of the squares are linked together by the splendid Rue de l'Impératrice, opened in 1855. Among the public buildings are the magnificent Hôtel-de-Ville, restored in 1702, the Palais de la Bourso (1860), the Palais de Justice, with a Corinthian portico, the Hôtel Dieu, re-erected on the site of the old hospital, the Hospice de la Charité, the classic Palais des Beaux-Arts, an artillery arsenal, a theatre in the Renaissance style of Louis XV., the theatre de Célestins, &c. The principal churches are the primordial St. Jean, in Roman style, those of Ainay rebuilt in the 10th c. in the Byzantine style, the Gothic St. Nizier and Notre-Dame on the summit of Fourvières, commanding one of the finest views in the world, stretching from the Alps to the Auvergne Mountains. The park of the Fête d'Or, on the left bank of the Rhone, is an area about three times that of the Champ de Mars of Paris, and includes botanical and zoological gardens, a gallery of natural history, an extensive nursery, &c. L. has numerous schools, scientific and literary societies, rich museums and art collections, a town library of 150,000 vols. and 2400 MSS., and a library attached to the Palais de Beaux-Arts of 160,000 vols. The great industry is the silk manufacture, which in and about the city employs some 70,000 looms, and 140,000 hands. The average value of the raw silk imported annually is £16,800,000, and of manufactured silk exported £20,000,000. The making of silk nets, handkerchiefs, and lace employs 800 looms. There are also large iron, copper, and bronze industries, and manufactures of glass, pottery, leather, beer, tobacco, chemicals, liquors, jewellery, hats (450,000 yearly), &c. Pop. (1872) 279,785. The ancient *Lugdunum*, on the hill of Fourvières (*Forum vetus*), was founded in 43 B.C. Augustus made it the capital of *Gallia Lugdunensis*, and it early became a great commercial centre, and was the birthplace of Germanicus, Claudius, Marcus Aurelius, Caracalla, and Geta. During the middle ages it belonged to the bishops of L., and was greatly disturbed by feuds between the Comtes de Forez and its ecclesiastical ruler. But in 1307 it was incorporated with France by Philippe le Bel, and its subsequent prosperity attracted from

Florence, Lyons, and Genoa, in the 15th c. a foreigner who brought with them the art of silk-weaving. In revoking the Edict of Nantes, Louis XIV. inflicted a blow on industrial L. from which it did not fairly recover till the Revolution. It rushed eagerly into the Revolution, demolishing its Bastille, the Château de Pierre-Scise, but turned on seeing the excesses of the movement, and for its backsliding the Convention decreed that 'L. n'existerait plus.' Collot d'Herbois, Couthon, and Fouché with an army of 60,000 men, after a siege nearly destroyed the town, ruthlessly massacring the inhabitants. The later events in its history are the riots of 1830 and the inundations of 1840, 1856, and 1875. See *Les Archives de L.*, by M. L. Niepce (Lyon, 1875).

Lyon, properly **Lion**, **Golfe de**, a bay in the S. of France, which receives the Rhone and Hérault, and the shores of which, in great part lined with lagoons (Fr. *lans*), resemble those of Holland and some parts in the Adriatic. There is no connection between the name of the Gulf and that of the city. Originally the Gulf was known as the *sinus Gallicus*; about the 14th c. it began to be called *sinus Leonis* ('Gulf of the Lion'), probably from the violence of its storms. See *Les Villes Mortes du Golfe de L.*, by Charles Lenthéric (Paris, 1876).

Lyon Court, the Heralds' College of Scotland, consists of three heralds and three pursuivants, presided over and appointed by the Lyon King-at-Arms (q. v.), whilst among its officials are the Lyon Clerk, or keeper of the record; the Lyon Clerk Depute; the Procurator Fiscal; a herald painter; and a messenger-at-arms, or macer. The functions of the court are regulated by Acts 1592 and 1672 of the Scots Parliament, and are similar to those exercised by its English prototype.

Lyon-King-at-Arms, a legal officer of Scotland, taking his title from the armorial bearing of the Scottish kings, the lion rampant. His jurisdiction empowers him to inspect the arms and ensigns armorial of all the noblemen and gentlemen of the kingdom, to distinguish the arms of the younger branches of families, and to give proper arms to deserving persons, and to *matriculate* these. The Court of Session has power to review the decision of the Lyon Court as to the matriculation of arms; but a reduction is incompetent unless at the instance of one claiming the arms in question.

Lyre, one of the most ancient of stringed instruments. Nearly all the Greek music was written for it. See **GREEK MUSIC**.

Lyre-Bird, a remarkable bird found in New South Wales, and belonging to the family *Menuridae*, of the order *Passeres*. The family consists of only one genus (*Menura*), represented by two species. Both in its appearance and in its habit of scraping large holes in the ground, the L.-B. resembles Gallinaceous birds, among which it was at one time classed by some naturalists. It derives its common name from the peculiar shape of the beautiful tail feathers of the male bird, which, when extended, exactly resemble the ancient lyre. It is a fine songster, having a loud and melodious note, and frequently imitates the notes of other birds. *M. superba*, the principal species, is about the size of a pheasant. In the other species, *M. Alberti*, the lyre-shaped feathers are smaller. Both build dome-shaped nests of twigs loosely woven, and are very shy and difficult to approach.

Lyric (Gr. *lyrikos*, from *lyra*, 'a lyre'), the name given by the Greeks to a kind of poetry originally set to the music of the lyre. L. poetry is the expression of the poet's own feelings, and has all the vivid charm of personality. We are invited to share in the love, hate, joy, or grief of a human being like ourselves, and the doors of our heart are insensibly thrown wide. The song, either sacred or secular, is the finest form of the L.

Lys or **Lève**, a river that rises in the department of Pas-de-Calais, flows N.E., forms part of the boundary between Belgium and France, and joins the Scheldt at Ghent, after a course of 100 miles.

Lysander, a famous Spartan general, the son of the Heraclid Aristocleitus by a Helot woman, received the command of the Spartan fleet in 407 B.C., and with the help of Cyrus the Younger defeated the Athenians under Antiochus off Notion. In 408, as vice-admiral, he again defeated them at Ægospotami,

and the year following brought the Peloponnesian War to a close by the capture of Athens. In 398 L. secured the succession to Agesilaus (q. v.), but rewarded only with ingratitude, he is said by the later historians to have plotted the substitution of an elective for an hereditary monarchy, an enterprise cut short by his death in the battle of Haliartus (395).

Lythra'ceæ, a natural order of herbs, shrubs, or small trees, numbering about 300 species, widely dispersed, but chiefly tropical. The type genus *Lythrum* has a representative in Britain, namely, *L. Salicaria*, a handsome plant often met with on river and ditch banks, and other watery places. It is interesting from having trimorphic flowers. From India comes the frequent greenhouse plant *Lagerstræmia Indica*, and Brazil produces the equally beautiful shrubby genus *Diplusodon*. Henna (q. v.) also belongs to this order. The genera *Lagerstræmia* and *Physocalymma* yield useful and ornamental timber. The bruised leaves of *Ammannia vesicatoria* are used in India to produce blisters. As a rule, the plants of the order are astringent.

Lytton, George, Lord, son of Sir Thomas L. of Hagley in Worcestershire, was born in 1709, educated at Eton and Christ Church, Oxford, travelled upon the Continent, and was sent to Parliament, where he became a conspicuous opponent of Sir Robert Walpole, on whose fall he was appointed one of the Lords of the Treasury. In 1756, though densely ignorant as to figures, L. was appointed Chancellor of the Exchequer, and promoted to the peerage in 1757. He died 22d August 1773. L.'s contributions to literature were held in high esteem by his contemporaries. The chief are *Observations on the Conversion of St. Paul* (1747), *Dialogues of the Dead* (1760), and *History of Henry II.* (1764).—**Thomas, second Lord L.**, born in 1744, died 27th November 1779. He was almost equally noted for his talent and immorality. The Letters and Poems ascribed to him are spurious.—**George William, fourth Lord L.**, of Frankley, was born in London, 31st March 1817, educated at Eton, passed to Trinity College, Cambridge, where he was Chancellor's medallist and senior classic in 1838. In 1846 he was Under-Secretary of State for the Colonies, in 1861-63 a member of the Royal Commission appointed to inquire into the management of the Public Schools of England, and was Chairman of the Commission on Endowed Schools, whose reforms were partly arrested by the return of the Tory party to power in 1874. L. committed suicide in a fit of despondency, 19th April 1876. He was an exquisite scholar, a pure philanthropist, a genuine Liberal, and a devoted Churchman. He merits remembrance for his virtues and his accomplishments.

Lytton, Edward George Earle Lytton-Bulwer, Lord, son of General Bulwer, was born May 1805, educated at several private schools, and entered Trinity College, Cambridge, graduating B.A. in 1826, and M.A. in 1835. He was M.P. for St. Ives in 1831, for Lincoln from 1832 to 1841, for Herts from 1852 to 1866, serving as Secretary of State for the Colonies in 1858. He was made a baronet in 1838, assumed the name of L. in accordance with his mother's will, and rose to the peerage in 1866. Under the eyes of men greater in intellect than himself, and in the face of a bitter criticism he provoked by his mannerisms and fopperies, L. gained a reputation achieved in any one department by few, and in so many departments by none of his contemporaries. Whether as essayist, actor, statesman, dramatist, scholar, or novelist, his successes were brilliant. He almost

succeeded in being a poet too. In Parliament his fame as a speaker rose high, and his speech on Lord Derby's Reform Bill of 1859 is still talked of as a masterpiece. His first drama, *The Duchess of La Vallière*, was indeed a failure; but he never knew when he was beaten. *The Lady of Lyons* (1838) and *Money* (1840) are still among the most popular plays on the stage. His learning in some branches of literature might be termed recondite; and his *Athens, its Rise and Fall* (1836), published almost as a challenge to professed scholars, a work none has convicted of shallowness, gives a picture of Greek life more vivid by far than can be found in any other book of the kind. As a mere boy he wrote a Wertherian romance entitled *Falkland*; but the novel that first brought him fame was *Pelham* (1828). His reputation was sustained by *The Disowned* (1828), *Deverell* (1829), *Paul Clifford* (1830), *Eugene Aram* (1832), and *Godolphin* (1833). With a firmer, bolder hand were written *Rienzi*, ringing with the cry of medieval Rome for freedom, *The Last Days of Pompeii*, a marvellous picture of imperial and pagan Rome (both in 1835), *The Last of the Barons* (1843), and *Alfred* (1848). Again his style changed (for the worse) in *Night and Morning* (1841); but when *The Caxtons* appeared in 1845 and *My Novel* in 1853, critics said that his genius had taken a great leap forward. His last novels, *The Parisians* and *Kielty*, *Chillingly*, were written almost on his deathbed. He died 18th January 1873. Those of his works not already mentioned are *O'Neil*, a tale in verse (1827), *The Siamese Twins* (1831), *Pilgrims of the Rhine, England and the English* (1833), *Leila and Calderon* (in one vol., 1835), *Ernest Maltravers* (1837), *Alice* (1838), *Zanoni* (1842), *Eva* (a volume of poems, 1842), *Poems and Ballads of Schiller* (1844), *The New Timon* (1846), *Lucretius* (1847), *King Arthur* (1848), *What will He do with It?* (1858), *A Strange Story* (1862), *Caxtoniana* (1863), *Lost Tales of Milotus* (1866), *Horace's Odes* (translated 1869), *Coming Race* (1871), *Pausanias* (unfinished, 1876), *Richelieu and The Sea Captain*, afterwards called *The Rightful Heir* (1839), *Not so Bad as We Seem* (1851), *Walpole* (1869). L.'s workmanship was at all times careful; but rapidity of execution was gained at the loss of deep inspiration. His stories are invariably fascinating, the earliest and latest excelling in brilliant analysis of contemporary manners, those intermediate (his best) powerfully dealing with historical and social questions, but all lacking the impulse of irrepressible passion. Still, when every abatement demanded by the severest criticism has been made, L. must continue to be regarded as one of the most richly gifted and versatile intellects of his age. His writings may cease to be read; that fate has overtaken greater authors than himself, but his name will always be remembered in the annals of English literature.—**Edward Robert Bulwer-L., Lord L.**, son of the preceding, born November 8, 1831, entered Her Majesty's diplomatic service when scarcely eighteen as private secretary to his uncle, Sir Henry Bulwer, ambassador at Washington. After occupying various positions of trust, he was appointed Secretary of Legation at Constantinople in 1863, and both at Madrid and Paris has acted as *chargé d'affaires*. In 1876 he was gazetted Viceroy of India. Under the pseudonym of 'Owen Meredith,' he published in 1855 *Clytemnestra and Other Poems*, in 1859 *The Wanderer*, in 1860 *Lucile*, in 1871 *Servike Psome* (Servian songs), in 1867 *The Poetical Works of Owen Meredith*, in 1869 *Orval, or the Fool of Time*, and in 1874 *Fables in Song*. *Tannhauser* (1861) was written by L. and Julian Fane, of whom he wrote a *Memoir* in 1871. L. also published in 1874 *Speeches of Edward, Lord L., with Prefatory Memoir by his Son*.

M.

the thirteenth letter of the alphabet, corresponding to the Greek *Mu*, and the Hebrew *Mem*. It is the labial among the liquids, and very uniform in pronunciation, being most nearly allied to B, with which letter it is occasionally confounded. *Camera* becomes 'chamber'; *mors* = death, has the same root as *ambrosia*; *hibernus* is the Latin adjective from *hiems* or *hiemps*. This last example shows also the connection of M with P, which may be further illustrated by the fact that modern Greek uses MP to express the sound of B, this latter letter being in that language pronounced as V. M sometimes interchanges with N; English 'him' is German *ihn* in the objective case, and the accusative termination *um* in Latin is always *on* in Greek. In Latin the final M must have had a peculiarly weak sound, for it is sometimes altogether dropped; in metrical scansion it is elided before a following vowel, and in manuscript writing it is frequently omitted and represented by a line over the word. As a numeral M stands for 1000, being said to represent the initial letter of *mille*, or more probably CIX. As an abbreviation, M.A. = *Magister Artium*; M.D., Doctor of Medicine, or of Music; M.S., manuscript; P.M., *post meridiem*, or after noon.

Maar'mor, or reversely, **Mormaer** (according to Skene) (Gael. *maor*, 'steward,' and *mhor*, 'great'), from the 10th to the 12th c. was the highest title of honour among the Scots, its holders exercising jurisdiction over such extensive districts as Athole, Moray, or Ross, and sometimes waging independent war with the Scottish sovereign, as in the case of Macbeth and Duncan VII. The office was strictly hereditary. With the extension of feudalism the title was gradually superseded by that of Earl (q. v.). The *Maor* was a subordinate authority, holding the same relative position to a M. as a baron to an earl or count. See Skene's *Celtic Scotland*, vol. i.

Maas (Fr. *Meuse*), a tributary of the Rhine, rises in the Plateau de Langres, in the S. of Haute-Marne, flows in a N. direction through the departments of Vosges, Meuse, and the wild, romantic Ardennes, crosses the Belgian frontier after passing Sedan, and receives at Namur its largest tributary, the Sambre, which nearly doubles its volume. It then changes its course to N.E., passes Liège, where it is augmented by the Ourthe, separates Dutch from Belgian Limburg, passes Maas-tricht and Roermond, receiving the Roer, traverses Dutch Limburg, and curving westward, forms the N. boundary of N. Brabant, and joins the Waal (q. v.) opposite Gorkum. Its entire length is 580 miles, of which 460 are navigable.

Maas'tricht (Flem. *Maestricht*; 'the pasture on the Maas'), a strongly fortified town of the Netherlands, and capital of Limburg, on the left bank of the Maas, 16 miles N. by E. of Liège, and 20 N.W. of Aachen by rail, and opposite the town of Wijk, with which it communicates by a stone bridge 500 feet long. Its chief buildings are St. Gervais Church, with five towers; a town-house, containing a public library; the citadel, on the Pietersberg; a synagogue, three hospitals, an atheneum, theatre, music-school, &c. The Pietersberg, a calcareous hill, is honeycombed by a quarry, forming a labyrinth with 20,000 walks. L. has an extensive transit trade, and manufactures of machinery, leather, glass, paper, woollens, pottery, firearms, soap, gin, &c. Pop. (1875) 28,891. L. suffered much in the wars between the United Provinces, Spain, and France. The neighbourhood can be flooded with water.

Mabillon, Jean, a learned French ecclesiastic, was born November 23, 1632, at Saint-Pierremont, entered the Benedictine Abbey of Saint-René (1653), began to edit the works of St. Bernard (1663), the first volume appearing in 1668. In 1681 appeared his *De Re Diplomatica*, which is still regarded as one of the most scholarly contributions to French history. M. travelled through France and Bavaria in 1682, through Italy in 1685, where he made a kind of triumphal progress among scholars. On his return he published the *Museum Italicum*. M. died at Paris, December 27, 1707. He was a man of true piety, and his ideal of historical research was high. His works, both in French and Latin, are extraordinarily voluminous. See Valéry's *Correspondance inédite de Mabillon et de Montfaucon*.

Mac, a common prefix in Gaelic surnames, meaning 'son.' Its etymology is still uncertain, but it is synonymous with the Norman *Fitz* (from Lat. *filius*), the Erse *O'*, and the Welsh *Ab*, contracted to *Ap*, and often incorporated, as in Pryce, originally Ap Rhys.

Macad'am, John Loudon, the inventor of 'macadamised' road-making, was born 21st September 1756, in Ayrshire, where he became in middle life a trustee for roads. He published two pamphlets, *A Practical Essay on the Scientific Repair and Preservation of Public Roads* (1819), and *Remarks on the Present State of Road-Making* (1820; 5th ed., with additions and appendix, 1822), recommending, with other improvements, the use in road-making of small pieces of granite, flint, or hard stone, in layers a few inches deep, which would become solidified by traffic. His views attracted the attention of Government, who appointed him surveyor-general of the roads at Bristol, where he first made a practical and successful trial of his system. He was next appointed surveyor of the metropolitan roads, and received a gift of £10,000 from the State. The honour of knighthood, which he declined for himself, was conferred on his son in 1834. He died at Moffat, Dumfriesshire, 26th November 1836. M. published *Observation of the Management of Trusts for the Care of Turnpike Roads* in 1825.

Maca'o, a Portuguese settlement on the S.E. promontory of the Chinese island of Hiang-shan, at the mouth of the Chukiang, 70 miles S. of Canton. Area 28 sq. miles; pop. (1871) 71,739, of whom about 10,000 are Europeans. The town is the seat of a bishop, has a senate-house, twelve churches, and a college, and is defended by six forts, with a garrison (1875) of 54 officers and 972 privates. The commercial importance of M. has been greatly affected by the foundation (1839) of Hong-kong, and by the suppression (1872-73) of the exportation of Coolies (q. v.), and an attempt to revive its prosperity by declaring it a free port (February 28, 1846) has hitherto proved a failure. In 1875-76 the revenues amounted to £77,619; the expenditure to £70,596. The Portuguese founded a factory at M. in 1563, and in 1586 obtained a grant of the peninsula, which till 1844 remained under the jurisdiction of Goa. In a grotto above the town Camoens composed his *Lusiad*.

Macaroni (Ital. *macare*, 'to bruise' or 'crush'), is a preparation from the hard varieties of wheat grown in tropical or warm countries, and which also are the source of the substance known as semolina. For the preparation of M. the wheat is ground to a fine meal, mixed into a stiff paste with water, and squeezed through openings in an enclosed box or piston. The nature of the apertures determines the name of the product, M. being formed as small tubes or rods of the diameter of a goose quill, while that expressed in fine threads through very small apertures is termed *Vermicelli* (q. v.). The same material is

also rolled out to thin flat cakes from which small rings, lozenges, stars, and innumerable other fancy shapes are stamped out, which are called Italian pastes. Of whatever form made, the material is subsequently dried, either by exposure to the sun or by artificial heat; the sun-dried qualities being the best. It is much used for thickening soups, in the preparation of puddings, and in other forms in cookery. The best qualities of M. and pastes are made at Cagliari in Sardinia, where the industry is extensive and important.

Macaronic Poetry, a hybrid composition consisting in the admixture of Latin words, forms, and construction with some modern vernacular, was invented by Titti-degli-Odassi, of Padua, towards the close of the 15th c. Well-known examples are the *Macaronea* (Tusc. 1521) of Teofilo Folengo, a Benedictine of Mantua; the *Meygra Entreprisa*, &c. (Avignon, 1537), of the Provençal Antoine de la Sable; the German *Floia, Cortum Versicale*, &c. (1593); the *Macaronte* of Molière's *Malade Imaginaire*, and the *Polemio-Middinia*, commonly ascribed to Drummond. See Morgan's *Macaronic Poetry* (New York, 1872).

Macaroon (Fr. *macaron*, 'a kind of pastry') a small sweet biscuit made in England from the meal of almonds, sugar, white of eggs, and grated lemon peel.

Macartney, George, Earl, son of George M. of Auchinleck, Ayrshire, Scotland, was born at Lissanourne, in Ireland, 14th May 1737, and studied at Dublin University. In 1764 he was appointed envoy extraordinary to the Russian court, became secretary to the Viceroy of Ireland on his return, and in 1775 was made Governor of Grenada and Tobago, where he remained till the capture of the islands by the French in 1779, when he was sent to Europe as a prisoner. In 1780 he was made Governor of Madras, and in 1792 was appointed first British ambassador to China. On his return M. was created an earl in the peerage of Great Britain. He died at London, 31st March 1806. His secretary, Staunton, has written a very interesting and instructive account of M.'s embassy. See also Barrow, *Public Life and Writings of the late Earl M.* (2 vols. Lond. 1807).

Macartney Cock, a species of *Phasianide* or pheasants, so named from its having been described in the account of Lord Macartney's embassy to China. It belongs to the genus *Gallus*, its scientific name being the *G. ignitus*. It has also been named the 'Fireback Pheasant,' and an allied species is Vieillot's fireback (*G. Vieillotii*). The back is covered with brilliant red feathers. The head is crested, and the general colour is a very deep violet black with a prominent metallic lustre. The central tail feathers are white, and the tail is divided—the feathers of each side being curved. The male is larger than the female, and attains a length of 2 feet. The M. C. inhabits Sumatra and other islands of the E. Archipelago.

Macassar, or Vlaardingen, the capital of the Dutch possessions in Celebes (q. v.), is situated near the extremity of the south-western peninsula, at the mouth of the Goa, and on the Strait of M. Its harbour has good anchorage, is protected by two forts, and was declared a free port, January 1, 1847. M. carries on a lively trade with Java and Singapore in horses, cottons, and cocoa-nuts, and has valuable trepang fisheries. Estimated pop. 21,000.

Macassar Oil. This product, largely used as a drying oil in Britain, is imported from India and other Eastern countries, and is believed to be principally obtained from the seeds of the safflower plant, *Carthamus tinctorius*. When first expressed, M. O. is white and thick like butter, but when refined it becomes liquid and transparent, in which condition it is used for culinary purposes, and for burning in India. It derives its name from the Dutch capital of Celebes, whence it was originally imported.

Macaulay, Thomas Babington, Lord, a great English historian, son of Zachary M., was born 25th October 1800, at Rothley Temple, Leicestershire. He was educated at a small school in Clapham, and under the private tuition of a clergyman. In his nineteenth year he went to Trinity College, Cambridge, became a great debater at the Union, twice took the Chancellor's Medal for English verse, gained (1821) the Craven Scholarship, graduated B.A. (1822), and was elected Fellow (1824). Before this M. had entered the arena of literature as a contributor to *Knight's Quarterly Magazine*. At the Freemason's Hall, London (1824), he made his debut as a public speaker upon the

question of abolition, began to contribute to the *Edinburgh Review* (August 1825), was called to the bar (1826), appointed to a Commissionership in Bankruptcy (1827), and, through the influence of Lord Lansdowne, was returned for Calne (1830) to the House of Commons. During the next two years his reputation was greatly extended by speeches delivered in the course of the debates upon Reform, which he supported from the Whig point of view. In 1832 M. was returned for Leeds, and spoke against the repeal of the Irish union, in behalf of a bill for removing the civil disabilities of the Jews, and another for depriving the East India Company of their exclusive trade with China. He was at the same time appointed Secretary to the Board of Control, and (in 1834) president of a new law commission for India, and member of the Supreme Council of Calcutta, where he remained till 1838. In 1839 M. was returned to Parliament for Edinburgh, was appointed Secretary of War (1840), re-elected for Edinburgh (1841), became Paymaster-General (1846), with a seat in the Cabinet, during all this period voting with his party and speaking in favour of various liberal measures. At the general election of 1847 M. lost his seat, owing to his advocacy of the Maynooth grant, and though the electors of Edinburgh retrieved their anti-Popish narrowness in 1852 by returning him unsolicited and with his expenses paid, his political career really ended at the former date. In 1849 he became Lord Rector of the University of Glasgow and Fellow of the Royal Society, in 1857 a foreign member of the French Academy, High Steward of Cambridge and Baron of Rothley. Meanwhile his progress in literature had been one of unsurpassed brilliancy. Besides his essays appearing at intervals in the *Edinburgh*, he published his *Lays of Ancient Rome* (1842), which contain vigorous and dashing verses. Two volumes of the *History of England from the Accession of James II.* came out in 1849, and other two in 1855. On both occasions the excitement which followed their publication was unprecedented. Now that the great controversies between Whig and Tory are laid to rest by the universal acceptance of the principles which the former persistently upheld, it becomes possible to do justice to the most brilliant and learned politician the Whig cause ever possessed. M. had a great historical faculty. He could appreciate characters, motives, movements, and issues. He was filled with a noble enthusiasm for rational liberty and orderly progress, and with an equally noble hatred of despotism and injustice. He recognized that a nation's history is the record of its manifold life, and he poured over his pages the exhaustless wealth of his knowledge, literary, social, religious, and political, till his readers are almost lost in the maze of vivid details. It was impossible that history written with such minuteness could be invariably correct. Errors were discovered and triumphantly exhibited by his political opponents, but when all abatements have been made, his work remains one of the great treasures of English literature, alike for the knowledge it displays, the spirit that animates it, the richness and felicity of its language, and the strength, animation, and brilliant simplicity of its style. During the last six years of his life M. contributed a number of lives to the *Encyclopædia Britannica*. He died at Holly Lodge, Kensington, on the 28th of December 1859. A complete edition of M.'s writings in 8 vols. was published by his sister, Lady Trevelyan, in 1866. See *The Life and Letters of Lord Macaulay*, by his nephew, G. O. Trevelyan, M.P. (2 vols. 2d ed. 1877).

Macaw (*Macrocercus*), the name applied to various *Scansorial* birds nearly related to the parrots, and included in the latter family (*Psittacidae*). A special sub-family (*Araine*) has been constructed for the reception of the M., the members of this group having bare cheeks and very long tail-feathers. The M. inhabits tropical America. Its plumage is brilliant. The bill is large and powerful, and serves to crack nuts and other fruits upon which it subsists. The M. may be domesticated, but never shows a docility equal to the parrot, while its voice is very harsh. The best-known species are the *M. macao*, the Scarlet M., and the Blue and Yellow M. (*M. Ararauna*). The former inhabits the W. India Islands, and attains a length of 3 feet. The latter, a native of tropical America, is more commonly brought to this country. The green M. (*M. severus*) is found in Guiana and Brazil, and commits great havoc in coffee-plantations.

Macaw Tree is applied to several species of *Acracmia*, a genus of palms allied to the coco palm, the name being taken from the elegant tufts of leaves at the summit of the stems. One

species, *A. seleroarpa*, is wide-spread in S. America, its trunk rises to 20 or 30 feet in height, and its leaves, which in the young state are eaten as a vegetable, when mature extend to 10 or 15 feet. The 'great' M. T. is *A. lasiopatha*, and *Solanum mammosum* has obtained the name of '*M. bush*.'

Macbeth or **Macbethad** (Gael. 'son of life'), a Scottish king, whose true history is almost lost in myth. He was husband of Gruach, a grand-daughter of Kenneth IV., and Maarmor of Myrhevi or Moray. At this time Orkney, Sutherland, and Caithness were in the hands of the Norse Earl Thorfinn. The *Orkneyinga Saga* gives a clear picture of the struggle between this Earl and King Duncan. Mr. Skene is of opinion that after Duncan had sustained a crushing defeat, M., instead of hastening to his help, treacherously joined his forces to those of Thorfinn, slew his master—according to the later chronicles—at Bothgowan ('smith's hut'), near Elgin, in 1039, and assuming his sceptre, wielded it with good repute, being the first Scottish ruler who opened communications with Rome, whither he is said to have gone on pilgrimage in 1050, and the first to make grants of lands to the Church. But Malcolm MacDuncan, aided by Siward, the Danish Earl of Northumberland, and by Macduff, Maarmor of Fife, defeated him at Dunsinane in 1054, and slew him at Lumphanan, in Aberdeenshire, December 5, 1056. Shakespeare borrowed his account of M. from Raphael Holinshed, and he again from Hector Boece. See Hill Burton's *History of Scotland*, vol. i. p. 369, and Skene's *Celtic Scotland*, vol. i. pp. 402-6.

Maccabees is a name given to a family of Jewish princes, otherwise and properly called the Asmonean dynasty, the history of which dates from the time of the persecution of the Jews under Antiochus Epiphanes (B.C. 167). When the officers of Antiochus were everywhere setting up heathen altars, at Modin, Mattathias, a priest, slew the first renegade Jew who advanced to take part in the worship, and led a band—including his own five sons, John, Simon, Judas, Eleazar, and Jonathan—who slew the Syrians present, and then retired to the desert, where they were soon surrounded by a small army. They threw down the heathen altars, and established the old worship, being generally victorious in their encounters with the Syrians. On the death of Mattathias (B.C. 166) the command of the insurgents was assumed by his third son Judas, from whose name, Makkabi ('hammer'), the whole family derived their name. With vastly inferior numbers he defeated the Syrian armies one after another, and at last recaptured Jerusalem. His first act was to purify the temple, and dedicate it anew to the service of Jehovah (B.C. 163), in commemoration of which act a festival was ever afterwards observed by the Jews. When Judas at last fell in battle (B.C. 160) he was succeeded by his brother Jonathan, who played an important part in the contests for the Syrian throne, and was made high-priest by one of the claimants. Jonathan being put to death (B.C. 143) he was succeeded by his brother Simon as high-priest and prince, under whom the country enjoyed a time of comparative quiet and prosperity in alliance with the Romans. In B.C. 135, however, he was murdered along with two of his sons, by his son-in-law, Ptolemy, and was succeeded by his son, John Hyrcanus I., who died B.C. 106, and was succeeded by his eldest son Aristobulus (B.C. 106-105), who assumed the title of royalty. The other M. were Alexander Jannæus (B.C. 105-78), Alexandra (B.C. 78-69), Aristobulus II. (B.C. 69-46), Hyrcanus II. (B.C. 46-30), Mariamne, the wife of Herod, and her brother Aristobulus, who was made high-priest, but afterwards put to death by Herod. See Ewald's *Geschichte d. Volk. Israel* (Eng. trans. 1869), and Stanley's *Jewish Church* (2d ed. 1877).

Maccabees, Books of, is the title of certain Jewish histories containing chiefly an account of the exploits of the Jews in their war of independence under the Maccabees (q. v.). There were in all four books, and according to some a fifth; of which three are still read in the Eastern Church, and two in the Western, although in the Reformed Churches they are placed among the Apocrypha (q. v.). The *First B. of M.*, which is the second in order of time, contains a history of the war begun by Antiochus Epiphanes against the Jews from B.C. 175 to the death of Simon Maccabee, B.C. 135. The original was probably written in Hebrew, but is now lost. The *Second B. of M.* begins its history a few years earlier than the first, and closes with the victory of Judas Maccabee over Nicanor (B.C. 161). It

is an abridgment of an older work by Jason, a Jew of Cyrene, giving the history of the Jews under Seleucus IV., Antiochus Epiphanes and Antiochus Eupator. The *Third B. of M.*, which is still read in the Eastern Church, professes to give an account of the persecution of the Egyptian Jews by Ptolemy Philopater, and of their deliverance by Divine interposition. As it thus contains the history of a time anterior to that of the Maccabees, it seems to have got its name from the resemblance of the actions it records to those in the B. of M. proper. The *Fourth B. of M.*, also called *On the Supreme Sovereignty of Reason*, and which in early times was ascribed to Josephus, contains a fuller history of the martyrdom of Eleazar, of the seven brothers, and of their mother, which forms the subject of 2 Macc. vi. vii. The *Fifth B. of M.*, which is now extant only in the Arabic and Syriac, begins with the attempt on the treasury at Jerusalem by Heliodorus, and ends with the murder by Herod of his wife Mariamne and his two sons.

M'Carthy, Justin, novelist and journalist, was born in Cork, November 22, 1830. He was on the staff of the *Cork Examiner* from 1846 to 1853, when he joined that of the *Northern Times*, Liverpool. In 1860 he became parliamentary reporter for the *Morning Star*, in 1861 foreign editor of the paper, and chief editor, 1864-68. During 1868-71 M. made a complete tour of the United States. For several years past he has been one of the chief political writers in the *Daily News*, a position he still (1877) holds. But though a vigorous and accomplished contributor to political literature, M. has won a wider fame in fiction. His novels are—*Paul Marston* (1866); *The Waterdale Neighbours* (1867); *My Enemy's Daughter* (1869); *Lady Judith* (1871); *A Pair Saxon* (1873); *Linley Rochford* (1874); *Dear Lady Disdain* (1875); and *Miss Misanthrope*, now (1877) appearing in the *Gentleman's Magazine*. These works are skilfully constructed, abound in incident, and are written in exquisitely beautiful English. Everywhere we can notice the play of a keen, incisive, and graceful intellect, of warm, tender sensibilities, and of a singularly pure and healthy spirit. M. has also written essays and papers on many subjects; *Con Amore* (a collection of essays, 1868); *Critical Notice of George Sand* (1870); *Prohibitory Legislation in the United States* (1872); *Modern Leaders* (biographical sketches, New York, 1872), &c. As a lecturer M. has few equals. The easy yet ornate elegance of his unwritten composition exerts a peculiar and unwonted charm.

M'Clellan, George Brinton, an U.S. general, born at Philadelphia, December 3, 1826, graduated at Pennsylvania University (1842), and at West Point (1846), served with distinction through the Mexican campaign (1846-48), and in 1855 visited the seat of the Crimean War, issuing on his return his *Organisation of European Armies*. In 1857 he quitted the army to assume the vice-presidency of the Illinois Railway, which he exchanged in 1860 for the presidency of the St. Louis Line. On the outbreak of the Civil War M. received the command of the Federal troops in Western Virginia (June 21, 1861), when he defeated the Confederates at Rich Mountain (July 11), and (August 20) of the Army of the Potomac. General-in-chief from November to March 11, 1862, he besieged Yorktown, but was forced by the disastrous 'Peninsular Campaign' to retreat to the James (July 4, 5); and appointed to the command of Washington (September 5), he followed Lee into Maryland, fought the indecisive actions of South Mountain (September 14), and Antietam (September 17), and in the November following was relieved of his command. In September 1864 he failed as Democratic candidate for the presidency, and having resigned his commission (November 4), made a tour in Europe (1865-68). On his return he was engaged in various engineering works, and in 1870 became superintendent of the New York docks, which office he resigned in 1872. M. is the author of numerous military and engineering text-books.

Macclesfield, a manufacturing town of Cheshire, England, on the river Bollin, 165 miles N.W. of London by rail. It has seven churches (the finest, St. Michael's, founded in 1278), and an endowed grammar school, founded in 1502, and rebuilt in 1866. M. is the chief centre in England of the silk manufacture. Dyeing and brewing are carried on, also the manufacture of machinery, pottery, and small wares. M. has three banks and two weekly newspapers, and returns two members to Parliament. Pop. (1871) 35,570.

M'Okintock, Sir Francis Leopold, an Arctic navigator born at Dundalk in 1819, entered the navy (1831), served in the Franklin Discovery Expeditions of Ross (1848), Austin (1850), and Belcher (1852), and became post-captain (1854). In 1857, as commander of the *Fox*, fitted out by Lady Franklin (q. v.), M. discovered the fate of Sir John and his crews, and on his return to England (1859) he was knighted, presented with the freedom of the city of London, and made I.L.D. of Cambridge and Dublin, and D.C.L. of Oxford. In 1871 he became rear-admiral, and in 1872 Superintendent of Portsmouth Dockyard. He is author of *The Voyage of the Fox in the Arctic Seas* (Lond. 1860; 3d ed. 1869).

M'Clure, Sir Robert John le Mesurier, the discoverer of the N.W. Passage, was born at Wexford, Ireland, January 28, 1807. Educated at Eton and Sandhurst, he entered the Navy, served in the Arctic Expedition of 1836, on the Canadian lakes, and on the American and W. Indian coasts till 1846, gradually rose to the rank of first-lieutenant (1838), joined Sir James Ross in the search for Franklin (1848), and on his return was made commander. In 1850 he was nominated to the *Investigator*, and again dispatched in search of Franklin. The expedition, entering Behring Strait, reached 117° 10' W. long, and 73° 10' N. lat., 30 miles from Melville Strait (16th September 1851), but was there fixed in the ice. A sledge party sighted the N.W. Passage on the 22d October. After a vain attempt to press forward, the *Investigator* sailed round the S. end of Banks' Land for 30 miles, and was again checked by ice. In an inlet which they called Mercy Bay, the party were imprisoned till April 1854, when they were relieved by Captain Kellett, who conveyed them to England. M. was made post-captain, and received a knighthood, while the officers and crew were rewarded by a grant of £10,000. Subsequently M. served in the E. Indies and China, and died at Portsmouth, October 18, 1873.

M'Crie, Thomas, D.D., a Scottish ecclesiastic and historian, was born at Dunse, November 1772, studied at the University of Edinburgh, was licensed by the presbytery of Kelso, and took charge of an Anti-burgher congregation in 1795. In 1812 he published a *Life of John Knox*, which remains unexcelled as a learned and sympathetic account of the Scotch reformer. The *Life of Andrew Melville* appeared in 1819, and bears the mark of patient scholarship, though, like his other writings, it is deficient in judicial balance when the question of Presbyterianism is concerned. Hallam condemns its 'Presbyterian Hildebrandism.' He died in Edinburgh, 5th August 1835, bearing a personal reputation for sincere piety and noble simplicity of character. See *Life of the Rev. Thomas M'Crie, D.D.*, by his son (Edinb. 1840).

Macculloch, Horatio, a Scottish landscape painter, was born at Glasgow in 1806. His first important work, 'A View on the Clyde,' appeared in 1829. In 1839 M. was elected an R.S.A., when he removed to Edinburgh, where he died, 24th June 1867. M. had a prolific pencil, and sent from his studio too much work. But his Highland scenes are strikingly vivid and faithful, and will long preserve his name in the northern part of the island. Among his more notable pictures are 'Loch-an-Eilan,' 'View in Cadzow Forest,' 'Misty Corries,' 'Deer Forest, Isle of Skye,' 'Mist Rising off the Mountains,' 'Kilchurn Castle,' 'Bothwell Castle,' and 'Inverloch Castle.'

Macculloch, John, M.D., a geologist and physician, was born in Guernsey, October 6, 1773. He graduated at Edinburgh, began practice at Blackheath, but in 1811 was employed by the Government to undertake various scientific surveys in Scotland. Latterly he was Professor of Chemistry and Geology in Addiscombe Military School, connected with the East India Company. He died at Penzance, Cornwall, August 21, 1835. M.'s chief works are *A Description of the Western Islands of Scotland, including the Isle of Man* (1819), *A Geological Classification of Rocks* (1821), *The Highlands and Western Isles of Scotland* (1824), *System of Geology and Theory of the Earth* (1831), and *Proofs and Illustrations of the Attributes of God* (1837), besides two medical works on *Malaria* (1827), and on *Remittent and Intermittent Diseases* (2 vols. 1829).

M'Call, John Ramsay, was born at Isle of Whithorn, Wigtonshire, 1st March 1789, and became (1817) a contributor to the *Scotsman*, which he edited for about two years. In 1818 he started a connection with the *Edinburgh Review*, to which he

contributed an unbroken series of articles, principally dealing with questions of political economy. In 1828 he was appointed Professor of Political Economy in University College, London, and in 1838 Controller of the Stationery Office. M. was a voluminous writer; but his style was clear and firm; and his thinking remarkable for practical good sense and general liberality. His *Dictionaries of Commerce and Geography* passed through several editions, and were translated into more than one foreign language. His editions of Smith and Ricardo are of high value, but the most popular of his works is *Principles of Political Economy* (1849). M. died 11th November 1864.

Macdonald, Étienne Jacques Joseph Alexandre, a French marshal, of Scotch descent, was born at Sedan, 17th November 1765, entered the army in his nineteenth year, served as sub-lieutenant under Maillebois, and in 1795 had risen to be general of brigade. For nine years he distinguished himself in the field, overcoming the Austrians at Modena (1799), and driving them from Switzerland and the Tyrol (1801), but his friendship for Moreau lost him the Emperor's favour. He lived in retirement for five years, and in 1809 was summoned to a command under Eugène Beauharnais, where he distinguished himself by executing the passage of Isonzo, compelling Laibach to capitulate, and capturing cannons and stores. At Wagram Napoleon was reconciled to him, and conferred upon him the title Duc de Tarente. In Spain, Russia, and Prussia, he led armies with success, and at the Bourbon return to power he took office under the monarchy, being confirmed in his peerage. From 1815 he acted as one of four majors-general of the royal guard near the person of the king. He died 7th September 1840, at Courcelles. See Jomini's *Précis des Opérations Militaires*.

MacDonald, George, novelist and poet, was born in Iluntly, Aberdeenshire, in 1825. He was educated at the University of Aberdeen, after which he studied at Highbury College, London, for the Independent ministry. For a short time he was a preacher in that body, but retired from the pulpit to devote himself to literature. He has frequently lectured in different parts of the United Kingdom, on Shakesperian and other subjects, and in 1872-73 made a lecturing tour in America. His works include *Within and Without*, a dramatic poem (1855); *Poems* (1857); *Phantasies* (1858); *David Elginbrod* (1863); *Alec Forbes* (1865); *Annals of a Quiet Neighbourhood* (1866); *Guild Court* (1867); *Robert Falconer* (1868); *Wilfrid Cumbermede* (1871); *Malcolm* (1874); *St. George and St. Michael* (1876); *Thomas Wingfold, Curate* (1876); and *The Marquis of Lossie* (1877). He has written some graceful fairy romances for the young, such as *At the Back of the North Wind* (1870); *The Princess Goblin* (1871); *The Wise Woman* (1876). M. is thoroughly at home in his portrayal of life and manners in the N.-E. of Scotland; infuses a poetry into his treatment of common things, and shows much insight into the development of thought and character. A vein of religious speculation and theological controversy runs more or less through all his novels. His feeling is earnest, his faith is broad and loyal, his creed a tolerant and hopeful Christianity. Among his purely religious writings are *Unspoken Sermons* (1866); *The Miracles of our Lord* (1870); and *Exotics* (translations from German and Italian hymns, 1876).

Macdonald, Sir John Alexander, a Canadian statesman, was born in Sutherlandshire, Scotland, in 1815, educated at the University of Aberdeen, and removed to Kingston, Canada, in 1820. He was called to the bar in 1835, elected to the Canadian Parliament in 1844, and held the posts of Receiver-General, Member of the Executive Council, and Commissioner of Crown Lands (1847-50). Twice Attorney-General for Canada (1854-62, and 1862-64), he was made Minister of Militia in 1865, Minister of Justice in 1868, and Premier in 1869, retaining office till November 5, 1873. The leader of the Conservatives, he was chairman of the commission in London that arranged the terms of confederation, 1866. At present (1877) he is leader of the Opposition in the Dominion House of Representatives.

Maoc, in medieval times, was a weapon of offence in the form of a short wooden staff headed with a heavy spiked ball of iron. Now it is a staff of office or authority in Parliament, law courts, universities, and with other high corporate bodies endowed in any way with judicial functions.

Mace consists of the arillode or false aril which surrounds the shell of the *Nutmeg* (q. v.). When fresh it is a brilliant scarlet colour, but on drying it becomes yellow, of which colour, and as thick, flat, somewhat heavy blades it is found in commerce. M. has the odour characteristic of nutmegs, and is used in cookery and medicine in the same manner. A false M. from species of *Myristica*, other than the true nutmeg, and possessed of a strong coarse flavour, is sometimes sent into the market.

Macedo'nia, anciently denoted a region N. of Thessaly, and varying in extent and character. At first it was a purely inland country, nowhere touching on the sea, but its limits were gradually enlarged until, in the reign of Philip, it reached as far N. as Mount Hæmus (the Balkans), and included a seaboard that stretched from the Propontis to the coast of Thessaly. M. is mainly mountainous, but contains three wide alluvial valleys, watered by the Axios, the Erigon, and the Haliacmon. The inhabitants were not originally regarded as true members of the Hellenic family, but at any rate in course of time they became thoroughly Hellenised, and if they did not add much to the common civilisation of Hellas, the conquests of Alexander carried it over half a world, and gave it an influence that is still felt in the East. Even at an early period they were far from barbarous. A Macedonian coin displaying superior art exists, bearing date 500 B.C., and we read of a king Alexander (the 'Philhellene') who was an admirer of the poetry of Pindar. Personal valour, and a frank, military spirit, were the characteristics of the people. The history of M. falls into three periods: (1) From the legendary past, reflected in Herodotus and the older poets, down to the Persian War, B.C. 490. (2) From the Persian War to the death of Alexander, B.C. 323. (3) From the death of Alexander to the Roman Conquest, 168 B.C. Its later history is merged in that of Rome. After the time of Constantine it was overrun by Slavic hordes, who gradually settled in its wasted plains. During the 9th and 11th centuries Asiatic colonists, both Persian and Turkish, were introduced by the Byzantine emperors, and it may now be safely affirmed that the old Macedonian race is practically extinct. See Cousinéry, *Voyage dans la Macédoine* (2 vols. Par. 1831); Leake, *Travels in North Greece* (4 vols. Lond. 1835); Ami Boué, *La Turquie d'Europe* (4 vols. Par. 1832).

Maceratu, a town of Italy, province of M., finely situated among vineyards and gardens, 23 miles S. of Ancona and 107 N.W. of Rome. It has a modern cathedral and six other churches, a fine Palazzo Comunale of the 13th c., and a university founded in 1824. Three miles S. are the ruins of the Roman Colonia Helena Rima. Pop. (1874) 19,832.

Macfarren, George Alexander, a distinguished English composer, was born at London, March 2, 1813. Taught by Charles Lucas (1827), and at the Royal Academy of Music by Cipriani Potter (1829), he became Professor of Harmony and Composition at the R. A. M. in 1834. He succeeded Sir W. S. Bennett as *Principal* of the R. A. M. in March 1875, and in April 1876 was made Professor of Music in the University of Cambridge, and also 'Doctor of Music' (Cantab.). Among the best of his numerous works (of the great merit of which there can be no doubt) are the operas *Don Quixote* (1846), *Charles II.* (1849), and *Robin Hood* (1860); his orchestral symphonies and overtures; the cantatas, *Lenore* (1851), *May-day* (1856), and *Christmas* (1860); and more recently the oratorios *Sir John the Baptist*, the *Resurrection*, and *Joseph* (September 1877). M.'s theory of music is contained in his *Rudiments of Harmony* (Lond. 1840), and *Six Lectures on Harmony* (1867).

Macgill'ycuddy Reeks, a group of schist mountains in the S.W. of Ireland, county of Kerry, W. of the Lakes of Killarney, 28 sq. miles in extent. Carran-tual (3404 feet) is the highest summit in Ireland.

M'Gee, Thomas D'Arcy, a Canadian politician, was born at Carlingford, Ireland, 13th April 1825, went to Boston in 1842, where he became editor of the *Pilot*, returned to promote the 'Young Ireland' movement of 1848, escaped to New York, America, where he was editor of the *Nation*, 1848-50, and later of the *American Celt*. Displeased with the 'Know-Nothing' movement (1854-56) he removed to Montreal, Canada, advocated ardent royalism in the *New Era*, entered the Canadian Parliament in 1857, and was made President of the Executive Council in 1864, and Minister of Agriculture in 1867. He denounced

the Fenian Society, and was assassinated by one of the body at Ottawa, 7th April 1868. M.'s chief works are *O'Connell and his Friends* (1845); *Irish Writers of the 17th Century* (1846); *Irish Settlers in N. America* (1852); *Canadian Ballads* (1858); *Popular History of Ireland* (2 vols. 1863); and *Speeches* (1865).

Macchiavelli, Nicolo, was born of a noble family at Florence, May 3, 1469. He developed his brilliant talents under the sway of Lorenzo the Magnificent, and after the death of that prince the 'Ten of Liberty and Peace' appointed him Secretary of the Florentine Republic, intrusting him during his term of office with no less than twenty-three embassies to foreign countries. He became the moving spirit of the republic, nerving its incapable chiefs to action, reorganising the whole of the Italian military system, and staving, at length almost single-handed, against the establishment of the Medici family by emperor and pope. But to these the gates of Florence once more opened (1512); the Signory fell, and with it the secretary. Despoiled of rank and office, he was subjected to repeated insult by the new government, and even imprisoned (1513) and tortured on a charge of conspiracy against Cardinal de' Medici, afterwards Leo X. During this period of disgrace were written his most famous works. Leo at length (1519) recalled him, intrusted him with the formation of a new administration and the fortification of the city, sent him on a mission to Carpi in 1521, and finally employed him in the army of the league against Karl V. He died at Florence, 22d June 1527. Pointed to by consent of contemporaries as the profoundest thinker and ablest diplomatist of his time, M. yet enjoys no very enviable reputation among moderns. 'Out of his surname,' says Macaulay (with more epigrammatic point, however, than philological accuracy), 'they coined an epithet for a knave, and out of his Christian name a synonym for the devil.' His views of history were far in advance of the age, as can be seen in the *Discorsi sopra la Prima decia di T. Livio*, his *Vita di Castruccio Castracani* (Prince of Lucca), his *Legazioni* (terse, witty diplomatic dispatches, full of brilliant pictures of contemporary events), and *Delle Historie Fiorentine* (brought down to the death of young Lorenzo de' Medici). His *Dell'Arte della Guerra* shows complete mastery of military systems. He wrote six comedies, one of which, *Mandragola*, Voltaire pronounces better than the best of Goldoni; and his *Belfegor* still holds place as a daintily humorous novel. Even as a poet he obtained some fame with the *Decennali*, *Assino d'Oro*, and *Capitoli*. But his fame or rather his notoriety rests on the treatise on government entitled *Il Principe*. Modern criticism has been unable to find for this work praise or blame strong enough. Chivalry, inhumanity, and utter villany, the noblest generosity, simplicity, and craft, romance and meanness, are alike distinctive of the sentiments expressed in it. But its immorality must be charged to the times. In its own day no city was raised against it. However despicable and dangerous are some parts of a book he probably wrote for bread, M. preserved all the virtues of a faithful citizen. The best edition of his works is in 10 volumes (Flor. 1818, new issue by P. Fanfani, 1873); a French translation of the entire works by Perriès appeared in 12 vols. (Par. 1823-26). See Macaulay's Essay; *Macchiavel, Son Génie et ses Erreurs*, by Artaud de Montor (Par. 1833); and more especially Francesco Nitti's *M. nella Vita, e nelle Dottrine* (1876), and Pasquale Villari's *N. M. e i Suoi Tempi*, both based on newly discovered documents (Flor. 1st vol. 1877).

Machines are combinations of elements, which by their relative and determinate motions are capable of applying energy to the performance of useful work. Until lately, especially in this country, each machine was studied by itself. The mechanism was first described, and the principles of its action then investigated, but little effort was made to attack the subject in a general way, and form a compact science of it. The French went to the other extreme, and regarded M. as merely illustrating particular theorems in theoretical mechanics. Quite recently the general solution of the machine problem has been attempted in two distinct ways by Professor Reuleaux of Berlin, and Professor Fleeming Jenkin of Edinburgh. The former considers M. kinematically, defining a mechanism as a closed kinematic chain, composed of elements which enter in pairs, such as a screw and its nut, a shaft and its bearing, &c. The latter, with the design of following up Rankine's investigations into the efficiency of a machine, and of applying graphic methods for its determination, conceives a machine as made up of elements

and joints, which are simply the surfaces of separation between the elements. The elements are the continuous parts of M., and may be solid or fluid. The steam in the cylinder and boiler of a steam-engine is as much an element as the piston-rod which it drives. The energy which drives the machine is developed in one element, or between two elements, and similarly the resistance which is overcome while the machine is doing useful work is exerted by one element, or between two elements. When one element of a machine is fixed, the earth simply becomes a part of that element, and in the analysis of a machine the size and material of an element is of no consequence. What is really essential is the knowledge of the magnitude and direction of the pressure at the various joints. Such is a brief outline of the principles upon which Jenkin bases his dynamic analysis of machinery, for the development of which reference must be made to his paper in the *Transactions of the Royal Society of Edinburgh* (April 1877). The particular forms of M., such as lever, wheel and axle, steam-engine, wedge, &c., are considered under their special headings. The most important works upon the theory of machinery are Willis' *On Mechanism*, Poncelet's *Mécanique Industrielle*, Morin's *Notions Fondamentales de Mécanique*, Moseley's *Mechanics of Engineering and Architecture*, Rankine's *Applied Mechanics, Prime Movers, and Millwork*, and Reuleaux's *Theoretische Kinematik* (English trans. by Professor Kennedy, Lond. 1876).

Mackay, Charles, LL.D., journalist and poet, was born in Perth in 1812, and educated in London and Belgium. In 1834 he published a volume of *Songs and Poems*. He was engaged on the *Morning Chronicle* from 1835 till 1844, when he became editor of the *Glasgow Argus*, a position he held for three years. M. was one of the original staff of the *Daily News*, to which he contributed in 1846 *Voices from the Crowd*, a series of poems which ran through several editions. For some years he was principal leader writer for the *Illustrated London News*. Among his chief works are *Memoirs of Popular Delusions* (1841); *Voices from the Mountains* (1847); *Town Lyrics* (1848); *Egeria* (1850); *The Lump of Gold* (1855); *A Man's Heart* (1860); *Studies from the Antique*, and *Sketches from Nature* (1864); *Under the Blue Sky* (1871); and *Lost Beauties of the English Language* (1874). He has compiled several excellent collections of songs and poems. In 1876 he published an interesting autobiography, *Forty Years' Recollection of Life, &c.*

Mackenzie, one of the largest rivers in the world, entirely within the Dominion of Canada, rises in Great Slave Lake, and flows in a direction N.N.W. to the Arctic Ocean. In the open season (June to October) it is navigable to Fort Simpson, where there are rapids, above which it is further navigable to Great Slave Lake. Its three great head-streams are the Peace, Athabasca, and English rivers; its extreme length is 2300 miles. Part of the upper basin is very fertile, and lignite beds occur here and there along the banks. The M. is named after Alexander Mackenzie, who first navigated it in 1789.

Mackenzie, Sir George, nephew of the Earl of Seaforth, was born at Dundee in 1636, and studied at Aberdeen, St. Andrews, and Bourges in France, then 'the Athens of Scottish lawyers.' In 1661 he defended the Marquis of Argyll against high-treason, and in the same year was appointed Justice-depute. In 1669, being then knighted, he was returned to Parliament for Ross-shire, and became king's advocate in 1677. Though he wrote *A Vindication of the Government of Charles II.*, he was not able to wipe out the epithet, 'bluidy Mackenzie,' which he earned by his inexorable attitude towards the Covenanters. M. wrote what Mr. Hill Burton calls 'some unpoetic' poetry, and certain *Essays* (Lond. 1713), of which the very titles convey a premonition of the jejune and didactic, as *Solitude preferred to Public Employment*; *On Moral Gallantry*, &c., yet his literary power was probably greater than might be inferred from these efforts, if Dryden's phrase, 'that noble wit of Scotland,' be more than idle panegyric. His *Discourse on the Laws and Customs of Scotland in Matters Criminal* appeared in 1678, his *Institutions of the Laws of Scotland* in 1684, and his *Complete Works* (Edinb. 2 vols. fol. 1716). He died in London, 2d May 1691. See *Memoirs of Sir G. M.*

Mackenzie, Henry, novelist and essayist, was born in Edinburgh in 1745. He was educated for the law, and became an attorney in the Scottish Court of Exchequer. He published

the *Man of Feeling* (1771); *The Man of the World* (1773); and *Julia de Roubigne* (1777). Of these novels, which are written in the sentimental style of the 18th c., the first is his best. They display keen sensibility, high moral feeling, delicate appreciation of character, and a refined and graceful style. But unfortunately they are no longer read. M. started two periodicals, *The Mirror* (1779) and *The Lounger* (1785), to which he contributed ninety-nine articles, including the touching *Story of La Roche*. He received the comptrollership of taxes for Scotland from Mr. Pitt for literary services to the Tory party. M. died 14th January 1831. His collected works were published in 8 vols. (1808). A French translation by F. Bonnet appeared in Paris (5 vols. 1825). See Sir W. Scott's *Eminent Novelists*.

Mack'erel (*Scomber*) a genus of Teleostean fishes, included in the family *Scomberidae*, in the members of which spiny rays exist in the first dorsal fin, and in the front of the remaining fins. The body of the common M. (*S. scomber*) is long, and tapers markedly at either extremity. The mouth and upper jaw are prominent. The colour is a bluish-black, marked with a green metallic lustre, the black tint being most prominent in the form of transverse bands above, whilst the under parts are of silvery whiteness. The hinder of the two dorsal fins is split up into a series of small fins extending along the back, and the anal fin is similarly divided. The M. is a migratory fish, and appears in vast shoals during May and June on the English coasts; on the west coast of Scotland it is most plentiful in July and August. It also occurs on the N. American coast, and in the Mediterranean Sea. The M. is captured in long 'drift' nets, which are sunk at night and fished in the morning. When caught by line, any brightly-coloured substance, such as a bit of red flannel, serves as a bait, though the usual bait is a thin strip of the skin of the M. itself. The M. entangles itself in the nets by thrusting its head through the meshes, and is caught by its prominent gill-covers on endeavouring to retract itself. The spawning-season extends over May and June. The flesh is somewhat strong-tasted; the celebrated *sarum* or 'relish' of the Romans being made from the fat of the M. The Hoose-M. is described under the head of SCAD (q. v.), and another species is the *S. colias*, or Spanish M.; that found on the N. States' coast being the *S. vernalis*.

Mack'intosh, Sir James, philosopher, politician, and historian, was born at Aldourie, Inverness-shire, Scotland, 24th October 1765. He graduated M.A. at King's College, Aberdeen, in 1784, and M.D. at Edinburgh in 1787. Subsequently medicine was exchanged for law, and after a successful career at the bar, notable for his brilliant conduct of the trial of Peltier, he was sent in 1806 to Bombay as recorder. On his return he became M.P. for Nairn, in the interest of the Whig party, and in 1818 Professor of Law at Haileybury College. He died in London, 30th May 1832. M.'s reputation was once much greater than it is. Macaulay speaks of him with a grave respect, which surprises those who still look into his writings. His eloquence is diffuse rather than brilliant, and neither in his parliamentary speeches nor in his philosophical treatises do we find any trace of a profound or penetrating genius. His chief works are *Vindicia Gallicæ*, which first brought him into public notice, and was designed for a reply to Burke's condemnation of the French Revolution; his once famous *Dissertation On the Progress of Ethical Philosophy*, in the *Encyclopædia Britannica*; a *History of England*; and a series of articles in the *Edinburgh Review*. M.'s *Miscellaneous Works* were published in 3 vols. (1846). See *Memoirs of the Life of the Hon. Sir J. M.*, edited by his son (2 vols. Lond. 1835).

Macintyre, Duncan Ban, commonly called by his countrymen *Donacha Ban* ('fair-haired Duncan'), one of the best Gaelic poets of modern times, was born in Glenorchy, Argyllshire, 20th March 1724, became forester first to the Earl of Breadalbane, afterwards to the Duke of Argyll, and entered late in life the city-guard of Edinburgh, where he died, October 1812. His poems were first published at Edinburgh in 1768, under the title *Orain Ghaidhealach, le Donacha Mac-an-t-soir* ('Gaelic Songs, by Duncan Macintyre'). They were reprinted in 1790, and again in 1804. In the opinion of Celtic critics, M. is a master of all kinds of lyric composition, serious and humorous. His diction is pure, and his versification harmonious. A monument has been erected to his memory on a hill near Dalmailly, commanding a fine view of Loch Awe.

Macknight, Rev. James, D.D., was born at Irvine, Ayrshire, September 17, 1721, studied at the Universities of Glasgow and Leyden, became parish minister of Maybole (1753), and of Jedburgh (1767), whence he was translated to Edinburgh (1772). In 1756 appeared his *Harmony of the Four Gospels*, of which a translation was made into Hindustani; in 1763 *The Truths of the Gospel History*, and in 1775 *A New Translation of the Apostolical Epistles*, all of which exhibited painstaking scholarship. See *Life of J. M.*, by his son, at the beginning of the *Epistles*.

Maclaurin, Colin, a celebrated Scotch mathematician, was born at Kilmolan, near Inverary, in February 1698. He was chosen Professor of Mathematics at Marischal College, Aberdeen, when only nineteen years old. In 1722 he travelled abroad as tutor to Lord Polwarth's son, and at this time wrote a treatise on the percussion of bodies, which gained the prize of the Royal Academy of Sciences at Paris. In 1725 he became Professor of Mathematics at Edinburgh. In 1745 he superintended the fortification of Edinburgh against Prince Charles Edward, on whose entrance he was forced to remove to York, where he died, June 14, 1746. M.'s principal works are *Geometria Organica* (1720), which secured him the esteem of Newton, *A Treatise on Fluxions* (1742), and two posthumous works, entitled *A Treatise on Algebra* (1748), and *Exposition of the Philosophical Discoveries of Sir Isaac Newton* (1748). He wrote several memoirs, one of which, on the theory of the tides, shared with Euler's and Bernoulli's the prize offered by the French Academy of Science in 1740.

MacIe, a mineral variety of Andalusite, which shows a tessellated or cruciform structure when broken across and polished. It is essentially a silicate of alumina, with a little magnesia and iron oxide. *Macles* is also a technical term in crystallography applied to *twin* or *compound* crystals, which are united according to some definite law.

Macleod, Norman, D.D., after Chalmers the most popular Scottish divine of the 19th c., belonged to a family that has given numerous sons to the service of the Church. He was born June 3, 1812, at Campbelltown, Argyshire, where his father was minister; was educated at Glasgow and Edinburgh; spent some time in Germany as travelling tutor, and in 1838 became minister of the parish of Loudoun in Ayrshire, whence in 1843 he was translated to Dalkeith. In 1845 he visited Canada on ecclesiastical business, and in 1851 accepted a call to the Barony Church, Glasgow. In 1854 he was appointed one of the Queen's Chaplains for Scotland, and Dean of the Order of the Thistle; in 1860 undertook the editorship of a new monthly magazine, *Good Words*, which under his management became one of the greatest successes in periodical literature; and in 1866, along with the Rev. Dr. Watson of Dundee, was selected by the General Assembly to inspect the Scottish Church Missions in India. His visit to the East in 1867 made an indelible impression on his mind, and gave a tone to all his after thought. In 1869 he was chosen Moderator of the General Assembly of the Church of Scotland. He died 16th June 1872. M. was a large-hearted and warm-hearted man. His sympathies were uncontrollably catholic, and he could not be brought to hate anything or anybody that God had made. Not possessed of a subtle or original mind, his intellectual endowments were nevertheless rich and various, and in the pulpit no Scottish preacher equalled him in easy, unaffected, and impressive eloquence. He approached most nearly to genius through his sense of humour, though both in sermon and story he occasionally showed himself a master of pathos. The Scottish people to a man loved and trusted him, and far beyond the border, in England, America, and India, an affectionate admiration was expressed for one who in the narrow ways of Presbyterianism moved with as free a step as the most liberal of Anglican divines. His piety, though unconventional and unostentatious, was sincere and strong. See *Memoir of Norman Macleod, D.D.*, by his brother the Rev. Donald Macleod (2 vols. 1876).

MacLise, Daniel, R.A., was born at Cork, of Scotch parents, January 25, 1811, became a student at the London Royal Academy in 1828, and carried off all medals he competed for. He was elected in 1835 Associate of the Royal Academy, and in 1841 R.A. In 1866 the presidency of the Academy was offered to M.; but declined. He died 25th April 1870. The 'Play Scene in Hamlet,' 'Shakespeare's Seven Ages,' 'The Marriage of Strongbow and Eva,' 'The Spirit of Chivalry,' 'The

Spirit of Justice,' 'The Sleeping Beauty,' 'Scene from Comus,' and 'Caxton showing to Edward IV. his First Proof-sheet' are among his most famous pictures. He succeeded specially in the skilful treatment of a class of subjects he may be said to have originated—combining the historical with the romantic. He executed fine portraits of Lytton, Dickens, Macready, &c. See *Pictures by M.* (11 steel plates), with biographical sketch by Jas. Dafforne (Lond. 1875).

Macmahon, Marie Edme Patrice Maurice; Duc de Magenta, descended from an Irish family which followed the fortunes of the Stuarts to France, was the son of Charles Laure de M., created a peer in 1827. He was born at Sully (Saône-et-Loire), November 28, 1808, entered the military service of France in 1825, was sent to Algeria in 1830, and by 1848 had become General of Brigade. He succeeded Canrobert at the Crimea (1855), and behaved with gallantry in front of the Malakoff. In the Italian war of 1859 his success at Magenta obtained for him the office of Marshal and the rank of Duc. Appointed Governor-General of Algeria (September 1, 1864), he proved himself to be a most incompetent administrator. M. took command of the first army corps, with headquarters at Strassburg, upon the outbreak of the Franco-German war. He was defeated at Wöth and captured at Sedan, and at the conclusion of the war operated against the Commune. On May 24, 1873, he succeeded M. Thiers as President of the Republic, and declared in October of the same year that 'he would not separate himself from the Conservative party which placed him in power.' Next month his tenure of office was extended until 1880. But to the Parliament which elected him by a majority of 68, there succeeded one having a Republican majority of 300. The Conservative pledge of M. could not be maintained. He tried the governments selected from this majority, but (May 16, 1877) in an imperious letter to his Prime Minister he rudely dismissed the Cabinet, called together one composed from the Bonapartist, Orleanist, and Legitimist ranks, and consented to a dissolution of Parliament. At Bourges (July 28th) he proclaimed his intention of keeping on constitutional ground at home, but the reactionary policy of his government, and their ultramontane leanings, filled France with apprehension during the months preceding the election of October 1877. M. is a brave soldier, but conspicuously unfit for political life.

Macmillan, Daniel and Alexander, the founders of a celebrated English bookselling and publishing firm. The former was born in the island of Arran in 1813, served his apprenticeship with Mr. Maxwell Dick of Irvine, Ayrshire, and was engaged successively with Thomas Aitkinson and Co., with Mr. E. Johnson of Cambridge, and for seven years with Messrs. Seeley. Alexander M., born at Irvine in October 1818, was also for several years in the employment of Messrs. Seeley. In September 1843, the two brothers began business in Cambridge; a year after the death of Daniel in 1857, a branch was opened in London; and in 1863 the whole publishing business was transferred to London. In the latter year Alexander M. was appointed publisher to the University of Oxford, and has signalled his office by a series of the most scholarly publications in all departments of learning ever issued from the English press. The services of the firm to the cause of education have been unspeakably great. Not to speak of their admirable text-books in classics and mathematics, they have practically revolutionised the teaching of English in all the great schools of the nation, and placed the study of Chaucer side by side with that of Homer. *Macmillan's Magazine*, started in 1859, is still (1878) a powerful and flourishing periodical. It has been distinguished from the first by its solidity, culture, earnestness, and purity of sentiment.

Macnee, Sir Daniel, a distinguished Scottish portrait painter, was born in Sirlingshire about 1806, studied at the Scottish Academy under Sir W. Allan, settled in Glasgow, and received one of the gold medals at the International Exhibition, Paris, 1855, for his portrait of the Rev. Dr. Wardlaw. A characteristic work is his portrait of Brougham, in the Parliament House, Edinburgh. Among his sitters have been many of the most illustrious Englishmen, as well as Scotchmen, of his day. M. was appointed President of the Royal Scottish Academy in 1876.

Maçon (the *Maïso* of Cæsar), chief town of the French department Saône-et-Loire, on the right bank of the Saône, 39

miles N. of Lyon by rail. It has two river harbours, with fine quays, and contains the ruined cathedral of St. Vincent, a prefecture, palace of justice, hôtel-de-ville with a public library of 7000 vols., and some interesting Roman remains. There are manufactures of watches, woollens, velvet, leather, faience, and hardware, and an important trade in Burgundy Wines (q. v.), grain, and cattle. Pop. (1872) 15,613.

Ma'con, a city of Georgia, U.S., on the Ocmulgee, at the junction of five railways, 80 miles S.E. of Atlanta. It has seven churches, a Baptist college, a Wesleyan Female College, six banks, and four newspapers. Pop. (1870) 10,813.

Macpherson, James, born in the parish of Ruthven, Badenoch, Inverness-shire, in 1738, was educated at the Universities of Aberdeen and Edinburgh, and returned as a schoolmaster to his native place. In 1758 he published an indifferent poem called the *Highlander*, followed by *Death* and the *Hunter*, both of them equally destitute of enduring poetic merit. In 1759 he became tutor in the family of Graham of Balgowan, and it was during this period that he met Mr. Home and submitted to him some short translations from ancient poems in the Gaelic language. In 1760, at the desire of Home and Blair, he published *Fragments of Ancient Poetry collected in the Highlands of Scotland*, consisting of sixteen pieces, which he held to be episodes of a great work relating to the wars of Fingal. On the strength of this publication he was prevailed upon to undertake a journey of research throughout the Highlands. The result was the appearance in 1762 of *Fingal, an Ancient Epic Poem, in six books, together with several other poems composed by Ossian, the son of Fingal, translated from the Gaelic language by James M.* In 1763 appeared *Temora, an Epic Poem, in eight books*. The literary world was taken by storm, the 'translations' were retranslated into French, German, and Italian, and a great controversy arose as to their genuineness, which continues to be periodically agitated unto this day. (See *OSSIAN*.) Through the Earl of Bute M. received in 1764 a civil appointment in N. America, and in 1766 he returned to act as a political writer in behalf of Government. His *Introduction to the History of Great Britain and Ireland* appeared in 1771, his *History of Great Britain from the Restoration to the Accession of the House of Hanover* in 1773. He was appointed agent for the Nabob of Arcot (1780), and returned to Parliament for Camelford. M. died at his estate of Belleville, Inverness-shire, 17th February 1796, and was buried at his own cost in Westminster Abbey. See *Dissertations to the Poems of Ossian* (1870), by the Rev. Archibald Clerk.

Macready, William Charles, an English tragedian, was born in London, March 3, 1793, and educated at Rugby. In June 1810 he made his *débüt* at Birmingham as Romeo. He made his first London appearance at Covent Garden, September 16, 1816, as Orestes in the *Distressed Mother*. Among his earliest triumphs were his Rob Roy and Mirandola. In 1822 and 1828 he played in Paris with much success. M. became manager in succession of Covent Garden and Drury Lane, and his rule was characterised by an attempt to elevate the public taste, even at personal loss. He produced the dramas of Bulwer, Talfourd, Knowles, and Browning, and took such parts as Virginius, Caius Gracchus, and Richelieu with great success. He shone in Macbeth and Coriolanus. One of the most thoughtful and scholarly of actors, he became, though in a widely different style, the legitimate successor of Keate. He visited America in 1826, 1843, and 1849. M. retired February 26, 1851, and was entertained at a banquet on March 1, graced by the presence of Dickens, Thackeray, Lytton, and a noble assemblage. He died April 29, 1873. See his *Reminiscences and Diary*, edited by Sir Frederick Pollock (2 vols. 1875).

Macrobius, Ambrosius Aurelius Theodosius, a Latin grammarian and antiquarian, flourished at the beginning of the 5th c., in the age of Honorius and Theodosius. He was probably a Greek. His extant works are the *Saturnalia*, in seven books, a series of dialogues in imitation of those of Plato, in which many historical, mythological, and antiquarian questions are discussed, four of the books being devoted to criticisms of Virgil; the *Commentarius in Somnium Scipionis*, embodying many of the views of the new Platonists; and *De Differentiis at Societatibus Græci Latineque Verbi*, which only survives in an abridged form. The best edition of M. is that of Gronovius (1670, reprinted 1736).

Macrotherium (Gr. 'large beast'), a fossil genus of Edentate mammalia, the remains of which occur in recent deposits in S. America and in the Miocene formations of France. It is one of the oldest of Edentate fossils, is widely distributed, and appears to have attained a gigantic size. No outer armour or hard parts existed, and the teeth wanted roots and were destitute of enamel.

Mac'ra, a genus of *Lamelibranchiate* (q. v.) mollusca, forming the type of the family *Macræide*. The shell is trigonal or three-sided and equivalve; the hinge has two prominent teeth. The mantle is open in front, and the breathing siphons are united and have fringed orifices. The foot is compressed. The genus M. includes several well-known species, both of recent and fossil kind. *M. stultorum* is a familiar living species.

Mac'ulæ is the term applied by Willan and Bateman to diseases of the pigmentary structure of the skin, the seat of the alterations being in the rate mucosum and papillary layer of the derma. The morbid appearances may depend upon original organisation, alteration of function, alteration of nutrition, or chemical coloration. *Treatment*—Iodide of potassium internally and as a local application, and lotions of the bichloride of mercury with or without the hydrochlorate of ammonia.

Madagas'car, a large island in the Indian Ocean, separated from Africa by the Mozambique Channel, which has a minimum width of 270 miles. From Cape Amber, in 11° 27' S. lat., to Cape St. Mary, in 25° 38' S. lat., the extreme length of M. is 940 miles. Its greatest breadth is 360 miles, and its area about 225,000 square miles. M. is traversed by chains of lofty and rugged mountains, which for the most part run parallel to the axis of the island, but the coast is usually low, the W. shore being marshy and the E. shore sandy and barren. From the coast on both sides the mountains rise in tiers to the centre of the island, which consists of an elevated plateau called the Imérina. It is bounded on the S.W. by the Ankarat range, the highest mountains in M., which reach a height of 8950 feet. The mountains terminate before reaching the S. end of the island, which consists of a sandy terrace. The central region abounds with craters and other evidences of volcanic action, and vast beds of red clay, resembling those of the Seychelles (q. v.), are found in other parts. The rivers are unimportant, the largest being the Betsiboka, which has a course of 400 miles, and is navigable by boats for 150 miles. Shallow lakes, many of which are salt, skirt the E. and W. shores, and the canalisation of the former was commenced by Radama I. M. possesses abundance of iron, which is found near the surface, as well as copper, lead, and manganese. Its forests yield magnificent timber, and the island is capable of producing rich tropical crops. Of these rice is the staple, but maize, tobacco, and the sugar-cane are also cultivated. The annual value of the export and import trade is now about £500,000, and is steadily increasing. Cattle, hides, beeswax, and gums are the principal exports, and are sent chiefly to Mauritius.

The Malagasy, or inhabitants of M., have been generally believed to belong to at least two distinct races—the Negrito and the Malay. Dr. Mullens, however, is of opinion that they are homogeneous, and that the differences in complexion, &c., are due to residence at a low or high level, the mountain tribes being much fairer than those of the sea-coast. He divides them into three great clans, the Hovas (pronounced Hooovas), Betsimisarakas, and Sakalavas. The first, though at one time despised and oppressed, now rule the whole island. Sir Bartle Frere considered them to bear a striking resemblance to the Japanese, but they are evidently of Malay origin. 'The Malagasy,' says Dr. Mullens, 'are a Malay people, following Malay customs, some of them possessing Malay eyes and hair and features, and all of them speaking a Malay tongue at the present hour.' The island is ruled by a Hova sovereign, residing at Antananarivo (q. v.), in Imérina, and the government is now in some degree constitutional, though the old feudal system is still in force. The population of M., which Ellis estimated at five and a half millions, Grandidier puts down at not more than four millions, and Mullens at only two and a half millions, of whom the Hovas constitute two-thirds.

The fauna of M. includes the curious animals belonging to the family Lemuridæ (q. v.), and the yet more singular Aye-aye (q. v.). Crocodiles infest the rivers and marshes, and serpents of great size are numerous, though few of them are venomous. In the sandy plains at the S. extremity of the island, the French explorer Grandidier discovered abundant remains of a small

species of hippopotamus, an animal which does not now exist in M. He also found bones and egg-shells of three species of the *æpyornis*, an extinct bird, believed to be allied to the *Dinornis* (q. v.), and which laid an egg even larger than that of the latter. The flora of M. contains many plants not found elsewhere, such as the peculiar lattice-leaf plant (*Ouvirandra fenestralis*) and the traveller's tree (*Urania speciosa*), which contains a supply of water in the base of its leaf-stalks.

The earliest mention of M. is in the 13th c., in the writings of Marco Polo, and in those of Edrisi, an Arab geographer, quoted by Abulfeda (q. v.). In 1506 it was accidentally discovered by the Portuguese, who in 1508 made an unsuccessful attempt to form a settlement near Cape St. Mary. In 1642 the French Société de l'Orient sent an expedition to the island, and since then the French have been unremitting, though unsuccessful, in their endeavours to gain possession of it. They still hold the island of Ste. Marie on the N.E. coast, and that of Nosibé ('big island') on the N.W. In 1816 the English established relations with the Ilova King, Radama I., with a view to the abolition of the slave trade, which took place in 1817. The first missionaries arrived in 1820, being sent by the London Missionary Society, and they met with great success. The enlightened Radama, however, died in 1828, and the throne was usurped by Ranavaloa I., one of his inferior wives. Under her the idols were restored, Christianity prohibited, the missionaries expelled from the island, and the native converts subjected to the bitterest persecution, many of them being speared, hauled from a precipice, burned, or boiled alive. This Malagasy Ahal'ah died in 1861, and her son, Radama II., favoured the Christians, but he was strangled in 1863. His widow, Rasoherina, succeeded him, and under her rule the Christians were not only protected but encouraged, and their numbers greatly increased. She died in 1868, and was succeeded by her sister, Ranavaloa II., the present sovereign. At her coronation the Bible played a conspicuous and honoured part, and in September 1869, she issued an order for the destruction of all the idols in the realm, and this was very generally carried out. Since then Christianity and civilisation have made most rapid strides in M., which seems to have a great future before it.

See the Rev. W. Ellis's *Three Visits to Madagascar* (1858), *Madagascar Revisited* (1857), *The Martyr Church of Madagascar* (1868) and articles by E. Blanchard in the *Revue des Deux Mondes* in 1872; *Twelve Months in Madagascar*, by the Rev. Dr. Mullers (1875), and a paper by the same author in the *Journal of the Anthropological Institute of Great Britain*, vol. v. (1876); *Histoire Physique, Naturelle, et Politique de Madagascar*, by M. Alfred Grandidier, in 28 vols., now (1877) in course of publication at Paris.

Mad Apple is a name sometimes applied to the fruits of *Solanum esculentum*, but they are more generally known as aubergines or brinjals, and are used as a culinary esculent.

Maddalo'ni, a town in S. Italy, province of Caserta, 26½ miles by rail N.N.E. of Naples, which is partly supplied from its large weekly markets. Pop. (1874) 18,767. 2½ miles N.E. is the great Carolino aqueduct, 30 miles long, which waters the gardens of Caserta.

Madd'en, Sir Frederic, an English scholar of great merit, born in 1801, was Keeper of the Department of Manuscripts in the British Museum from 1837 to 1866, and died 8th March 1873. In the course of a laborious life M. edited numerous historical, genealogical, and literary works, among which may be mentioned *The Household Book of the Princess Mary, Havelok the Dane, William and the Werewolf, Syr Carwayne, Gesta Romanorum, The Wycliffite Version of the Holy Scriptures, Layamon's Brut, and Matthew Paris's History of England*. He also wrote numerous archaeological articles which have not been collected. All his work is thorough, scholar-like, critical, and fruitful. His edition of Layamon (q. v.) in particular, is one of the most valuable contributions ever made to the elucidation of the language and literature of 'Transition English.'

Madd'er. The M. of commerce is obtained from two only of the numerous species of *Rubia* to which the plants belong. These are *Rubia tinctorum*, cultivated in European countries, and *R. perigrina*, which yields the roots imported from the Levant. To these may be added *Munjeet*, the produce of *Rubia munjista*, cultivated in East India, and which yields the same tinc-

torial principles as the two species above mentioned. M. roots, when fresh, are from 1 to 2 feet in length, and about ¼ inch in thickness, with a yellow core, but reddish towards the circumference. The roots when collected are washed, and dried by artificial heat; they are freed from their shrivelled skin, and roughly pounded to a powder, in which form they are sent into the market. The cultivation of M. for use in dyeing has been prosecuted from time immemorial in the Levant, whence it spread to Greece, Italy, the S. of France, Alsace, Silesia, and Holland. For upwards of a century Avignon has been a most important centre of the cultivation, yielding in recent years fully one half of the entire quantity consumed. In dyeing and calico-printing M. root is used either simply powdered, or in the form of preparations known as *Garancine* (q. v.), *garanceux*, *flowers of M.*, *M. extract*, and *alizerine*. The last only of these preparations, alizerine, is a definite chemical compound, the others being extracts containing alizarine and other tinctorial principles in a more or less concentrated form. Alizarine and purpurine are the two chief tinctorial principles present in M., and till the year 1868 they were obtained from that source alone. They are now, however, artificially prepared from anthracene, a product of coal-tar, with such striking success, that M. root has suddenly fallen from a place of the first importance as a dye-stuff to a position of comparative indifference, and the cultivation has decreased with great rapidity. In calico-printing artificial alizarine (which as a commercial article contains a certain proportion of purpurine) is almost exclusively employed; but in Turkey-red dyeing, and in wool dyeing M. and its preparations are still employed. In the processes of Calico-Printing (q. v.), M. was formerly employed only as a 'dye-colour': that is, the cloth was printed with mordants, and afterwards dyed in a beck containing a hot extract of M. root; but artificial alizarine is treated as a pigment colour, and topically fixed by steaming. As a dye-colour, by means of suitable mordants, numerous exceedingly fast and solid shades of colour can be obtained with M., including a range of pinks, scarlets, reds, purples, browns, chocolates, and black. The imports into Great Britain in 1876 were 25,570 cwts. of M., valued at £52,073; 33,824 cwts. of M. root, valued at £45,093; and 15,398 cwts. of garancine, of the value of £142,038.

Madder Lake is a brilliant red pigment, the chief constituent of which is purpurine, obtained by treating M. with a boiling solution of alum, adding a little carbonate of soda, filtering, and collecting and drying the precipitate which results, and which is a compound of alumina and the tinctorial substance.

Madeira (Sp. *Madêira*), an island belonging to Portugal, in the N. Atlantic Ocean, 280 miles N. of Tenefle, in the Canaries, 620 S.W. of Lisbon, and 390 W. of the African coast, lat. 32° 36'—32° 53' N., and long. 16° 40'—17° 20' W. Area 345 sq. miles; pop. (December 31, 1876) 123,841, including the islet, Santo Porto, with 1760. M. is of volcanic origin, and has a wildly irregular surface, rising in Pico Ruivo to 6050 feet, and sinking in many rich and singularly deep valleys, of which the most notable is the Curral, 2060 feet from brink to bottom. The coast is precipitous, and indented by few harbours, the only port and town being Funchal (q. v.). The climate is remarkably fine, and M. is one of the chief resorts of pulmonary patients; the average temperature in summer is 74°, and in winter 64° F., and earthquakes are of rare occurrence. Among the products are rice, sugar, coffee, bananas, wheat, chestnuts, pineapples, oranges, and M. wine. Since the grape disease (*Phylloxera vastatrix*) the vine-cultivation, for which M. was long famous, has declined greatly, but is again increasing. In 1876 the value of wine (220,365 gallons) exported was £108,405, of which considerably more than a half went to Great Britain; of sugar, £25,235; of embroidery, £10,135; of onions, £1383; of coal re-exported, £41,565. The total exports amounted to £217,181; and the imports, chiefly coal, cottons, woollens, Indian corn, wheat, and iron wares, to £295,101. There entered the port of Funchal (1876) 606 vessels of 449,496 tons (424 British, of 371,876 tons), and cleared 602 of 448,987 (421 British, of 371,507). In 1876 M. had 22,642 oxen, 17,321 sheep, and 269 horses. The cattle are mostly stall-fed, and fodder is not abundant. The inhabitants are a mixed Portuguese, Arab, and Negro race. M., identified by some with the ancient *Insula Purpura*, was discovered by the Genoese in the 14th c. A Florentine chart of 1351 calls it the *Isola do Legnami* ('island of

timber'), a name which the Portuguese who found their way hither in 1418 translated into *Madeira* ('timber'). See Schultze, *Die Insel M.* (Stuttg. 1864), and White, *M., its Climate and Scenery*.

Madeira, a navigable river of Brazil, is formed by the confluence of the Beni and Marmora, which rise in Bolivia. It joins the Amazon after a course of 700 miles, some 200 of which are obstructed by cataracts.

Madeira Wines. The qualities and varieties of M. W. are numerous, and differ very widely in commercial value. The kinds chiefly known and appreciated in European markets are Malmsey, Tinto, Sercial, Bual, and Palhetinho, and the highest qualities are produced only on the S. side of the islands. M. W. are naturally rich in alcohol, but those sent to the British market are, like most alcoholic wines, artificially brandied. They are generally fine keeping wines, improving greatly in bouquet by age, and a good Madeira can never be too long kept. Their mellowness and flavour are developed by heat and shaking, on which account the wines are frequently sent on voyages to the East or West Indies, and an East Indian Madeira is regarded as a great luxury.

Madhava Rao, Sir, K.C.S.I., a distinguished native Indian statesman, who was long *deewan* or finance minister of the State of Travancore, which he made the most flourishing perhaps in the peninsula. He left Travancore in 1872, and for some time filled the same office at Indore, but on the deposition of the Guicowar in 1875 he was appointed regent to the young prince, in which capacity he hospitably entertained the Prince of Wales.

Madia, a coarse clammy annual (*M. sativa*), forming a genus of *Compositæ*, and a native of the countries of Chili N. to California, but has been introduced into cultivation in various parts of Europe, &c., for the sake of its seeds, which yield a good oil, and form also a nourishing oil-cake for cattle.

Madison, a city in Indiana, U.S., on the Ohio, 90 miles below Cincinnati, 80 miles S.S.E. of Indianapolis by rail. It has fifteen churches, three banks, three newspapers, and extensive trade in pork and provisions. Tanning and brewing are carried on, also the manufacture of flour and machinery. Pop. (1870) 10,709.—**M.**, the capital of Wisconsin, U.S., situated between two lakes at the junction of five lines of railway, 75 miles W. of Milwaukee. It has a handsome state-house, a university, twelve churches, three banks, two daily and eight weekly newspapers. Agricultural implements, carriages, woollens, and flour are manufactured. Pop. (1870) 9176.

Madison, James, fourth President of the United States, was born at Port Conway in Virginia, March 16th, 1751, and graduated at Princeton in 1771. In 1776 he entered the Virginia Assembly, where he struggled persistently for the removal of Dissenters' disabilities, became a member of the council of state in November 1777, and of Congress in March 1780. During the national convention of 1787, he took a great part in framing the constitution of the United States, and ably advocated its principles in the pages of the *Federalist*. From 1792 he was the avowed leader of the Republican party, in 1798 led the Virginia legislature in its opposition to the 'alien and sedition laws' of the Union, and during Jefferson's (q. v.) term of office held the post of Secretary of State. On the 4th March 1809, M. was made President, and on the 18th June 1812, though personally in favour of conciliation, consented to a declaration of war against England. His active measures led to his reelection in 1813, after which he devoted himself to restoring public tranquillity, and retired from public life March 4, 1817. He died at his estate of Montpelier, June 28, 1836. M. was a prudent statesman, without eloquence or genius; and his moderation and integrity were rewarded by the entire confidence of the country.

Mad'oo, a Welsh prince, the second son of Owen Gwynnedd, who according to Cynric tradition sailed westward with a small fleet in 1170, and after some weeks' voyaging landed on a fertile continent peopled by a race that differed greatly from Europeans. After a long sojourn he returned to Wales, leaving behind 120 of his comrades, and having equipped a second fleet of ten vessels, he set sail once more and was never after heard of. Catlin in his *Letters on the N. American Indians* (1841) regards the Tuscaroras as a mixed race, descended from these old Welshmen

and the American aborigines; but Humboldt, though by no means wholly rejecting the tradition, points out that the statement that the bard Meredith celebrated the wanderings of M. fifteen years before Columbus' discovery requires confirmation, the first documentary notice of them occurring in Lloyd's *Historie of Cambria* (1584). M. is the hero of one of Southey's epics.

Madonn'a (Ital. *Mia donna*, 'My Lady') is a name given to the Virgin, generally in art. Some of the early fathers, particularly St. Ambrose, held the Mother of God to possess perfection of corporeal as well as of moral beauty. The representation of the Virgin therefore became the grand aim of Christian art. The first mention of her worship occurs in the writings of St. Epiphanius, who died in 403; and the first mentioned picture of her (declared an authentic likeness) belongs to nearly the same date. Her effigy was stamped on Greek coins about 886 A.D. The M. was first represented alone, her face resembling Christ's, hands crossed on the bosom, and eyes lifted to heaven. Towards the close of the 5th c. she was painted with the infant Jesus, sitting on a throne. Late in art she was again depicted alone. See Mrs. Jameson's *Legends of the M.* (Lond. 1852).

Madoqua (*Neotragus saltiana*), a genus of antelopes occurring in rocky regions in Abyssinia, and noted as being one of the smallest members of its group. It rarely exceeds 14 inches in height and has long legs. It is of a silvery grey colour above, the back being a chestnut-brown, and the under parts pure white. The M. was discovered by Bruce, the Abyssinian traveller.

Madras' Presidency, a province of British India, which occupies the S. portion of the peninsula. On three sides it is bounded by the sea; but it is shut in on the N. by the Bombay Presidency, the dominions of the Nizam of Hyderabad, the Central Provinces, and the Orissa Division of Bengal. Its coherence is interrupted by the Native State of Mysore, which covers much of the hilly interior; and a long narrow strip runs up the E. coast from the mouth of the Godavery to the Chilka Lake, 6° of latitude farther than on the W. Total area 138,318 sq. miles; pop. (1871) 31,597,872, apart from the Native States of Travancore and Cochin. The principal mountains are the E. and W. Ghats (q. v.), which are joined towards the S. by the Neilgherry range. The rivers are the Godavery, Kistna, Pennar, and Cauvery, which all open E. towards the Bay of Bengal. The interior is mountainous and covered with jungle; on the W. coast only a narrow strip of fertile land intervenes between the Ghats and the sea, and the rainfall here is excessive. On the E. coasts, there are plains where the rainfall does not exceed 30 inches, the deltas of the rivers are annually turned into sheets of green rice, by natural floods and by irrigation. Of the total area about one-third is cultivated. The staple crops are rice, which is styled a wet crop, and the following dry crops:—*Chalum* (a kind of maize), *cimboo* (a millet), *ragee* and *varagu* for food grains; *gingelly* among oilseeds; and cotton, tobacco, indigo, sugar-cane, chillies, plantains, and betel leaf. The coconut and areca-nut palms are especially common on the W. coast, where the hill slopes also yield pepper and cardamoms. Into the mountainous interior European enterprise has introduced coffee, tea, cinchona, and potatoes. There are important government irrigation works at the head of the deltas of all the great rivers, which irrigated in 1875 more than four and a half million acres, paying to government a total land revenue of nearly two millions sterling. In addition there is the Madras Irrigation Company, which has spent a guaranteed capital of more than one and a half million. Many of the canals are also used for navigation. Despite these works and innumerable tanks, the entire region has suffered frightfully from the famine of 1876-77. The most distressed tracts were in the N. and the hilly interior, into which it has been found almost impossible to import adequate supplies of grain. For many months Government supported, directly or indirectly, about 2,000,000 souls, but the mortality from actual starvation, and from diseases engendered by want, has been very high. The Presidency possesses about 1700 miles of seaboard, but not a single really good harbour. In the year 1874-75, the total sea-borne trade amounted to sixteen millions sterling; 34,189 ships entered, with a tonnage of 2,499,000. This, however, includes the coasting trade, which is carried on in native craft averaging under 40 tons burden. The foreign imports proper were valued at £3,812,000, of which cotton twist and cotton piece goods formed more than one half; the foreign exports were valued at £6,794,000, chiefly raw

cotton, coffee, grain, indigo, hides, and oil. The principal ports are Madras, Tuticorin, Mangalore, Calicut, Cochin, and Coconada. The manufactures are now insignificant, though it was the weaving of muslins, prints, &c., which first attracted the British to the Coromandel or E. coast. There are specialities of jewellery and carving at Trichinopoly and Vizagapatam. There is little mineral wealth. Iron was at one time worked by European capital at several places, all now abandoned; and in the district of Salem there are immense beds of magnetic ore. Coal is only known to exist near Elore, in the extreme N.E. In the Wynaud (q. v.) there is great expectation of valuable gold deposits. The most important industry is the manufacture of salt, conducted by evaporation along the E. coast, which forms a government monopoly. About 200,000 tons are made annually; the duty amounts to almost exactly 3d. per lb. There are altogether about 16,000 miles of roads. In 1875 there were 1075 miles of railway open, belonging to the Madras and S. Indian Companies, on which a total of £12,730,000 had been expended; the net earnings were £228,767. The Madras Railway connects Madras City with Bombay, Bangalore, Ootacamund on the Neilgherries, and Bepore on the E. coast; the S. Indian line goes due S. to Tuticorin.

Of the total pop. 92·3 per cent. are Hindus, mostly of the Sivite sect; 5·9 per cent. are Mohammedans, most numerous on the Malabar coast; and 501,627 souls, or 1·5 per cent., are native Christians, most numerous in Tinnevely, Madura, and Tanjore. Among the Hindus, the higher castes, are very thinly represented, there being only 547,000 Brahmins, and 190,000 Kshatriyas or Rajputs. The average density of the pop. is 226 per sq. mile. The towns with over 50,000 inhabitants are Madras City, Trichinopoly, Tanjore, Madura, Bellary, and Salem.

The administration is vested in a Governor, together with an executive council of three members, of whom one must be the Commander-in-Chief. There is a Legislative Council of eight additional members, of whom three are natives. There are 21 districts, each with a Magistrate-Collector, and a Judge, who are members of the Covenanted Civil Service. In 1874-75 the imperial revenue was £8,823,000, of which £4,637,000 came from land, and £1,531,000 from salt. In addition, about £530,000 was raised locally. The total expenditure was £5,970,000, including £2,804,000 for the military department, and £400,000 for public works. The Madras army, which is under its own Commander-in-Chief, numbered 47,000 men, of whom 34,000 are natives, but the greater part were serving out of the Presidency, in Burmah, the Central Provinces, and even Bengal. The European troops are stationed at Fort St. George, St. Thomas Mount, Bellary, Trichinopoly, and Cannanore. The police numbered 23,451 officers and men, at a cost of £355,700. As regards education, there were altogether 9151 institutions, with 255,737 pupils, at a total cost of £256,800. There were six general and four professional colleges, with a total of 400 students; eleven normal schools, with 1421 pupils; and four special schools, with 849 pupils. In addition, there were six private colleges and five private normal schools. At the university there were 784 matriculations, or threefold the number ten years previously; 183 candidates passed the First Arts Examination; 55 for B.A.; 1 for M.A.; 9 in Law; 2 in Medicine; and 2 in Civil Engineering. The languages spoken almost entirely belong to the Dravidian (q. v.) family of the Turanian branch, by far the most wide-spread being Tamil and Telugu.

This tract of country was in early days occupied by great historical Hindu kingdoms, but the chief rulers, with whom European nations first came into contact, were the Mohammedan Nawab of the Carnatic and the Zamorin on the Malabar coast. The first English commercial settlement was at Masulipatam in 1620, and in 1639 permission was obtained to build Fort St. George, the nucleus of Madras city. For a short period, this Presidency was predominant over all the other English settlements in India; and during the latter half of the 18th c. the continuous wars with the French, and afterwards with Hyder Ali and his son, cause the Carnatic to figure largely in Indian history. But the genius of Clive surpassed that of Dupleix, Bassy, and Lally; Coote was a match for Hyder, and since the capture of Seringapatam, and the death of Tippoo, in 1799, Madras has been a country without a history. The first large acquisition of British territory was the cession of the N. Circars by the Mogul emperor in 1766. The Mahratta Rajah of Tanjore was deposed in 1799; and two years afterwards the Nawab

of the Carnatic resigned his territory to the Company. His title became extinct in 1855, but his representative is still called Prince of Arcot, and is the first native nobleman of Madras. During the Sepoy Mutiny of 1857, the whole of this Presidency remained undisturbed. See Annual Blue Books on *The Moral and Material Progress of India* (Lond.); *Annual Administration Report of the M. P.* (Madras); Orme's *Military History of India*.

Madras City, or **Madras-patam** ('the city of the college or 'school'), is co-extensive with the district of the same name, and is situated on the E. or Coromandel coast of India, 885 miles S.W. of Calcutta, 790 miles S.E. by rail of Bombay, and 513 miles N.E. by rail of Tuticorin in the extreme S. of the peninsula. Area of the municipality 27 sq. miles; number of houses 51,714; pop. (1871) 397,552; average density of pop. 14,724 per sq. mile. Fort St. George, originally founded in 1639, is the most conspicuous building, immediately facing the sea. It contains a large arsenal, as well as accommodation for native and European infantry. The artillery headquarters are at St. Thomas Mount, a suburb to the S. The residence of the Governor, called Government House, is a fine building, surrounded with gardens, separated from the fort on the N. by a narrow river. N. of the fort is the native quarters, known as Black Town, which is densely populated. Most of the Europeans live in detached houses in the environs, but the offices of administration and the business warehouses line the beach. There are churches and chapels of all denominations. The cathedral is called St. George's; the first English church, St. Mary's, was opened in 1680. The chief educational establishments are the Presidency College, the Central Institution of the Free Church of Scotland's Mission, the Doveton Protestant College, the Medical and Civil Engineering Colleges. The university is merely an examining body. A flourishing School of Art was established by Dr. A. Hunter in 1850, and now receives official support; it has passed nearly 5000 students. There is also a Central Museum, annually visited by 120,000 persons. The Government model farm is in the immediate neighbourhood, at Sydapet. There are public statues to Lord Cornwallis, Sir T. Munro, and General Neill. The city is supplied with water from the Red Hill Reservoir, and sanitation is carefully enforced. The municipality have acquired a sewage farm, and the entire drainage system is now (1877) undergoing reconstruction. The city is, probably, not unhealthy, as judged by an Oriental standard, but the returns of vital statistics are not yet trustworthy. The death-rate for 1876 was abnormally swollen by reason of the crowds who flocked in from the famine-stricken tracts. In the year 1874-75, the total municipal income was £50,739, of which £23,000 came from rates on houses, &c.; the expenditure was £55,925, including £14,800 for conservancy, £10,800 for public works, and £5729 as interest on Water Works Loan. Of the total pop., 77·6 per cent. are Hindus, and 12·8 per cent. Mohammedans; the Europeans number 3613 or '9 per cent., the Eurasians 12,013 or 3·0 per cent., and the native Christians 21,441, or 5·3 per cent. Though situated on an open, surf-beaten coast, with only a wooden pier, it possesses an important maritime trade, equal to more than one-third of that of the entire Presidency. Ships anchor in the roads, a mile from the shore, in from 7 to 9 fathoms of water, and have always to put to sea in heavy weather. Communication is maintained by masulah boats and catamarans. In 1874-75, the total imports were valued at £3,520,000, chiefly cotton goods, government stores, metals, wearing apparel, and liquor; the exports at £2,441,000, chiefly raw cotton, coffee, indigo, and grain. During the year 889 ships entered, with a tonnage of 527,798 tons. A harbour, the foundation of which was laid by the Prince of Wales (1875), is to be completed in five years at a cost of £565,000. It will consist of two piers of rubble and concrete, each 500 yards long, enclosing a space of 170 acres, with enough water for the largest ships. This will, however, afford no protection in case of cyclones, which are of frequent occurrence. In the storm of May 1872, twenty-nine vessels were wrecked, with a tonnage of 10,800 tons, but only nineteen lives were lost. The municipality is governed by a board of commissioners, of whom one-half are elected by the ratepayers.

The site of Madras was acquired in 1639 from the Hindu Rajah of Chandgherry, by Mr. Francis Day, the Chief of the Company's trading settlement at Armagon. The fort was finished in 1643, and the agency was raised to the rank

of a Presidency in 1653. In 1746 it capitulated to the French under La Bourdonnais and Dupleix, and remained in their possession until the treaty of Aix-la-Chapelle in 1749. They greatly improved the fortifications. In 1758-59 it was again besieged by the French, but successfully defended by Pigot and Lawrence. In 1780 it was threatened by Hyder Ali's cavalry, who burned the villages between St. Thomas Mount and the fort. The only other historical event was the visit of the Prince of Wales in December 1875.

Mad'repore, a general name given to many species of *Sclerodermic* corals. The family *Madreporidae* belongs to the *Zoantharia sclerodermata*, and has a composite or compound coral, of apparently porous nature. These corals are among the most prominent of the reef-building forms. They are usually hard, coarse, limy, and massive.

Madrid, the capital of Spain and of the province of M., a part of New Castile, lies near the heart of the country, on the left bank of the Manzanares, a small sub-affluent of the Tagus, and on a hilly sandy plateau 2200 feet above the sea, treeless save in the vicinity of the city, and stretching away in the N. to the snow-capped Sierra de Guadarrama. One of the handsomest of European cities, it has a very modern aspect, and is partly surrounded by a brick wall 20 feet high, and pierced by 16 gates, the most notable being the Puerta de Alcalá (1759), a triumphal arch 72 feet high at the foot of the Calle de Alcalá, a magnificent street, that traverses the city from N.E. to S.W. The city is girt with fine promenades and stately suburban villas embowered in beautiful gardens. On the E. side is the famous Prado, the evening resort of the people, with parterres, trees, and marble fountains. Outside the Puerta de Alcalá, in the Plaza de Torres, stood the circus for bull fights erected by Philip V. to accommodate 12,400 persons, which was taken down in 1874, when a new one was begun a little farther N. M. has seventy-two public squares, of which the chief are the Puerta del Sol, the centre of pleasure and business, the Plaza Mayor, 398 by 306 feet, the scene of the *auto-da-fé*, surrounded by colonnades, the Plaza Oriente in front of the royal palace, containing an equestrian statue in bronze of Philip III., and forty-four other statues of kings and queens, and the Plaza de las Cortes, with a fine bronze statue of Cervantes. The great building in M. is the Real Palacio, on the W. side, between the city and the river. It is a square, 470 feet on each side, and 100 feet high, built (1737-50) of granite and white marble, occupying an area of 220,900 sq. feet, enclosing a court 240 feet square, and containing a library of 100,000 vols., an armoury of 2533 specimens, and a numismatic collection of 150,000 pieces. M. has also some sixty churches, several decorated by old masters, forty-four monasteries, used since 1836 for secular purposes, twenty-four nunneries, twenty-four hospitals (one with 1526 beds), fourteen barracks, 100 elementary schools, several colleges or higher schools, a university (since 1836), a medical school, a conservatorium of music, eight theatres, four public libraries (the national with 230,000 vols.), eight museums, a botanical garden, an observatory, an academy modelled on that of Paris (since 1847), &c. The royal museum in the Prado contains a gallery of 1833 pictures, one of the richest collections in the world, with 65 by Velasquez, 58 by Ribera, 46 by Murillo, 10 by Raphael, 62 by Rubens, 43 by Titian, and 22 by Van Dyck. The Escorial (q. v.) is 26 miles N.W. of the city. The industries of M. are slight, the chief manufactures being chocolate, beer, shoes, boots, plated ware, coaches, gloves, and fans. The commerce, however, is important, as M. is the entrepôt for all the interior provinces. Retail business is mainly in the hands of foreigners, mostly French, but most of the wholesale trade is carried on by native houses. The climate is described in a Spanish proverb as 'three months of winter and nine months of hell.' The temperature, which ranges from 18° to 105° F., is subject to frequent and sudden changes. Between the sunny and shady side of a street the difference of temperature is sometimes 20°. The prevailing winds are the parching *Solano* from the S.E., and the icy N. wind from the Guadarrama. Pop. (1870) 332,024. M. or *Majerit* is first mentioned in history in 932, when it was taken by Ramiro II. of Leon. A strong outpost of the Arabs, it was captured by Alfonso VI. of Castile in 1083. Philip II. made it his capital in 1560, when it was still surrounded by extensive forests. From this time it grew rapidly into a fine city, and became the centre of the history of the Spanish people. M. was

taken by the French in 1808, and in a rising against Murat some 1500 citizens lost their lives. Recovered by Wellington, 12th August 1812, it subsequently sided with Prim in the revolt which drove Isabella II. from the throne in 1868, and cordially welcomed her son, Alfonso XII., 14th January 1875. See Mesonero Romanos, *El Antiguo M.* (Madr. 1861).

Mad'rigal (Ital. *madrigale*, Sp. *madrugada*, 'dawn'; or Ital. *mandra*, 'a sheepfold?'), a short, pointed poem of Spanish and Italian origin, the subject being usually amatory or pastoral. The importance of the *music* which was set to the M. becoming (about 1500-1620) greater than that of the words, the term became musical. In its most advanced form a M. is a composition for (usually) five or six vocal parts, with several voices to a part, and its short and expressive phrases are piled upon one another by all the artifices of imitation and counterpoint. The noble compositions of Edwards, Morley, O. Gibbons, Bennet, Byrd, and many others in this form, mark it as peculiarly English.

Mad'ura (from a Sanskrit word meaning 'honey sweet'), the chief town of the district of the same name, in the Madras Presidency, British India, on the right bank of the Vygarh river, and a station on the newly-opened S. Indian Railway, 274 miles S. from Madras by rail; pop. (1871) 51,987. It is a very ancient city, having been the former capital of the Pandian dynasty of Dravidian kings, referred to by Ptolemy. The lofty stone walls are now ruinous. The chief buildings are the great temple of Siva, with its colossal porticoes, and the palace of Tirumalei Nayakkan (1623-59), which now holds all the administrative offices, but is falling into decay. The manufactures are cotton weaving, and a speciality of turbans with a border of gold lace. The district of M., which borders on the Palk Straits, has much level plain, and also the mountains of Puhai, which run up to 8000 feet; area 9502 sq. miles; pop. (1871) 2,266,615. It contains the tract of Dindigul, where the best tobacco in India is grown, to be manufactured into Trichinopoly cigars. The crops are rice and *ragée*; the manufactures are woollen blankets, and salt made by evaporation on the sea coast, on which the annual duty is £60,000. There is some coasting trade. M. was an early scene of the activity of Jesuit missionaries, and there are still many native Christians. A railway to M. from Trichinopoly was opened in 1875.

Mad'vig, Johan Nikolai, a Danish philologist and politician, born August 7, 1804, at Svaneke in Bornholm, entered the University of Copenhagen (1820), where he took his doctor's degree (1826), and was appointed Professor of the Latin Language and Literature (1829). His earliest works, *Emendationes in Ciceronis Libros de Legibus et Academicis* (1826), and *De Asconio Pediano* (1826), attracted much attention, and from this time M. produced a series of critical works which have had the greatest influence on scholarship, particularly in the direction of textual criticism. Of these the chief are *Ciceronis Orationes Selectæ Duodecim* (4th ed. 1858); *Ciceronis Cato Major et Lælius*; *Ciceronis de Finibus Bonorum et Malorum libri v.* (2d ed. 1869), with a rich critical and exegetical commentary; *Opuscula Academica* (1st vol. 1834; 2d 1842); *Latinsk Sproghe til Skolebrug* (1841, 5th ed. 1870; Eng. trans. by Woods, Oxford, 1851); *Græsk Ordforingslære* (2d ed. 1857; Eng. trans. by T. K. Arnold). From 1848 to 1851 M. was Minister of Religion and Education. He entered the 'Landsting' in 1853, and in 1855 the 'Rigsraad,' of which he was president till 1863. Of his political writings, *Curiafstemning* (1853) and *Den Nationale Politik og det danske Monarchi* (1864) had a marked effect on public opinion. Throughout this period M. still continued his philological lectures and study, the fruits of which are *Emendationes Livianæ* (1860); *Livius* (4 vols. 1861-66), in which he was assisted by Ussing; and *Adversaria Critica ad Scriptores Græcos et Latinos* (2 vols. 1871-73).

Mæander (mod. *Bosuk*, i.e., 'great,' *Meinder*), a river in Asia Minor, 200 miles long, which flows W.S.W. from Mount Aurene, in Phrygia, to the Ægean Sea near Miletus. The proverbial windings of the M. made its name a synonym for a tortuous course.

Mæce'nas, Caius Cilnius, a Roman statesman, born on the 13th April, 73-63 B.C., of an equestrian family, descended from the royal *Lucumones* of Etruria. He is first mentioned in 40, when he helped to bring about a marriage between Octa-

vianus and Scribonia, and took part in the negotiations with Antonius that led to the peace of Brundisium. During the war with Antonius he remained at Rome, entrusted with the care of civil affairs, and effectually crushed the plot formed by the younger Lepidus. After the battle of Actium (31 B.C.) M. for many years enjoyed the highest confidence of his master, and he is said to have been his chief adviser in establishing the empire. But between 21 and 16, from some unknown cause, an estrangement took place, and Tacitus says that from this time till his death (B.C. 8), M. had only the appearance of the emperor's friendship. With most of the poets and learned men of the time he lived on the most intimate terms, and towards Virgil (q. v.), Horace (q. v.), and others he was so bountiful, that the name of M. as a literary patron has become proverbial. He was a wise and faithful minister, and, if over-addicted to ease and luxury, found in his enjoyment of these a security that Augustus, equally with Julius Cæsar, would have denied to a man of higher ambition and a more 'lean and hungry look.'

Mælår, Lake (anc. *Logrin*), a beautiful lake in the S. E. of Sweden, surrounded by the provinces of Upland, Vestmanland, and Södermanland. Greatest length from E. to W. 79 miles; area, 761 sq. miles (of which 478 are water, the rest made up by 1260 islands of various sizes); greatest depth, 170 feet (mean depth, 85). M. receives a large number of small streams, which, with the Strömsholm and Hjelmare canals, afford communication with the interior of the country. Its level is 2 feet above the Baltic, with which, besides its natural outlets Norrström and Söderström, it is connected by the Södertelge Canal. On the shores and islands of M. are 9 towns, 200 castles, and a very large number of villas.

Maestricht Beds form a local deposit at Maastricht in Holland, which occupies a position intermediate to the highest English Chalk formations and the lowest Tertiary. They consist of a yellowish limestone, and abound in corals, bryozoa, foraminifera, echinoderms, and lamellibranchs, and the remains of the *Mososaurus*, a large reptile.

Maffei, Francesco Scipione, Marchese, an Italian (ambasciatore) at Verona 1st June 1675, studied at the Jesuit college of Parma, and served through the War of the Spanish Succession. Devoting himself to letters, he founded the *Giornale de Letterati d'Italia* (1710), and by his tragedy *Merope* (1713), and comedy *La Ceremonia* (1730), as well as by sundry works upon the dramatic art, won a high reputation, and exercised a healthful influence on the Italian stage. He visited France (1732), England (1736), Holland, and Germany, and died at his native place 11th February 1755. The complete edition of his works (18 vols. Ven. 1790) includes treatises on theology, archæology, and literary subjects generally.

Mafra, a town of Portugal, in Estremadura, 18 miles N. W. of Lisbon, and celebrated for the immense, finely decorated building which João V. erected here in 1717-31, and which comprises a royal palace, with 866 rooms; a cathedral, 186 by 135 feet, surmounted by a splendid dome; and a monastery, with 300 vaulted cells. The whole is of white Carrara marble, and stands in the midst of beautiful gardens.

Magadorá, or Makadish'u, a town on the E. Coast of Africa, belongs to the Imaum of Muscat, and has some trade in slaves, ivory, gum, spices, &c. Founded by the Arabs in 924, it was formerly a great trading place. Pop. 5000.

Magazine (Arab. *makhzan*, 'storehouse') is a name especially given to a storing-place for gunpowder. The military M. is bomb-proof, and is usually covered with earth, having the entrance protected by heavy traverses. On shipboard the M. is so placed in the hold that it may be instantly flooded in case of fire. The name is also applied to a literary periodical on account of its 'stores' of varied knowledge.

Magdala, a town of Abyssinia, on a branch of the Blue Nile, in a mountain region, 9000 feet above the sea, and 120 miles S. E. of Gondar. It was taken and destroyed by the English 13th April 1868. (See ABYSSINIA.) General Napier, commander-in-chief of the English expedition, was created Baron of Magdala.

Magdalen College (pron. *Maudlin*), Oxford, was founded in 1455 by William of Waynflete, Bishop of Winchester, and Lord

High Chancellor of England, for a president, forty fellows, thirty scholars (called *demies*), a schoolmaster, usher, four chaplains, a steward, organist, eight clerks, and sixteen choristers. By 17 and 18 Vict. c. 81, ten fellowships were suppressed, the remainder thrown open; the demyships were increased to forty, each of an annual value of £95; and twenty exhibitions and four Waynflete professorships were established. With its noble tower, exquisite chapel, cloisters, and hall, M. C., standing on the banks of the Cherwell, and surrounded by the Magdalen water-meadows, is the most beautiful of all the Oxford colleges. It presents to 41 livings, and in 1876 had 199 members of Convocation, 101 undergraduates, and 389 members on the books.

Magdalen Hall, now Hertford College, Oxford. In 1282 Elias de Hertford founded Hertford, Hert, or Hart Hall, which, raised to a college in 1740 by Dr. Richard Newton, the then principal, was dissolved in 1803, owing to want of funds, but in 1816 was incorporated with M. H. The latter, founded by Bishop Waynflete as an appendage to Magdalen College, and an independent hall since 1602, was itself dissolved in 1874, and its principal and scholars, with certain fellows, incorporated as Hertford College, which consists of a principal, 15 fellows, and 28 scholars, presents to 10 livings, and in 1876 had 193 members of Convocation, 69 undergraduates, and 312 members on the books.

Mag'dalen Islands, a group of eleven islets in the Gulf of St. Lawrence, 55 miles N. W. of Cape Breton Island, and 85 S. W. of Newfoundland. Area, 125 sq. miles; pop. (1871) 3172. Grindstone, Allright, and Amherst are the largest. Fish, oil, and gypsum are exported.

Magdaleña, a river of S. America, rises in the Cordilleras of Ecuador, flows N. through Colombia, and enters the Caribbean Sea, after a course of 900 miles. It is full of cataracts as far as Honda, 540 miles from the mouth, where it becomes navigable. It is the chief means of communication with Bogota (q. v.).

Magdalene, Mary, is so called from Magdala, the city she belonged to, and to distinguish her from the other Maries mentioned in the Gospels. She is first mentioned as being in attendance on Christ, along with certain other women, after she had had seven devils cast out of her (Luke viii. 2), then as standing with other women near the cross at the crucifixion (John xix. 25), and lastly as the first to whom Christ appeared after his resurrection (Mark xvi. 9; Luke xxiv. 10; John xx. 1, 14; but cf. Matt. xxviii. 9). From the gratuitous assumption that M. M. was the same as the Mary mentioned in Luke vii. 36-50, there has been a prevalent notion that previously to her association with Christ she was an unchaste woman, and this is the character in which she has always been represented in art. The same assumption appears in the phrase, a 'M. asylum.'

Magdalene College, Cambridge, founded (1519) by Edward Stafford, Duke of Buckingham, and completed, after his attainder, by Thomas Audley of Walden (1542), has eight open fellowships; three open scholarships of £60, three of £40, and six of £20; and eight exhibitions. This college possesses the MS. diary of Samuel Pepys (q. v.), and his valuable collection of books, known as the Pepysian Library. It presents to six livings, and in 1877 had 126 members of the Senate, 52 undergraduates, and 216 members on the board.

Mag'deburg, the capital of the province of Saxony, Prussia, 76 miles W. S. W. of Berlin, at the junction of four main railway lines, and on the left bank of the Elbe, which is here divided into three arms. A fortress of the first rank (since 1866), it is also one of the most important commercial towns in N. Germany. It consists of the town proper, and of four suburbs, one of which, Friedrichstadt, lies on the right bank of the Alte Elbe. The river here encircles an island, which is occupied by the citadel, and connected with both banks by bridges. M. has a massive Gothic cathedral (1208-1363, restored 1825-35), with a tower 337 feet high, and containing the tombs of Otho I. (died 973), and his wife, the English Editha; a church of Our Lady, in Romanesque style of the 12th c.; a lofty monument of Otho I., erected by the municipality soon after his death, and restored in 1858; many benevolent institutions, and several military, medical, and industrial schools, &c. Fine promenades are the Fürstenwall, on the Elbe, and the Friedrich-Wilhelm's Garten, adjoining the glacis in the S. W. Two miles below M., on the

river, are Herrekrug, and Vogelsang, both favourite resorts, with beautiful gardens. The manufactures are cottons, woollens, beet-sugar, tobacco, chocolate, machinery, leather, gloves, and spirits, and there is a large transit trade. Pop. (1875) 122,789. M. was founded at the beginning of the 9th c., and chiefly owed its early prosperity to Otho I., who established a Benedictine monastery here in 937. In 967 the town was raised to the rank of an archiepiscopal see, to which was annexed the primacy of Germany. After much contention, it threw off the archiepiscopal yoke, and towards the end of the 15th c. compelled the prelates to reside elsewhere. The Reformation was espoused as early as 1524. During the Thirty Years' War, M. resisted the attacks of Wallenstein for seven months (1629), but in 1631 was stormed by Tilly, who slew some 30,000 inhabitants, and left only the cathedral and 140 houses standing. The see, which was presided over after the Reformation by three Protestant archbishops, was incorporated with the Mark of Brandenburg in 1680. M., with a garrison of 23,800 men, surrendered ignominiously to the French under Ney, November 8, 1806. It was restored to Prussia in 1814. See Wolter, *Geschichte der Stadt M.* (1845); Hoffmann, *Chronik der Stadt M.* (1843-50).

Magdeburg Centuries was a Church history published at Basel (1559-74), and so called because it was divided into centuries, and was begun at Magdeburg, by M. Flacius (1552), who was assisted by J. Wigand, M. Judex, B. Faber, A. Corvinus, T. Holthutens, and others. The writers, who got the name of M. Centuriators, were Protestants, whose object was to demonstrate that early Church history, when cleared of the obscurity and fables with which it had been overlaid by Romish writers, was opposed to the doctrines and pretensions of Popery. The history was only brought down to the 13th c., and as a volume was devoted to each century, the work just extended to 13 vols. folio. It was in reply to the M. C. that Baronius wrote his *Annales Ecclesiastici* (12 vols. fol. Rome, 1588-1607). See Dowling's *Introduction to the Critical Study of Ecclesiastical History* (Lond. 1838).

Magdeburg Hemispheres are two hollow hemispheres which fit accurately together so as to form an air-tight sphere. They were invented by Otto von Guericke, of Magdeburg, to practically demonstrate the enormous pressure exerted by the air, an experiment which he accomplished by exhausting the sphere of its contained air, and then trying to pull the hemispheres asunder.

Magee, William, D.D., born in county Fermanagh, Ireland, March 18, 1766, graduated at Dublin University (1785), was elected fellow (1788), ordained (1790), and after serving for some years as assistant professor of Oriental languages, was raised to the chair of mathematics (1806). In 1811 he published his *Discourses on the Atonement* (7th ed. 1841), and the year after accepting the livings of Kappagh and Killyleagh, became Dean of Cork (1814), Bishop of Raphoe (1819), and Archbishop of Dublin (1822), where he died, August 18, 1831. A complete edition of his works appeared in 1842.—**William Connor M., D.D.**, born at Cork in 1821, entered Trinity College, Dublin (1834), became incumbent of the Octagon Chapel, Bath (1850), and of Quebec Chapel, London (1860), Rector of Enniskillen (1861), Dean of Cork (1864), and shortly afterwards of the Chapel Royal, Dublin, Donellan Lecturer (1865-66), and Bishop of Peterborough (1868). He has published numerous sermons, but is best known by his speech against the disestablishment of the Irish Church (June 14, 1869).

Magellan, properly **Magalhaens, Fernando de**, a famous navigator, was born at Oporto about 1470, served in the E. Indies under Albuquerque, experienced niggardly treatment at the hands of Dom Manuel, entered the service of Karl V. in 1517, and undertook to find a western route to the Moluccas. With a fleet of five vessels and 234 men, he sailed from Seville, August 10, 1519. He reached the mouth of the La Plata, January 12, 1520, and entered (October 21) the strait which now bears his name, but which he called the 'Strait of the Eleven Thousand Virgins.' Clearing the strait, he discovered the great southern ocean, which he named the Pacific, on account of the tranquillity of the weather. After many hardships, the fleet, reduced to three vessels, reached the Ladrões, March 6, 1521, and Tamar, the first discovered of the Philippines, on the 18th of

the same month. M. was killed on the island of Matan in an encounter with natives, April 27, 1521. Only one ship and fifteen men returned to Europe, thus completing (September 6, 1522), for the first time a voyage round the world. See Amoretti's *Narrative* (Milan, 1811), and *The First Voyage Round the World*, from the accounts of Pigafetta and other contemporary writers, by Lord Stanley of Alderley (Lond., printed for the Hakluyt Society, 1874).

Magellan, Strait of, divides Patagonia from Tierra del Fuego. It is about 300 miles long, and is now regularly navigated by steamers. At the W. entrance there is a Chilean colony, which had a pop. of 1140 in 1874. The Strait was discovered by Magalhaens in 1520. At a place called Vaqueria, Captain Corey discovered three large beds of coal of an average thickness of 24 feet (April 1875). See J. G. Kohl's very interesting *Geschichte der Entdeckungsreisen sur M.'s Strasse* (Berl. 1877).

Magen'die, François, a French physiologist, was born at Bordeaux, October 15, 1783. In 1821 he began the publication of a medical journal, and the same year was elected a member of the Academy of Sciences. In 1831 he became Professor of Medicine in the Collège de France. He died at Paris, October 7, 1855. By experimenting on living animals he made many important physiological discoveries, and is specially known for his investigations into the action of poisons and the physiology of the nervous system. Of his numerous writings, the more important are *Précis Élémentaire de Physiologie* (2 vols. 1816); *Leçons sur les Phénomènes Physiques de la Vie* (4 vols. 1836-38); *Leçons sur les Fonctions et les Maladies du Système Nerveux* (2 vols. 1839); and *Recherches Philosophiques et Cliniques sur le Liquide Céphalo-rachidien ou Cérébro-spinal* (1842).

Magenta, a town of N. Italy, province of Milan, 20 miles E. of Milan city by rail. It lies in a wine-growing district traversed by the Naviglio Grande, and gives name to one of the new coal-tar colours. From its central position it has been the theatre of many battles, of which the last and greatest was that in which the Italians and French defeated the Austrians, 4th June 1859, forcing them to evacuate Lombardy. Marshal Macmahon bears the title of Duc de M. A monument was erected here to Napoleon III. in 1862. Pop. (1874) 6135.

Ma'gerö. See NORDCAP.

Maggio're, Lago di (Lat. *Lacus Verbanus*), the second largest and most beautiful of the Italian lakes, lies between the Swiss canton of Ticino on the N., Lombardy on the E., and Piedmont on the W. It is 678 feet above the sea-level, 37 miles long by 2-8 broad, and 2800 feet deep, and is fed by the Tosa, Tresa, and Ticino. The northern shore is fringed by lofty granite mountains, which, along the eastern side, slope gradually down to the level of the plains of Lombardy, and in the middle of the lake are the four Borromean Islands.

Magg'ot, a name given to the grubs or larvæ of flies or *Dipterous* insects, but applied also to the larvæ of other groups of insects, e.g., the beetles. They appear in putrefying or decomposing substances, and their appearance was held to be a proof of spontaneous generation, till Redi of Florence, in the middle of the 17th c., showed that they proceeded in reality from the eggs of the flesh-flies.

Ma'gi (Gr. *magoi*, 'wise men'; Pehlvi, *mag*, 'priest') were originally the priestly caste of the fire-worshipping tribes of Western Asia, according to Herodotus one of the six tribes of the Medes, a position apparently analogous to that of the Levites among the Jews. Under the Medo-Persian empire, after a struggle with the Persian dualism (see PARSEES), the Median nature worship maintained its footing, and the M. also remained the priestly and learned caste, with unbounded influence in religious, social, and national affairs, inasmuch that it was considered a necessary part of a princely education to be instructed in their peculiar learning. From the nature of their religion their science included astrology, many forms of divination, interpretation of dreams, and other natural phenomena. According to Strabo they practised three forms of divination:—(1) By raising the dead (see NECROMANCY), (2) by cups, and (3) by water. Their religion was reformed by Zoroaster (q. v.), and the order divided into three classes:—(1) Herbeds ('learners'), (2) Mobeds ('masters'), (3) Dester Mobeds ('perfect scholars').

In later times the civilised world was overrun with *magians* or *magicians* who could predict the future by the language of the stars, interpret dreams, cure by charms otherwise incurable diseases, &c. But the fall of the Eastern monarchies in connection with which the M. had been maintained had deprived them of their authoritative position, and the progress of knowledge and the spread of Christianity gradually deprived them of their influence. All the arts of divination, &c., gradually fell into disrepute, and *magic* became a comprehensive name for jugglery and tricks of legerdemain.

Magio (through the Gr. *magos* from the Pehlvi *mogh*, 'a priest,' akin to Sansk. *mahat*, 'great') may be termed the science of superstition—a philosophy of the Unknown older than Von Hartmann's. It comprehends all forms of Witchcraft (q. v.); the degraded Fetichism (q. v.) of Africa, Shamanism (q. v.) of Tartary, and Taoism of China; and the abstruser Alchemy (q. v.), Astrology (q. v.), and Divination (q. v.), with its modern developments Clairvoyance (q. v.) and Spiritualism (q. v.). Its origin is traceable to man's love of referring all effects to some cause known or unknown. Phenomena which we now-a-days explain, or think to explain, by attributing them to 'odid' or 'psychic force,' an older generation would have ascribed to occult powers—in a word, to M. For what is M. to one is science or imposture to another. Hence jugglers, ventriloquists, and charlatans figure side by side with sages and self-duped fanatics; and the Marabouts (q. v.) of Algeria, the medicine men of the Red Indians, and the Dr. Slades of civilised England, are as truly magicians in the eyes of their believers as were ever the Magi (q. v.) of Persia, the adepts of the Cabala (q. v.), or the Rosicrucians (q. v.) of the 18th c. Nay, Solomon and Alexander, Aristotle and Virgil, Robert Grosseteste and St. Thomas Aquinas, Roger Bacon and Faust, all these have been at one time or another regarded by the vulgar as professors of M.; and placed in the midst of savages, Tyndall or Carpenter might win, like Houdin, a reputation equal to that of Albertus Magnus, Michael Scott, Cornelius Agrippa, Paracelsus, Van Helmont, Dee, Lilly, Cagliostro, and other masters of 'grammar.' The Alexandrian philosophers distinguished between the *goëcia* of demons and the *theourgia* of good genii, and C. Agrippa divided M. into three kinds:—*Natural*, producing marvellous effects by the application of natural agents to passive objects; *judicial*, nearly identical with judicial astrology; and *superstitious M.*, more powerful than either of the preceding, baneful in its workings, and depending on the co-operation of evil spirits. The popular medieval fancy, again, classed all M. under the two heads of *Black* and *White*. The latter of these was not only held to be lawful, countenanced as it was by many of the highest ecclesiastics and princes of the times, and hallowed by countless religious rites and formularies; but, as the foster-mother of chemistry, astronomy, medicine, and a host of the arts and sciences, did undoubtedly work on the whole for the good of the human race. But if the White were beneficial, the Black Art was no less deadly in its results. Believing in their own pretensions to supernatural powers, its practisers scrupled at no villany in the prosecution of still greater results, and the nameless abominations of Giles de Retz and his compeers account for, if they do not justify, the horrible persecutions of wizards and sorceresses that were acted throughout the 16th and 17th centuries. See Symphorien Champier, *Dialogus in Magica Arte* (Lyon, 1506); Montfaucon Villars, *Le Comte de Gabalis* (Par. 1670); Defoe, *System of Magic*; Tiedemann, *De Artium Magicarum Origine* (Marb. 1787); Horst, *Zauberbibliothek* (6 vols. Mainz, 1820–26), and *Von der alten und neuen Magie Ursprung, Idee, Umfang, und Geschichte* (Mainz, 1820); Scott, *Letters on Demonology and Witchcraft* (1830); Godwin, *Lives of the Necromancers* (1830); Ennemoser, *Geschichte der Magie* (Leips. 1844; Eng. trans. by W. Howitt, 1854); Eliphaz Levi, *Dogme et Rituel de la Haute Magie* (2 vols. Par. 1856), the work of a firm believer in the reality of M.; Comte de Resie, *Histoire des Sciences Occultes* (Par. 1857); L. F. Maury, *La Magie* (Par. 1860); and Michelet, *La Sorcière* (1862).

Magio Lantern is an optical instrument for throwing a magnified image of a picture upon a screen. It consists of a lantern with a horizontal tube inserted in the one side at the height of the lamp flame, whose rays are directed through the tube by a reflector placed behind. Before entering the tube the rays are concentrated by means of a plano-convex lens. They

then pass through the picture, which is painted in transparent colours upon glass, and are received by a double convex lens set in the further extremity of the tube. The image of the picture is then brought to a focus, and thrown upon a screen which is placed at a certain distance. The glass slide must be inserted upside down, since the image is inverted when projected upon the screen.

Magic Square is an arithmetical curiosity on which the oldest writing in existence is a MS. of the 16th c. (now in the Paris *Bibliothèque Nationale*), and which has since engaged the attention of many eminent mathematicians. It consists of a series of numbers belonging to an arithmetical progression, so arranged in the equal subdivisions of a square that the sum of any column or row, horizontal, vertical, or diagonal, is the same. The following are the two simplest, formed of the natural numbers from 1 to 9, and from 1 to 16 inclusive respectively:—

2	7	6	1	15	14	4
9	5	1	12	6	7	9
4	3	8	8	10	11	5
			13	3	2	16

The latter has the further property that if quartered, the numbers in each quarter, when added together, give the same sum 34. See Hutton's *Recreations in Mathematical Science* (1814).

Magilus, a singular genus of *Gasteropodous* Mollusca, represented by the *M. antiquus*, which bores into masses of coral. It inhabits the Red Sea and Mauritius. In the young state the shell is of ordinary form, and of thin and delicate structure. It encloses itself amongst the growing coral, and elongates its shell to keep pace with the growth of the latter. An 'operculum' closes the mouth of the tube. M. may attain a length of 2 or 3 feet.

Maginn', William, LL.D., son of a classical teacher, was born at Cork, Ireland, 11th November 1794, entered Trinity College, Dublin, at the early age of ten, and took the degree of LL.D. in 1816. During 1818–20 he was a frequent contributor to *Blackwood*, settled in London in 1823, and rapidly came to the front as a brilliant and versatile penman. In 1828 he joined the staff of the *Standard*, and was editor of *Fraser's Magazine*, when its pages were constantly irradiated with the flashes of youthful genius. He died at Walton-on-Thames, 21st August 1842. His *Homeric Ballads*, *Shakspeare Papers*, and critical essays have been edited by Dr. R. S. Mackenzie (5 vols. New York, 1855–57). M. was one of the gayest, brightest, and wittiest of those reckless litterateurs who half a century ago worshipped with equal devotion at the shrines of Apollo and Bacchus.

Magliabecchi, Antonio, was born at Florence in 1633. Bred a mechanic, he gained fame as a scholar, became librarian to Cosmo III., and lived the life of an eccentric bookworm in the strictest seclusion till his death at Florence, 12th July 1714. He made little use of his learning, except in publishing a catalogue of Oriental MSS. in the Laurentian Library, and editing the *Hodaportion* of Ambrosio the Camaldulensian and the *De Præstantia Virorum sui ævi* of Benedetto Accolti. His letters were published (5 vols. 1745), at Florence, where his library (30,000 vols.) still remains entire.

Magna Charta, properly **Magna Carta**, was a 'treaty of peace' between King John and the English people, so called on account of its importance, to distinguish it from the *Carta de Foresta*. It was submitted to and signed by the king, July 15, 1215, on the banks of the Thames between Staines and Windsor. 'Although it is not the foundation of English liberty, it is the first, the clearest, the most united, and historically the most important of all the great enunciations of it; and it was a revelation of the possibility of freedom to the medieval world.' There is still a copy of it in the British Museum. The central clause of the charter was that which enunciated the principle that 'no freeman shall be taken or imprisoned, or be divested of his freehold or liberties, or free customs, or be outlawed, or exiled, or any otherwise destroyed; nor will we pass upon him, nor send upon him, but by lawful judgment of his peers, or by the law of the land. We will sell to no man, we will not deny or delay to any man justice or right.' It was also provided that royal exactions should be repressed, inasmuch as 'no scutage or aid shall be imposed on our realm save by the common council of the realm,' whilst guardians

were restrained from wasting the lands of their wards; heirs were to be married without disparagement, and widows protected against the compulsory marriages to which they had been subjected to the profit of the crown. Nor were the benefits of M. C. confined to the rich. What was granted to the tenants-in-chief in the way of immunity from the exactions of the crown, was granted to the under-tenants in their relation to superiors. And the towns were confirmed in their privileges of regulating trade, dispensing justice, and of deliberating upon their own affairs. So often did monarchs try to evade these conditions that there are on record thirty-eight ratifications of the M. C. See Thompson's *Essay on M. C.*, and Professor Stubbs' *Selected Charters* (1874).

Mag'na Græ'cia, the Roman translation of the name (*Μεγάλη Ἑλλάς*) given by the Greeks to their group of colonies in Southern Italy. The term does not seem to have been used with much strictness of application. Sometimes it denotes only the cities on the Tarentine Gulf, at other times it excludes those N. of the Bruttian Peninsula; but it is more generally extended to all the Hellenic settlements on the Italian mainland from Cumæ southwards. Whether the Hellenic cities of Sicily were ever included under the appellation is more than doubtful. The name had no territorial meaning, though it is certain that in some instances the colonists acquired not only rule over the native Italian tribes, but also the possession of land. It was employed rather in an *ethnic* than a *geographical* sense. Wherever the Hellenes went they carried Hellas with them, and in Italy their cities were so numerous and became so rich and powerful that the name M. G. was hardly hyperbolic. The earliest settlement is believed to have been Cumæ (q. v.), but the exact date is not known. Omitting the Sicilian cities, the next in order were the Achæan settlements of Sybaris (q. v.) and Croton (q. v.), followed by the Spartan settlement of Tarentum (q. v.), and the Locrian settlement of Locri Epizephyrii, all within the last twenty years of the 8th c. B.C. Most of the cities, however, on the Tyrrhene and Ionian Seas were not colonies direct from Hellas, but from the first Hellenic settlements in Southern Italy. Such were Posidonia, Laüs, Scidrus founded by Sybaris; Terina, and Caulonia, by Croton; Hipponium and Medma by Locri, &c. The golden time of the cities of M. G. was from about 710 to 510 B.C., though Tarentum flourished down to its capture by the Romans in 209 B.C., and the important cities of Thurii and Heraclea were not founded till 443 and 432 B.C. respectively. The causes of their decline were mutual jealousies with their accompaniments of bloody strife, the rise of the Syracusan power in the South, and of the Samnite power in the North. Rome deliberately allowed them to perish from political motives, Rhegium, Posidonia (Pæstum), and Brundisium alone maintaining their prosperity. In the days of Cicero, M. G. was 'wiped out' (*deleta*).

Magne'sium (symbol Mg; atomic weight 12), is usually grouped with the metals of the alkaline earths—barium, strontium, and calcium, but many of its properties resemble more nearly those of zinc. It occurs in nature as a constituent of various minerals, which have as a rule a peculiar soapy feel. The metal, which is best obtained by fusing chloride of M. with sodium, is brilliant white in colour, resembling silver. It is more ductile and malleable than zinc, fuses below a red heat, and may be distilled. Unlike the other metals of the alkaline earths it is practically unacted upon by cold water, and only slowly oxidised by boiling water. In the presence of acids, however, oxidation takes place rapidly. A M. wire when heated in a flame takes fire and burns with an intense white light, which has been used for photographic purposes at night. It forms only one oxide (Mg O), corresponding in composition to the other alkaline earths, and generally known by the name of *calcined magnesia* from its formation by calcination of the carbonate. It is much feebler as a base than baryta, strontia, or lime, combining with water without evolution of heat. Its hydrate is very slightly alkaline, and is easily decomposed by heat. Calcined magnesia when mixed with water forms in time a hard compact mass like plaster of Paris, and may be used for similar purposes. The carbonate occurs in the mineral kingdom as *Magnesite*, and as a constituent of *magnesian limestone* or *Dolomite*. It is the latter mineral that forms the chief source of our magnesian compounds. By calcining Dolomite to remove the carbonic acid, and then washing to remove part of the lime, a residue of lime and mag-

nesia is left, which by treatment with sulphuric acid is converted into a mixture of the sulphates. From this the *sulphate* of magnesia may be readily dissolved and reprecipitated by evaporation as prismatic crystals having the composition $MgSO_4 \cdot 7H_2O$. The chief source of the sulphate, or *Epsom salt* as it is commonly termed, from its former occurrence in certain springs near Epsom in Surrey, is however the *mother liquor* left after evaporating sea water during the manufacture of common salt. (See EPSOM SALTS.) *Chloride of M.* ($MgCl_2$) is important as the source of the metal. It is obtained by evaporating a solution of hydrochloric acid neutralised by magnesia or the carbonate. To prevent the chloride being decomposed by water at the close of the process, hydrochlorate of ammonia is added, and the double chloride of M. and ammonium formed. From this the latter may be driven off by fusing. M. is one of the few metals which unite directly with nitrogen at a high temperature to form a *nitride*. The nitride of M. (N_2Mg_3) gives rise to magnesia and ammonia when treated with water. Compounds of M. are met with in many minerals. Periclase and brucite contain the oxide; guanite and struvite the phosphate (which also enters into the composition of bones); boracite the borate; serpentine and olivine the silicate; and pearl spar the carbonate, forming a crystallised compound with the carbonate of lime.

Medicinal Properties and Preparations of M. The compounds of magnesium, employed in medicine, are magnesia and its carbonates, its sulphate and citrate. Magnesia is employed as an antacid, laxative, and antilithic; and is prescribed in cases of dyspepsia, acidity, gout, and various complaints attended with acidity and constipation. It is an excellent and mild purgative for children. *Carbonate of magnesia* is prepared under two forms—the heavy and the light. *Heavy carbonate of magnesia* acts in the same manner as magnesia, and from it *liquor magnesia carbonatis*, or fluid magnesia is prepared. *Citrate of magnesia*, the French *limonade purgatif*, is prepared from the carbonate of magnesia, citric acid, syrup of lemons, bicarbonate of potash, and water. The sulphate of magnesia is the same as *Epsom Salts* (q. v.).

Magnetism. If a bar of soft iron be held in a certain definite direction with reference to the earth, and be hammered, twisted, or filed, it will be found upon trial to have acquired the property of attracting and lifting small fragments of iron or steel. The bar has become a *magnet*; and the influence which imparts this property to iron is called M. There are other and better methods of making magnets than that indicated above. These will be described later. Before discussing the fundamental experiments upon which the theory of M. is based, however, it is advisable to notice as a preliminary that the same attractive power is possessed by a native ore of iron, called magnetin, magnetic iron ore, or loadstone. It is said to have been found in great abundance near Magnesia in Lydia, from which the name (Gr. *magnes*) was probably derived. The attractive force exerted by a long thin magnetised bar is greatest at the extremities of the bar, and vanishes towards the middle. This is readily shown by simply plunging a bar magnet into a heap of iron filings, which on the withdrawing of the magnet will fix themselves in clusters only at or near the extremities. If suspended so as to permit of free motion in a horizontal plane, the magnet will always tend to set itself in a definite azimuth, and if disturbed from this azimuth will oscillate about it. For ordinary latitudes the general direction of position taken up is north and south, so that the one extremity, called the *north pole*, points north, and the other, called the *south pole*, points south. Every magnet has this directive property. If a second magnet be brought near the suspended one, the latter is drawn out of its original position of equilibrium and takes up a new position relatively to the other magnet. By experiment it is found that if the north pole of the second magnet be brought near the north pole of the suspended magnet, the latter is repelled and the south pole attracted. This is precisely the same law which holds in static electricity—*like repels like, and like attracts unlike*. It warrants us also in treating of M. mathematically, to speak of the one pole as *positive* and the other as *negative*. If two freely and horizontally suspended magnets be placed near one another in the same plane, they will tend to set themselves so that the nearer ends are opposite poles—as also the further ends. We have seen that a single magnet, uninfluenced by other magnets, tends to set itself in a north and south direction;

and this would indicate that the earth itself is a great magnet, whose poles are situated near the geographical poles of the earth. Strictly speaking, then, what is commonly called the north pole of a magnet should be called the south, since it is attracted by the north magnetic pole of the earth; and such was the nomenclature originally suggested by Gilbert (q. v.) in 1600, who was the first to discuss scientifically the fundamental phenomena of the polarity of magnets. From these experiments we conclude that every magnet (including the earth) has two dissimilar poles, and that like poles repel each other, and unlike poles attract. Further, the poles of a magnet are equal in intensity of magnetisation—i.e., the one will attract a third pole with the same force that the other repels it. Hence, mathematically, we may express the strength of the one pole by $+m$, and of the other by $-m$. It is impossible to isolate one magnetic pole from the other; if a magnet be cut in two, the halves present the same polarity that the whole did originally. Into however many fragments a magnet may be broken, indeed, each little piece is in itself a perfect magnet. The force with which two poles attract or repel each other was found by Coulomb by means of the Torsion Balance to be proportional directly to the product of the intensities, and inversely to the square of the distance separating them. Hence, defining a unit magnetic pole as a pole which exerts unit force at unit distance on another equal pole, and representing the intensities of the two poles by m and m' , and their distance from one another by r , the force between

them is $F = \frac{mm'}{r^2}$. When m and m' are of different signs, the force is attractive, and tends to diminish the distance between the poles; when m and m' are of the same sign, the force is repulsive, and tends to increase this distance. The above formula is identical with the one which holds for gravitation; and consequently all the theorems proved by Newton for the law of the inverse square hold in the theory of M. Further, the following propositions regarding the potential may be assumed. The potential at a point distant r from a magnetic pole of intensity m is $\frac{m}{r}$, and represents the work done on or by a unit pole carried from this point to an infinite distance. Taking the unit pole as positive, the work will be done *on* the unit pole when $\frac{m}{r}$ is negative, since there is resistance to be overcome,

and *by* the unit pole when $\frac{m}{r}$ is positive. The force at the point in any given direction is equal to the rate of change of potential in that direction. The idea of potential implies (see ELECTRICITY) action through a medium. Of the true nature of the action we have no clear conception; but its effect is to modify the region immediately surrounding a magnet, inducing in it a state of strain, and constituting what is termed a *magnetic field*. The existence of a magnetic field is not necessarily dependent upon the presence of a magnet—the same state of things may be produced, as will be shown later, by electric currents. Consequently it is more proper to regard the magnetic field and not the magnet as the direct cause of the various magnetic phenomena. This was the great step taken by Faraday in his investigations. He conceived *lines of force* to emanate in all directions from the poles of a magnet; and the direction of the line of force at a given point is the direction of greatest rate of change of potential. Hence the equipotential surfaces are everywhere perpendicular to the lines of force. The equipotential surfaces due to a single magnetic pole are therefore spheres, since the lines of force are straight lines diverging in all directions from the pole. Practically, however, such an arrangement cannot be realised, on account of the impossibility of isolating a single pole. The lines of force due to a single bar magnet are curved, and run from pole to pole—in other words from the place of highest potential to the place of lowest. According to convention, the N. pole of a magnet is regarded as the positive pole, so that the direction of a line of force at any point is the direction in which a positive unit pole would be urged by the magnetic forces. In a *uniform* magnetic field the lines of force and therefore the equipotential surfaces are parallel. Such a state of things can only be produced by particular combinations of magnets, but it may be assumed to exist in small portions of space at a great distance from the pole producing the state. Thus the magnetic field due to the earth's M. at any

place in ordinary latitudes may be taken as uniform. The direction of the lines of force is shown by what is called the *Dipping Needle* (q. v.). All magnets tend to set themselves in a particular vertical plane, which intersects the earth's surface in what is called the *magnetic meridian*—this property is shown by the ordinary compass needle. If a magnetised needle be suspended from its centre of gravity, however, it tends also to set itself at a certain inclination from the horizontal, called the *dip*. This dip gives the true direction in which the lines of force due to the earth's M. act. It varies in value from 0° near the equator to 90° at the magnetic poles. (See TERRESTRIAL M.) The direction of dip is the direction in which the bar of soft iron must be held so as to be magnetised in the manner indicated in the opening sentence of the present article; and the discussion of this point introduces the vast subject of *magnetic induction*.

If a piece of soft iron, not originally magnetised, is brought near a magnetic pole, it immediately acquires the polarity peculiar to a magnet. This is the primary phenomenon of induction. An ordinary iron nail, attached by its one extremity to the N. pole of a magnet, has its other extremity at once magnetised so as to act also as a N. pole. A second nail may then be attached to the free end of the first, and so on, until a chain of nails set end to end is obtained hanging from the pole of the magnet. The chain may be formed into an arc, by simply bringing the last member, whose free extremity is of course a N. pole, into contact with the S. pole of the magnet, to which it will at once adhere strongly. This phenomenon of magnetic induction is at first sight closely analogous to electric induction, and originally it was explained upon the same hypothesis of two fluids which attracted each other, while each repelled itself. Upon this hypothesis unmagnetised matter was neutral, because of the complete intermingling of the two fluids, whereas in a magnet the fluids had been separated, the one kind collecting at the one extremity, the other kind at the other. On the approach of the one end of a magnet to a piece of soft iron the fluids in the latter were separated, the kind different from that in the contiguous pole being attracted, the same kind being repelled. This hypothesis, however, is untenable in the light of the well-known and already-mentioned phenomenon that the fragments of a broken magnet are in themselves perfect magnets. Poisson, it is true, obviated this difficulty by supposing the separation of fluids to take place not in the general mass of the magnet, but in the individual particles which make up the magnet. His theory, however, leads to the result, which can hardly be physically true, that the space occupied by the molecules bears to the whole volume of the magnet the ratio 134:135. Weber's theory differs from Poisson's in assuming that the molecules of iron are permanently magnetised, that in non-magnetised iron these molecules are set indifferently in all directions, but when placed in a magnetic field they turn or tend to turn in one direction, so that the whole magnet acquires polarity. This theory implies a maximum intensity of magnetisation, which is reached when all the particles are set parallel to each other. Experiments by Joule, Müller, and more especially by Beetz, furnish complete evidence as to the existence of this limit. The last-named physicist, by electrolytic deposition of iron in a strong magnetic field, obtained a filament of iron whose *magnetic moment* (the product of the length into the strength of the positive pole) was hardly increased by the action of a powerful magnetic force acting in the same direction. A magnetising force in the reverse direction reduced the filament to the condition of ordinarily magnetised iron. Weber's hypothesis is thus in perfect accordance with experiment. The angle through which the molecules are turned, and therefore the resulting magnetisation of the bar, depend upon the strength of the magnetic field, and if the magnetising force exceeds a certain limit, experiment shows that after removal of the force a certain residual magnetisation remains, and the soft iron bar is permanently magnetised. The molecules have acquired a permanent *set*, and have not returned to their original relative positions. If, instead of a soft iron bar, a steel bar be used, the inductive effect is very much smaller, but the residual magnetisation is greater in proportion to the magnetisation produced when the magnetising force is present. It would appear, then, that the molecules of steel are more difficult to rearrange; but, once moved, they have a much feebler tendency to return to their original positions.

Under ELECTRICITY, CErsted's discovery of the effect of a current upon a magnet in its vicinity—the fundamental fact of

electro-magnetism—is discussed. The properties of *solenoids* or helices of conducting wire are shown to be precisely analogous to the properties of bar magnets. Every electric current, indeed, forms in the region around it lines of magnetic force. Wherever a current is, there is a magnetic field. Conceive an indefinitely long vertical straight wire carrying an electric current, and suppose a person so to set himself in the position of the wire that the current flows from his head to his feet; then a freely suspended magnet would under the action of the current turn so that the N. pole would point to his right hand. The lines of magnetic force are concentric circles, which have their common centre coincident with the wire, and which lie in planes perpendicular to the wire; the equipotential surfaces are therefore planes containing the straight wire. Ampère and Weber have shown that the magnetic action of a small plane circuit at distances great compared to the dimensions of the circuit is the same as that of a magnet whose axis is perpendicular to the plane of the circuit, and whose magnetic moment is equal to the strength of the current multiplied by the area of the circuit. If the circuit be the boundary of a surface, and if for this surface a magnetic shell of the same intensity as the current be substituted, the magnetic action of the shell upon distant points is the same as the action of the current. A person standing on the *positive* side of this shell, that which corresponds to the N. pole of a magnet, would have the current in front of him flowing from right to left. The action of a current of intensity i of any form and size, at an external point (P) may be studied by taking the circuit as the boundary of a surface (S), and breaking up this surface into a number of elementary quadrangular elements, small compared to the radius of curvature of the surface and to their distance from P, by two series of lines crossing each other. Round each element let a current of intensity i flow. Then at any common line of separation there will be equal currents flowing in opposite directions, whose magnetic effect is *nil*; and therefore the total effect of the elementary circuits is equivalent to that of the original circuit. Substitute for each small circuit-compounded area, a magnetic shell of intensity i ; and the result will be a whole magnetic shell of intensity i coinciding with the surface S having the same magnetic action at P as the original circuit. The form of the surface S being quite arbitrary, the above shows that the action of a magnetic shell at an external point depends only on its magnetic intensity and the form of its edge, being quite independent of the form of the shell itself. The action of an electric circuit upon a magnetic system in its neighbourhood may therefore be deduced from the action of a magnetic shell, having the circuit for its boundary, on the same—provided that the magnetic shell passes through no part of the magnetic system. And hence, the action of the system upon the circuit may be deduced from its action upon the shell. Consequently, the mutual action of two circuits may be deduced from the mutual action of two shells which have these circuits as their boundaries, and which have their magnetic intensities equal to the respective current intensities. Lenz's Law of the induction of electric currents (see *ELECTRICITY*) holds then for more purely magnetic phenomena. In other words, the motion of a magnet in the vicinity of a closed circuit should induce in it a current, whose mechanical action upon the magnet tends to stop its motion. This was experimentally discovered by Faraday, and has since been proved by both Thomson and Helmholtz to be a necessary deduction from Ørsted's discovery taken in connection with the principle of the conservation of energy. It is the fundamental experiment, upon which magneto-electricity is based, and upon which the construction of magneto-electric machines depend.

The magnetic action of electric currents is taken advantage of in the manufacture of magnets. If a steel or hard iron bar be made the core of a coil or helix of wire through which a powerful current is passed, the bar is permanently magnetised. A soft iron core is magnetised only temporarily, and loses its power as soon as the current stops. This property which soft iron possesses of readily acquiring and losing its magnetism on make and break of the current is widely taken advantage of in the construction of electric bells, induction coils, and other electro-magnetic machines. The magnetic action of electric currents further suggested to Ampère his theory of magnetism. He conceived a bar-magnet to owe its magnetism to electric currents revolving round it. This conception may be advantageously applied to

Weber's theory of magnetism, and the permanent magnetisation of the molecules may be looked upon as in reality due to electric currents flowing round each. Upon this theory, then, the true seat of magnetic action is in the region surrounding the magnet and not in the magnet itself. The same is indicated by Faraday's wonderful researches in the magnetism of bodies—researches which extended to other bodies than iron with similar magnetic properties. The metal nickel had long been known to behave like iron, and the repulsion of bismuth and antimony by a magnetic pole had also for some time afforded grounds for speculation as to the true nature of M.; but it remained for Faraday to show that all bodies, solid, liquid, or gaseous, are either *paramagnetic* like iron and nickel, or *diamagnetic* like bismuth and antimony. See *DIAMAGNETIC*.

If the conductor moving relatively to a magnet be a closed circuit, a current of considerable intensity may be induced in it, the direction of which depends upon the direction of motion of the nearest pole relatively to the circuit. Machines constructed with a view to the generation of currents by this means are called *magneto-electric* machines. The first machine of this kind was constructed in 1833 by a Frenchman, Pixii. He made a U-shaped magnet rotate round a vertical and longitudinal axis beneath two fixed coils, in which the currents were induced and utilised. Saxton and Clarke improved upon this arrangement by making the coils rotate instead of the heavier magnet. In Clark's machine the U-shaped magnet is inverted and set vertically, and near its lower extremity the two coils, with soft iron cores, are made to rotate rapidly round a horizontal axis, which passes between the permanent poles. The two iron cores are joined by iron at the back—*i.e.*, at the ends furthest from the horse-shoe magnet. The wires forming the coils are united so as to make one single wire, whose free extremities are attached to a commutator, by means of which the current may be allowed to pass or be broken at will. Each coil passes once in front of each pole during each revolution. The magnetisation of each core is therefore constantly varying in intensity, and suffering constant reversion, so that two equal and opposite currents are induced in each coil at each revolution. At any instant the current in the one coil is right-handed, while that in the other is left-handed; but the coils are so joined that the currents are added to one another, and by an arrangement of contact pieces on the axis the direction of the ultimate current in the external circuit is kept constant. The currents produced by Clarke's machine are of sufficient intensity to decompose water, fuse a thin wire, or magnetise an electro-magnet; but for greater effects the machine would require to be made of inconvenient dimensions. By using a number of coils, and a corresponding series of magnets, a more powerful arrangement may be obtained. Such, for instance, is the machine constructed by Nollet of Bruxelles, which has been successfully used in the lighting of lighthouses. Far more powerful in their effects, however, are the inventions of Siemens, Wheatstone, Wilde, and Ladd. The current induced by the permanent magnet is used in exciting an electro-magnet which is then employed in inducing a second current, which is as much stronger than the original current as the electro-magnet is stronger than the permanent magnet. Siemens and Wheatstone converted the permanent magnet itself into the electro-magnet by sending the induced current round it. These machines can produce currents capable of fusing an iron rod an inch in diameter and a foot long. Great improvements have recently been effected by Gramme; and a Gramme machine, worked by a gas-engine, is now recognised as the most economical means for producing an electric light. Graham Bell's *telephone* must also be regarded as a magneto-electric machine. It consists essentially of a permanent magnet, a closed coil and circuit, and a vibrating iron disk. This disk being in a magnetic field is of course magnetised, and any motion of the disk must induce in the coil a current which flows through the whole circuit. The vibratory motion produced in the disk by articulation of sounds results in the generation of rapidly alternating currents in the circuit; and these currents carried round the coil of a second similar instrument produce variations in the magnetic field there which set its disk into vibrations, similar in every respect to the vibrations of the first disk. These vibrations are then transmitted to the air as sounds, which are an exact reproduction of the original sounds. By this means words have been transmitted through considerable lengths of wire. For standard works see article *ELECTRICITY*.

Magnificat is the name given to the song of the Virgin Mary recorded Luke i. 46-55, which in the Vulgate begins *M. anima mea Dominum*, and which is sung at evening service in the Roman Catholic, Lutheran, and Anglican Churches. The first mention of it, according to Bingham (*Ecl. Ants.*), is about 506, when it was ordered to be sung in the French churches at morning service.

Magnolia is named by Linnæus after Dr. Pierre Magnol. The natural order *Magnoliaceæ*, having *M.* for its representative genus, consists of some seventy species of splendid trees or shrubs. The genus *M.* is found abundantly in the S. United States, and is also met with in various parts of Asia. *M. grandiflora*, a native of Carolina, forms a most conspicuous object in the landscape, attaining sometimes a height of 30 feet, and bearing a profusion of flagrant flowers of a milky-white colour 6 to 8 inches in diameter, in contrast to evergreen shining elliptical leaves that measure 9 inches long. Its noble appearance has led to its introduction into British gardens, where, however, it is usually trained against a wall. *M. conspicua*, from China, has also been introduced into cultivation since 1789; its large lily-like flowers, which expand in spring before the leaves are developed, and are produced in large quantity, render the tree at a distance one compact sheet of white. *M. purpurea*, a Japanese species, has fragrant flowers, the outer portions of which are purple and the inner white. It too stands open-air cultivation in S. England. Another handsome species is *M. Camellia*, a native of Sikkim, and *M. macrophylla*, belonging to the United States, is described as attaining a height of 40 feet, with leaves more than 3 feet long, whilst its flowers attain a diameter of 12 inches. Most of the species possess aromatic tonic properties sufficient to lead to their employment in fevers and rheumatism. *M. glauca* is known in America as 'Swamp Sassafras,' from its ordinary place of growth, and the similarity of its properties to real sassafras. For other notable plants belonging to *Magnoliaceæ* see STAR ANISE, TULIP-TREE, and WINTER'S BARK.

Magnus or **Mag'ni, Johannes**, a Swedish historian, born at Linköping, 19th March 1488, studied at Louvain and Köln, and in 1523 was appointed Archbishop of Upsala, with the consent of Gustaf Vasa. His opposition to the Reformation led to his imprisonment for a short time in 1526, after which he visited Russia, Poland, Germany, and afterwards Italy, where he died at Rome, 22d March 1544. During his exile he wrote a *Historia metropolitana Ecclesie Upsalensis* (Rome, 1557-60) and *Historia de omnibus Gothorum Sueonumque Regibus* (1554).—**Olaus M.**, brother of the above, born 1490, after holding various posts in the Swedish diplomatic service, accompanied his brother into exile as his secretary, and was after his death appointed titular Archbishop of Upsala, yet remained at Rome, where he died in 1558. He edited his brother's works, and himself wrote a comprehensive *Historia de Gentibus septentrionalibus earumque diversis Statibus* (Rome, 1555; Eng. trans. Lond. 1658), which was long the main source of knowledge of Sweden and the Swedes available to other nations.

Magnusen, Finn, the name by which is best known Finnur Magnússon, who was born 27th August 1781, at Skalholt, in Iceland, and in 1815 was appointed professor at Copenhagen, where from 1819 he lectured on old Scandinavian literature and mythology. In 1829 he was made 'Geheimarchivar,' which he continued to be till his death, 24th December 1847. *M.* was a laborious investigator and profound scholar in Northern mythology, chronology, and palæography. The following are his chief works,—*Udsigt over den kaukasiske Menneskestammes ældste Hjemsted og Udvandringer* (1818), *Bidrag til Nordisk Archæologie* (ib. 1820), *Dansk Oversættelse af Samunds Edda I.-V.* (1821-23), *Eddalæren og dens oprindelse* (1824-26), *Prisca veterum borealium Mythologiae Lexicon* (1829), *Grönlands historiske Mindesmærker* (1838-42), which last, as well as the posthumous *Antiquités russes* (1860-62), were prepared in conjunction with Rafn.

Magpie (*Pica caudata*), a species of insectorial birds, allied to the Crows (q. v.), and included in the Corvirostris section of the order. The average length is 18 inches, and the beak, wings, and tail are black, glossed with a beautiful metallic lustre, the breast, abdomen, and flanks, and certain portions of the wings being white. The tail is long and spreading. The food consists of insects and fruit, but the *M.* is also known to seize the eggs and young of other birds by way of food, and to attack

mice, reptiles, &c. The nest is of dome-like shape, and is generally found at the summit of a tall tree. The *M.* is well known as a tame bird. It learns to talk with great ease and vivacity, and is a most inveterate thief. The *M.* is common on the Continent, and occurs in N. Asia and in N. America, and is represented by allied species in Eastern Asia.

Magyar. See HUNGARY.

Mahābalipūram, or **The Seven Pagodas**, a ruined city on the Coromandel or E. coast of S. India, 33 miles S. from Madras. It is celebrated for its highly ornamented pagodas, and for carvings on the rocks. The city itself is said to be covered by the sea. See Fergusson's *History of Indian Architecture* (Lond. 1876).

Mahābhārata (probably 'the great story of the children of Bharata'), one of the two great epic poems of Sanskrit literature, containing upwards of 100,000 verses. In many respects it may be compared with the Iliad of Homer. It relates a war between the two rival families of the Kauravas and Pandavas, resulting in the supremacy of the latter in Hindustan. In this there is undoubtedly a basis of historical fact, which it is now impossible to discriminate. With the main story are mingled numerous episodes, taking up three-quarters of the whole, and forming a basis of cosmogony and philosophy for Hindu education. The author is reputed to be Vyasa; but as this name means 'distributor or arranger,' and as it is also assigned to the compiler of the Vedas, &c., it is reasonable to conjecture that the *M.*, like the Iliad, was the growth of many minds and of many years. The complete text has been published in India. See Lassen's *Indische Alterthumskunde* (Bonn, 2d ed. 1875).

Mahābuleshwar, a hill station and sanitarium in the district of Sattara, Bombay, British India, 30 miles N.W. of Sattara by a good carriage road, and 114 S.E. of Bombay. It is situated 4500 feet above the sea, among the highest peaks of the W. Ghats, near the sources of the Kistna river. The rainfall is said to average 230 inches, which nearly all falls in the four monsoon months. The station was established by Sir J. Malcolm in 1828; and the climate is considered most beneficial to those suffering from the Guzerat fever.

Mahādeo ('the great god,' or 'Siva'), a mountain range in the district of Hoshungabad, Central Provinces, British India, 4500 feet above the sea. It has given name to a peculiar formation of sandstone rock, which attains a thickness of 2000 feet, and rises very precipitously from the plain. A great religious gathering used to be held here, but is now stopped on account of its dangers.

Mahājūn (lit. 'great man'), the name throughout India of the rural money-lender, an important personage in almost every village. In some parts of Bengal it is calculated that three-fourths of the cultivators are his debtors. He never charges less than half an *anna* in the rupee per mensem, or 3½ per cent. per annum. But his advances are usually made in kind, for food or seed-grain, to be repaid also in kind after harvest, with a certain recognised addition. It does not appear that he is regarded with any special aversion by the people.

Mahānuddy (Mahanadi, 'great river'), a river of India, which rises near Rajpur in the Central Provinces, and flows in an E. course into the Bay of Bengal by a large delta, S. of False Point, in Orissa. Its total length is 520 miles, and its drainage area 43,800 square miles. It receives many tributaries among the hills, and reaches the plains at Cuttack city by a most picturesque gorge. Its maximum discharge in full flood is said to be 1,800,000 cubic feet per second. It is the husbanding of this enormous water supply that forms the problem of the Orissa canals, which have cost 2½ millions sterling. In the bed of the *M.* are found diamonds of fine quality. See Hunter's *Orissa* (Lond. 1872).

Mahānunda, a river of N. Bengal, India, which rises in the Himalayas above the district of Darjeeling, and flows on the whole S.E. till it joins the Ganges at Godagaree, after a course of 240 miles. In its lower part it is much used for navigation, especially near Maldah town, and its fish are celebrated.

Mahāvāṇsa, a Pali chronicle of Ceylon (q. v.), from the earliest ages to the time of Mahanama-thera, its first compiler, (432 A.D.), and carried on by various authors down to 1756. Like the *Dipavāṇsa*, a still earlier history of the island, it opens with a preliminary sketch of Buddhistic India. The Hon. George Turnour published the first thirty-eight chapters (Candy,

1837), and a few others have been edited in different periodicals by Mr. Rhys Davids and others; but the Ceylon Government has now entrusted the completion of the work, from chapter 39 onwards, to the chief priest Sumangala and Batwan Tudawa Pandit, who in December 1876 had brought it down to the reign of Parakrama Bahu (1153).

Mahé, a French settlement on the Malabar or W. coast of S. India, at the mouth of a small estuary, 7 miles S. from Tellicherry, and 636 from Bombay. Area about 2 sq. miles; pop. about 2000. It was finally restored to the French in 1815. The coasting trade in 1872-73 showed an export of £2702, and an import of £2435.

Mahmud the Ghiznevide, born at Ghuzni, 12th December 967, succeeded his father in the emirship of Khorasan and Bokhara (997), and having conquered the neighbouring provinces of Persia, made Ghuzni (q. v.) his capital, and renounced his allegiance to the califs. He next turned his arms against India, which he invaded fourteen times (1001-28), ravaging Kanoge and Mathura, and carrying off the gates of the famous temple of Somnath. The first of the Mussulman invaders, to him is due the spread of Islam in India. Among a host of men of letters attracted by the splendour of his court, the poet Firdusi (q. v.) stands forth pre-eminent. M. died at Ghuzni, April 30, 1030. See Hammer-Purgstall, *Gemäldeaal Moslemischer Herrscher* (Darms 1837).

Mahmud II., Sultan of Turkey, son of Abdul Hamid, born 20th July 1785, ascended the throne on the deposition of an elder brother, Mustafa IV. The janissaries revolting in favour of Mustafa, he secured his position by destroying his family root and branch. Soon he was embroiled, not only with mutinous pashas and Servian rebels, but with Russia and England. He concluded peace with England in 1809, and with Russia, in the Bucharest Treaty, May, 1812. Greece revolted in 1821; and her independence followed the battle of Navarino on October 20, 1827. Thereafter the disturbances of the janissaries waxed so great that the sultan broke up the perilous force, killing some six thousand. No sooner had he concluded a second disastrous war with Russia (1829), than Mehemet Ali, pasha of Egypt, raised an insurrection; and while a second disturbance of the same kind was raging, M. died, 1st July 1839. His reign was of interest because of his determined struggle, notwithstanding continued oppositions, interruptions, and disappointments, to introduce the institutions of Christian Europe into Turkey, especially to reform his corrupt and inefficient army, and organise a juster system of taxation.

Mahogany, an important and valuable furniture wood, the produce of *Swietenia mahagani*, a tree belonging to the natural order *Cedrelaceæ*, a native of Central America, Mexico, and Cuba, with some of the other W. Indian Islands. The M. tree is of slow growth, but attains to a great height, and it flourishes best on a rocky soil. Its leaves are unequally pinnate, the flowers are axillary, and its fruit consists of a five-celled woody capsule, each cell containing numerous alate seeds. The bark is astringent, and is used as a febrifuge; and the wood also contains the astringent principle catechin, present in catechu. The wood has recently been employed with success in calico-printing, but its great use and value are found in qualities which pre-eminently fit it for use as a furniture wood. It is exceedingly uniform in grain, strong, and free from warping, takes a fine durable polish, and is rich and pleasing in colour. The wood obtained from Cuba and the other W. Indian Islands has generally a handsomer grain than that grown on the mainland, whence in commerce the former is distinguished as Spanish M., the latter being known as Bay M., Baywood, or Honduras M. Spanish M. is cut into veneers, and when richly mottled or possessed of a fine 'curl,' it is exceedingly valuable and costly, while Baywood is plain in appearance, and used only for solid parts of furniture. The beauty of the wood is said to have been first discovered by a carpenter on board Sir Walter Raleigh's vessel in Trinidad harbour in 1595, but it was not brought into prominent notice until the end of the 17th c., when its merits were pointed out by Dr. Gibbons, a London physician. At one time M. was much used in shipbuilding, but now, except for internal fittings, it is not so much employed. The imports of M. into Great Britain during 1876 were 80,705 tons, valued at £737,550. African M. is *Khaya Senegalensis*; Bastard M., *Ratonia apitata*;

E. Indian M., *Seymida febrifuga* and *Cedrela toona*; Madeira M., *Ersea indica*; and white or wild M., *Simostomum bifurcatum*.

Mahon, Lord. See STANHOPE.

Mahony, Francis, better known by his *nom. de plume* of **Father Prout**, was born at Cork in 1805, educated for the Romish Church, and became incumbent of Watergrass Hill. His opinions were of the most cosmopolitan kind, and during the best days of *Fraser's Magazine* he was a constant contributor to its columns. His scholarship was wide, but was utilised by him chiefly for quaint and humorous reference. 'Modest distrust of his own power to please deterred Prout from obtruding much of his personal musings. He preferred chewing the cud of classic fancies or otherwise approved and substantial stuff, delighting to invest with new and varied forms what had long gained universal recognition.' For many years he acted as Paris correspondent for the *Globe* newspaper, and for some years as Roman correspondent of the *Daily News*. Some of his lyrics are of a high order, *The Bells of Shandon* having attained a national reputation. He died at Paris, 18th May 1866. M.'s *Reliques*, collected from *Fraser* in 1836 (new ed. 1860), are the most characteristic of his writings in prose and verse. His later writings were edited by Blanchard Jerrold as *Final Reliques* in 1874.

Mahrattas, or **Marhattas**, a powerful Hindu nation, who once contested the supremacy of India with the British. Their native country, Maha-rashtra, or the great country, is a tract centering round Poonah, the former capital of the Peishwahs. It extends N. to Guzerat, S. to Canara, and E. about as far as Nagpur; the W. is bounded by the Indian Ocean. It is watered by the rivers Neibudda, Godavery, and Kistna; and is broken by the N. and the W. Ghauts, which supply natural fortresses. The M. were always a warlike and clever race; but they first became known in history under the leadership of Sivaji the Great, who was born near Poonah in 1627. By his audacity and valour he founded a semi-independent power over all the M. country, when the Mogul Empire was at its height, and while English merchants were settling at Bombay and Surat. His capital was the fort of Raighur, and his family continued to reign at Sattara until 1848. But from about 1712 all real power passed into the hands of the Peishwah or prime minister, who made himself hereditary mayor of the palace, and ultimately established a dynasty at Poonah, which was overthrown by the English in 1818. The last heir to this name was the infamous Nana Sahib. The Raja of Sattara and the Peishwah were always regarded as the heads of the Mahratta confederacy, which is said at one time to have had a collective revenue of 7 millions sterling, and to have been able to bring 100,000 horsemen into the field, besides infantry and guns. But the military strength lay with four great subordinate chiefs, who each carved out for his family a kingdom by arms. Of these, Scindiah was perhaps the greatest. His capital was at Gwalior in Central India, and for many years the Mogul emperor was a puppet in his hands. The capital of Holkar was at Indore, also in Central India; and the Guicowar, or cowherd, reigned at Baroda. These three families still exist as British feudatories, and are proud to maintain the old military magnificence of the M. The fourth was the Bhonsla dynasty of Nagpur, who extended their power as far E. as Orissa, and became extinct in 1853. The early M. policy was based upon hostility to the Mohammedans, and was carried out both by bravery and treachery. The chiefs often quarrelled among themselves; but it is not impossible that they would have recovered India for the Hindus, had it not been for the disastrous battle of Paniput (q. v.), the Flodden of the M., in which they were entirely defeated by the Afghans, allied with the Nawab of Oude. This was in 1761. The British first came into conflict with the M. in 1778, when Warren Hastings was governor-general. A national league was formed against the British by the Nizam of the Deccan, Hyder Ali and the M., but the alliance was short-lived, and though the war was not altogether glorious to the British arms, a creditable peace was concluded at Salbye near Gwalior in 1782. The overthrow of the M. power was the continual aim and the crowning result of the policy of the Marquis of Wellesley. The M. were divided against themselves; Poonah was attacked and plundered by both Holkar and Scindiah; but in 1802, by the treaty of Bassein, the exiled Peishwah was taken under British protection, reinstated at Poonah by an armed force, and induced to pay

£250,000 a year to support a British contingent; the Guicowar of Baroda was also brought under the same subsidiary system. This led to the second Mahratta War, in which Sir Arthur Wellesley, operating from the S., and Lord Lake in the N., completely broke the power of Scindiah and the Nagpur Rajah. The chief battles were Assaye, Argaum, and Laswari. Great cessions of territory were obtained from both chiefs, and they bound themselves no longer to employ French officers. This was only lasted four months of 1803; in the following year Holkar was conquered, also by Lord Lake. The M. were now no longer independent confederate states with disciplined armies; but the disbanded soldiers, with the connivance of their chiefs, joined the marauding Pindarees (q. v.), and became the scourge of all Central India. In 1817 the Marquis of Hastings resolved to put down this pest, and commenced what is sometimes known as the fourth Mahratta War. The Peishwah took this opportunity to attack the Residency at Poonah, but he was defeated and dethroned. The Nagpur Rajah made a similarly treacherous attempt, but his dynasty was continued for a time. Holkar and the Pindarees were overthrown at the battle of Mehidpur, while Scindiah remained a half-hearted ally. Since this date the M. have accepted the British supremacy. Much of their native country now forms an integral portion of the Bombay Presidency, and the great chiefs remained loyal even through the Mutiny of 1857-58, though the native contingents of both Holkar and Scindiah joined the rebels. Their natural abilities have been greatly turned towards commerce; in the S. Mahratta country some of the finest cotton is grown, while the states of Gwalior and Indore produce the opium of Malwa. Among other Mahratta states may be mentioned Tanjore in S. India, founded by a half-brother of Sivaji; Kolhapur, among the W. Ghats, where a descendant of the great conqueror still governs; and the Puar Rajah of Dhar. The Rao of Kutch is also a Mahratta. It is important to recollect that the M. are not a caste, but a nationality. Sivaji and the Bhonslas claimed to be Rajputs; the Peishwahs were undoubted Brahmins; while Scindiah and the Guicowar have never concealed their Sudra descent. It was as cavalry armed with the spear, and not as infantry or gunners, that they attained their military pre-eminence, in this differing both from the British Sepoys and the Sikhs.

The *Mahratta language*, a vernacular corruption from the Sanskrit, and akin to Gujarati, is recognised in the courts of Bombay and the Central Provinces. See Colonel Grant Duff's *History of the M.* (Lond. 1826); *Pandurang Hari, or Memoirs of a Hindu*, edited by Sir B. Frere (Lond. 1872), and *Lord Wellesley's Despatches*, edited by Owen (Oxf. 1877).

Mai, Angelo, born at Schilpario, near Bergamo, March 7, 1782, entered the novitiate of the Society of Jesus (1799), but eventually taking orders as a secular priest, became Professor of Greek and Latin at Naples (1804); keeper of the Ambrosian Library at Milan (1813), and of the Vatican Library at Rome (1819); supernumerary apostolic proto-notary (1825); prefect of the Congregation of the Index (1833); and a cardinal (1838). He died at Albano, September 9, 1854. M's fame rests chiefly on his discovery on Palimpsests (v.) and decipherment of numerous lost works of the classic authors, among them fragments of Cicero's *Orations* and *De Republica*, and of the writings of Fronto, Plautus, Porphyrius, Dionysius Halicarnassus, Lysimachus, Isæus, and others. The results of his discoveries he collected and gave forth to the world in *Scriptorum Veterum Nova Collectio* (10 vols. 1825-38), *Classicorum Aulorum Collectio* (10 vols. 1828-38), *Spicilegium Romanum* (10 vols. 1839-44), *Patrum Nova Bibliotheca* (6 vols. 1852-53), &c. His noble library, sold for the benefit of the poor of his native village, was purchased by Pio Nono for the Vatican Library.

Maiden, The, a machine for decapitation resembling the guillotine, but without its contrivance for binding its victims. The M. was used in Scotland at least as early as 1556, when it was employed to behead one of the murderers of Rizzio, but was discontinued about the close of the 17th c. The M. used in Edinburgh is still preserved in the Antiquarian Museum there.

Maiden-Hair, a name given to *Adiantum capillus veneris*, a particularly graceful fern, from the fine hair-like stalks of its fronds. In the British Isles it is found on damp rocks near the sea in various counties from Dorset to the Isle of Man, and is again native on the W. coast of Ireland. The genus *Adiantum*, as at present defined by Mr. Basker, contains rather

more than sixty species spread through all temperate and hot climates. Many of these are special favourites with fern-fanciers. A fern of another genus, namely the *Asplenium trichomanes*, has frequently the name of black M.-H. applied to it. See CAPILLAIRE.

Maidenhead, a town of England, in the county of Berks, is picturesquely situated on the right bank of the Thames, 26 miles W. of London by rail. It has a large trade in timber, besides some malting and brewing, and is a favourite resort of Londoners. Pop. (1871) 6173.

Maidment, James, was born in London in the last decade of the 18th c., but his parents having settled in Scotland, he was educated at the High School and University of Edinburgh. He passed advocate in 1817. M. was in practice until recent years, and has the reputation of being still one of the best peerage and antiquarian Scottish lawyers. But his life has been much devoted to the resuscitation of quaint and curious *morceaux*, literary, genealogical, and historical, some from original MSS., others from rare and well-nigh forgotten publications. Nearly sixty such works have been edited by M., with illustrative notes, either 'edifying or diverting.' Among these are *Scotland's Complaint upon the Death of our late Sovereign, King James of most happy memorie*, by David Prymrose, reprinted from the edition of 1625 (Edinb. 1817); *Raid of Ruthven: with Preface and Notes* (Edinb. 1822); *Nuga Derelicta quas colligerunt I. M. et R. P.* (Edinb. 1822); *A North Country Garland: a Collection of Ancient Ballads never before printed* (1824) *Scottish Pasquils or Lampoons, now first printed from the Original MSS.* (1827-28); *Reliquia Scotica: from Original MSS. and Scarce Tracts* (1828); *Nuga Scotica* (1829); *Historical Fragments relative to Scottish Affairs from 1635 to 1664* (1832-33); *Catalogues of Scottish Writers* (1833); *Analecta Scotica: Collections illustrative of the Civil, Ecclesiastical, and Literary History of Scotland, chiefly from original MSS.* (1834-38); *The Argyle Papers* (1834); *Ballads and other Fugitive Poetical Pieces* (1834); *Galatians, an Ancient Mystery: taken down from the Recitation of the Guisards at Stirling* (1835); *The Correspondence of Sir John Gordon, Baronet* (1835); *Remains of Sir Robert Sibbald* (1837); *Court of Session Garland* (1839); *Reports of Claims preferred to the House of Lords in the Cassilis, Sutherland, and Spynie Peerages* (1840); *A New Book of Old Ballads* (1844); *Scottish Ballads and Songs* (1859); *Ancient Scottish Elegiac Verses*; Lithgow's *Poetical Remains* (1863); *The Dramatists of the Restoration* (11 vols., 1872-75).

Maids of Honour. See LADIES OF THE QUEEN'S HOUSEHOLD.

Maid'stone, an old town of England, county of Kent, on the right bank of the Medway, 43 miles S.E. of London by rail. Its notable buildings are the large Parish Church of All Saints, a fine specimen of Perpendicular Style, dating from the 14th c., the assize court and county jail, built in 1818 at a cost of £200,000, the corn exchange, cavalry barracks, town hall, W. Kent infirmary, museum, &c. The industrial products are paper, oil, farm implements, Roman cement, leather, malt, beer, spirits, and sacking. In the vicinity are extensive quarries, orchards, and hop-gardens. Pop. (1871), 26,237. M. sends two members to Parliament. It was called by the Britons *Caer Megwaid*, the town on the Medway, according to Nennius, and its later name, *Medwegston*, is modified in Domesday Book to *Meddestane*. Fairfax stormed M. in 1648.

Maigre (*Sciaena aquila*), a species of Teleostean fishes, belonging to the family *Scianidae*. It is common in the Mediterranean Sea, and occasionally occurs on the S. coasts of Britain. It is a fish of some three or four feet in length; though specimens of six feet are not uncommon. Its colour is a silver-grey above and white below, the fins being reddish-brown. The M. is valued for its flesh, but it is very notable for the purring noise or grunting sound it is capable of making, and which is audible even when the fish is in tolerably deep water. In former years the ear-bones of the M. were regarded as charms, which had the power of curing colic.

Mail. See ARMOUR AND CHAIN MAIL.

Mails and Duties, a Scotch law term, denoting the rents of an estate, whether in money or in grain. Hence an action

for the rents, or for an assignation to them, is called an action of M. and D. Under the Quinquennial Prescription Act of 1669 a tenant is not liable for arrears of rent after five years from the time of his removing from the land.

Maimatchin', a town of Mongolia, an entrepôt of the Chinese trade with Russia, on the frontier of the Trans-Baikal government, adjoining the Russian emporium of Kiachta (q. v.). It has lost much of its former importance since the Treaty of Pekin (1860), which opened the whole frontier to Russian commerce. Pop. 2000.

Maimonides, or **Rabbi Moses ben Maimon**, abbreviated **Rambam**, was born at Cordova in 1135, and died at Cairo 1204, or according to others 1206. He was descended from a family which had been distinguished for learning for generations; and his father, himself a writer on religion and astronomy, instructed him in all the Arabic and Rabbinical learning. The father, Maimon, had to leave Cordova with his family, in consequence of the persecution of the Jews by the Calif Abdul-Mumen, and removing to Fez he outwardly conformed to Mohammedanism, while secretly maintaining his adherence to Judaism. In 1165 he removed with his family to Acre, and thence to Jerusalem, where he died. On his father's death, M. removed to Cairo, and made a living for a time by the sale of precious stones, but afterwards took to the practice of medicine, and rose to such eminence in that profession as to be appointed physician to Saladin. His knowledge of medicine, however, was but a small part of his immense learning. Besides being a profound student of the Bible and Talmud (q. v.), he studied all the branches of Arabian science, and so much of the Greek philosophy as had been translated into Arabic. He wrote on Jewish theology and law, and on mathematics, astronomy, and medicine, besides giving lectures in the Rabbinical college. But what contributed as much as his vast learning to the extraordinary influence he gained in the Jewish community was his peculiar views regarding Jewish law and tradition. 'It had been usual up to his time,' says Dr. Jost, 'to look upon the law simply as the will of God, demanding obedience and submission, and all inquiry was directed to the ascertaining what was commanded and what was forbidden, without permitting the further inquiry, why. M. started from quite a different ground-principle. He was inspired with the conviction that the Mosaic law and the oral tradition had not been revealed to Israel to oblige them to a blind obedience; but that, as the whole of revelation consists of the highest truth, the highest excellence consists, not in the mere observance of the law, but in an observance resting upon a knowledge of its inner grounds, and that the most incumbent duty of the Israelite is to make a thorough study of it, so as to fulfil it not only according to the letter, but in the right spirit.' His chief theological works were:—*A Commentary on the Mishna* (1168), written in Arabic, but afterwards translated into Hebrew and incorporated with the Talmud; *The Second Law* (1180), which was a complete collection of Jewish law; *Guide to the Erring or Teacher of the Perplexed* (also first written in Arabic, but translated into Hebrew in his lifetime), which was 'a sort of key to the right understanding of the words, vocables, phrases, metaphors, parables, allegories, and all those things in sacred Scripture which, when taken in their literal sense, appear to teach something foreign to the purpose, heterodox, paradoxical, absurd, or to have little or no use.' See Jost in Herzog's *Encyclopædie*, art. M., and Rosin, *Die Ethik des M.* (Bieslau, 1876), a work in which the obligations of M. to Greek, Arabic, and Jewish writers are clearly and skillfully set forth.

Main (Lat. *magnus*, 'great'), the chief part, hence the open or high sea, as distinguished from inlets, gulfs, and such like. Thomson speaks of the 'Hebrid Isles, placed far amid the melancholy main.' The same word enters into the composition of 'mainland,' which is so called in contrast to the small area of islands. In naval affairs, the epithet M. distinguishes the largest mast and its belongings.

Main, a picturesque river in central Germany, springs from the Fichtelgebirge in two branches, the Rothe and Weisse Main, which unite 3 miles S.W. of Kulmbach, after which it flows W. past Bamberg, Würzburg, Aschaffenburg, Offenbach, and Frankfurt to Castel, opposite Mainz, where it joins the Rhine, after a course of 304 miles. It is connected with the Danube by the Ludwigs-Kanal.

Maine, one of the old provinces of France, bounded N. by Normandy, E. by Perche and Orléanais, S. by Touraine and Anjou, and W. by Brittany. It submitted to William the Conqueror (1060), was conquered by Philippe Auguste (1204), recovered by Edward III. (1357), but given up (1360), and finally annexed to the French crown by Louis XI. (1481).

Maine, the most north-easterly state of the American union, is bounded N. by New Brunswick, S. and S.-E. by the Atlantic, E. by New Brunswick, and W. by Quebec and New Hampshire. Area, 35,000 sq. miles; pop. (1870), 626,915. The coast-line, the most irregular in the United States, is 2486 miles long, following its indentations, of which seventeen are large bays, forming excellent harbours, sheltered by islands. The N. part of M. is traversed in a south-westerly direction by the Appalachians, which attain a height in Katahdin of 5385 feet. The range is not continuous here, but is broken by the broad valleys of the Penobscot, Piscataquis, Kennebec, Androscoggin, and the Aroostook, a branch of the St. John, which forms part of the N. boundary. The lakes on the river courses have an aggregate area of 2300 sq. miles, and of these the chief is the Moosehead, 35 miles long. The rocks in the S. are mainly Eozoic, in the N., including the watershed, Silurian and Primitive. Much of this surface is covered with glacial drift. Along the coast are quarries of roofing-slate and lime, which supply most of the United States. Other minerals of economic value are iron, galena, granite, and white marble. The soil is only rich in the 'valleys, and some three-fifths of the surface are still under forest—in the N. chiefly pine, hemlock, and spruce, in the S. white and red oak, beech, ash, birch, and maple. Among fruit-trees are the plum, cherry, pear, and apple. M. is almost the only state where are still found the moose and caribou, and here they are fast disappearing before the hunter. The lakes and rivers abound with fish and winged game, while the mountains are the haunt of the black bear, deer, catamount, wild cat, wolf, racoon, porcupine, martin, badger, sable, &c. The climate is one of extremes, ranging at Portland from 24° to 100° F., and the average rainfall amounting yearly to 45 inches. In 1873 the produce of hay was 2,007,000 tons (value \$25,087,500), Indian corn, 852,600 bushels, wheat 219,750, oats 1,305,750, barley 420,280, rye 26,010, and potatoes 2,997,100. The factory system of making cheese and butter was introduced in 1872. In 1873 there were 55,960 horses, 126,878 milch cows, 75,503 working oxen, 138,479 other cattle, 338,682 sheep, and 63,000 swine—total value, \$20,096,272. In 1873 the value of cotton goods produced was \$12,427,670; of woollens, \$6,605,292; of boots and shoes, \$3,820,986; of lumber, \$9,230,222; of minerals, \$4,822,050, and leather, \$3,187,300. The value of all industrial products was \$96,209,136. In 1875 there were 968 miles of railway. M. publishes sixty-five newspapers. Augusta is the state-capital, but the chief cities are Portland, Bangor, and Lewiston. First settled in 1623, M. was annexed to Massachusetts, and made an independent state in 1820. A dispute with Britain as to the N.-E. boundary, which was begun about 1784, and nearly resulted in war, was settled by the Ashburton treaty in 1842. In 1851 the state legislature passed the M. liquor law, prohibiting the sale of all intoxicating liquors as a beverage. Since the Civil War much has been done to encourage immigration, and a large Swedish colony is now established within the territory.

Maine, Sir Henry James Sumner, LL.D., born in 1822, entered Pembroke College, Cambridge, came out senior classic (1844), was elected a Fellow, but took his M.A. from Trinity Hall (1847), and was created LL.D. *per litteras regias*. He was appointed Regius Professor of Civil Law at Cambridge (1847), Reader on Jurisprudence at the Middle Temple (1854), and Law Member of the Supreme Government of India (1862). His powers as a jurist were evidenced during a seven years' residence in India by his introduction of many healthful legislative reforms; and, returning to England in October 1869, he received the Corpus Professorship of Jurisprudence in the University of Oxford (1870), a seat in the Council of the Secretary of State for India (1871), and the rank of a K.C.S.I. He is author of *Ancient Law: Its Connection with the Early History of Society, and its Relation to Modern Ideas* (1861); *Village Communities in the East and West* (1871); and *Lectures on the Early History of Institutions* (1873).

Maine-et-Loire, a department of France, in the lower basin of the Loire. Area, 2749 sq. miles; pop. (1872), 518,471. It is traversed from E. to W. by the Loire, which here receives the Mayenne and the Authion from the N. and the Layon from the S. In part richly wooded, it also yields cereals to the value of 61,000,000 francs. Among other products are excellent fruits and wine. There are coal and iron mines, textile industries, chiefly at Cholet (q. v.), and a trade in grain, wine, cattle, &c. The chief town is Angers.

Main'otes, the people of Maina, a mountain region of Laconia, in the Peloponnesus, between the Messenian and Laconian gulfs. The name is first met with in the 10th c., but the M. boast their descent from the ancient Spartans, though some regard them as of Slavic origin. They remained pagan till the reign of Basil (867-886 A.D.), and were never brought completely under Turkish rule. They fought bravely for the liberation of Greece. The M. are now estimated at 60,000.

Maintenance is the intermeddling in an action or suit that does not concern the person interfering. It is punishable by fine and imprisonment. A man may, however, with impunity maintain the suit of his near kinsman, servant, or poor neighbour.

Mainte'non, Madame de, belonged to a Huguenot family, and was born of a scapegrace father, Constant d'Aubigné, in the prison of Niort, 27th November 1635. She was baptized Françoise d'Aubigné, and educated by mother and aunt alternately as Catholic and Protestant. Forced by poverty to marry the deformed and sickly Scarron, she acted as his nurse for many years, and at his death (1660), depended solely on royal bounty for support. In 1664 Mde. Scarron became governess to Mde. de Montespan's children, and when these grew too numerous to hide, she took them with her to a large house in Paris, where she often received their father, Louis XIV. The king had been prejudiced against her; her beauty had fled, for she was now over forty, yet he declared on seeing her that to be loved by such a woman was worth a life. He bought her the estate of Maintenon, the name of which she assumed, and privately married her about the year 1685. Till his death she maintained absolute rule over him, changing him from profligate to bigot, putting upon the court the mask of decency at least, and certainly doing France a service by opposing the extravagant policy of Louvois. At her desire Louis founded St. Cyr, a religious seminary for young ladies of quality. She eagerly pressed the King to revoke the Edict of Nantes, though she professed to have no hand in the ruthless *dragonnade* that followed. M. lived a life of splendid loneliness, preserving what, for these days, was a spotless and admirable character, and on the king's death retired to St. Cyr, where she died, 15th April 1719. The first good collection of her *Lettres* was that by Lavallée in his edition of her *Œuvres* (Par. 1854 *et seq.*); the most complete is by the same writer (4 vols. Par. 1865-66). See *Histoire de Mme. de M.*, by the Duc de Noailles (Par. 1848-59), and one of the most brilliant of Sainte-Beuve's *Causeries du Lundi* (vol. iv.).

Mainz (Fr. *Mayence*), a strongly fortified town of Germany, in Hesse-Darmstadt, on the left bank of the Rhine, opposite and below the influx of the Main, 7 miles S. of Wiesbaden by rail. It communicates with the small town of Castel by a bridge of boats 600 yards long, and is defended by a principal rampart (comprising 14 bastions and a citadel), a series of advanced forts connected by a glacis, and several advanced entrenchments, all strengthened since 1866. The cathedral, founded in 978, partly destroyed six times, and finally restored in the beginning of the present century, is an imposing structure, various parts of which date from the 12th and 15th centuries. It is beautifully vaulted and frescoed, contains 14 altars and 20 minor chapels, is surmounted by two fine domes, flanked by two towers (one 324 feet high), and is richer in interesting tombs than any other cathedral in Germany. Other buildings are the Gothic Church of St. Stephen (built 1318, and restored 1857), with an octagonal tower 214 feet high; the old Electoral Palace (1627-78), containing a rich collection of Roman remains, a picture gallery, and a library of 100,000 vols.; the arsenal, the palace of the Grand Duke, the barracks, a Fruchthalle (used for concerts), a theatre, &c. A bronze statue of Gutenberg, a native of M., designed by Thorwaldsen, was erected here by subscriptions from all parts of Europe. The *neue anlage*, or public prome-

nade, commands beautiful views of the river. There are many Roman remains, including the *Eigelstein*, a sort of cairn, 42 feet high, erected in honour of Drusus, and 62 pillars of an aqueduct, several 30 feet high. M. manufactures tobacco, soap, artificial pearls, carriages, isinglass, vinegar, &c., and has a large transit trade in grain and wine. Pop. (1875), 57,847. M., the ancient *Moguntiacum*, was a Roman fortress, founded by Drusus in 14 B.C. It became the seat of the first German bishopric (751), and subsequently the centre of the powerful 'League of the Rhenish Towns,' established in 1254. It was then called 'Golden M.,' on account of its prosperity. Its university, founded in 1477, was suppressed by the French, to whom the city was ceded by the Peace of Campo Formio in 1797. In 1814 it was assigned to the Grand Duchy of Hesse, and declared an imperial fortress by the Treaty of Versailles, 15th November 1870. See Schnaeb, *Geschichte der Stadt M.* (Mainz, 1841-44), and Klein, *M. und Seine Umgebungen* (Mainz, 1873, new ed. 1861).

Maiolica, or Majolica. This art term, now loosely applied to all kinds of enamelled earthenware, ought properly to be restricted to the tin-enamelled lustred ware introduced into Europe by the Moors, and perfected in Italy during the Renaissance. The Italians named this peculiar ware M. because they first became acquainted with it through Majorca (then currently spelled *Maiolica*), where, as well as in Spain, the Moors had established potteries.

Maistre, Comte Joseph de, a French politico-religious thinker, was born at Chambéry, in Savoy, April 1, 1754, educated at Turin, and under the influence of his parents adopted strict Catholic opinions. By 1788 he had become a senator, but when the territories of the Sardinian king were over-run by the French, M. accompanied his master to the island of Sardinia. In 1803 he went to St. Petersburg as ambassador from the court of Turin. He remained in Russia for fourteen years, and died at Turin, 26th February 1821. His chief works, *Du Pape* (Lyons, 1821), *De l'Église Gallicane* (Par. 1821-22), *Soirées de St. Petersburg* (Par. 1822), place him at the head of the school of 'revived Catholicism'—a school brought into existence as a protest against the anarchy which closed the 18th c. See Sainte-Beuve, *Portraits Contemporains* (vol. ii.); John Morley's *Critical Miscellanies* (first series).

Maitland, a town in New S. Wales, 93 miles N. of Sydney. It is divided into two distinct municipalities, E. and W. M., and from its low-lying position on the banks of the Hunter river, is liable to disastrous floods. The surrounding district is so fertile as to be called 'the granary of New S. Wales.' Coal and kerosene shale are abundant in the district. Pop. (1874) W. M., 5381; E. M., 2282: total, 7663.

Maitland, the name of a celebrated Scottish family. Its first distinguished member was the poet, **Sir Richard M.**, of Lethington, born in 1496, and educated at St. Andrews and in France. Before 1561, when he was made a lord of session, he had become blind. From 1562 to 1567 he was privy seal. He died 20th March 1586. M. wrote, in his later years, a number of familiar poems, printed at Glasgow in 1830 by the Maitland Club, which is named after him. He also collected 272 early Scottish poems in two MS. vols. that are now preserved in the Pepysian Library at Cambridge.—**William M.**, often called **Secretary Lethington**, the eldest son of the above, was born about 1525, and educated at St. Andrews and in France. In 1555, through the influence of Knox, he became a Protestant. Mary of Guise made him secretary of state in 1558, but in Oct. 1559 he joined the lords of the congregation, and took part in the negotiations leading to the Treaty of Berwick (Jan. 1560). On Mary's coming to Scotland, M. became one of her chief advisers, and was repeatedly her ambassador to Elizabeth. He was made extraordinary lord of session in 1561, and in 1563 led the prosecution against Knox for high treason, in which, as well as in the church debate with Knox, in June 1564, he displayed great ability, but was discomfited. His complicity in the murder of Rizzio at first cost him the queen's favour, but before the end of 1566 he was again her trusted secretary. M. was privy to the murder of Darnley, yet he joined the nobles who effected Bothwell's removal. He was present at James VI.'s coronation in 1567, and, though secretly corresponding with Mary, was with her enemies at Langside. After Mary's flight, Murray,

whom he had often offended, caused him to be arrested at the Council Board (3d September 1569), on a charge of being accessory to Darnley's murder. He was imprisoned at Stirling, then removed to Edinburgh, where by a trick his friend Kirkcaldy of Grange had him removed to the castle. M., still plotting for Mary, was proclaimed a traitor (May 14, 1571), and on the surrender of the castle in 1573, fell into the hands of Morton. He died in prison at Leith, June 9, 1573, probably by suicide. M. was one of the ablest men of his time—fertile in invention, astute, and highly accomplished, but too crafty and unscrupulous to retain the confidence of any party. Buchanan has severely censured his crooked ways in his satirical tract, *The Chameleon*.—**John M.**, the only **Duke of Lauderdale**, eldest son of John, first Earl of Lauderdale, and grandson of John, first Lord Thirlstane (brother of Maitland of Lethington), was born 24th May 1616. After a superior education under Presbyterian influences, he entered public life as a supporter of the Covenant, and as such took his seat in the famous Assembly of Divines at Westminster in 1643. In the following year M. was one of the Commissioners employed to treat with Charles I. at Uxbridge, and again, in 1647, of those sent to induce him to sign the Covenant. After this he went to Holland, where he remained till 1650. He returned with Charles II. in that year, but was taken prisoner at the battle of Worcester (1651), and kept in the Tower till released by Monk in 1660. He forthwith repaired to the Hague, and ingratiated himself with Charles. Gradually, after the fall of Middleton (1662) and Rothes (1667), all authority in Scotland fell into his hands. By arbitrary and merciless measures against the Covenanters he gained the favour of the court, and in 1672 he was created Marquis of March and Duke of Lauderdale, two years afterwards being raised to the English peerage as Viscount Petersham and Earl of Guilford, with a seat in the Privy Council. He was a member of the 'Cabal' administration, after the fall of which he still retained his power in Scotland. But at length his venality and arrogance wore out the patience of the nation; he lost the favour of the Duke of York, and in 1682 was removed from all his public offices. He died at Tunbridge on the 24th August of the same year. M. was a man of ability and learning, but of a disgusting appearance, and an imperious, passionate, and cruel disposition.—**James M.**, **Eighth Earl of Lauderdale**, born 26th January 1759, and educated at Edinburgh, Glasgow, and Paris, was from 1780 a member of the House of Commons and a steady supporter of Fox. In 1789, on his father's death, he entered the Upper House. During Fox's ministry he was made a peer of Great Britain and member of the privy council. In 1816 he opposed Napoleon's removal to St. Helena. M. is also known for his *Inquiry into the Nature and Origin of Public Wealth* (1804), which provoked a controversy with Lord Brougham, and his pamphlets on Bullion in 1812. He died 13th Sept. 1839. See Anderson's *Scottish Nation* (Edinb. 1863).

Maize (*Zea mays*; Su. *mais*, from Haytian *mahiz*), a genus of grasses belonging to the tribe *Phalarideæ*. They are monœcious plants, with male flowers in terminal racemes, and the females axillary in the sheaths of the leaves. The *Z. mays*, or Indian corn—the well-known and important cereal—is on the best authority indigenous to the warmer parts of S. America; it was, however, found in cultivation in Central America at the time of the discovery of the continent, and it is supposed by some that a variety is native in the W. India Islands. Since its introduction to Europe the range of cultivation has spread to most of the warmer temperate regions of the globe, and it is largely grown in India, in parts of Africa, whilst in Australia it thrives in a marvellous manner. In favourable summers it grows freely, and ripens its 'cobs' in Britain, but the large supply required for the home consumption is chiefly imported from the United States. As a cereal it has many qualities to recommend it for culture where the climate is sufficiently warm to ripen the grain properly, growing, as it does, freely in diverse soils, and under dissimilar states of moisture and dryness. The crop is easily saved, and with ordinary care the grain is as easily preserved. Indeed Meyen calculated that the return from M. under the most favourable circumstances would be eight hundredfold, and under any circumstances it is the largest yielder amongst cereals in warm countries. As a fattening saccharine green-fodder M. is also justly appreciated. A fine flour called *maizena*, corn flour, Oswego flour, prepared

from this grain, is now extensively used as a valuable article of light diet, and its ordinary meal mixed with other flour furnishes good bread, but by itself the deficiency of gluten renders it unsatisfactory for the purpose. (See INDIAN CORN.) In America the various dishes *hominy*, *mush*, *pop-corn*, are preparations of M., and the young 'cobs' are often boiled for the table or are pickled. Sugar, treacle, a beer called *Chica* (q. v.), a spirituous liquor, and vinegar, are all obtainable from this useful grass, whilst the refuse parts, such as the stalks, the dried leaves, the spathes, are further turned to profitable services. The spathes, for instance, are much used for packing oranges and lemons, and from the straw good writing and printing paper can be prepared. Five other species of *Zea* are natives of S. America.

Majesty (Lat. *majestas*, from the old *majus*, i.e., *magnus*, 'great'), a title common to all sovereigns, except the Sultan of Turkey, who is addressed as 'Your Highness.' It was originally the term used to denote the authority and dignity of the people of Rome. On the establishment of the empire it was transferred to the Imperatores (*Augusti*), and from them it passed to the sovereigns of Western Europe. Henri II. of France was the first of these who bore the title. At the treaty of Cambrai (1529) Karl V. alone was so distinguished; but at the Peace of Ctespy in 1554, 'Royal M.' was attributed both to Karl V. and François I., and at the Peace of Château-Cambresis in 1559, the title 'Most Christian and Catholic M.' was for the first time employed. In England Henry VIII. first assumed the style of M. From the idea of M. flow the so-called *Rights of Majesty*, essentially consisting in the irresponsibility of the monarch, and the sacredness and inviolability of his person.

Majesty, Letter of, an imperial or royal writ, but especially the document whereby the Emperor Rudolf II. crushed (11th June 1609) the religious freedom of the Bohemian Protestants, and removed various of their civil rights, and whose abrogation by the Emperor Matthias in 1618 occasioned the Thirty Years' War (q. v.).

Major. See SCALE, KEY, INTERVAL.

Major, in the British army, is a mounted field-officer, second to the lieutenant-colonel in command of a regiment. Before promotion to a majority a captain must pass an examination as to the manipulation of a small military force in the field. The appointment as M. to a regiment is for five years, but is renewable. There were 720 majors on full pay according to the army estimates of 1876. Their daily pay varies from 24s. 5d. in the household cavalry to 14s. 6d. in the artillery. About 200 years ago these officers were termed serjeant-majors, the title now in use for the highest rank of non-commissioned officers.

Major or Mair, John, was born at Cleghornie, near North Berwick, in 1469, and educated, it is believed, partly at Oxford and Cambridge, and partly at the university of Paris. In 1506 he became a doctor of the Sorbonne, and in 1519 accepted a professorship at St. Andrews, but the political discord sent him back to Paris, where he devoted himself to teaching. In 1533 he was appointed provost of St. Salvator's College, University of St. Andrews, an office which he retained till 1549. His opinions concerning ecclesiastical and secular government were of a bold and liberal order, and both upon Knox and Buchanan exercised considerable influence, though the latter speaks disparagingly of him—*solo cognomine, Major*. The *In quatuor Sententiarum lib. Commentarius* (published at Paris, 1516) won him a European reputation as a commentator, and his *De Historia Gentis Scotorum, seu Historia Majoris Britannia*, published at Paris, 1521 (reprint, Edinb. 1740), began to tone down the fabulous element which held so large a place in Scotch annals. He died at St. Andrews about 1550.

Majorca (Sp. *Mallorca*), the largest of the Balearic Isles (q. v.) belonging to Spain, lies in the Mediterranean, 107 miles S.E. of the mouth of the Ebro. Area, 1420 sq. miles; pop. 262,893. It is mountainous in the N., rising in Silla de Torellas to a height of 4596 feet, but slopes to the S., where are several good harbours. With a rich soil and a climate that is a perpetual spring, it produces plentifully the cereals, fruits, and herbs of S. Europe, and also exports marble, slate, plaster, &c. The capital is Palma.

Majority. See AGE.

Makall'ah, a seaport of Arabia, 300 miles E.N.E. of Aden, is much visited by vessels for provisions, and exports gum, hides, senna, &c. Pop. 7000.

Makó, a town of Hungary, on the Maros, 120 miles S.W. of Pesth, has many mills, and a trade in wine, hemp, cattle, &c. Pop. (1869) 27,449.

Makrizi, Ahmed al, an Arabian writer, was born about 1360 at Cairo, his surname being derived from Makriz, a suburb of Baalbek, where his family had formerly resided. At Cairo he spent the greater part of his life, teaching jurisprudence and filling the offices of *mohasib* ('inspector of weights and measures'), and of *khatib* and *imam* in the mosques of Amrou and Hakem; and there he died in the early part of 1442. Of his numerous writings on Egyptian topography and history, a complete list is given in De Sacy's *Chrestomathie Arabe* (l'ar. 1806), and several of them have been translated into Latin, French, and German.

Malabar (*Malayalam*, 'country skirting the hills'), the name formerly given to the entire W. coast of the Indian Peninsula, between the W. Ghauts and the Arabian Sea, in opposition to the Coromandel coast on the E. It was the scene of the first settlements of European nations, especially of the Portuguese. —The British *district* of M., to which the name is properly restricted, is in the Presidency of Madras, and is bounded N. by Canara, and S. by the State of Cochin, and is separated by the mountains from Mysore and Coorg. Area, 6002 sq. miles; pop. (1871) 2,261,750. The majority are Hindus, among whom the Nair and Tiar castes are prominent; the Moplah tribe of Arabian Mohammedans are numerous, as also are Syrian and Roman Catholic Christians. The chief towns are the seaports of Calicut, Cannanore, Jellicherry, and Cochin; and Palghat inland. A European regiment is required to restrain the fanaticism of the Moplahs. Harbours are numerous, and the coasting trade is very large. In 1874-75 the exports were £2,253,423, chiefly coffee, products of the cocoanut-palm, and pepper; the imports were £920,913, chiefly rice, piece goods, and cotton twist. The forests produce teak, rosewood, and sandal-wood. The mountainous tract, called the Wynaud yield abundant coffee, and are said to possess gold. Other products are cordage, oil (both made from the cocoa-nut), betel nuts, arrowroot, and ginger. M. is in the presidency of Madras.

Malacca, a British settlement on the S.W. coast of the Malay peninsula, extending 40 miles along the Strait of M., and inland for a distance of 25 miles. Area, 1000 sq. miles; pop. (1871) 77,735. It is for the most part flat, and jungly, and is bounded E. by a range of hills, attaining its greatest height of 3920 feet in Mount Ophir. The climate is healthy, the temperature ranging from 72° to 85° F., and the products are rice, timber, sago, pepper, rattans, and tin from the mines in the district of Naning. Malays and Hindus constitute the bulk of the inhabitants. The capital, M., lies at the mouth of a small river, and has a pop. of some 10,000. Its church of Our Lady del Monte was founded through the exertions of St. Francis Xavier. Originally a settlement of the Portuguese under Albuquerque (1509), M. passed to the Dutch in 1642, and in 1795 to the British, to whom it was formally ceded in 1824.

Strait of M., separating the Malay peninsula on the N.E. from Sumatra on the S.W. is 520 miles long, and 25 broad at the S., and 200 at the N. extremity.

Mal'achi (prob. a contraction of *malachijah*, 'messenger of Jehovah') was chronologically the last of the Hebrew prophets, as his book is the last in the O. T. canon. He is placed by most critics in the age of Nehemiah, and if those be right who place him during Nehemiah's second visit to Judæa, then he prophesied before the 32d year of Artaxerxes Longimanus, B.C. 433 (M. ii. 10, 11, iii. 8-10, cf. Neh. v. 14, xiii. 10-12, 23-30), although some critics think it more probable that the book was composed under a predecessor of Nehemiah. The tone of the book is thoroughly post-exilian. The priestly and prophetic spirit struggle for mastery.

Mal'achite, a green-coloured mineral, composed essentially of carbonate of copper, and occurring associated with other ores of copper as an incrustation or stalactite. It is found in abundance in Cornwall, also in S. Australia, Siberia, Tyrol, and Cuba. It is capable of receiving a high polish, and is much used for ornaments and inlaid work.

Mal'achy, St., born at Armagh in 1094, became a priest (1119), Abbot of Bangor (1121), Bishop of Connor (1124), and Archbishop of Armagh (1134). Resigning the primacy (1137), he visited St. Bernard at Clairvaux, and Pope Innocent II. at Rome, and returned as papal legate (1139) to Ireland, where he founded a Cistercian monastery (1142), and brought the synod of Inis Padrig to recognise the supremacy of Rome (1148). He died at Clairvaux, whither he had again repaired to meet Eugenius II., in the arms of St. Bernard, his friend and biographer, November 2, 1148. The *Prophecy of St. M. concerning the Future Roman Pontiffs* is to be found in Moreri's *Dictionnaire Historique* (ed. 1759, vol. vii. p. 117). It is a clumsy forgery, written probably by some partisan of Cardinal Simoncelli (1590), and first alluded to by Arnold de Wyon (circa 1595).

Malacoptery'gii or **Malacop'teri** (Gr. 'soft-finned'), a group of Teleostean fishes represented by the eel, herring, salmon, trout, carp, barbel, &c. The fin-rays are *soft* and many-jointed. The swimming-bladder is always developed, and communicates with the throat by means of a duct. The scales are usually *cycloid*, although *ganoid scales* may be developed. The ventral fins may be wanting (eels, *M. Apoda*), or when present are placed on the abdomen (salmon, herring, &c.)—the latter forming the *M. abdominalia*.

Malaga, a province of S. Spain, bordering on the Mediterranean, and bounded E. by Granada, and W. by Cadiz. Area, 2823 sq. miles; pop. 505,010. It is partly cultivated, partly consists of high mountains and wooded hills. Corn is abundant, and the cultivation of the sugar cane yielded in 1874 219,000 cwt. (worth £189,200), though in 1875, owing to an early frost, it amounted but to 150,000 cwt.

Malaga, a fortified seaport in Spain, in the province of Malaga, on the Mediterranean, at the mouth of the Guadalmedina ('river of the town'), 100 miles S.S.E. of Cordova by rail. It is beautifully situated at the foot of the Moorish citadel El Gibralfaro, and though generally uneven and irregularly built, has some fine streets and squares, chief of which are the Calle de la Alameda, Cortina del Muelle, and Calle Nueva, the Plaza de la Constitution, and Plaza de Riego. The Moorish arsenal (the Atarazanas), and the Alcazaba, at the foot of the castle-hill, once the favourite residences of the Moorish nobility, are now frequented by the poorest. Several forts protect the town and harbour (which can hold over 450 ships). The 'Molo' is 1382 yards long. M. is a flourishing centre of trade; it has two great iron foundries, and manufactures cottons, linens, and chemicals. In 1875, 192 English vessels, of 112,153 tons, entered the port; cleared 186, of 109,933 tons. The principal imports are timber, staves, and deals, iron, steel, hardware, and machinery, tinplates, hides, cotton, petroleum, fire-bricks, spirits, sugar, and cocoa; and exports raisins, almonds, figs, grapes, lemons, oranges, wine, oil, soap, peas, esparto-grass, and lead. *M. wines* are sweet and rich, some red, others white; of the former, Don Pedro Ximenes is the best; of the latter, M. muscatel and Lagrima di M. M., though said to have been founded by the Romans, bears a name clearly derived from the Phœnician (*maluca*, 'salt'). From 1015 to 1079 it was the residence of independent Moorish kings, but in 1487 it was taken by the Spaniards. Pop. (1860) 94,732.

Malaguett'a Pepper. See GRAINS OF PARADISE.

Malapteru'rus (Gr. 'soft fin-tail'), a genus of Teleostean fishes, belonging to the family of the sheat-fishes or *Silurida*. *M. electricus* is a familiar species, occurring in the Nile; *M. Beninensis* being found on the W. coast of Africa. The former is a fish with electrical organs, and capable of giving shocks of considerable power. It has a soft dorsal fin near the tail.

Mal'aria. See MIASMA.

Malay Apples. See EUGENIA.

Malay Archipel'ago, also called **Eastern** or **Indian Archipelago** and **Malai'sia**, the largest cluster of islands in the world, lying in the Indian Ocean, Pacific Ocean, and the Chinese Sea, between the S.E. of Asia and the N.W. of Australia, in long. 95°-140° E., and lat. 10° N.-11° S. Area, about 650,000 sq. miles; estimated pop. 22,829,000. The islands,

mainly of volcanic origin, are of the most diversified shapes. They are for the most part covered with tropical forests, and traversed by lofty mountain ranges. The seven principal groups are (1) the Sunda Islands in the W. and S., including Sumatra, Java, &c.; (2) Borneo, in the centre, the largest island in the world; (3) the Celebes, E. of Borneo; (4) the Moluccas or Spice Islands, in the extreme E.; (5) the Sulu Islands, and (6) the Philippines in the N. The climate is genially tempered by the surrounding seas, and the chief products are rare plants and spices, valuable timber, cotton, tobacco, sugar, and fruits. The wild animals comprise the elephant, tiger, panther, deer, wild-hog, ourang-outang, monkey, &c. The Dutch are masters of many of the islands; the Spaniards have only the Philippines, the Portuguese, Dilli and part of Timor, and the British, Labuan and Singapore. Malays (q. v.) are the principal inhabitants; Papuans or Negritos occupy many islands to the E., and a large number of Chinese are scattered throughout the archipelago. See A. R. Wallace's *M. A.* (2 vols. 1869).

Malays (native, *Malayu*), a name of uncertain derivation given by themselves to the dominant people in the Malay peninsula and archipelago, in a larger ethnological sense including the Polynesians and the Madagascars, or inhabitants of Madagascar. Some ethnologists (after Blumenbach) have made the M. the distinct type of a fifth or brown race of mankind, but the best recent savants class them with the Mongols. Brown in colour, and short in stature, the M. have prominent facial bones, black coarse hair, large dark eyes, flat features, and high cheek-bones. They have long been divided into three classes:—(1) the so-called civilised M., who work in gold and filigree, make weapons, sailing vessels, &c., and have a written language; (2) the *orang-laut*, a kind of sea-gypsies or pirates; and (3) the *orang-utan*, 'wild men,' or dwellers in the woods. Idle, lying, treacherous, implacable, the M. of the second class are skilful sailors, but are much given to drinking, gambling, and cockfighting. They are professed Mohammedans (since the 12th c.), and their language, soft in sound and simple in construction, is the *lingua franca* of Eastern commerce. Of the many dialects, the most refined is Javanese. The literature is meagre, and is marked by prevailing Sanskrit and Arabic influence. The alphabet used is Arabic. See Malay Grammars and Dictionaries by Marsden (1812), Crawford (2 vols. 1852), Dr. Pijnappel (Amsterd. 1874), and L'Abbé P. Favre (Vien. 1875), the posthumous work of Von Dewall (1876), and the *Transactions* of the Asiatic Societies of the Hague and Batavia.

Mal'colm, the name of four Scottish kings. **M. I.**, 'King of Alban,' succeeded Constantine by the Tanist law in 942, and first sought to extend his authority beyond the Spey, slaying Cellach, ruler of Moreb (Moray). By promising to perform military and naval duties for Eadmund king of England, he was allowed to annex Strathclyde (945), which became an appanage of the heir-apparent of the Scottish crown. This transaction has been interpreted by one school of controversialists as a testimony to the absolute vassalage of the king of Scotland to the king of England; by another as a token of feebleness of the English king. According to the Ulster Annals, M. was slain in 954—the Pictish chronicle says by the Men of Moerne at Fodresach (Fetteresso) in Kincardineshire.—**M. II.**, son of Kenneth, and grandson of M. I., became 'king of Alban' in 1005, and reigned for thirty years. The principal events were his unsuccessful attempt to wrest the regions north of the Spey from the grasp of Sigurd, Earl of Orkney, his invasions of the Earldom of Lothian, and his ultimate victory at Carham (1018), by which he retained the territory, doing homage for it to the English king, and his acknowledgment of Cnut (1031) as overlord. Tighernac records his death in 1034, calling him 'King of Alban and head of the nobility of Western Europe,' but in the Chronicle of Marianus Scotus (a contemporary), he is called *rex Scotia*—the first time the land of Alban received that name.—**M. III.** (1057–93), surnamed Canmore ('great head'), during his long reign saw the beginning of what was one of the most momentous changes in the character of Scotland. The Norman conquest of England drove numbers of Englishmen N. At one time there were as exiles at his court Eadgar the Ætheling, his mother, and two sisters. The consequence was that manners began to be transformed from the Celtic towards the English type. In support of the Ætheling, M. made a raid into Durham with the most cruel results. He also married Margaret, sister of the Ætheling. In 1072 he ac-

182

knowledge William as his overlord, but afterwards broke his vassalage, and harried the country as far as the Tyne. A peace ensued till 1092, when M. again made a southern invasion. On the fifth expedition of this kind he and his son perished on the banks of the Alne, November 13, 1093.—**M. IV.**, grandson of David, reigned from the spring of 1153 to the winter of 1165. He was only twelve years of age when the crown came to him. The events of his reign are the subjection of Galloway, the treachery and antagonism of the chiefs, and the loss of the northern counties of England. See J. H. Burton's *History of Scotland*, vol. i.; Freeman's *History of the Norman Conquest*, vol. i.; and Skene's *Celtic Scotland*, vol. i.

Malcolm, Sir John, G.C.B., a distinguished political or diplomatic officer in India during the most troubled period of the British rule, was the son of a Scotch yeoman, and was born 2d May 1769, near Langholm in Dumfriesshire. He arrived at Madras as an infantry cadet before he was fifteen. In a diplomatic capacity he was present at the fall of Seringapatam, and in the Mahratta campaigns of the Duke of Wellington. M. was thrice sent as ambassador to Persia, in 1800, 1808, and 1810, and his memory is still honoured in that country. But his chief distinction is as the pacifier of Central India after the wars of Holkar and the Peishwah in 1817. From 1827 to 1830 he was Governor of Bombay; and on his return to England sat in Parliament for Launceston, as an ardent supporter of his lifelong friend the Duke of Wellington. He died in London, 31st May 1833, and was honoured with a statue in Westminster Abbey, and an obelisk on his native hills. M. wrote a *History of Persia* (2 vols. 1815), *Political History of India, 1784–1823* (1826), and *Life of Lord Clive* (published 1836). Three of his brothers also attained knighthood in the public service. See *The Life of Sir J. M.*, by Sir J. W. Kaye (2 vols. Lond. 1856).

Mal'dive Islands ('thousand isles'), a group of coral formation in the Indian Ocean, about 340 miles W. of Ceylon. They are fertile in various kinds of palm and bread fruit. The inhabitants, who are Mahomedans of Malay origin, and are estimated at 200,000, are expert sailors, and carry on a considerable trade. They recognise a sultan, who lives on the largest island, called Mahl, and is tributary to the government of Ceylon. They bear a good reputation for kindness to shipwrecked mariners. In 1875 the exports to British India, excluding Ceylon, were valued at £29,562; the imports at £29,829.

Mal'don, a river port of England, in the county of Essex, on the Chelmer, 16 miles S.W. of Colchester by rail. It has two churches, a town-hall, custom-house, public-hall (1860), and manufactures of crystallised salt, silk fabrics, ropes, sails, farm implements, &c. The value of exports (1874) was £57,096; and 151 vessels, of 9521 tons, belonged to the port, besides 371 fishing-boats. There entered (1875) 1876 vessels, of 93,633 tons; cleared 1950, of 86,049 tons. M. returns one member to Parliament. Pop. (1871) 5586.

Malebranche, Nicolas de, the youngest of a family of ten children, was born at Paris, August 6, 1638, studied philosophy at the College of La Marche, and theology at the Sorbonne, entering in 1660 the Congregation of the Oratory. Here he studied Greek, history, and Hebrew, but the *Traité de l'Homme* of Descartes turned the course of his studies towards philosophy. The result was shown in his *Recherche de la Vérité* (1674–75), a treatise which developed the idea that the reason, absolutely untrammelled, is the principle of certainty, that divorced from the control of the senses, it approaches supreme truths, that it sees in the thought of God the primal cause of phenomena, and that phenomena themselves carry the mark of their celestial origin. Theologians accused him of extravagance and infidelity, and denied that a doctrine of free-will could be evolved from his philosophy. As an answer he published *Traité de la Nature et de la Grâce* (1680), which roused the opposition both of Arnauld and Bossuet, an opposition which was carried on in an interchange of bitter treatises for six years. In 1688, M. published the *Entretiens sur la Métaphysique et sur la Religion*, 'a complete résumé' of all his doctrine upon the soul and its union with the body, the nature of ideas, the imperfection of sense, the vision in God, the empire of Providence, and the laws observed in the regulations of soul and body. On account of the lucidity and elegance of his style he is ranked among the French classics. M. died at the Oratory St. Honoré, Paris,

13th October 1715. See *Damiron, Histoire de la Philosophie du Dixseptieme Siecle.*

Male'sherbes, Chrétien, Guillaume de Lamoignon de, was born 6th December 1721 at Paris, received his education among the Jesuits, was returned to Parliament 3d July 1744, became President of the Court of Aids (1750), and censor of the press. He boldly denounced to the king the character of the administration under which the poorer classes were overloaded with taxation. At the same time the leniency and generosity of his exercise of the censorship gave greater freedom of speech to contemporary writers; and to his exertions are greatly due the *Encyclopédie*. M. retired at the royal request to his own estates (1771), was recalled (1774) by Louis XVI., and immediately began working at a scheme of fiscal reform, which was thwarted by the dismissal of Turgot. Once more returning to privacy he remained in it until 1793, when he volunteered to defend the king against the charges of the Convention. His devoted behaviour on that occasion sealed his own fate, for he was imprisoned in the gaol at Port Libre (December 1793), and guillotined, April 22, 1794. M. was brave, wise, and learned, besides being one of the most intelligent pioneers of freedom during the period in which he lived. See *Sainte-Beuve's Causeries du Lundi*, vol. ii.

Malibran, Mme. (Maria Felicita), daughter of Manuel Garcia (q. v.), was born at Paris, March 24, 1808. Brought to London in 1816, she made her début there as *Rosina in Il Barbiere*, June 7, 1825. Her visit to the United States of America, 1825-27, as one of her father's operatic troupe, was the means of introducing the Italian opera into that country. There she married Eugene Malibran, a merchant; after the dissolution of this marriage she became the wife of De Bériot, the violinist, at Paris, 1836. From 1827 to her death at Manchester, 23d September 1836, she commonly spent the winter in Paris and the spring in England, increasing her reputation as a magnificent mezzo-soprano singer and a graceful actress.

Malignant Pustule, is a disease which has been long known on the Continent, in France, Germany, Russia, Sweden, Lapland, and Italy, but its occurrence escaped general recognition in this country till 1863, when Dr. William Budd showed that it had been long known in this country as an Epizootic (q. v.), causing every year a large mortality among English live stock. Among cattle M. P. is called *joint murrain*, *lock quarter*, or *quarter evil*, and by the French, *charbon*, *quarter*, and *sang*, and by the Germans *milsbrand*. The identity of the M. P. of man, with the *charbon* or *spenic fever* of cattle has been satisfactorily proved; for the disease, when contracted by man, has been communicated back to the animal by inoculation. In man the specific poison is implanted on some uncovered part, as the hands or face, and produces, in the first instance, a redness like the bite of a gnat. This is followed by a minute vesicle, and a peculiar form of gangrenous inflammation spreading to the neighbouring tissues, the death of which is so complete that sensation is entirely lost. Crops of secondary vesicles form around the erysipelatous-like areola; the lymphatics become inflamed; the breath fetid, and death follows amid all the indications of septic poisoning. At the outset the disease is local, but in a very short time general poisoning ensues, so that the disease is amenable to treatment only at the earliest stage of the disease. The disease may be communicated to man (1), by direct inoculation, as in the case of butchers, farmers, skinner, and drovers; (2), by contact with the skin or the hair of diseased beasts; (3), by eating the flesh of animals killed while affected with it, or by using the milk or butter of those thus affected; and (4), by insects which have been in contact with the bodies or carcases of diseased animals. Dr. Trousseau states that in two factories in Paris, where the horse-hair was imported from Buenos Ayres, and in which only six or eight hands were employed, twenty persons died in ten years from M. P. In 1876 there was a death from M. P. in Glasgow Royal Infirmary, the patient having been a worker in a hair factory.

Malignant Tumours. See CANCER and TUMOURS.

Malines, the French name for Mechlin (q. v.).

Malin'gering: See FEIGNING OF DISEASE.

Mallard (*Anas boschas*), a well-known species of *Anatide* or ducks, popularly known also as the wild duck. The male is

brilliant or metallic green on the head and neck, the lower part of the neck being encircled with a collar of white. The back is a chestnut-brown, and the remaining tints include a grey below and various black markings. The female is of a sombre brown hue. The average length is 2 feet. The nest is made of grass, and is lined with soft down. It is placed close to the water's edge, and the eggs are large and white, tinted with green. The M. arrives in this country in October, and is snared in large numbers in nets and by decoys.

Malleability, the property which certain kinds of matter possess of extending under the blows of a hammer. It is thus opposed to brittleness, and is a property almost restricted to metals. The most malleable of known substances is gold, which can be beaten out to leaves only $\frac{1}{100,000}$ of an inch in thickness. The commoner metals rank in M. as follows:—Silver, copper, platinum, iron, aluminium, tin, zinc, lead. M. varies with temperature, each metal having a particular temperature for maximum M.

Malle'aceæ, a group of *Lamellibranchiate* Mollusca, represented by the *Malleus* or Hammer Oyster (q. v.).

Mall'et, Paul Henri, historian and archaeologist, was born in 1730 at Geneva, where he became Professor of History in 1760. Subsequently, on account of his researches, pensions were granted him by friendly princes. He died in his native city, February 8, 1807. Besides his histories of Denmark, Hesse, Brunswick, Switzerland, and the Hanseatic League, M. wrote *Introduction à l'Histoire de Danemarck*, translated into English by Bishop Percy under the title of *Northern Antiquities* (2 vols. Lond. 1770), a work of great merit considering the period at which it was produced. The best edition is that by I. A. Blackwell (Bohn. 1849).

Mall'et, originally *Mall'och*, David, a Scottish litterateur, born at Crieff, Perthshire, about 1700, was for some time tutor in the family of the Duke of Montrose, and after travelling over the continent of Europe, settled in London, where he died, 21st April 1765. He wrote several plays, *Eurydice*, *Mustapha*, the masque of *Alfred* (in conjunction with Thomson), a *Life of Lord Bacon*, &c., but is now only remembered, and that faintly, for his ballad of *William and Margaret*, in which some natural pathos finds expression through the conventional diction of the time. M. was an unscrupulous pamphleteer.

Mallow (*Malva*) is the genus from which the natural order *Malvaceæ* takes its name. In *Malva* proper there are sixteen species, all natives of Europe, temperate Asia, and N. Africa; and adding the closely-allied genera of the marsh M. (*Althæa*) and tree M. (*Lavatera*), the total number of species bearing the name of M. is forty-six. The separation of the three genera is founded on certain differences in their outer floral envelopes. *Malva* is represented in Britain by the common M., the dwarf M., and the musk M.—the last-named being so called from its slight musk odour. The common M. from its mucilaginous property is much used as a rustic (and quack) medicine. The dwarf M. is grown in Egypt as a pot herb. The tree M. bears also the name of Bass M., from growing on the Bass Rock at the mouth of the Firth of Forth—formerly in plenty, now sparsely.

Mallow, a market-town of Ireland, on the Blackwater, 19½ miles N.N.W. of Cork by rail, has a court-house, gaol, barracks, county infirmary, and a mineral spring, the hottest in Ireland. Brewing, tanning, and salt-refining are the chief industries. M. returns one member to Parliament. Pop. (1871) 4165.

Malmesbury, a market-town of England, in Wiltshire, on the Avon, 12 miles W. of Swindon, has breweries and tanneries, and some manufactures of ribbons and pillow-lace. Its chief interest lies in its buildings—the ruined Benedictine abbey (founded, according to William of M., before the year 670) the abbey church, a 15th c. market-cross, and the house where Hobbes the philosopher was born. M. returns one member to Parliament. Pop. of parliamentary borough (1871), 6879.

Malmesbury, James Harris, First Earl of, an English diplomatist, son of James Harris (q. v.) the philologist, was born at Salisbury, 9th April 1746, and educated at Oxford and Leyden. He was Secretary to the Embassy at Madrid in 1768, Ambassador at Berlin, 1772-76, at St. Petersburg, 1777-82, at the Hague, 1784-88, and again at Berlin, 1793-97. At the last-

named capital he negotiated a treaty of subsidies, and the marriage of the Prince of Wales (afterwards George IV.) with Princess Caroline of Brunswick. In 1796-97 he was sent on an unsuccessful mission to France to treat for peace. In 1798 he was created Baron, and in 1800 Earl of M. From his retirement from the diplomatic service till his death he was much consulted by statesmen on foreign affairs. He died November 21, 1820. His *Diary and Correspondence*, in 4 vols., a most valuable work for historians, was published by his grandson, the third earl, in 1845.—**The Right Hon. James Howard Harris, Third Earl**, was born in London, 25th March 1807, and educated at Oriel College, Oxford. He was elected Conservative member for Wilton in 1841, but succeeded to the title in the same year. He was Foreign Secretary under Lord Derby, 1852 and 1858-59, and Lord Privy-Seal, 1866-68. He held the latter office also under Mr. Disraeli from 1874 to 1876, when he retired on account of ill health. He was a friend of the Emperor Napoleon, and his policy inclined towards alliance with the French empire. In addition to the *Diary and Correspondence* already noticed, he has published *The First Lord Malmesbury, His Family and Friends* (2 vols. 1870).

Malmesbury, William of, an English historian, born in Somersetshire in 1095, educated at Oxford, took orders, and became librarian in the Abbey of Malmesbury. He died about 1143. His chief work is *Gesta Regum Anglorum*, the best edition of which is that by Sir Thomas Duffus Hardy (2 vols. 1840). It begins with the English invasion, and comes down to the year 1143, is written with rhetorical art of the medieval sort, but at the same time shows great industry and a critical spirit. There is an English translation in Bohn's Antiquarian Library. Other works of M.'s are *Historia Novella*, *De Gestis Pontificum*, *Antiquities of Glastonbury*, *Life of St. Aldhelm*.

Malmö, a seaport in S. W. Sweden, on the E. shore of the Sound, 14 miles S.S.W. of Lund by rail. It is surrounded by a canal, has some fine churches, a town-house, and a palace (the original Malmöhus), founded in 1424, now a prison. There are several schools and hospitals. The trade of M. is extensive, and tobacco, wool, gloves, and soap are manufactured. In 1870, 2482 vessels, of 178,080 tons, entered the port; cleared 2311, of 142,470 tons. Pop. (1805) 4932; (1876) 32,155. Here was concluded the seven months' armistice of August 26, 1848, between Denmark and Prussia.

Malm'sey, or **Malva'sia**, is the richest and most characteristic variety of wine produced in the island of Madeira (see **MADEIRA WINES**). It has been cultivated for at least two centuries. There are several qualities of M., the finest being the produce of a very limited area on the S. of the island, and it is reserved for the royal table of Portugal.

Malone, Edmund, was born 4th October 1741 at Dublin, educated at the university of his native place, and called to the bar in 1767. Instead of practising, he went to London, cultivated the acquaintance of men of letters, and made literature his pursuit. In 1780 he published his researches upon the text of Shakspeare; in 1790 appeared *The Plays and Poems of W. Shakspeare*, a remarkably careful edition, with suggestive notes, and in 1797 he edited an edition of Sir Joshua Reynolds's posthumous works. M.'s sagacity and discrimination were shown in the detection of Chatterton's Rowley forgeries, and the Shakspearian forgeries of the Irelands. He died in London, 25th May 1812. See Prior's *Life of E. M.* (1860).

Malory, Sir Thomas, the compiler of *The Most Ancient and Famous History of the Renowned Prince Arthur*, of whom we only know that he was a knight, and that he completed his work in the ninth year of the reign of Edward IV. (1469-70). Of this quaint volume, based on the great prose romances of Merlin, Lancelot, Tristram, the Queste du St. Graal, and the Mort Artus, seven black-letter editions are known to exist—Caxton's (July 1485), of which the only complete copy is in the Earl of Jersey's library at Osterley Park, Middlesex; two by Wynkyn de Worde (1498 and 1529); Copland's (1557); two by Thomas East, one folio, the other 4to, both undated; and William Stansby's (1634), which last edition has been reprinted in *Walker's British Classics* (2 vols. 1816), by Joseph Haslewood (3 vols. 1816), and by Thomas Wright (3 vols. 1866). Of Caxton's original edition a reprint appeared in 1817, edited by Robert Southey. See **ARTHUR**.

Malpighi, Marcello, a celebrated Italian anatomist, was born at Crevalcuore, near Bologna, March 10, 1628. He was Professor of Medicine at Bologna, Pisa, and Messina successively, and in 1691 went to Rome as first physician to Pope Innocent XII., and there died November 29, 1694. His chief discoveries relate to the anatomy of the skin, the kidney, and the spleen, certain portions of which are now known by his name. He wrote a variety of works upon the subjects of his research, which were collected and published under the title *Opera Omnia* (Lond. 1686). His *Opera Posthuma* (1697) were edited by Regis of Montpellier, and his *Opera Medica et Anatomica Varia* (1743) by Gravinelli.

Malpighia, *cææ* is a natural order of exogenous trees and shrubs, many climbing twiners, consisting of about 600 species widely distributed throughout tropical and sub-tropical regions, the greater part being natives of America. The climbing portion abound in Brazil, interlacing the trees of the forest and trailing over the rocky places. Several species belonging to the order are grown in hothouses for their showy flowers and creeping habit. The bark of some species of *Byrsonima* is used in their native countries for tanning purposes, also for snake bites, skin diseases, &c., and the fruit of others, as also of the *Malpighia urens*, is used as food. See **ALCORNOCO**, and **BARDADES CHERRY**.

Malpighian Bodies. See **KIDNEY** and **SPLEEN**.

Mal'plaquet, a village in France, department of Nord, on the Belgian frontier, 26 miles E. by S. of Valenciennes, where the Austrians and English, under Prince Eugene and Marlborough, defeated the French under Villars, September 12, 1709.

Mal'ström (Norw. *male*, 'grind,' and *ström*, 'stream'), or **Mos'köström**, a violent current in Lofoten (q. v.), between Moskö and Moskenæsö, which is often described as a terrible whirlpool, but is only dangerous during the N.W. winds of autumn and winter. Fifty miles S.S.E., the yet more violent **Saltström** between Godö and Suömö to Salten Fjord, at the spring-tides raises such seas as bar all vessels from entering the fjord.

Malt is barley or any other grain in which germination has been induced for the purpose of partially converting its starch into sugar, fitting it for brewing or distilling. The process of malting is described in detail under the head **BEER** and **BREWING**. During the year 1876, in the United Kingdom, 60,929,633 bushels of M. were charged with duty, amounting to £8,262,746.

Extract of M., prepared by concentrating an infusion of malt, enters into a number of medicinal preparations, and is regarded as a valuable dietetic remedy in America.

M. refuse consists of the *cornings* or rootlets which are screened from the sprouted M., and of *brewer's grains* or *draff*, names applied to the M. after the extraction of its valuable ingredients. These waste substances are useful for feeding cattle.

Mal'ta, a British island in the Mediterranean, situated 58 miles S. of Sicily, and 200 N. by E. of Tripoli. Area, 142 sq. miles; pop. (1871) 145,604. It is about 17 miles long and 10 broad, is mainly formed of limestone, and has cliffy shores hollowed by the sea into innumerable caves and grottoes, and fringed by many islets and rocks. Some 4 miles N.W. lies the smaller island of Gozzo (q. v.), and between it and M. is Comino, separated from M. by the Freggi Rhede. The Ben-jemma hills or crags, which extend across the island, do not exceed a height of 590 feet, and the surface is varied by parallel valleys, of which the most extensive is Melleha. A shallow surface-soil is well cultivated, and yields grain, cotton, sugar, wine (resembling that of Spain), oranges, figs, and olives. Other products are aloes, salt, soda, marble, alabaster, building-stones, &c. There are fine mules, asses, and goats, and birds of brilliant plumage. The climate is hot, but healthy. M. is, however, chiefly important as a military and naval station on the route to Egypt and India, and on account of the excellence of its harbours and the vast fortifications around the capital, Valetta (q. v.). Medina, ('the city'), now called Citta Vecchia, the former capital (pop. 7000), lies near the centre of the island, is still a bishop's see, and has a palace of the grand masters of St. John, a cathedral, a collage, &c. The island contains numerous small towns and *casals* or villages. It is governed by the commandant of the garrison, aided by a council of sixteen, of whom eight are freely elected.

and eight are officials. In 1874 the revenue was £175,073, and the expenditure £161,734. At the beginning of 1876 the total effective force amounted to 5143 men, and the cost of the colony to the British exchequer (1873) was £306,433. Since 1823 the language of business has been mainly English, but over the island both Italian and a corrupt Arabic mixed with words from various other languages are spoken. The prevailing religion is Roman Catholic.

History.—At a very early period the island was probably colonised by the Phœnicians. Though it became in a great measure Hellenised, there is no trace in history of *Melita* having ever fallen into the hands of the Greeks. Long a Carthaginian colony, it was ravaged by a Roman fleet, B.C. 257, and surrendered by Hamilcar, son of Gisco, to the Romans in the second Punic War (B.C. 218). In sacred history it is celebrated as the place where St. Paul was shipwrecked on his voyage to Rome, A.D. 60. The name first appears in its corrupted form of *Malla* in the Maritime Itinerary. After the fall of the Roman empire, M. was taken by the Vandals (454), and by the Goths (494), but was recovered by Belisarius in 533, and remained subject to the Byzantine empire until it was conquered in 870 by the Arabs, who called it *Mallache*. The Sicilian Normans seized it in 1090, and it subsequently passed to the German emperor by marriage-contract, was taken by Charles of Anjou, and retained by the French till recovered by the Emperor Karl V., who gave it to the knights of the order of St. John of Jerusalem, then recently driven by the Turks from Rhodes. The knights strongly fortified M., and by repeatedly punishing the fierce Barbary pirates, provoked the Turks to assaults of M. in 1557 and 1565. In the latter siege, the fame of which spread throughout Christendom, Sultan Solymán was forced to re-embark with a loss of over 25,000 of his best troops. The knights and Maltese fought gallantly with Don Juan of Austria against the Turks at Lepanto in 1571. Warring incessantly with the Moslem, the knights held M. till Napoleon made himself master of the island by treachery in 1798. It was captured in 1800 by the English, to whom it was formally ceded by the Peace of Paris. See Boisgelin, *Ancient and Modern M.* (2 vols. Lond. 1805); Bres, *M. Antica illustrata* (Rome, 1816); Avalos, *Tableau Historique, Politique, Et Physique de l'Île de Malte* (Par. 1830); Tullack, *M. under the Phœnicians, Knights, and English* (Lond. 1861); and Adam, *Notes of a Naturalist* (Edin. 1870).

Malta, Knights of. See JOHN, KNIGHTS OF ST.

Mal'to-Brun, properly **Malthe Konrad Bruun**, a famous geographer, born at Thisted, Jütland, 12th August 1775, was intended for the Church, but preferred literature; studied at Copenhagen, ardently advocated the principles of the French Revolution, and was banished in 1800. In Paris he devoted himself chiefly to the study of geography, an almost unknown subject then, as may be inferred from Voltaire's calling Copenhagen a city in Skaane. For several years he was joint editor of the *Journal des Débats*, and a selection of his contributions was published by Nacet (3 vols. 1828). But his fame rests on his geographical works—*Géographie, Mathématique, Physique et Politique* (conjointly with Mentelle, 16 vols. 1803-5); *Tableau de la Pologne* (1808); *Annales des Voyages, de la Géographie, et de l'Histoire* (24 vols. 1808-15); *Précis de la Géographie Universelle* (8 vols. 1810-29); *Traité Élémentaire de Géographie* (2 vols. 1830-31), &c. M., who did much for the establishment of the *Société de Géographie*, died 14th December 1826.—**Victor-Adolphe M.**, his son, born in 1816, is secretary of the *Société de Géographie* (since 1855), and the author of many admirable geographical works.

Maltese Cross, a cross of eight points, or *patte* ('pawed,' from Fr. *patte*, 'paw'), so called from its having been adopted by the knights of Malta. See JOHN, KNIGHTS OF ST.

Maltese Dog, a species of pet dog, covered with long silky hair, of white colour and beautiful lustre. It was originally brought from Malta, and is still uncommon enough to fetch a very high price. The ears are long, and the tail curls over the back.

Mal'thus, **Thomas Robert**, an English economist, was born at Albury, near Guildford, in 1766. His father was a wealthy and accomplished man of studious habits; one of his tutors was Gilbert Wakefield, the pugnacious but warm-hearted correspon-

dent of Charles Fox and Bishop Watson. After a distinguished career at Cambridge, M. took holy orders, but his clerical duties did not interfere with his studies. He travelled through the north of Europe with the indefatigable Edward Daniel Clarke, and also saw France and Switzerland during the Peace of Amiens. In 1805 M. became Professor of Political Economy at Haileybury College, where he taught till his death, 29th December 1834. M. received no preferment in the Church, but he was elected a member of the principal learned societies in Europe. He helped to found the extinct Political Economy Club and the still flourishing Statistical Society. In 1798 he published anonymously the first sketch, *Essay on the Principle of Population*, of his chief work, which he acknowledged and greatly extended in 1803 and again in 1817. It proceeds on the assumptions that population increases in a geometrical ratio, or that every generation doubles itself; and that the means of subsistence cannot increase faster, by the increased application of capital and skill, than in an arithmetical ratio. As, however, population depends on food, its growth is restrained by the want of it, either guarded against or actually felt. Hence the famous positive and preventive checks of—1. moral restraint, 2. vice, 3. misery (including starvation and disease). M. had already discredited the 'populousness of ancient nations,' and the subject had been treated with some system by Rev. Robert Wallace (*Numbers of Mankind in Ancient and Modern Times*, Edin. 1758). On the other hand, Godwin in the *Inquirer*, and Condorcet had maintained an indefinite growth of the human race; and this view was afterwards supported by Sadler, Price, Doubleday, and to a certain extent by Carey and Senior. It has lately been suggested that procreation should be artificially prevented (*Proceedings of British Association, Plymouth, 1877*). M. also published *Principles of Political Economy* (3 vols. Lond. 1819-20; new ed. 1836), and *Definitions in Political Economy* (Lond. 1827). See Memoir by Bishop Otter, prefixed to the 1836 edition of the *Principles of Political Economy*.

Mal'ton, a market-town of England, in the N. Riding of Yorkshire, on the Derwent, 18 miles N.N.E. of York. Its chief buildings are the Priory Church, now (1878) in course of restoration at the expense (£10,000) of Earl Fitzwilliam, the Norman church of St. Michael, restored 1859, the town-hall, corn-exchange, and assembly rooms. New waterworks were completed in 1867. Brewing, tanning, iron and brass founding, and the manufacture of machinery and farm-implements, are the staple industries. M. returns one member to Parliament. Pop. (1871) 8168.

Malu'rus, and **Malurine Birds**, a group of *Incessores*, found in Australia, and belonging to the *Dentirostral* section of the order. The nostrils are open, and the tail is long and rounded. The hinder toe has a strong claw. To this group belong the emeu wrens (*Stipiturus*) and the blue wren (*Malurus*), &c.

Malva'cese, a large and important order of exogens which numbers about 700 species, world-wide in their distribution excepting the very cold regions. It comprises herbs, shrubs, and soft-wooded trees, with entire or variously divided leaves furnished with stipules, and the whole plant often covered with stellate hairs. Flowers usually axillary or in spikes, often with a double calyx; sepals three to five or more; petals five, and twisted in the bud. Stamens numerous, united, forming a tube. Pistils one to three or more, with rayed stigmas. Fruit, a capsule, dry or pulpy, with the seeds involved in wool-like hairs. Many are of a weedy nature, but generally have pretty flowers, and others are favourite garden plants. They abound in mucilage, and are not known to possess any poisonous qualities. The bark of many yields textile materials, and cotton is the seed-covering in the most important genus of the order. The tree-mallow has lately been cultivated in the N. of Scotland for paper-making purposes. See ABELMOSCHUS, COTTON, HIBISCUS, HOLLYHOCK, MALLOW, MARSH-MALLOW, SIDA, and URENA.

Mal'vern, Great, a town of England, in Worcestershire, on the E. side of the Malvern Hills, 9 miles S.W. of Worcester by rail. Its picturesque vicinity, sheltered situation, and pure mineral springs have made it a resort of the fashionable. There

are several large hydropathic establishments, and in the centre of the town are fine promenade gardens. M. Proprietary College (founded 1865) is a Gothic building, with a façade 210 feet long, and a central tower 100 feet high, and is designed to accommodate 600 boys. Pop. (1871) 5693. Little M. is a village 3 miles to the S.

M. Hills, in the S.W. of Worcester and in Hereford, form part of the W. boundary of the Severn valley, reach a height of 1396 feet, and afford extensive views of Wales.

Malwa, the name of a former Mohammedan kingdom in India, which covered the plateau between the Nerbudda and Bundelkund, almost co-extensive with the present Central Indian Agency. Pop. 241,000. The capital was at Mandu. After the defeat of the Mahratta chiefs Scindiah and Holkar, and the dispersal of the Pindaree marauders, this tract was pacified by Sir John Malcolm in 1817. It produces the famous M. opium of commerce, on which the duty is levied at Bombay, to the amount annually of more than £2,000,000 sterling on 40,000 chests. M. is the home of the Bheels, a wild hill tribe, who have been converted into excellent soldiers. Under the W. M. Agency there are twenty-one independent chiefs, or *thakurs*, who pay tribute either to Scindiah or Holkar. The principal is the Rajah of Rutlam. See Darnall's *Chronological and Historical Chart of India* (Lond. 1877).

Mamelukes (Arab. 'slaves'), the name given to the soldiery by which the sultans formerly governed Egypt. Their origin dates from the conquests of Genghis-Khan (q. v.). That monarch sold 12,000 of his captives, mostly Mingrelians and Tcherkesses, but also Turks and Kiptchaks, to Nejmeddin Eyyub, Sultan of Egypt, who formed them into a military force. Ever turbulent and rebellious, in 1251 they murdered the Sultan Turan-Shah, and for 266 years Egypt was ruled by a succession of Mameluke princes. In 1517 the Mameluke dynasty was overthrown by Selim I., and Egypt was henceforth governed by a Turkish pasha, the M. continuing to rule the provinces in the subordinate position of Beys. The decline of the Ottoman power in the 18th c. rekindled their ambition, and before 1770 Ali-Bey, the most powerful of the Mameluke chiefs, had made himself wholly independent of the Porte. The M. played a prominent and patriotic part during the French invasion of 1799, but in 1811 they were massacred to a man by Mehemet-Ali (q. v.).

Mamiani, Count Terenzio della Rovere, was born at Pesaro, in the States of the Church in 1802, came into notice (1831) in the outbreak of the Romagna against the temporal authority of Pope Gregory XVI., and took refuge in France, where he devoted his leisure to the cultivation of philosophy and poetry. In 1833 appeared his *Inni Sacri*, in 1836 his *Nuove Poesie*, the latter being an attempt to apply to the Christian legends the method of Homeric verse. During his absence from Italy he kept a watchful eye upon the political opportunities afforded in behalf of the national freedom of his native land, and at Paris he created a propagandist society. In 1848 he returned to Rome, became a member of the moderate Liberal party, and was appointed President of the Cabinet. His moderation compelled him to retire, but at Turin he founded the Society of the Union of Italy, going back to Rome to become Foreign Minister in the Galletti Cabinet. From Genoa, in 1859, he went to the Parliament of Turin, and became Minister of Public Instruction (Jan. 1860), ambassador to Greece (March 1861), Italian minister at Bern (1865). In his philosophical works M. strove to reconcile the spirit of Christianity with the last results of scientific investigation. In 1870 he started a quarterly review, *La Filosofia delle Scuole Italiane*.

Mammalia (from Lat. *mamma*, 'the breast'), a class, at once the highest of *Vertebrates* and of the animal kingdom, represented by the animals familiarly named 'quadrupeds,' and by man. Other animals, such as whales, 'sea-cows,' &c., are included in this type, these forms being mammals specially adapted for an aquatic existence. M. may be defined as a class characterised by having *two occipital condyles*; by being *warm-blooded*; by having a *four-chambered heart* and *non-nucleated* red blood corpuscles; a *body-covering of hairs*; and *mammary or milk-glands*, by the secretion of which the young are nourished for a longer

or shorter period after birth. The general consideration of the class may be commenced by a reference to the body-covering. Hairs are present usually in a very perfect degree, but in some forms (e.g., whales) the hairy covering may be limited to a few hairs surrounding the mouth, while in such forms as the Pangolins (*Manis*) horny scales cover the body, and in the armadillos bony plates exist. The hairy covering in others (e.g., porcupines) is modified to form strong spines. The *internal skeleton* varies in the development of its various parts. Except in whales, &c., the great regions of the body seen in man are usually to be recognised. In man himself, and in some monkeys and bats, the lowest number of vertebrae is found. In man, seven cervical, twelve dorsal, five lumbar, five sacral, and three or four coccygeal or tail-vertebrae occur. The cervical vertebrae rarely exceed seven in mammals. Even the giraffe has but seven in its elongated neck; the manatee and one of the sloths (*Choloepus*) have six only, while a three-toed sloth has nine. The back or dorsal segments number twelve as a rule, an armadillo has ten only, a lemur sixteen, while the elephants have twenty dorsal vertebrae, and the two-toed sloth no less than twenty-four. There are only two or three lumbar vertebrae in *Ornithorhynchus* and *Echidna*; as many as twenty-four exist in dolphins, but some of the so-called dorsal vertebrae may belong to the tail. The tail varies greatly in length. Thirty-three vertebrae exist in this part in the long-tailed spider monkeys; in the bats, on the other hand, only two may be developed. The *ribs* correspond in number with the *dorsal* or back-vertebrae. Twenty-four pairs of ribs exist in the two-toed sloth, and in some whales, on the contrary, only nine pairs are found. The skull is joined to the spine by means of two condyles in mammals; birds and reptiles have one condyle only. And while in the latter animals the lower jaw is of *compound nature*, and articulates with the skull by means of a *quadrate bone*, in M. the lower jaw is always of *simple nature*, and articulates directly, and of itself with the skull. The *limbs* of mammals are usually four in number, but (as in sea-cows and whales) only two fore limbs may exist in the form of swimming-paddles, whilst all four limbs are developed as swimming organs in seals and walruses. The bone known as the *coracoid bone*, in all mammals except the *Ornithorhynchus*, is a mere process of the *scapula* or shoulder-blade. In the *Ornithorhynchus* the coracoid bone is distinct and bird-like, and forms the chief support of the fore limb. The *teeth* of mammals usually number four distinct kinds, *incisors*, *canines*, *molars*, and *premolars*, but great variations (noticed in the articles relating to the various mammalian orders) exist in the form, structure, and arrangement of these organs. The great armadillo possesses no less than ninety; while over 200 are found in the dolphins. Certain teeth, such as the incisors of elephants and Rodents, grow throughout life, and form the *tusks* of these animals, while the canines of the walruses are similarly enlarged. Usually two sets of teeth are developed, but, as in dolphins and Edentata, one set only may be developed. The Guinea-pigs shed their milk teeth before birth. The *thorax* or chest of M. is completely separated from the abdomen by a midriff or *diaphragm*, and the lungs never exhibit the open structure seen in birds. The *stomach* is usually simple, but may be of complex character, as in *Ruminantia* (q. v.) or as seen in the pig, in kangaroos, &c. The *blood-corpuscles* are *non-nucleated*, i.e., do not, as in reptiles and birds, possess a central *nucleus* or particle. The blood-corpuscles of M. are of circular shape, those of the camels, however, being elliptical in form. The *mammary* or *milk-glands* number two in man and apes, and are placed on the chest (*pectoral mammae*). In whales there are also two mammae, but these are *inguinal* in position, i.e., are situated in the groin. In elephants, sloths, and sea-cows, two pectoral mammae are found as in man. The Insectivorous Tanreos have no fewer than twenty-two milk-glands. These glands unite to form the *udder* in Ruminants. The *nipples* of the glands rarely exist in an odd number, but some opossums exemplify this condition. The structure of the mammary gland is alluded to in the article BREAST (q. v.). The *classification* of M. forms a subject of great difficulty, owing to the different features which have been from time to time selected as a basis for arranging these animals. Owen has, for example, arranged the mammals in the following order, according to the form and structure of the *brain*, but this 'cerebral classification' has not been generally adopted, pre-

sumably from the difficulty of determining the brain-characters of any given series of these animals:—

Divisions.	Orders.
I. LYENCEPHALA (q. v.) (‘smooth-brained’).	<i>Monotremata</i> and <i>Marsupialia</i> .
II. LISSENCEPHALA (q. v.) (‘smooth or even-brained’).	
III. GYRENCEPHALA (‘convoluted-brains’).	<i>Insectivora</i> , <i>Edentata</i> , <i>Rodentia</i> , <i>Cheiroptera</i> .
IV. ARCHENCEPHALA (arch or ‘dome-brained’).	<i>Quadrumania</i> , <i>Ungulata</i> , <i>Proboscidea</i> , <i>Carnivora</i> , <i>Cetacea</i> , <i>Sirenia</i> .
	<i>Bimana</i> (Man).

The system of Mammalian arrangement depending on the feet and teeth is also defective in many respects, although forming perhaps the most readily understood of all the classifications of this group; but probably the most satisfactory arrangement is that founded, according to De Blainville's system, on the peculiarities of the female reproductive organs, and on the character of the *Placenta* (q. v.) in the various groups. Thus we may divide all M. into those (*Implacentalia*) which do not possess a placenta, and those (*Placentalia*) in which that structure is developed during the process of gestation. The form and nature of the placenta serve to further subdivide the group. Thus when the placenta is cast off at birth, it is then said to be *deciduate*, and M. exhibiting this peculiarity of development are said to be *deciduate M.* When, on the other hand, there is little or no substance, either of the mother or young cast off, the placenta is said to be *non-deciduate*. A placenta such as occurs in man, apes, rodents, &c., and which presents a rounded cake-like shape is named *discoid*. That found in Carnivora and elephants, and which assumes a rounded form, is termed *zonary*; while other forms give rise to the names *diffuse* (pig, horse, whale), *cotyledonary*, &c. (See PLACENTA.) The terms *Implacental* and *Placental*, applied to those mammals in which the young are not or are connected before birth with the mother by means of a placenta, have been related by De Blainville to peculiarities in the female reproductive organs. Thus in the lowest M., in which no placenta occurs, the female generative organs are bird-like in disposition. Hence arises the term *Ornithodelphia*. In the kangaroos and their allies the uterus or womb is double, and such forms are named *Didelphia*, while the highest or Placental Mammals are named *Monodelphia* from the fact that the uterus is single. The following table gives the classification of the mammals, according to the systems just noticed. Detailed descriptions of the various orders will be found under such headings as *Marsupialia*, *Monotremata*, *Carnivora*, *Proboscidea*, &c.; while the more prominent species of M. are described in separate articles, e.g., ELEPHANT, LION, HYRAX, SLOTH, &c.

Divisions.	Sections.	Orders.
I. IMPLACENTALIA.	A. ORNITHODELPHIA.	1. <i>Monotremata</i> . Ex. Ornithorhynchus and Echidna.
	B. DIDELPHIA.	2. <i>Marsupialia</i> . Ex. Kangaroo, opossum, wombat, &c. 3. <i>Edentata</i> . Ex. Sloths, armadillos, ant-eaters. 4. <i>Sirenia</i> . Ex. Manatee and dugong. 5. <i>Cetacea</i> . Ex. Whales, dolphins, &c. 6. <i>Ungulata</i> . Ex. Hippopotamus, all ruminants, horses, tapir, rhinoceros, &c.
II. PLACENTALIA.	C. MONODELPHIA.	7. <i>Hyracoides</i> . Ex. Hyrax, the ‘cony’ of Scripture. 8. <i>Proboscidea</i> . Ex. Elephant. 9. <i>Carnivora</i> . Ex. Lion, dog, bear, &c. 10. <i>Rodentia</i> . Ex. Rat, beaver, squirrel, &c. 11. <i>Insectivora</i> . Ex. Moles, shrew, hedgehog. 12. <i>Cheiroptera</i> . Bats. 13. <i>Primates</i> . Man and apes.

Mamm'ary Gland. See BREAST.

Mammary Gland, Diseases of. The diseases peculiar to the M. G. occur most frequently after delivery, or during lactation, in consequence of the determination of blood to the

organ for the formation of milk, or from some obstruction in the lacteal tubes. Inflammation of the mamma may be excited by external injury, or cold, but it most frequently arises from excessive accumulation of the secretion within the lactiferous ducts. It generally spreads rapidly and involves a great part of the organ, terminating in the formation of abscess. It usually commences with rigors, fever, and shooting pains increased by pressure. A hard and painful tumour, often deep-seated, may be felt, and as the swelling becomes more diffused the skin becomes dusky-red, hot, and shining. *Treatment*:—At the early stage of the disease the local application of warm vinegar, persevered with for twenty-four hours, is the most certain as well as the most comforting means that can be used. If there be no abatement of pain or intumescence, leeches should then be applied around but not over the indurated nodule. As soon as the abscess points to any particular part of the surface it should be opened. From the very commencement, the M. G. should be supported, and the arm on the affected side should rest in a sling. *Excoriated* nipples frequently lay the foundation of mammary abscess, from the child not being applied to the breast owing to the pain which it occasions. Ulcerations generally commence in the form of a chaf, the surrounding skin being rubbed off by the action of the child's mouth. *Treatment*:—Astringent lotions of alum or borax dissolved in rose water or almond mixture, or, better still, sulphate of zinc or of copper, or the nitrate of silver in weak solution, should be applied by a camel's-hair pencil, care being taken that the nipple is well cleansed before the child is allowed to suck. The applications may cause temporary pain, but the cure will be more certain and rapid. Whenever the child is taken from the breast the nipple should be covered by a metal shield to be constantly worn. The M. G. is liable to numerous diseases to which glands are subject. See DISEASES OF GLANDS, CANCER, CYSTS, TUMOURS, and INFLAMMATION.

Mamm'ee Apple, or S. American Apricot, is the highly esteemed fruit of a large tree named *Manca Americana*, a native of the W. Indies and of tropical America, but now cultivated and almost naturalised in some parts of tropical Africa and Asia. The fruit is the size of a large orange, and the fleshy or edible portion is yellow, with a sweetish aromatic taste. It is eaten plain or in slices with wine and sugar, or is made into a preserve. The seeds are very bitter.

Mamm'oth (Slav. *mdmant*, from Tartar *mama*, ‘the earth’), or *Elephas primigenius*, an extinct species of elephants which in the Tertiary period existed in Europe and N. Asia, where its colossal tusks (Siberian ivory) of 5 feet long are often found in great numbers. Remains of this animal, revealed by the thawing of the ice in which for thousands of years they have been imbedded, show that they had a covering of hair which on the neck formed a sort of mane, and lived on the branches of acicular-leaved trees.

Mammoth Caves, the largest in the world, are situated in Kentucky, U.S., 80 miles S.S.W. of Louisville, and 10 from the railway. Formed in the sub-carboniferous limestone by the action of water, they extend over an area of 6000 sq. miles in Kentucky, besides part of Indiana and Tennessee. In the county of Edmonston alone there are 500 mouths of vast, beautiful, but little explored caves. The Mammoth Cave proper is on the left bank of the Green River, 200 feet above which is the entrance. The river penetrates the caves, and is here called the Echo River. Though the cave contains much beautiful incrustation, its most imposing effects are due to the great size of the various halls, and the majestic dignity of its domes. It has been explored for 10 miles, and varies in width from 70 feet to a mere fissure. The earth is rich in nitre, and there are twenty species of cavern animals, including three species of blind fish, a blind cray-fish, rats, bats, &c. The temperature is uniformly 59° F., and the nitrous air, deliciously clear and pure, is beneficial in cases of consumption and asthma. See a series of papers in the *Illustrated London News* for 1877.

Man. The different races of men and their distinguishing characters having been considered under the head of ETHNOLOGY, it remains in the present article to point out some of the chief features through the possession of which man assumes the highest place in the animal series. It is worthy of remark, that regarded from an anatomical or structural aspect, there are no features which specially separate man from the highest apes or

from quadrumana at large. His body is built upon the type common to all vertebrata, while he shares the more special structure of the quadrumana, and is linked to them by structural bonds of the closest possible kind. At the same time *M.* may be regarded as presenting us with the highest development or extreme of animal structure. He exhibits certain features utterly wanting even in the highest apes, and must therefore be ranked as a genus of animals widely different from the genera of quadrumana most nearly allied to him. The consideration of man's psychical or mental attributes is a totally different matter. Here no parallelism is permissible or possible between the brute and human type. Community of instincts undoubtedly does exist between these types, but the differences are certainly those of kind as well of degree. *M.* differs thus from all lower forms in the extreme development of *consciousness*, or the power of knowing 'self,' and of accounting to a greater or less degree for his actions. It is this particular development which chiefly distinguishes *M.*'s mental state from that of *Instinct* (q. v.), and which places him, regarded from a mental standpoint, at once and for ever above the entire animal creation. As regards the chief differences which are perceptible between *M.*'s structure and that of the apes, we may justly note his perfect adaptation to the *erect posture*. No ape can assume an erect position for any length of time, and a semi-erect posture is the nearest approach which many quadrumana can make to man's position. The curves of the human spine; the graduated form of the spinal column itself, which tapers from base to apex; the broad pelvis and sacrum, and the consequent wide separation of the heads of the thigh bones, constitute several characters of man's structure, adapted specially for the maintenance of the erect posture. The manner in which the human *skull* is set on the spine, and the conformation of the skull itself, also form characters of distinctive importance in *M.*'s economy. A line marking the centre of gravity of the skull of *M.* would pass between the *occipital condyles* or processes whereby the skull is joined to the spine. The cranium of *M.* is evenly balanced on the spine, and is thus kept in position without any considerable muscular effort requiring to be exerted. The hinder portion of the skull is occupied by dense brain-matter, and the weight of this portion is counterbalanced by the larger front portion which includes the face. The bones of the human face do not project beyond the cranial or brain cavity, but are situated below the brain; the face underlying the brain in fact. A glance at the extreme prolongation of the facial bones in even the highest apes will show the vast differences which exist in this respect between *M.* and his nearest allies. The presence of a well-defined *chin* is a very striking character of *M.*; and this character is most apparent in the highest races of mankind. The jaws of *M.* are of proportionally small size, as compared with his cranium; while his teeth are arranged in a continuous series—a feature exhibited by no other animal save a Lemur (q. v.) *Tarsius*, a form which in other respects is far removed from the human type. The highest apes have hands which are clumsy organs when compared with those of *M.*; the human thumb being larger in proportion to the hand generally than that of any ape, and being also endowed with a greater mobility and power of opposing itself to the other fingers than is found in any of the quadrumana. The thigh of *M.* is of great relative length, and his arms reach only to the middle of the thigh—these proportions being greatly exceeded in some apes (e.g., *Gibbons*). *M.* is a truly *plantigrade* mammal, i.e., he applies the whole sole of the foot to the ground in walking. *M.*'s foot is arched from side to side and from behind forwards, whilst the development of the heel and the placing of the heel firmly on the ground are human characters of especial value. In respect of the large relative size, and proportional development of certain parts of the brain and nervous system, *M.* exhibits differences from the highest apes. As regards *M.*'s relationship with the anthropoid or *M.*-like apes, it may be noted that the human structure, so to speak, is not an improved variety of the structure of any one ape, but a concentration of the characters of all the higher quadrumana. Thus the gorilla is most *M.*-like in the curvature of the spine, in its pelvis, in the development of the heel, in the absolute capacity of the brain-cavity, in the proportions of the leg to the foot, and of the foot to the hand. But this ape has thirteen dorsal vertebrae and thirteen pairs of ribs, and only four lumbar vertebrae, and has the teeth broken up into a discontinuous series. Occasionally in *M.* thirteen pairs of ribs may be

developed. The oranges, of all apes, approach most nearly to *M.* in the number of ribs, and in the form of the cerebrum or brain-proper. The chimpanzees are most human in the shape of the skull, especially in early life, and in the length of the arms as compared with that of the lower limbs.

The *antiquity* of *M.* is a subject regarding which very diverse opinions exist. Much that is speculative, and little that is certain, is known. Whatever be the duration or length of the period which geology with its relative chronology may attach to the interval that has elapsed since the Post-Tertiary Period, the question of *M.*'s antiquity must stand or fall thereby. It is a matter of absolute certainty that *M.* existed in that period; it is still a matter of doubt and speculation as to the *time* which has elapsed since the prevalence of Post-Tertiary conditions.

Man, Isle of, an island in the Irish Sea, nearly equidistant from England, Scotland, and Ireland, being 27 miles W.S.W. of St. Bees' Head in Cumberland, 16 S. of Burrow Head in Wigtown, and 27 W. of Strangford Lough in Down. It is 31 miles long, by from 8 to 13 wide, has an area of 209 sq. miles, and a pop. (1871) of 53,763. The Calf of *M.*, a precipitous island lying 3 miles S. of the south-western extremity, has an area of 620 acres. The I. of *M.* itself is traversed in a north-easterly direction by a ridge of mica-slate hills, which in Snaefell (Scand. 'snow mountain') and North Barrule (Celt. 'top of an apple') attain a respective elevation of 2004 and 1804 feet, and in which the Sulby, Neb, Douglas, and other streams take their rise. The general formation is slate resting on granite, passing on the coast into grauwacke, and the chief minerals are lead and copper ore. The Foxdale mines yield annually 1500 tons of galena; the Laxey mines, 1600 tons of galena, 1500 of copper ore, and 5000 of blende ore. Limestone, slate, clay-slate, and sandstone are also raised. The climate is mild and healthy, with a mean winter temperature of 41° F.; and the soil—a light sand resting on grauwacke or clay-slate—yields good crops of oats, turnips, and artificial grasses. The native horses resemble the Welsh ponies; the sheep, the Southdown breed; and the cattle have been much improved by Ayrshire and short-horn crossings. There are no reptiles, the Manx puffin is extinct, but grouse, partridges, and snipes are plentiful. The tailless cat of the island is well known. The herring and deep-sea cod fisheries are the staple industry, the latter—from June to October—employing from three to four hundred boats, and yielding average returns of £70,000 per annum. There are also manufactures of woollens, linen, canvas, ropes, sailcloth, &c., and breweries, paper-mills, and tanneries. The customs' duties for the year ending March 31, 1875, amounted to £42,346. Castletown (the capital), Douglas, Ramsey, and Peel are the chief towns. The *Manx dialect*, belonging to the Gaelic branch of the Celtic family of languages, is fast dying out; but the island still retains its special governor, a council of eight members, and the 'House of Keys' with twenty-four members, the two together constituting the 'Court of Tynwald' (Scand. *thing*, 'assembly,' and *völtr*, 'plain'), which meets every 7th at Tynwald Mount, a circular barrow, 2½ miles E. of Peel; and no Acts of the English Parliament extend, without special provision, to the I. of *M.* The bishopric of *M.* (founded, according to tradition, by St. Patrick, in 444) was united to that of the Hebrides (Norse, *Sudreyjar*, 'Southern Isles') in the 11th c., the two remaining dependent on the Norwegian Archbishop of Trondhjem till 1334. Hence the bishop is still styled 'Bishop of Sodor and *M.*' He sits in the House of Lords, but has no vote. The Anglican is the established religion, and the tithes were commuted by an Act of Tynwald (1839) for £5050. Little is known of the early history of the I. of *M.* (Celt. *man*, 'a district'; the *Monapia* of Pliny). It is believed to have been ruled by a Welsh dynasty from A.D. 517 to 913, and was certainly held by a succession of Norwegian jarls—twenty-one per cent. of the local names are still Norse—until 1264, when Magnus ceded it, along with the Western Isles, to Alexander III. of Scotland. During the wars between Bruce and Balliol it was occupied by Edward I., and in 1344 William Montacute, Earl of Salisbury, was crowned King of *Man*. From him it passed successively, by sale or grant, to Sir William le Scroop (1393), Henry Percy, Earl of Northumberland (1399), and Sir John Stanley (1403), whose great-grandson, Thomas, was created Earl of Derby (q. v.) in 1485. The island was held by Fairfax for the Parliament (1651-60), and on the death of James, the tenth Earl of Derby (1736), it passed to James,

second Duke of Athole, a descendant of the youngest daughter of the seventh earl. To check the contraband trade, which, it was estimated, involved an annual loss to the revenue of £350,000, the British Government purchased in 1765 the sovereignty of M. for £70,000, and in 1825 the manorial rights, ecclesiastical patronage, &c., for £416,114. See Sacherell's *History of the I. of M.*, edited by J. G. Cumming (Douglas, 1859).

Manaar, an island off the N.W. coast of Ceylon, forming the E. link of the chain called Adam's Bridge, which stretches from Ceylon to India across Palk Strait. It is unhealthy, and inhabited only by a few persons of mixed Portuguese descent. M. has given name to the Gulf which indents the opposite coast of India N.E. from Cape Comorin.

Manaca, a Brazilian name for *Franciscea uniflora*, a shrub belonging to the natural order *Scrophulariaceæ*. The root, and to a less extent the leaves, are used in Brazil in syphilitic complaints. It is bitter, purgative, emetic, and in large doses poisonous.

Manacor, a town in the interior of the island of Majorca, 30 miles E. of Palma, has some trade in wine, oil, brandy, verdis, &c. Pop. about 10,000.

Manag'ua, the capital of Nicaragua, on the S. shore of the lake of the same name, 50 miles S.E. of Leon. It has a central position, and is surrounded by rich coffee plantations. Pop. 6500.

Manasseh (Heb. 'causing to forget,' Gen. xli. 51) was the elder of the two sons of Joseph, the Hebrew patriarch, and was counted one of the twelve tribal heads of the Israelites. The territory of the tribe, which numbered at the Exodus 32,200 (Num. i. 35), and at the next census 52,700 (xxvi. 34), was situated partly on the E. of the upper Jordan and partly on the W., between Ephraim on the S. and Mount Carmel on the N.—**M.**, the thirteenth king of Judah, succeeded his father Hezekiah in 697 B.C. His reign lasted longer than that of any other prince of the house of David, and is distinguished for nothing better than the restoration of the heathen worship, with all its abominations, which had been abolished by his father.

Manatee (*Manatus*), an aquatic member of the class *Mammalia* (q. v.), formerly included with the whales and dolphin.

Manatee.

&c., in the order *Cetacea* (q. v.), but now with another animal, the Dugong (q. v.), forming the order *Sirenia* (q. v.), which is distinguished by several well-marked characters from the *Cetacea*. The genus *Manatus* is represented by several species, of which the *M. Americanus* of the Atlantic shores of N. America, and the *M. Senegalensis* of African coasts are the two most familiar. The names 'lamantin' and 'sea-cow' are frequently applied to the M. The body is fish-like and is terminated by a horizontal tail-fin. Only six neck vertebrae are developed. The nostrils are at the extremity of a well-developed snout, and can be closed at will. There are no external ears, and the body is but sparsely covered with bristles. Two upper incisors and eight molars in each side of each jaw constitute the entire armament of teeth, the incisors being small and falling out in early life. The milk glands or mammae are two in number, and are situated on the breast. The fore-limbs alone are developed, a rudimentary pelvis being present. The M. frequents estuaries and shallow coasts, and feeds on vegetable matters. The average length is 8 feet.

Manoh, or **Maunch** (Fr. *manche*, from Lat. *manica*, 'a long sleeve'), in Heraldry, represents a lady's sleeve with long hanging ends, which was worn in England under Henry I.

Mancha, La, part of the old Spanish province of New Castile (see CASTILE), included in the modern province of Ciudad Real, is world-famed as the home of Don Quixote.

Manche, a maritime department of France, is bounded N.N.E. and W. by the English Channel, E. by Calvados and Orne, and S. by Mayenne and Ille-et-Vilaine. Area, 2289 sq.

miles; pop. (1872) 544,776. A range of hills, culminating in the Signal-de-l'Hermitage (1027 feet), intersects the department from S. to N., and it is watered by the Vire (50 miles), and several other streams. The Channel Islands lie off the coast, which is also fringed by Mont St. Michel, Chausey, D'Aurigny, &c. The climate is moist, the soil fertile (three-fifths of it arable), and 44,000,000 gallons of cider are produced annually. There are manufactures of linen, cloth, woollens, gloves, and glass; fishing, mining, and shipbuilding industries; and a trade in fish, cattle, horses, and agricultural produce. Two railways traverse the department, the chief towns of which are St. Lo, Cherbourg, and Granville.

Manchester, a city of England, is situated in the S.E. of Lancashire, on the Irwell, where it is joined by the Irk and Medlock, 7 miles above its entrance into the Mersey, 188 miles by rail N.N.W. of London through the Trent valley, 31 E. by N. of Liverpool, 41½ N.W. of Sheffield, and 85 N. of Birmingham. One of the greatest railway and canal centres in the kingdom, it is unrivalled by any city in the world for the extent of its manufactures and the perfection of its industrial machinery. The Irwell separates it from the borough of Salford, which is virtually a part of the city, communicating with it by ten bridges, exclusive of the suspension bridge between Lower Broughton and Pendleton. M. covers an area of 99 sq. miles; Salford an area of 7.9. The situation is flat and somewhat low, and immense sums of money have been expended of late years in street improvements. After the widening of Victoria Street, St. Mary's Gate, and Deans Gate (1874), the site was sold by the corporation for £288,960, or £56 per sq. yard. M. is on the whole regularly built, the chief streets (1877) Portland Street, Mosley Street, Market Street, and Oldham Road, generally running from N.E. to S.W. and at right angles. Of the few public squares the principal are St. Ann's Square, with its bronze statue of Cobden, and the Albert Square, in which stands a canopied monument of the late Prince Consort, surmounted by a spire 75 feet high. At the foot of Victoria Street a bronze statue of Oliver Cromwell, the gift of Mrs. Heywood, was unveiled 1st December 1875. M. is well endowed with recreation grounds. Besides the Peel Park, containing the Royal Museum, the Queen's Park, also enclosing a museum, and Phillips Park in Bradford township (all acquired by public subscription, 1845-46), it has the beautiful Alexandra Park, opened in 1870, and adjoining which is the Aquarium (1874); the Race Course at New Barns, 100 acres in extent, with a grand stand to accommodate 2700 people; various public gardens, of which the largest are Belle Vue, on the Hyde Road, with good zoological collections, and Pomona at Cornbrook, where are held horse and cattle shows, &c. The finest public building in M. is the new town-hall, facing Albert Square, a vast Gothic structure, covering an area of 8648 sq. yards, and containing over 200 rooms, built 1868-77, at a cost, including land, not far short of £800,000. The main front, 328 feet long, is relieved by the mass of the central tower, supporting a clock lantern, 280 feet high; the hour bell is 7 tons in weight, and a carillon of 21 bells (playing tunes in five different keys) makes up a total of above 31 tons. Other notable secular buildings are the Royal Exchange (1866-74), 4050 sq. yards in area, and containing the largest exchange room in Europe (215 by 104 feet); the Assize Courts (opened 1864), in decorated Gothic style, with a tower 210 feet high, and a beautiful interior; the Salford town-hall (1825), with an elegant Doric portico; the town-hall of Hulme (1802-66), a handsome Italian edifice; the Royal M. Institution, in Grecian style; the police courts, founded in 1863; and the gaol, occupying 7 acres, and constructed on the model of Pentonville. In M. and Salford there were in 1871 100 churches of the Establishment, 180 Dissenting chapels, 17 Roman Catholic chapels, 4 German churches, 3 synagogues, and 1 Greek church. M. was made the seat of a bishop in 1847. The cathedral, an old Gothic collegiate church, was built in 1422; the finest of the other churches is the Roman Catholic St. John's, called the cathedral, a cruciform building with a needle spire 239 feet high. M. has a School of Art, a Literary and Philosophical Society, a Royal School of Medicine (now connected with Owens College), an Academy of Fine Arts, Royal Botanical Gardens, a Free Library (opened 1852), an Hospital (called 'the college' for 40 boys), and Library founded by Humphrey Chetham in 1665, the free

grammar-school, one of the best in the country, founded in 1515, the Lancashire Independent College, a Wesleyan College, a Baptist College, the M. Commercial Schools, High School for Girls, &c. At the head of the educational system of M. stands Owens College, founded by John Owens in 1851, and having in 1877 a senate of 20 professors and 1450 students. The handsome new buildings for the college were erected in 1871-73. Among the benevolent institutions of M. are the Royal Infirmary (since 1752), a Royal Lunatic Asylum, Barnes' Convalescent Hospital, some 12 other hospitals, various dispensaries, schools for the deaf and dumb, and blind, &c. M. has many places of amusement, including 4 theatres, music-halls, the Free-Trade Hall, &c. The chief market is Smithfield, with a covered space of over 12,000 sq. yards, besides extensive butchers' shambles; a new fish and game market was opened in 1873. The market tolls and rents amount yearly to £35,000. Water is supplied to M. through iron-pipes from reservoirs at Blackstone Edge, Woodhead, distant 20 miles. Both the water and gas-works belong to the corporation. The investment in the former is about £3,750,000.

The great industry of M. is the spinning of cotton and various cotton fabrics, and for miles around, the city gives employment to the most extensive works for calico-printing, bleaching, and dyeing. Another immense industry depending on the former, is iron-founding and the manufacture of steam-looms, spinning-mills, and powerful engines, both fixed and locomotive. M. also manufactures great quantities of silks, mixed goods, 'small-wares,' and various other textiles. In 1877 M. had 80 cotton mills, about 20 silk-mills, 50 smallware mills, above 30 dye-works, and 100 machinists' workshops; a still greater number of cotton-mills, scattered over the counties of Lancashire, Cheshire, &c., belong to what are known as 'M. manufacturers,' who have only offices or warehouses in M. itself. The cotton-mills generally employ some 60,000 persons, earning wages to the amount of £30,000 a week. In the production of machinery a great proportion of the workmen are skilled and highly-paid engineers. Among the other industrial establishments are extensive flax-mills, wire-works, chemical works, paper mills, sugar refineries, printing offices, and Sir Joseph Whitworth's gun-factory. It need scarcely be added that the merchants and manufacturers of M. have commercial dealings with every trading country in the world.

M. returns three members to Parliament, and Salford returns two. In 1871 the pop. of the municipal borough and city, which included the townships of M., Ardwick, Beswick, Chetham, Chorlton-on-Medlock and Hulme, was 351,189 as against 338,722 in 1861; the parliamentary borough comprising also the townships of Bradford, Newton, and Harpurhey, was 379,374. The pop. (1871) of Salford was 124,801. M. is the *Mancunium* of the Romans. The first part of the word is probably the Celtic *man*, 'a district.' The town has an ancient though not distinguished history. Acres' fair has been held here (now on 1st October) since 1134. The manorial rights were sold in 1579 to John Lacye for £3000; they were finally bought by the corporation in 1845 for £200,000. Prince Charles Edward entered M. on the 29th November 1745. The manufacture of 'M. cotton,' a kind of woollen cloth made of unprepared fleece, was introduced in 1352. Subsequently Flemish artizans, invited by Edward III., greatly developed this industry. Fustian was one of the earliest articles of the local manufacture; Humphrey Chetham, founder of 'the College,' was a fustian dealer. It was not, however, till after the invention of the power-loom that the textile industries of M. began to assume any great importance beyond our own country. As the centre of the Anti-Corn-Law League, founded here in March 1839, M. has a solid claim to the lasting gratitude of the English nation.

Manchester, a city of New Hampshire, U.S., on the Merrimack, 16 miles S. of Concord by rail, has fifteen churches, nine banks, a free library of 18,000 vols., five public parks, seven newspapers, &c. Four spinning-mills employ 300,000 spindles and 7600 looms, and derive their water-power by two canals from the Amoskeag Falls, which, with a fall of 54 feet 10 inches, are the highest on the Merrimack. There are also manufactures of stockings, leather, machinery, edge-tools, &c. Pop. (1870) 23,536. Settled in 1722, M. was incorporated as Derryfield in 1751, assumed its present name in 1810, and was made a city in 1846.

Manchineel is the poisonous *Hippomane Mancinella*, a tree belonging to the natural order *Euphorbiaceæ*, and about which as many fabulous tales have been told as of the celebrated Upas tree of the E. It is common in the W. Indies and neighbouring Central America, growing usually on the sea shore, and rising to 40 or 50 feet in height, bearing simple shining elliptical leaves, inconspicuous flowers, a yellowish-green fruit—tempting enough to the eye, but highly acrid and blistering to the skin—as is also the copious milky juice of the plant. Bastard M. is *Camararia latifolia*, also W. Indian and poisonous, but belonging to the Dogbane Family (*Apocynaceæ*).

Man'dalay, the present capital of Independent Burmah, on the left bank of the Irrawady river, about 450 miles above Rangoon, a little higher up than the now deserted capitals of Ava (q. v.) and Amarapura (q. v.). It is the creation of the reigning monarch, having been only commenced since 1853; but as trade in Burmah is a state monopoly, it has already gained all the foreign commerce of the country, conducted by river steamers, some of which are royal property. The exports are petroleum, saltpetre, terra japonica, sugar, and timber; the imports are rice, dried fish, and English piece-goods. Here is the palace of the king, and the residence of the British Political Agent. See Dr. Anderson's *M. and Momien* (Lond. 1876).

Manda'mus, the name of a writ issuing in the Queen's name, from the Queen's Bench Division, requiring any person, corporation, or inferior court, to do some specified act of duty, which some one has a right to have done, and has no other legal means of compelling the performance of.

Mandarin, the title bestowed in all European languages on Chinese officials of every grade. The word does not appear in Chinese, where *kwan* is the corresponding term, nor is it connected with the Port. *mandar*, 'to command;' being identical with the Sansk. *mantrin*, 'counsellor,' brought by the Portuguese from Indian waters.

Man'date is a contract by which one employs another to act for him in the management of his affairs, or in some special department of them. The employer is called the *mandant*, the person employed is called the *mandatory*. The mandatory acting gratuitously is not liable beyond his cash transactions, and for such diligence and attention as he would presumably give to his own affairs. A somewhat greater responsibility attaches to the paid mandatory, who must repair the damage arising from his own inadvertency. It seems to be the law in England that if a mandatory undertake an office gratuitously, and omits to do the work, he is not liable in damage; but that he is so liable, if he enters on the work, and then neglects it. In Scotch law, the undertaking of the office causes liability.

Man'deville, Sir John, an English traveller of great celebrity, was born at St. Albans, in Hertfordshire, about the year 1300, left his native land in 1322, and was absent for thirty-four years, during which he tells us he 'passed thorough Turkye, Tartarye, Percy, Surrye, Arabye, Egypt, the highe and the lowe, Ermonyne, the litylle and the grete; thogh Lybye, Caldee, and a gret partie of Ethiopie; thogh Amazoyne, Inde, the lasse and the more, a gret partie; and thorough many other iles, that been abouten Inde.' He took service as a soldier with the Sultan of Babylon and the Khan of Cathay, and proved himself a bold and valiant knight. On his return to England he wrote in 1356 *The Voiage and Travaile of Sir John Maundeville*, first in Latin, then in French, and finally in English, 'that every man of my nacioun may understonde it.' M. died at Liège, 17th November 1372. The best edition of his work is that by J. O. Halliwell, published in 1839 (reprinted 1866), with introduction, notes, and a glossary. During the Middle Ages it was immensely popular, and was translated into several languages, but after the 17th c. it began to be discredited; and for many years the phrase 'as great a liar as Sir John Mandeville' was thought to be the superlative of mendacity. An impartial study of the *Voiage and Travaile* dissipates such a notion, and shows M. to have been in the main a clear-sighted, accurate, and honest narrator of what he saw with his own eyes, and only credulous (after the fashion of the times) in regard to what he was told. His wonderful stories are matters of hearsay. The only thing that throws suspicion on his veracity is the resemblance of some parts of his work to the narra-

tive of an older Italian traveller, Odoric, a Franciscan friar of Pordenone in Friuli.

Mandha'ta, an island in the Nerbudda, district of Nemur, Central Provinces, British India, nearly a square mile in area, whose banks rise precipitously 400 feet from the river. Here are two of the twelve original 'lingas' or emblems of Siva; and the whole island and the neighbouring banks of the river are covered with ruined temples of the Sivaite, Vishnuvite, and Jain sects of Hindus. Not a single sculpture has been left unmutated by Mohammedan fanaticism.

Man'dible, **Mandibula'ta**. The name M. is used in comparative anatomy to denote the chief jaws in such animals as insects, lobsters, crabs, centipedes, spiders, &c., and the large jaws in such molluscs as the cuttlefishes. In vertebrate anatomy the name M. is restricted to the *lower jaw*, as distinguished from the *maxilla* or upper jaw. All animals that have prominent mandibles, e.g., beetles, are termed 'mandibulate.'

Manding'os, a superior negro people of Senegambia, inhabiting the N. slope of the Sudan, S. from the Gambia, and found scattered through the neighbouring lands as colonists, traders, preachers of the Koran, artists, &c. Black, well-formed, with regular features, they are singularly active, intelligent, and enterprising. Their speech is used in trade from Senegal to Timbuktú.

Man'doline (It. *Mandolina*, *Mandola*, prob. = Lat. *Pandura*, Gr. *pandoura*, from Pan), an old instrument of the guitar kind.

Man'drake is the name applied to two species of plants belonging to the natural order *Solanaceæ*, and constituting the genus *Man'dragora*, a Greek word signifying 'hurtful to cattle.' They are natives of S. and E. Europe and W. Asia. The root is thick and fleshy, and is sometimes forked in a curious manner so as to present a fancied resemblance to the human figure; from it spring a number of simple ovate lance-shaped leaves. The flower-stalks rise from the leaves, and bear a solitary bell-shaped flower, followed by a fruit like the potatoe-apple, but larger. As with their near ally the nightshade they are poisonous. In olden times they were administered on account of their narcotic quality during surgical operations. Ancient and mediæval writers record the wonderful virtues and power of the M. The earliest mention of it is in Gen. xxx. 14.

Man'drill (*Cyncephalus* or *Papio maimon*), a species of Baboon (q. v.) found on the W. coast and in other parts of Africa, and distinguished by the prominent cheeks, which are of the most vivid blue and scarlet colour, while the natal callosities or bare hip-patches are also of bright red. The general body-colour is an olive brown, lightest on the under parts. The head is dog-like, the canine teeth prominent, and the tail short. The ears are small and destitute of fur. The M. is fierce and untamable. Its average length is 3 or 4 feet.

Mándû, the former capital of the Mohammedan kingdom of Malwa, now in the petty state of Dhar, 15 miles N. of the Nerbudda River, and 26 S.W. of Mhow. It was founded in the 4th c., and was the capital of Malwa from 1387 to 1570, when it was captured by Akbar. The circuit of the ramparts is said to be as much as 37 sq. miles; but inside all is deserted, overgrown with jungle, and the haunt of tigers. A Jumma Musjid, or great mosque, and the mausoleum of a king in white marble, are still well preserved.

Mandu'ria, a town in S. Italy, province of Lecce, 23 miles E. by S. of Taranto. Pop. (1874) 7761. M. was a Salentine city as early as the 4th c. B.C., and considerable ruins exist of its double circuit of walls. It was destroyed by the Saracens, and the inhabitants founded near by Casal Nuovo, which name at the close of the 18th c. was exchanged for the ancient M. A well is still shown which Pliny accurately described as having its water always at a uniform level.

Mándvi, the chief seaport and most populous town of the native state of Kutch, in political connection with the government of Bombay, India, on the N. shore of the Gulf of Kutch. Pop. (1872) 35,988. Ships of considerable burden anchor in the roads.

Manetho was an Egyptian priest who lived in the reign of Ptolemy I., and compiled about B.C. 250 a history of his nation from the ancient records and memorials of the Egyptians themselves, and especially from their sacred books. The work was written in Greek, and professed to have been derived from cer-

tain pillars in the Siriadic land, which had been inscribed in the sacred dialect of Thoth before the flood. The inscriptions had been translated into Greek, and the translations laid up in the Egyptian temples by the sacred Thoth. Josephus copied some passages from M. (*Cont. Ap.*), which are all that remains of the history itself. Julius Africanus, a Christian of Alexandria (3d c.), and author of a chronology from the Creation to A.D. 221, preserved the dynasties of M. in two versions differing from each other and from Josephus. But the work of Africanus shared the fate of M.'s history, and his 'lists' have been preserved only in the Chronicon of Eusebius (q. v.). The history was divided into three parts, of which the first comprised the prehistoric or mythological period and the first eleven of the thirty dynasties; the second, the period beginning with the twelfth dynasty and ending with the nineteenth; and the last, the remaining eleven dynasties, concluding with the history of Nectabanus, the last of the native kings. The mythological period extended to 24,900 years, and that of the monarchy, from Menes, the founder, till the conquest by Alexander the Great (B.C. 332), to 3555 years. Besides his history, M. wrote a work (*Tôn Physikôn Epitómē*) on the theology of the Egyptians, giving an account of the origin of the gods, of the world, and of the laws of morality. See Bunsen's *Ägyptens Stelle in der Weltgeschichte* (Hamb. 1857); Chabas' *Mélanges Égyptologiques*.

Man'fred, King of Sicily, was a natural son of the Emperor Friedrich II., and was born about 1231. On the death of his half-brother, Konrad IV., in 1254, he acted as regent for Konradin, son of Konrad, and on a rumour of his nephew's death was chosen King of Sicily. M. was a mainstay of the Ghibelline party, and the help which he gave to Farnata degli Uberti contributed to the great defeat of the Guefts at Montapertio in 1260. He twice suffered papal excommunication, but no real misfortune befell him till the invasion of his dominion by Charles of Anjou, brother of Louis IX. of France. After varying success M. was defeated and slain at the battle of Benevento, 26th February 1266, and the power of the Ghibellines was broken throughout Italy. See Cesari, *Storia di Manfredi* (Napl. 2 vols. 1837); Münch, *König M.* (Stuttg. 1840); Schirrmacher, *Die letzten Hohenstauffen* (1871).

Manfredonia, a seaport of Italy, in the province of Foggia, on the Gulf of M., and at the foot of Monte Gargano, 25 miles E.N.E. of Foggia. Its sand-choked harbour is defended by a strong castle; and at Siponto, 2 miles to the S.E., is the fine Romanesque cathedral of its archbishop. M., founded by Manfred (q. v.) in 1256, from the ruins of Sipontum, was plundered by the Turks in 1620, and has never regained its former importance. Pop. (1874) 7938.

Mangalore, the chief town of the district of S. Canara, in the Madras Presidency, British India, on the Malabar coast, 440 miles S.E. of Bombay, and 370 W. of Madras. Pop. (1871) 29,712. The military cantonments lie N. of the town. M. is the port of Mysore and Coorg. In 1874-75 the exports were valued at £505,847, chiefly rice, timber, and coffee; the imports at £272,704. M. is an old town. It was repeatedly captured by the Portuguese in the 16th c. In 1784 a treaty was concluded here with Tippoo Saib.

Manganese (atomic weight 55; symbol Mn), a metallic element somewhat resembling iron in its chemical and physical properties. Three distinct oxides are known; and the existence of other two is probable, though they have not yet been obtained in the anhydrous state. The *protoxide* (MnO) is obtained as a green powder by heating the carbonate of M. in an atmosphere of hydrogen to prevent oxidation. The *sesquioxide* (Mn₂O₃) forms the mineral *braunite*, and with water the mineral *manganite*. It is a weak base; and its compounds readily decompose when heated, being reduced to the corresponding salt of the protoxide. The *red oxide* (Mn₂O₄) is the most stable of all the oxides, and is produced when any of the others is heated in the air. It occurs in nature as *hausmannite*, but its chief source is by heating the binoxide. The *binoxide* is the chief form in which M. is found in nature. It is the essential constituent of *pyrolusite*, *psilomelane*, and *wad*, and in commerce is ordinarily known as the black oxide. It yields oxygen when heated, and is the source of all the compounds of M. It does not combine with acids, but if heated with sulphuric acid it loses half its oxygen, and is reduced to the protoxide, which then unites with the acid to form sulphate of M. Manganic acid

(MnO_2) and permanganic acid (Mn_2O_7) have never been obtained separate. They are known by their hydrates (H_2MnO_4 and $HMnO_4$, respectively), the latter of which is a thick syrupy liquid of a greenish colour. It is one of the most powerful oxidising agents known, instantly igniting combustible bodies with which it is placed in contact. Both of these acids form salts, which are known as manganates and permanganates. The only manganate of importance is the potassium salt (K_2MnO_4), which is formed by heating to redness a mixture of caustic potash and binoxide of M. Its solution in cold water is at first green, but it rapidly changes colour, passing through various intermediate hues till it becomes red. Hence its old name—*mineral chameleon*. Manganate of soda, or *Condy's green disinfecting fluid*, is used as a bleaching agent. The permanganate of potash ($KMnO_4$), prepared by heating a mixture of potassium chlorate, caustic potash, and the black oxide, is remarkable for its great colouring power, and for the ease with which it decomposes many organic substances. Consequently it is extensively used as a disinfectant under the name of *Condy's red disinfecting fluid*. M. appears to form three chlorides, $MnCl_2$, Mn_2Cl_4 , $MnCl_3$, but of these only the first is stable. It is obtained in large quantity as a waste product in the preparation of chlorine in the manufacture of bleaching powder; and may be prepared on a small scale by dissolving any oxide of M. in hydrochloric acid.

Medicinal Properties of M. M., in the form of the black oxide, is used for producing chlorine. As a medicine it is *not official* in the British Pharmacopœia; but the *magnesium oxidum præparatum* is an admirable remedy for gastrodynia, pyrosis, &c., in doses of from 10 to 30 grains. The *sulphate* of M. is useful, as a purgative, in gouty affections; but its taste is disagreeably styptic, and its action is somewhat uncertain. M. is associated with iron in several recent preparations, as Syrupus Ferri Phosph. c. Manganesimo.

Mange. See ITCH MITT.

Mango, a genus of trees belonging to the natural order *Anacardiaceæ*. The *M. Indica* grows abundantly in India, and is now cultivated in most hot countries, together with numerous varieties. It is from 30 to 40 feet in height, of a spreading rounded form, with dense foliage of lance-shaped leaves about 7 inches long; the panicle, of numerous, small, fragrant flowers, is large, branched, and divaricating. The fruits are about the size of a large pear, and in the good varieties of M. are much esteemed; in the inferior kinds they possess a strong turpentine flavour. They are eaten plain, or sliced with wine, sugar, and nutmeg; or they may be boiled; or different preserves prepared from them. A very palatable spirit too may be obtained from the juice of the fruit. In the unripe state they form a very excellent pickle, and constitute an ingredient of tarts. The light and friable wood is used in India with sandal wood in burning the bodies of persons of distinction. A gum resembling gum tragacanth is obtained by wounding the stem and branches.

Mango Fish (*Polynemus paradiseus*), a Teleostean fish belonging to the family *Sciænidæ*. The name is derived from the bright yellow colour of the fish, which resembles that of the ripe fruit of the same name. The M. F. occurs in the Bay of Bengal and in other parts of the Indian Ocean. It has seven thread-like or filamentous appendages borne beneath the pectoral fins, the uppermost projecting beyond the tail. An allied species, *P. multifilis*, has fourteen. The flesh of the M. F. is usually eaten in a preserved and salted state. In India it is known under the name of 'burtah.' Isinglass is prepared from the air-bladder of the M. F. In form the fish somewhat resembles the perch.

Man'gold-Wurzel (Ger. 'beet-root'). Most writers consider the M.-W. and the Beet (q. v.) as produced from *Beta vulgaris* at their wild stock, but Dr. Hooker says that *B. maritima*, a frequent British coast plant, is probably the origin of both. At any rate the M.-W. is evidently so closely related to the beet of cultivation, that it cannot be considered as more than a large and coarse variety of it. It is only quite recently that the cultivation of M.-W. as a field crop has become general, good books of sixty years ago not making any mention of it as a fodder root, though it is stated to have been introduced into England in 1786. Its advantage over the turnip is that it yields a much larger produce, is not subject to alarming diseases nor extensive attacks of insects, and is more patient of a high tem-

perature. The mode of culture does not materially differ from that of the turnip. Usually the crop is ready during October, and the roots being raised without bruising, are stored for spring use in protected pits or clamps. When their harshness has passed away by keeping, they form an excellent, palatable, and nutritious food for stock of all kinds.

Man'gonel. See BALISTA.

Mangosteen is the fruit of *Garcinia Mangostana*, belonging to the same genus as the Gamboge (q. v.), and is considered one of the most delicious fruits known, being peculiarly cool and grateful to the taste. The tree is about 20 feet high, with opposite horizontal branches, and firm, smooth, elliptical leaves; the flowers, about two inches across, have four deep red petals; the fruit, about the size of a small orange, is crowned with the persistent rays of the stigma, its rind containing a powerful astringent gum. M. is a native of Molucca and other Spice Islands, and has become naturalised in Java, Singapore, and other parts of the East.

Man'grove is the name by which the trees belonging to the genus *Rhizophora* ('root-bearer') are known—the type genus of the natural order *Rhizophoraceæ*. The chief point of interest connected with the M. arises from its peculiar mode of growth and germination. Inhabiting sea-side mud swamps in tropical countries, it makes continuous advances ocean-ward, by the branches of each tree sending down roots into the mud, which in time become independent trees, and further, by the aerial germination of the seeds, which only drop from the parent after they have assumed dimensions sufficient to take possession of the mud below, in advance of the parent tree. By these means 'a complicated labyrinth is at length formed,' constantly extending and advancing mile upon mile along low shores, and giving rise to the dreaded term 'M. swamps'—an equivalent of malaria and fever. An abundance of tannin exists in the M., and the fruit of *R. Mangle*—the typical species—is said to be sweet and edible.

Ma'ni, Ma'nes, or Manichæus, the founder of Manichæism, was born somewhere in the Persian empire about A.D. 250. Educated among the Magi (q. v.), if he did not become a member of that fraternity, he was at the court of Sapor, as physician, astronomer, artist, philosopher, and poet, at the time when Christianity was being persecuted by that monarch, and Zoroastrianism, after a period of adversity under the Parthians, was triumphantly restored, but divided into two hostile factions. The Magusians, to which faction M. belonged, maintained the primitive creed, according to which Ormuzd and Ahriman were the sole deities; the other, or Magian faction proper, maintained that there was a third and supreme deity, *Zarvān-akavane* ('time without bounds'), the source of all being whatsoever. M. now offered Christianity to the Persians as the pure Magusian creed, but the prejudices of his countrymen, especially the jealousy of the Magians, were too strong for him, and he was obliged to flee. From that time he assumed the rôle of a prophet and apostle, professing to be the Paraclete promised by Christ. From the place of his exile he sent out missions to all parts of Asia, and here he produced his sacred book, the *Ertenghi Mani*. On the death of Sapor, his successor Hormisdas recalled M. and gave him a strong castle for a residence; but under the successor of that prince, Varanes I. or II., he lost his life. Being inveigled into a disputation with the Magi, on his defeat he was flayed alive and his carcass thrown to the dogs, A.D. 277.

Ma'nia (Gr.), in its primary sense, means raving madness, and the term may be used with propriety as its English synonym. The premonitory symptoms of M. are gloom and despondency, sometimes deep stupor, the reverse of the excitement which follows. The physical symptoms are impaired health, insomnia, deranged liver, slight or acute febrile symptoms; and, sometimes, decided indications of cerebral congestion.

When M. is fully developed, the perceptions of the patient, whether they be primarily or secondarily affected, may convey to him a hallucination or illusion sufficient to determine his conduct. Such illusions and hallucinations, when believed in and acted upon, imply the existence of corresponding delusions, and give rise to the most extraordinary and violent language and acts. Ordinary *Acute* M. may yield rapidly to treatment; may terminate in death from exhaustion; may recur in intermittent paroxysms; or may terminate in *Melancholia* or

Dementia (q. v.) of an incurable nature. The most important influences predisposing to M. are, hereditary tendencies, a delicate mental organisation, and an unbalanced mind. Among the exciting causes are inflammation of the brain or its membranes, intemperance, the puerperal state, disordered health, disturbed affections, &c.

Manichæans, the religious sect founded by Mani (q. v.). After the death of that teacher his opinions spread throughout Persia, Syria, and Egypt. About A.D. 296 Diocletian issued severe edicts against Mani's followers as a Persian sect hostile to the empire. After being apparently extinguished, their opinions were resuscitated in the Eastern Church in the 7th c. by the Paulicians, and in the Western in the 11th c. and 12th c. by the Cathari, Paterini, &c. The system of Mani resulted from a fusing together of Zoroastrianism and Gnostic Christianity. According to the dualism of the former, he maintained that there are two eternal principles of good and evil. Ormuzd, the good principle or deity, has five ministers—light, air, fire, bright water, and gentle winds; Ahriman, the evil principle, has also five—darkness, fire, smoke, foul water, and tempestuous winds. When the realm of light was discovered by the powers of darkness, they immediately invaded it. For its defence a spiritual emanation, 'the first man,' was produced, but the spiritual armies under his conduct were defeated by Ahriman; and in consequence the beings made in the likeness of this Adam were of an evil nature. Another emanation of light, 'the Spirit of Life,' taking the command of the defeated armies, gained a partial victory over the powers of darkness, and was able so to blend the spiritual and the material that the light possessed the means of ultimate escape. Thus in every human being there is a soul of darkness derived from Ahriman, and a soul of light from Ormuzd, while the material body is necessarily evil and vicious. Salvation is the freeing of the soul of Ormuzd from the dominion of Ahriman. Ormuzd, the first person of the Christian trinity, produced the Christ, surnamed Mithras by the Persians, and the Holy Spirit. Christ descended upon the earth to draw upwards the souls of light; his body, however, being a mere phantom (see DOCTÆ), and his sufferings only apparent. Those who confess Christ must renounce Jehovah, the servant of Ahriman and fashioner of the material universe, and seek the freedom of the immaterial heaven. The souls which achieve this salvation must undergo a twofold purgation after death, the first by water in the moon, the second by fire in the sun. Those who have lived in sin must either undergo another life, or be consigned to the demons of the air; and when all but the irrecoverable are purified, all matter will be consumed. The members of the sect were divided into two classes, the Elect or perfect, and the Hearers or learners. The former obeyed a rule of most severe asceticism, and were solemnly admitted by a baptism of purification. For the latter the rule of morality was the same as for the former, but they were not bound to the same ascetic life. See Neander's *Kirchengesch.* (Eng. trans. 1858), Gieseler's *Handbuch d. Kirchengesch.* (Eng. trans. 1865), Baur's *Das Manich. Religions-System* (Tüb. 1831).

Manila, or **Manilla**, the capital of the Philippines, and residence of the Spanish viceroy, on the S.W. shore of Luzon (q. v.), at the mouth of the Pasig, and on the deep Bay of M. The city proper lies between the river and the bay, is defended by walls and a citadel, and is laid out in fine broad streets and spacious public squares, ornamented with fountains and tropical foliage. The chief buildings are the large cathedral (built 1654-72), the magnificent palaces of the viceroy and archbishop, the Hall of Audience, and extensive colleges and barracks. A splendid promenade on the ramparts is much frequented in the evenings. Biondo, a suburb on the N. bank of the Eider, is the seat of commerce, and here are to be seen representatives of almost all countries in the world, especially Spaniards, Englishmen, Americans, Chinese, and Malays. On account of its position and excellent harbour, M. has long been the entrepôt for all the Philippines. The principal exports are hemp, tobacco, rice, sugar, cotton, coffee, cordage, sapanwood, buffalo hides, gum-mastic, indigo, and tortoise-shells; the imports are English textiles and iron wares, and Chinese silks, nankins, vermilion, &c. M. cheroots and cigars are world-famous, and their manufacture, a government monopoly, employs 2000 hands. Of M. hemp many fabrics are made, noted for delicacy of texture. In

1875 the exports amounted to 15,727,262 dollars, of which 6,085,697 were to Great Britain. There entered the port (1875) 262 vessels of 143,969 tons. M. has a good climate, the average temperature being 82° F., but earthquakes have been frequent, the most destructive being those of 1824 and 1863. Pop. of the city proper 15,000, with suburbs 150,000. M. was founded by Legaspi in 1571, and is one of the four ports of the Philippines open to foreign commerce.

Manin, Daniello, an Italian patriot, was born at Venice, May 13, 1804, graduated at Padua in his seventeenth year, and being ready for the profession of advocate before the law allowed him to practise, he spent the interval in studying Roman law and languages. In 1831 he issued a proclamation which was distributed among the people in the interests of Italian independence, and from this date was recognised as one of the leaders of the national party. On the 21st of December 1847 he got up a petition which declared that the Lombardo-Venetian kingdom was national and Italian. He was arrested 18th January 1848, but in the March following was liberated by the Revolution. M. immediately proclaimed a republic, after which he proceeded to announce reforms in law and finance, and to organise a scheme of military resistance. In vain he appealed to England and France for assistance against Austria. On the 24th August 1849 the capitulation of Venice had to be signed. M. retired to Paris, where he died 22d September 1857. He was one of the most enlightened and self-devoted of Italian advocates for national unity. See Martin's *Daniel M.* (1859). In 1860 F. Planat de la Faye issued a French translation of the unpublished papers of M. under the title of *Documents et Pièces Authentiques laissés par Daniel M.*

Manioc, **Man'dioc**, or **Cassava**, is prepared from two Euphorbiaceous plants belonging to the genus *Manihot* (formerly *Jatropha*), viz., *M. utilisima*, the bitter; and *M. Aipi*, the sweet. Both in growth are slender and shrubby, rising from long, thick, fleshy roots, and bearing seven-parted and five-parted leaves respectively. They are extensively cultivated in tropical America and the W. Indies for their parsnip-like roots, which contain a great quantity of farina. This is obtained by 'maceration and filtering in water,' and on being dried forms the wholesome and nutritious food known by the three names heading this article. The roots of *M. utilisima* are, however, in their raw state highly poisonous—the poison being removed by pressure of the moist grated mass; those of *M. Aipi* are wholesome. Tapioca is manufactured by heat from the starch which settles in the water used in the preparation of the meal. The meal formed into small oatmeal-like cakes is known as C.-bread, and from it, after mastication, and subsequent fermentation and boiling of the ejected material, an intoxicating drink, called by the Indians 'piwarrie,' is formed, which is said, on good authority, to have an agreeable taste, however disgusting the process of preparation may appear. An approved sauce termed *Casa-reep* (q. v.) is made from the concentrated and boiled poisonous juice above referred to, the poisonous property being dissipated by the boiling.

Manis, a genus of Mammalia belonging to the order *Edentata* (q. v.), and natives of Africa and India. They have a body-covering of horny, overlapping scales, and thus resemble the armadillos. The long-tailed M., or pangolin (*M. tetradactyla*), attains a length of 5 feet, of which the tail measures 3 feet. It is found in W. Africa, and feeds on the white ants and other insects. No teeth exist, but the tongue is very long and protrusible. The *M. pentadactyla*, or short-tailed pangolin, is a native of India.

Manissa, a town of Asia Minor, vilayet of Aïdin, on the Sarabat (*Helmus*), 28 miles N.E. of Smyrna, with which it is connected by rail. It has thirty-two mosques, an Armenian church, 3 Greek churches, and four synagogues, and extensive manufactures of cotton, tobacco, salt, &c. It exports much grain and wine. M. is a favourite retreat of the English and German residents at Smyrna. Pop. 23,000. M., the Lydian *Magnesia*, was the scene of Scipio's victory over Antiochus III. of Syria, and the residence of several Turkish sultans.

Mantio'ba, an independent province in the Dominion of Canada, is bounded S. by Minnesota and Dakota, and on its other three sides by the N.W. Territory, extending from the

parallel of 49° on the United States frontier to that of 50° 30' N., separating it from Rupert's Land. It is sometimes regarded as including the vast unorganised N.W. Territory, which is in a sense dependent upon it, being subject to the governor of M. This larger M. has an area of 2,891,734 sq. miles, and a pop. (1871) of 11,963, but the organised province as already defined is only 14,340 sq. miles in extent. The province is entered in the N. by Lakes Winnipeg and M., from the former of which the Red River flows S. to form the boundary between Minnesota and Dakota, receiving its great affluent, the Assiniboine, from the W. The fertile plain of M., in great part covered with tall grass, is almost a dead level near the Red River. In the E. the country is more broken and woody, but almost everywhere it produces abundantly wheat and most other crops. In winter one of the coldest inhabited parts of N. America, in the rather short summer very warm, M. is remarkably healthy. The rain and snow are very light, and the air is delightfully clear. M. is well stocked with game, including the buffalo, and the waters teem with valuable fish. Cattle, horses, and sheep are extensively reared, and among the exports are flour and furs. The country suffers occasionally from the visitation of grasshoppers. Most of the inhabitants are Indian half-breeds—5757 French-speaking, 4083 English-speaking—while 1565 are whites, and 558 are Indians. The capital is Fort Garry. The government is vested in a lieutenant-governor and an executive council of five; the legislature consists of a council of seven, appointed for life, and an assembly of twenty-four elected members. Either French or English may be spoken in the legislature, and the public documents are printed in both languages. The common law of England prevails, subject to statutory modifications. M. sends two senators to the Dominion Parliament, and four elected members to the lower house of that body. There is (1877) no provincial debt. The Roman Catholic religion was fairly established here by early missionaries to the Indians. There are many Scottish Presbyterians. St. Boniface is the seat of a Roman archbishop, and Fort Garry of the Anglican bishop of Rupert's Land. The board of education consists of equal members of Protestants and Catholics. St. John's College (Anglican) and St. Boniface's College (Roman Catholic) were incorporated in 1872. In 1872 M. had three weekly newspapers. M. is the N. part of the country purchased from the Hudson Bay Company in 1810 by Thomas Douglas, Earl of Selkirk, who planted here the famous Red River Settlement, called also Pembina, and later Assiniboia. The first settlers were Gaelic-speaking Highlanders from Scotland, and these were joined by a band of Canadians in 1815. When the United States boundary was fixed, a part of the colony was found to lie S. of the line. The government of the colony subsequently reverted to the Hudson Bay Company, and was vested in the 'council of Assiniboia' till 1871, when the Dominion completed the purchase of the territory of the Company. The colonists, especially the French Canadians, protested against the colony being treated as dependent territory. Under Louis Riel they openly rebelled and seized the public treasury, but submitted on the appearance of a military force. The government was, however, induced to erect part of the newly acquired territory into the independent province of M. See NORTH-WEST TERRITORY.

Manitoulin Islands, a group in the N. of Lake Huron, belonging to Britain, have an area of 1870 sq. miles, and a pop. (1871) of 2000, mostly Indians. The Great Manitoulin is 90 miles long, and from 5 to 30 broad, and is of irregular shape. The group is covered with vast pine forests. Eleven of the small islands belong to Michigan, and are inhabited by 891 Mormons.

Mann, Horace, LL.D., born at Franklin, Massachusetts, May 4, 1796, graduated at Brown University, Providence (1819), was called to the bar (1823), and elected (1827) to the legislature of Massachusetts. In 1836 he became President of the State Senate. As Secretary of the Board of Education (1837-48), M. visited the schools and colleges of Europe (1843), and published his *Lectures on Education* (1848). He was a member of Congress (1848-53), and President of Antioch College, Yellow Springs, from 1852 until his death, August 2, 1859. M.'s ardent advocacy of the abolition and temperance causes is set forth in his *Letters and Speeches on Slavery* (1851) and *Lectures on Intemperance* (1852). See his *Life*, by Mrs. M. (1865).

Manna, a kind of sugar obtained from the Manna Ash, a tree growing in the mountainous parts of Southern Europe,

particularly in Sicily. M. incisions are made with a knife in July or August, day after day, beginning near the root and gradually ascending to the branches. From these incisions the M. slowly exudes, and hardens into flakes. It is a light porous substance of a yellowish colour, and is of some commercial importance. It consists chiefly of a sugar that can be crystallised, called Mannite (q.v.), and of another that cannot be crystallised—the latter being used medicinally as a mild purgative. Among other M.-yielding plants, besides the ash, may be mentioned the *Eucalyptus mannifera* of Australia, and the common or European larch. The M. of the Israelites is represented in Scripture as a special and miraculous gift of God, and not as an ordinary product of nature. Yet it is only proper to note that in the region through which the wanderers passed there still grows a substance called M. by the Arabians. It is collected in the month of June from the tamarisk shrub (*Tamarix gallica*). Burckhardt, who travelled through the peninsula of Sinai, states that it drops from thorns on the sticks and leaves that cover the ground, and must be gathered early in the morning, before the sun's rays melt it. The Arabs cleanse and boil it, strain it through a cloth, and put it into bottles, where it can be kept for years.

Manna Group consists of the grain of a species of grass, *Glyceria fluitans* (Manna Grass), deprived of its husks, and prepared for use in soups, and for puddings, the same as the semolina of hard wheat. The grass is a native of Great Britain, growing in marshy places; but M. C. is prepared chiefly in Poland and Hungary. The name is frequently given to Semolina (q.v.).

Manna Grass is applied to *Glyceria fluitans* on account of its sweet seed, the scientific name of the genus being selected by Brown for a like reason when he separated it from *Poa*. The plant has a wide distribution, and is common through Britain by the sides of ditches, ponds, and most watery places. It has also received the name of float or flote-grass, from its stems often reclining in the water, its leaves floating on the surface, and further, as Dr. Prior says, from its general abundance in irrigated or 'floted' meadows. In Central Europe the seeds are collected, and when husked, are used as an ingredient of soups, &c. They cannot, however, be obtained in large quantity, owing to the promptitude with which the individual seeds fall from the spikelet as they become ripe. (See MANNA CROUP.) Another and handsome species of the genus is *G. aquatica*, also widely distributed, and in Britain frequent in watery places. It grows to 6 feet high, is available for the landscape-gardener, and is useful for fodder, litter, and minor thatching purposes.

Mannheim, or **Man'heim**, a town of Germany, Grand-Duchy of Baden, at the confluence of the Neckar and Rhine, 51 miles above Mainz, and 35 miles N. of Karlsruhe by rail. It is divided into 112 squares, with broad streets between. Noteworthy buildings are the Schloss (1720-29), with fine art collections, the theatre, where Schiller's first pieces were performed, Schiller's Monument (1862), the Jesuits' Church (1733), the Observatory, Arsenal, and Kaufhaus, all dating from about 1750. The Rhine is crossed by a handsome railway bridge (1867), and the Neckar by a suspension bridge (1845). M. is the chief commercial town of the Upper Rhine, and has important manufactures of tobacco, leather, india-rubber, woollens, carriages, furniture, machinery, toys, and beer. Pop. (1875) 46,452.

Manning, Henry Edward, Cardinal, son of the late W. Manning, Esq., M.P., was born July 15, 1808, and educated at Harrow and Balliol College, Oxford. He became Vicar of Lavington in 1834, and Archdeacon of Chichester in 1840. He was a select preacher at Oxford during the Tractarian movement, of which he was an eloquent leader. M. published 2 vols. of sermons in 1842 and 1846, and three series of sermons preached before the University in 1844, 1848, and 1850. On the Gorham decision regarding baptism, in 1851, he seceded from the Church of England and joined that of Rome. Ordained priest in 1857, he then became Superior of the House of Oblates of St. Charles Borromeo, Bayswater. M. succeeded Cardinal Wiseman in the Archbishopric of Westminster in 1865, and attended the Ecumenical Council at Rome in 1870. A Roman Catholic University was opened under his auspices at Kensington, October 15, 1874; and on March 15, 1875, he received a Cardinal's hat. M. is an uncompromising Ultramontane, and has been incessant in his appeals to his country to return to

the bosom of the early Church. He has worked hard for the better education of the Roman Catholic poor, is an ardent supporter of the temperance cause, and has taken a prominent part in various national movements unconnected with his own communion. His very numerous published writings include *The Grounds of Faith* (1852), *The Temporal Power of the Pope* (1866), *England and Christendom* (1867), *Ireland—a Letter to Earl Grey* (1868), *Petri Privilegium* (pastoral letters on papal infallibility, 1871), *Sermons on Ecclesiastical Subjects* (1872), *The Vatican Decrees*, a reply to Mr. Gladstone's *Expostulation* (1875), and the *Glories of the Sacred Heart* (1876). *The True Story of the Vatican Council* appeared from his pen in the *Nineteenth Century*, in four parts, March–June 1877.

Mann'ite, or **Manna Sugar** is a sweet crystallisable substance allied to sugar, obtainable from Manna, from mushrooms, and various other vegetable sources; and it can also be artificially made from a solution of cane sugar by the action of sodium amalgam. It is distinguished from true sugars by being incapable of undergoing alcoholic fermentation. It is used for coating nauseous medicines and as a sweet.

Manoel, do Nascimento, Don Francisco, one of the chief modern lyrists of Portugal, was born at Lisbon in 1734. He wrote under the *nom de plume* of 'Filinto Elysio' a large number of odes, sonnets, and epistles, whose liberal principles awaking the resentment of the Inquisition, he fled to France, and died at Paris, 25th February 1819. His *Obras Completas*, among which are translations of La Fontaine's *Fables*, Chateaubriand's *Les Martyrs*, and Wieland's *Oberon*, appeared at Paris (11 vols.) in 1818–19.

Man-of-War, a general term, of unknown origin and antiquity, for all line-of battle ships, frigates, corvettes, &c., of the British navy, which made up a total (1875) of 241. It corresponds to the Ger. *kriegsschiff* and the Fr. *vaisseau de guerre*.

Man-of-War Bird. See FRIGATE BIRD.

Manometer (Gr. *mados*, 'rare', *metron*, 'a measure'), an instrument for measuring the pressure, and therefore the density of air or other gas. The barometer, the steam-gauge of a steam-engine, and the pressure-gauge of an air-pump, are particular forms of manometers.

Man'or, in English law, is a freehold estate held by the Lord of the M. Manors are as ancient as the Old English constitution. Part of the land on which the lord resided was cultivated as his demesne land for the use of his household; the rest being distributed among his tenants-in-fee for life, or for so many years. Manors were formerly called *Baionies*, and they are still called Lordships. Each lord was empowered to hold a court, called the *Court-Baron*, for redressing misdemeanours, and for settling disputes among the tenants.

Manre'sa, a town of Spain, province of Barcelona, on the river Llobregat, 30 miles N.W. of the city of Barcelona. It has cotton and silk manufactures. Pop. 9000.

Mans, Le, the chief town of the French department of Sarthe, on the river of that name, 51 miles N.N.W. of Tours by rail. Its chief buildings are the cathedral of St. Julien (1216–1434); four stately churches; the theatre (1839–42), one of the finest in France; the prefecture, containing a public library of 50,000 volumes; the hôtel-de-ville, lyceum, natural history museum, &c. M. is at the junction of five railways, and carries on an active trade in linen, hemp, poultry, and candles, and among its industries are spinning, weaving, bleaching, dyeing, bell and machine founding, and the manufacture of hosiery. Pop. (1872) 39,548. The *Suindinum* of the *Cenomani*, it became, under Karl the Great, one of the first cities of the kingdom; but from the reign of Hlodwig down to that of Henri IV. it is said to have suffered twenty-four sieges. General Marceau defeated 60,000 Vendéens here (December 12, 1793); and here, in 'a week of battles,' Prince Friedrich Karl and the Duke of Mecklenburg, with 120,000 men, defeated 200,000 French under General Chanzy (January 10–17, 1871), taking 18,000 prisoners, two colours, and twenty guns, with a loss to themselves of 180 officers and 3470 men.

Mansard or Mansart, François, a French architect, born in Paris in 1598, died there in 1666. He first designed the curb-roof named after him, which is formed with an upper and an under set of rafters, the latter less inclined to the horizontal

than the former.—**Jules Hardouin M.**, nephew of the above, born at Paris in 1645, died at Marly in 1708. He was the architect of the palaces of Versailles and Trianon, and the dome of the Hôtel des Invalides.

Manse (Norm. *manse*, from Lat. *mansio*), in Scotland, is the designation of the dwelling-house of the minister of the Established Church. Every rural parish minister is entitled to a M., and to have it upheld by the heritors (see HERITOR); and where there is no M. the minister is entitled to have half an acre of ground designed to him by the Presbytery (q. v.) for a M., offices, and garden, and to have the heritors ordained to erect a M. and offices upon it (see GLEBE). The M. includes a dwelling-house, stable, barn, and cowhouse.

Man'sel, Henry Longueville, D.D., born at Cosgrove, Northamptonshire, October 6, 1820, and educated at Merchant Taylors', became a scholar and fellow (1842) of St. John's College, Oxford, and in 1843 took a double-first, and was ordained. He was successively appointed Reader in moral and metaphysical philosophy at Magdalen College (1855); Hampton Lecturer (1858), when his lectures on the *Limits of Religious Thought*, applying to Christianity the philosophy of the Conditioned (q. v.), involved him in a controversy with Professor Maurice; Waynflete Professor of Logic (1859); Regius Professor of Ecclesiastical History, and a Canon of Christ Church (1866); and Dean of St. Paul's (1868). He died at Cosgrove Hall, July 31, 1871. A follower of Hamilton, whose *Lectures* he edited conjointly with Professor Veitch, M. was the author of *Prolegomena Logica* (1851), *The Philosophy of the Conditioned* (1866), and of a posthumous work on the *Gnostic Heresies of the First and Second Centuries* (1874), to which is prefixed a sketch of his character by Lord Carnarvon.

Mans'field, a town of England, in the county of Nottingham, within the ancient bounds of Sherwood Forest, 14 miles N. by W. of Nottingham by rail. It has large iron foundries, and lace thread mills, besides some machine stocking-knitting, limestone and sandstone quarrying, &c. The Thursday market is supplemented by a stock market monthly. Pop. (1871) 11,824.

Mansfield, William Murray, Earl of, fourth son of Viscount Stormont, was born at Perth, 2d March 1705, studied at Westminster and Oxford, travelled in France and Italy, called to the bar 1731. His first case earned him a great reputation for oratory, and within a couple of years he was conducting appeals at the bar of the House of Lords. In 1738 he married a daughter of the Earl of Nottingham, entered Parliament as Solicitor-General in 1742, charged Lords Lovat, Balmerino, and Kilmarnock with high treason in 1746, became Attorney-General in 1754, and in 1756 was made Chief-Justice of the King's Bench and elevated to the peerage. He was created an earl in 1776, but his administration of justice rendered his name so unpopular that during the riots of 1780 his house was burnt down. M. retired from office in 1788, and died 20th March 1793. He was buried in Westminster Abbey. See Campbell's *Lives of the Chief-Justices of England*.

Man'slaughter is, in English law, the killing of one man by another without deliberate intention.

Mant, Richard, D.D., born at Southampton, February 12, 1776, passed from Winchester School to Trinity College, Oxford, and was elected a fellow of Oriel (1798), taking his M.A. in 1800, and D.D. in 1815. Ordained in 1802, he was successively vicar of Great Coggeshall, Essex (1810); Bampton Lecturer (1812); chaplain to Archbishop Manners Sutton (1813); rector of St. Botolph's, Bishopsgate (1815); and of East Horsley, Surrey (1818); bishop of Killaloe and Kilmacoe (1820), and of Down and Connor (1823). He died at Ballymoney Rectory, in the county of Antrim, November 2, 1848. M.'s best-known work, prepared in conjunction with the Rev. George D'Oyly, D.D., is his edition of the Bible, with notes selected from the Anglican divines (3 vols. Lond. 1817; New York reprint, with additional notes by Bishop Hobart, 2 vols. 1818–20). He also published an annotated *Book of Common Prayer* (1820), a *History of the Church of Ireland* (2 vols. 1839–40), *Ancient Hymns from the Roman Breviary* (new ed. Oxf. 1873), &c. See his *Life*, by Archdeacon Derens (1849), and a complete list of his works in vol. xxxi. new series, of the *Gentleman's Magazine*.

Mantchu'ria, the most northerly part of the Chinese empire, is bounded S. by Corea and the Yellow Sea, W. by Mongolia, and N. and E. by Asiatic Russia, from which it is separated by the rivers Amoor and Ussuri. The country, which is little known, extended formerly to lat. 58° N. and long. 142° E., but that part of it lying N. of the present boundary rivers was ceded to Russia in 1860. The area is now estimated at 370,000 sq. miles, the pop. at 3,000,000. M. is divided into the three provinces of Liaotung or Shin-king, Girhin, and Saghalin-ulu, and the capital is Mukden (q. v.). The country is for the most part plateau land, bordered in the S. by the Shan-Alin mountains, and in the W. by the Khingan range, which rises to a height of 15,000 feet. It is traversed by several great valleys, that of the Sungari, an affluent of the Amoor, being the most remarkable. The plateaus in the S. are covered with dense forests, the haunts of many valuable fur-bearing animals. The rivers yield abundantly salmon, sturgeon, &c., and the natural products are barley, wheat, millet, ginseng, rhubarb, and tobacco. On the prairies there is much rearing of horses, sheep, and cattle. The Mantchus belong to the Tungusian family of the Mongols, and in appearance closely resemble the Chinese, but are lighter in complexion, stronger in build, and more intelligent and enterprising. According to Williams, they are the most improvable race in the centre if not in the whole of Asia. In the beginning of the 17th c., they invaded China, and in 1643 seized Peking, and placed their chief, Shunche, the first of the present dynasty, on the throne of the Celestial Mings. (See CHINA.) Agriculture in M. is mainly carried on by the Chinese, while the Mantchus have become the dominant people throughout the empire as officials, soldiers, handicraftsmen, and merchants. For Chinese they gradually dropped their own language, the basis of which was Tungus, but which contained many Mongolian, Turkish, and Chinese words. Their written speech, formed from the Mongolian in 1599, runs perpendicularly like the Chinese. See a dictionary by Amiot (Par. 1789), and grammars by Gabelentz (Altenb. 1832) and Kaulen (Regensb. 1856), and Mantchu translations of the *Se-Schu*, *Schu-King*, and *Schi-King*, with a Mantchu-German dictionary by Gabelentz (3 parts, Leips. 1865).

Mantegna, Andrea, a famous Italian painter and engraver on copper, was born at Padua in 1431, studied under Squarcione, married a daughter of Giacomo Bellini, and opened a school in Mantua which acquired a wide celebrity. He died in 1509. M.'s best works are the frescoes in the Church of the Eremitani (Padua), and in the Castello di Corte (Mantua), the altar-piece of St. Zeno (Verona), the 'Dead Body of Christ' (Berlin), and the cartoons of 'Cæsar's Triumph' (Hampton Court). M. is considered the head of the 'Paduan School,' which is distinguished by its close but servile study of the antique, and its comparative neglect of nature. His colouring is almost always dry. The most notable of his pupils were Correggio and Raibolini. M. had three sons, all of whom were painters.

Mantell, Gideon Algernon, an English geologist, was born at Lewes in Sussex in 1790. He practised first as a physician, settling in Brighton in 1835, and at London in 1839; but his later years were wholly devoted to geology. M. especially directed his attention to the fossils of the Wealden beds, his rich collection of which he ultimately sold to the British Museum. He discovered many new forms, especially the *Iguanodon*, the *Hylæosaurus*, the *Pelorosaurus*, and the *Regnosaurus*, four of the five great Dinosaurian reptiles. For his researches he obtained from the Royal Society the Wollaston medal in 1835, and the Royal medal in 1849. He died at London, November 10, 1852. M. was a voluminous author, his chief works being *The Fossils of the South Downs* (1822), *Illustrations of the Geology of Sussex* (1827), *The Fossils of Tillgate Forest* (1827), *Geology of the South-East of England* (1833), *Wonders of Geology* (1838), and *Medals of Creation* (1844), besides numerous memoirs in the *Philosophical Transactions* and other scientific publications.

Mantes, an old town of France, department of Seine-et-Oise, on the left bank of the Seine, 33 miles W.N.W. of Paris by rail. Its church of Notre Dame dates from the 13th c., and St. Macloù has a tower of the 14th. Flour, leather, and beer are manufactured, and there is some trade in corn and wine. Pop. (1872) 5332. M., surnamed *La Jolie*, was burned (1087) by William the Conqueror, who here sustained the injury which caused his death.

Manteuffel, a noble family of Germany, which from Pomerania has spread over Mecklenburg, Brandenburg, Saxony, Livonia, and Courland, and of which several members took part in the Thirty Years' War and the Seven Years' War. The two Manteuffels most conspicuous in the 19th c. are: (1) **Otto Theodor, Freiherr von M.**, born February 3, 1805, at Lübben, became Vice-president of the government at Stettin in 1843, and member of the 'Staatsrath' in 1844. In the first United Diet (1847 and 1848) he was one of the chief members of the Conservative party, on the 8th November of the latter year receiving the direction of home affairs in the ministry '*Der rettenden That*.' On the 28th November 1848, he represented Prussia at Olmütz, after which Prussia was for a few years largely directed by the bureaucratic and retrograde policy of M., who was little liked by the people, and whose removal from office, October 1, 1853, was hailed as the beginning of a new era. (2) **Edwin Hans Karl, Freiherr von M.**, cousin of the preceding, born at Magdeburg, February 24, 1809, became an adjutant of the king in 1848, and in 1857 chief of the so-called military cabinet of the ministry of war, in which position he had great influence in the appointment of officers. In 1864 he was in the war against Denmark, in August 1865 held the chief command in Slesvig, and opened the war of 1866 by forcing the Austrians out of Holstein and surprising Stade. He afterwards was put at the head of the main army, of which the real leader was Falckenstein, and after the war was made by royal favour general of cavalry. In January 1867 he went to Russia on a diplomatic mission, and was next year made general of the first division, which command he held in the war of 1870. On the 14th August M. undertook the attack on the retreating French army, on the 18th August took part in the battle of Gravelotte, and was afterwards among the besiegers of Metz, where he drove back the sorties at Noisseville of the 31st August and 1st September. After the surrender of Metz, M. led the army sent to the N., defeated Faidherbe at Amiens and Hallue, and occupied Normandy. On the 8th January 1871, he was set over the army in the S., and ended the war by forcing Bonaparte to enter Swiss territory on the 19th January, and on the 20th June became commander-in-chief of the army in France. On September 1, 1873, M. was made General-Field-Marshal.

Mantidee. See MANTIS.

Man'tiger, or **Mantègre**, in Heraldry, a horned monster with the body of a lion and the head of a man.

Mantine'a, an important city of ancient Greece, in Arcadia, on the borders of Argolis, famous for a great battle between the Spartans and Thebans, B.C. 362, in which Epaminondas (q. v.) met his death. Its extensive ruins are now called *Palaëpoli*.

Man'tis, a peculiar genus of *Orthopterous* insects, distinguished by the great length of the first pair of legs. These being bent when at rest, the insect appears in a kneeling posture; hence its French name, the '*Prieux Dieu*.' It is also known as the 'Soothsayer' and as 'Prophet,' and even the scientific name of the familiar European species—*M. religiosa*—has been suggested by the peculiar shape of the fore-legs. The Hottentots worship the M. as a tutelary deity. Its head is of horizontal conformation, and triangular in front. The feelers are long and delicate, and the prothorax gives the insect the appearance of having a long neck. The wings are broad, and have straight veins. American species are the *M. Carolina*, and *M. argentina*, the latter occurring in Buenos Ayres. The M. is carnivorous and raptorial. It preys upon other insects; and the *M. argentina* even seizes and eats small birds. The Chinese keep M. in cages for the amusement of watching the combats which take place between them.

Man'tle (Ger. *mantel*, It. *mantello*, Lat. *mantilum*, originally a towel for the hands, *manus*), a loose cloak worn over other garments. The long M. worn over their armour by knights in the middle ages was an important part of their insignia. Noble ladies usually had their mantles adorned with the impaled arms of themselves and their husbands.

In *Malacology*, M. denotes the external fold of the skin of the molluscs.

Mant'let, in Fortification, a musket-proof shield of wood, metal, or rope, used to shelter gunners at embrasures, or to cover the advance of sappers or riflemen. It is now almost superseded by the Gabbion (q. v.).

Mant'ling or **Lambrequin**, a small velvet or silk mantle, generally crimson and lined with ermine, fastened by tassels to the helmet, and covering the wearer's shoulders. In heraldry, the M. frequently forms the background of the shield and its belonging, the whole constituting an achievement or Hatchment (q. v.) of arms.

Man'tua (Ital. *Manтова*; probably from the Celtic *man*, 'a district'), a town of Italy, capital of the province of the same name, 40 miles E. of Cremona by rail, stands on an island 5 miles in circumference, in the middle of a lagoon formed by the Mincio, nature and art combining to render it the strongest fortress of the Quadrilateral (q. v.). Chief of its many buildings erected or adorned by Mantegna and Giulio Romano, are the cathedral of St. Pietro, the church of St. Andrea (1472), with a white marble façade and a dome (1782), the Corte Reale (1302) or Palazzo Vecchio of the Gonzagas, now partly used as barracks, the Castello di Corte, and just outside the S.W. gate, the famous Palazzo del Tè, so called because built in the form of a T. Other edifices are the Accademia Virgiliana, with frescoes and sculptures, the Liceo, with a library of 80,000 volumes, the museum, theatre, &c. M. has manufactures of leather, linen, silk, woollens, and paper. Pop. (1874) 26,687. An ancient Etruscan city, and the birthplace of Virgil (B.C. 70), M. was ruled by the house of Gonzaga (q. v.) from 1328 to 1708, when it was seized by the Austrians. It was captured by the French in 1797, and again in 1800, and having been held by Austria from 1814 to October 11, 1866, was finally surrendered to Italy, in accordance with the Treaty of Vienna.

Mānu (*Menu* = 'thinker,' probably derived from the same root as the English *man*; comp. also Egyptian *Men* and Greek *Minos*), the traditional lawgiver of the Hindus, and founder of the caste system. Being merely a metrical *resumé* of older materials, the Institutes of M. are to be regarded as representing rather the ideal order of society, such as the sacerdotal caste would wish, rather than a code of legislative enactments. In this respect they may be compared with the Mosaic law. The sanctity attributed to the Institutes, and the severity of the penalties by which this is enforced on the people, are almost incredible. Besides social regulations, there are included a cosmogony, a system of metaphysics, and a theory of the transmigration of souls. The system must be fixed with any approximation to certainty. It is intermediate between the Vedas and the epic poems, and probably contemporaneous with the settlement of the Aryan-speaking race in the upper plains of Hindustan. Translation by Sir W. Jones (2d ed. Lond. 1825); Elphinstone's *History of India*, vol. i. (4th ed. Lond. 1864).

Man'uel I. Comne'nus. See BYZANTINE EMPIRE.

Manure is used in agriculture for accelerating the growth and increasing the production of cultivated crops. Any substance which, when mixed with soil, promotes vegetable growth comes under the designation of M. The name is derived from the Lat. *manu operare*, 'to work by the hand, to till,' through the French *manœuvre*, 'tillage.' The bulk of the organic structure of plants is composed of the elements oxygen, hydrogen, nitrogen, and carbon, which, in the several combinations of carbonic acid, water, and ammonia, are drawn from the atmosphere and the soil. Besides these constituents, however, certain minerals form part of the constituents of plants, and are, therefore, essential to their existence. These earthy substances comprise potash, soda, lime, magnesia, alumina, phosphoric acid, sulphuric acid, oxide of iron, silica, &c., and since they are found, in variable proportions, in the ash of plants, they are termed *ash-constituents*. On the sufficiency of ash-constituents in the soil, depends the full development of a plant, and deficiency in any one essential results in unhealthy and limited growth. Were the same crop, as wheat, to be grown year after year on the same soil it would, on account of the annual abstraction of the essential ash-constituents, eventually become infertile; provision must therefore be made for returning the abstracted constituents to the soil. A rotation of crops is generally practised by British agriculturists, wheat or other cereals being succeeded by root crops and grass, which take up from different depths of soil and in variable proportions the mineral constituents necessary to their growth. The exhaustion of the soil is thus in a manner retarded, but the ultimate result of infertility is the same, unless the soil be re-enriched by artificial means, in other words, by M. M., then, exerts a fertilising influence on the soil, by supplying mineral

constituents, but in addition it furnishes a supply of nitrogenous matter, which maintains the soil in the highest state of productivity.

Liebig's 'mineral theory' of agriculture sets forth that the efficacy of M. is due to the available amount of ash-constituents, which stimulate in direct proportion the assimilation of carbonic acid and ammonia from the atmosphere, and therefore it is superfluous to supply nitrogen in M. This theory, however, is contrary to facts, for elaborate and prolonged experiments at Rothamstead by Messrs Lawes and Gilbert (*Journal of the Royal Agricultural Society*, 1847-64) with mineral M. and nitrogenous M., separately and combined, proved, especially in the case of wheat, that a vast increase of produce attended the use of M. rich in nitrogen, whereas Liebig's wheat M. used alone failed to yield good crops.

Natural manures, consisting of *farmyard M.*, or the excreta of animals kept on the farm, vegetable refuse of all kinds, the offal of slaughter-houses, and occasionally, near towns, human *dejecta*, formed the staple fertilisers down to a comparatively recent period. In seaboard districts, fish offal and seaweed, and in inland parts wood ashes, soot, &c., were also resorted to. Farmyard M. is most valuable for all kinds of crops, since it contains all the constituents assimilated by them, and for certain crops its value and amount may be enhanced by a proper regard to the animals' food. Guano (q. v.), experimentally used in Great Britain early in the present century, formed an important addition to natural manures, and it eventually rose to the first rank among fertilisers. Subsequently a number of other natural products were imported for use as M., and gradually the manufacture of artificial or *specific* manures arose, and has developed into one of the most important and prosperous of British industries. In Great Britain especially, with its dense population and limited area of arable land, extended means of stimulating the productiveness of the soil so as to obtain the maximum amount of produce were greatly desiderated, and this want specific manures have been found to supply. In the preparation of them, the M. manufacturer has regard to the nature and proportion of the constituents specially affected by particular kinds of crops, and for the provision of these constituents very diverse materials are laid under contribution. Besides the natural manures already enumerated, chloride of ammonia, sulphate of ammonia, nitrate of potash, nitrate of soda, dried blood, nitrogenous refuse of certain factories, as tar, hair, leather, glue, horn, shoddy, woollen rags, &c., are made use of in compounding nitrogenous manures, which are specially valuable for cereals, and generally useful on account of the presence of phosphates and alkalies. Phosphatic manures are chiefly used for root crops, and into their composition bones, phosphatic guano, apatite, phosphorite, coprolites, &c., enter (see SUPERPHOSPHATE OF LIME). To heavy clay soils and others deficient in lime, slaked lime is applied, or marl, and gypsum are incorporated with the artificial M. In 1876 Great Britain imported:

	Tons.	Value.
Bones of Animals and Fish for Manure only	85,129	£524,769
Guano	199,291	2,295,744
Manures, unenumerated	204,707	543,165

Man'uscripts (Lat. 'what are written with the hand,' also *M. libri*, or *codices manuscripti*) is the name given to all books written with the hand, before and after the invention of printing. The reading and proper use of these forms the chief part of the science of Diplomats; their preservation, cataloguing, &c., develops and tests the knowledge of the librarian. All old M. still extant are written either on parchment or paper. The paper is partly Egyptian, made from the papyrus plant, the use of which for M. ceased in the West in the 9th c., partly cotton or silk (*charta bombycina*), invented in the East about 706 A.D., which was used until the invention of linen-paper in the 13th or 14th c. Pens are first mentioned in the 7th c. Black ink was most common. It consisted chiefly of oven black, soot of rosin and pitch, burned ivory, ground coal, &c., and in the earliest times was not mixed with vitriol. Red (*rubrum*) ink is also found in very old M. The opening letters, the first lines, and the index were written in it, hence the expressions *rubrum*, *rubric*, and *rubricator*. Blue ink was seldom used; green and yellow still less so. In respect of their outer form M. were divided (1) rolls (*volumina*), the oldest kind, and (2) stitched books, the *codices* proper. Among the ancient writers of M. (*scribae* or *librarii*) were freed men or slaves; in later times the monks, the

Benedictines, by the rules of their order, were bound to undertake the task: correctors and rubricators afterwards amended and embellished the manuscript text. The internal characteristics, especially the peculiarities of the handwriting and of the letters, are of far greater importance than the external signs for judging of the age, value, &c., of M. Walter's manuscript *Lexicon Diplomaticum* (3 vols. Gött. 1745-47) is still of great value for this division. The age of Greek M. is less easily determined by the character of the writing than the Latin. In general it should be noted that the characters of Greek M. are lighter, more pleasing and flowing the older the M. are, and that they become stiffer and stiffer in later times. The want or existence of the Greek accents decides nothing. Greek M. older than the 7th or 6th c. will not be easily found. The characters of Latin M. have been classified partly according to their largeness or smallness (*majuskeln* or *minuskeln*), partly according to the different shape and aspect which they assumed among different nations, or at certain periods (*Scriptura Romana, antiqua, Merovingica, Longobardica, Carolingica*, &c., to which, after the 12th c., was added the so-called *Gothic*, which is a skilfully sharpened and corniced *Minuskel*), and for each of these kinds of writing rules have been framed by which the age of M. can be determined. Before the 8th c. punctuation is seldom seen, and even after its introduction in the 13th and following centuries, M. are found without punctuation, but with the separation of the word. M. which have small capitals or other divisions are always old. The so-called direction-word, or the first word of the following sheet, at the end of the foregoing, belongs to the 12th and following centuries. The fewer and lighter abbreviations a manuscript has, the older it is. In the oldest M. the words usually follow each other uninterruptedly, without any division; it is only since the 9th c. that the division of words has become general. The form of the Arabian letters, which one first finds in the beginning of the 12th c., also contributes to fix the age of M. Many M. distinctly state at the end when and by whom they have been written. The genuineness of these subscriptions must not be accepted without investigation, as they often appear only on one part of the M., or are pure forgeries. Nor can one determine with certainty from these the age of the M., as later writers often copy such notices from the originals before them. M. from which the original writing has been effaced by a new and later writing, are called *Palimpsests* (q. v.). See Ebert, *Handschriftenkunde* (2 vols. Leips. 1825-27); Kirchhoff, *Die Handschriftenhändler des Mittelalters* (Leips. 1853); Leon de Rosny, *Recherches Historiques et Philologiques sur l'Écriture des Différents Peuples, Anciens et Modernes* (l'ar. 1857-58).

Illumination of M.—Egyptian illumination, the earliest of which we have any distinct trace, consisted in the use of a vermilion colour for the first character in each leading passage. There is little good decoration in the oldest Latin MSS., such as the Vienna Roman Calendar and the Vatican Virgil, both of the 4th c. They contain coarse illustrations, with an occasional red border, figures shaded in bistre with a pen, and outlines filled in with heavy colours. There are also, however, some cases of golden lettering or rose-stained vellum (e.g., St. Jerome's *Preface to Book of Job*). It is in the Byzantine MSS. of the 5th c. that we first find gold borders surrounding white or stained vellum, ogrund, the letters being golden, or black or of some other colour, and the ground being sometimes golden. Only one exception may be made in favour of the *Codex Argenteus* of Ulphilas (A.D. 360) preserved in the Royal Library, Upsala, the earliest Mæso-Gothic version of the Gospels, written in silver and gold letters on a purple ground. Passing over the MSS. known as the Vienna gold, silver, and purple Gospels, we come to the period of the Emperor Justinian (6th c.) when a distinct Persian influence is said to appear in the Byzantine illuminations, as well as in the contemporary architecture. Instead of the symbolism of the Catacombs, we have the elaborate realism which appears in the square and oblong framed pictures of the Eusebian Canons and the Syriac Gospels. These patterns were carried through Europe by the Christian missionaries, but an entirely original style seems to have been used by the early Irish Church, who formed their initial letters and borders and tessellated pages by means of small compartments filled with diagonal lines, concentric spirals, interlaced ribbons, rows of red dots, and a great variety of lacertine animals and birds. This style, of which the *Book of Kells* and the *Durham Book* are the finest specimens, was extensively spread by Columba, Aidan,

Boniface, and Kilian. Gold is sparingly used, and there are no body colour pictures. The Augustinian books present a combination of the Irish decoration with Old English writing and Latin pictures well shaded and done with the brush. A later combination, in which gold is more profuse, and the letters other than initial are Roman rustic capitals, is shown in the Utrecht Psalter. It is marked, too, by pen and ink drawings from the coloured Latin miniatures formerly prevalent. Even in England, though gold writing and rose-staining were not generally practised, MSS. as splendid in coloured decoration as any in Byzantium were occasionally produced. Such, among many others, was the *Benedictorial* of St. Ethelwold, the work of the famous painter-monks (*illuminatores, notarii, and librarii antiquarii*) of Hyde Abbey [Winchester New Minster]. When black ink was used for liturgies, red ink was used for title-page and headings, hence *rubric*. Green, yellow, and blue inks were chiefly confined to capitals. Azure and vermilion were favourite colours for the pure decoration, some of which are so brilliant and durable as to suggest the use of oil, though white of egg was more probably employed. The work of the *Scriptorium*, which Alcuin says is better than field work, as profiting both soul and body, was not confined to gospels, missals, anthems, but included some leading classics. From the fusion of the Roman or Pictorial, the Byzantine or Golden, and the Hiberno-English or Intricate, sprang the Romanesque and ultimately the medieval. In the Caroline writings, e.g., the *Evangelistarium* of Toulouse, and the products of the great abbey of St. Martin at Tours, we have the beginnings of the eclectic French school, in which purple vellum and gold lettering are sometimes found along with Kufic borders, Latin figures, Old English fretwork, and an outline style quite different from the fluttering outline of the peniculate sketches of the Hiberno-English. There is also the odd broken-backed letter called from its birthplace *Lombard brist*. This French movement was probably helped by the dispersion of Greek artists under the Iconoclastic emperors. At Byzantium itself, the revival under Basil the Macedonian was ultimately overlaid by Saracenic and Moorish decoration. In Italy classical traditions were for long wholly lost until recovered under the teaching of Cimabue and Giotto. In the German MSS. of the 12th c. (under Barbarossa) we find, in connection with the Caroline knotted ends to initials, the profuse, but stiff, foliation which, so far an imitation of nature, prepares the way for the medieval or Gothic of the 13th, 14th, and 15th centuries. This foliation, the work of the pen more than the brush, has a close similarity to the black lead lines of stained glass painting. One sign of the transition to medieval is the restriction of the enormous Arabesque initial to the corner formed by the top and side ornaments. The medieval reached its climax in the 14th c., Jean Duc de Berri and the Duke of Bedford being two of its greatest patrons. It varied in different countries just as the Gothic architecture did. In England the colouring was fuller and deeper than in France, and the action of the figures was more intense, a vein of caricature appearing in secular MSS. There also appeared the diapered background of burnished gold, which latterly under the influence of the Italian and of the Van Eycks became an architectural and then a landscape background. The principal English products may be seen in the catalogue of William of Wykeham's library. In Italy, illumination, which Dante mentions as an art belonging to Paris, was revived in the 13th c. by Oderigi and Bolognese. To these succeeded Fiorentino, Fra Angelico, Memmi (of Sienna), Cosme of Ferrara, and many others. Of these *quattro* and *cinque cento* works, all inspired by a mystical religious sentiment, the finest are the choir books of Sienna Cathedral. Some have been chromo-lithographed by the Arundel Society. Among the authors of arabesques and miniatures on secular subjects, the greatest names are Girolamo and Giulio Clovio. In the first block-books spaces were left for illuminated initials, &c., to be filled in by hand, but these were afterwards reproduced (except in colour) from blocks or movable types, as in the Mainz Psalter. At the Reformation vast quantities of illuminated MSS. were destroyed as 'superstitious books.' (See Bale's account of this.) The principal authorities on this subject are: Humphrey's *Illuminated Books of the Middle Ages*; Tymms' and Wyatt's *Art of Illuminating*; Agincourt, *Histoire de l'Art par les Monuments*; Kugler, *Handbuch der Kunstgeschichte*; Sylvestre and Champollion's *Paléographie Universelle*; Shaw's *Illuminated Ornaments*. Practical information will be got in the works of De Lara, Lucien, Harrison,

Audley, Meme, and *The Illuminator*. Special works are Westwood's *Palaeographia Sacra Pictoria*, and Chassants' *Manuel des Abbreviations*.

Manu'tius (Ital. *Manuzzi* or *Manucci*) **Aldus**, a famous early printer, also often called 'Aldus the Elder,' was born at Bassano in 1449. From his press at Venice, established 1488, came the celebrated Aldine Editions (q. v.), so called after Aldus, which instantly acquired a great reputation for improved typography, and are still highly prized for their accuracy. M. was a good classic, and was assisted in his editorial work by many other scholars, who joined him in forming the Aldine Academy. He printed twenty-eight *Éditiones Principes* of Greek authors, compiled a Greek-Latin lexicon, and died at Venice, 6th February 1515. The printing establishment was kept up till the death of his grandson, 'Aldus the Younger,' 28th Oct. 1597. See Renouard, *Annales de l'Imprimerie des Aldes* (3d ed., Par. 1834), and Schük, *Aldus M. und seine Zeitgenossen* (Berl. 1862).

Man'wyne, a town in the Chinese province of Yunnan, bordering on Independent Burmah, the scene of the treacherous murder of Mr. Margary, an enterprising British diplomatic officer, on 22d February 1875. See *Journey of A. R. Margary from Szechuan to Bhamo, and back to M.* (Lond. 1876).

Manzo'ni, **Alessandro**, a great Italian author of noble parentage, was born at Milan in 1784, educated at Milan and Paris, went to Paris in 1805, where he showed his first poem upon the death of Carlo Imbonati to the poet Faurel. In 1808 he married the daughter of a Geneva banker and retired to the neighbourhood of Milan. Five years after he published some hymns of a religious caste, which obtained a great popularity, and in 1826 appeared the tragedy *Il Conte di Carmagnola*, a work which forestalled the *Hernani* of Victor Hugo in its spirit of romanticism and scorn for the historical unities. In 1827 M. published what remains his masterpiece, *I Promessi Sposi*, a novel dealing with scenes and characters at the beginning of the 17th c., and modelled to a certain extent upon the plan of Sir W. Scott. No modern work has been more widely read. Up till the year 1877, 116 Italian editions had been issued; 17 translations in German, 19 in French, and 10 in English. It is an eloquent, dramatic, and picturesque novel, and will long preserve the name of its author. M. was nominated an Italian senator in 1860, and died May 22, 1873. A complete edition of M.'s works, in 5 vols., was published by Tomaseo at Florence, 1828-29. See Sainte-Beuve's *Portraits Contemporains* (vol. ii.).

Mao'ri (i.e., 'native'), the name of the race by whom New Zealand was inhabited when discovered by Europeans. The M. belong to the Malayan family of mankind, but are evidently of mixed descent, their features manifesting the greatest diversity of type. In some of the leading tribes the physiognomy, complexion, and hair of the chiefs closely resemble those of Europeans; but the mass of the people incline more to the negro type, much modified and improved. They are of square build, averaging 5 feet 6½ inches in height, and muscular, though inferior in this respect to Europeans.

The origin of the M. is enshrouded in much uncertainty. The native traditions—on which little reliance can be placed—relate that the M. came to New Zealand about 500 years ago in two canoes, named the Arawa and Tainui, from Hawaiki, which some ethnologists identify with Hawaii, in the Sandwich Islands (q. v.), while others identify it with the much nearer island of Savaii, in the Samoan group. Mr. J. T. Thomson, of Otago, has made an elaborate attempt to trace the M., through the Malays, to the ancient inhabitants of Barata, in Southern India, basing his arguments principally upon linguistic evidence. His theory is supported by the discovery, some years ago, of a Brahminical bell, bearing an inscription in the ancient Tamil character, in the North Island. In 1877, too, there were discovered, in the Weka Pass Ranges in the Middle Island, some remarkable rock paintings, representing animals foreign to New Zealand, weapons and dresses of semi-civilised people, together with inscriptions in a character resembling the Tamil. In the Chatham Islands (q. v.) there lingers a small remnant of a race called the Morioris or Maiorioris, which some believe to have been the aboriginal race of New Zealand. The Morioris are a shorter and feebler race than the M., by whom and epidemic disease their number has been reduced to 140.

The M. are a brave and intelligent, but revengeful and treacherous race, their moral perceptions being as dull as their intellectual faculties are acute. They are close observers of nature, and when first known were found to have a surprisingly correct system of botanical classification of their own. War of the most cruel and relentless kind was their principal occupation, and in its track slavery and cannibalism followed. The latter the M. assert to have been unknown to their ancestors before their arrival in New Zealand. At one time universal, this horrible practice is now extinct, no case having occurred since the war in 1869. Infanticide, polygamy, tattooing, and *tapu* (taboo) were also M. customs which are now obsolete, or nearly so. By the last the priests declared certain persons or objects to be consecrated and inviolable, and Mr. Colenso states that 'the stoutest and fiercest of the New Zealand chiefs howed like an infant before it, and dared not disobey its behests.' Though without any definite form of religion, the M. in their pagan condition were much under the influence of sorcerers who traded on their superstitions. The M. idea of a spirit was confined to that of an *atua*, or evil demon, whom he sought to propitiate. Only one tribe worshipped idols, and another trees, but the rainbow was everywhere an object of veneration, and the spider and lizard were regarded with awe. The progress of Christianity among the M. has been much checked since 1863 by the outbreak of the *Hauhau* religion, a singular medley of Scripture truth and fanatical superstition.

The M. system of government was tribal, the country being divided between large clans, of which there are eighteen in the North Island, and these being in turn subdivided into numerous small tribes or *hapus*. The titles to land were most complicated, and gave rise to endless bloodshed. Since 1858 an influential section of the M. have kept aloof from Europeans, yielding allegiance only to a king chosen by themselves, and the Queen's writ does not run in their territory. This movement caused two fierce wars in 1860 and 1863. A third war, in 1868-69, had its origin in a massacre of colonists by M. prisoners who had escaped from the Chatham Islands.

The M. are excellent sailors and fishermen, while their military skill and oratorical powers are remarkable. They are too indolent, however, to attain success as agriculturists or artisans, though they raise large quantities of potatoes, and display much skill in weaving and carving. Schools are now common among them, and they also own and publish two newspapers. A few have risen to affluence by leasing their land, and live in the best European style, while M. members sit in both houses of the Colonial legislature. Nevertheless the M., as a people, have made little real progress in civilisation beyond dropping their barbarous customs and adopting the European dress, while they have acquired the vices of civilised races with a fatal readiness. Through the operation of these, and of epidemics, especially influenza, the M. are rapidly decreasing in numbers. In 1874 the M. population of New Zealand was officially estimated at 46,016, of whom 43,408 were in the North Island.

The M. language is a branch of the great Polynesian tongue, and is divided into ten dialects. It contains only fifteen letters—five vowels and ten consonants—and is both euphonic and expressive. Every syllable ends in a vowel. The language was first reduced to writing by the missionaries, and the Scriptures and other books have been translated into it.

See Dr. Dieffenbach's *Travels in New Zealand* (Lond. 1843); Rev. R. Taylor's *Te-Ika-a-Maui* (Lond. 1855); Sir G. Grey's *Polynesian Mythology* (Lond. 1855); Dr. A. Thomson's *Story of New Zealand, Past and Present* (Lond. 1859); Dr. Karl Scherzer's *Voyage of the Novara* (Lond. 1863); Judge Manning's *Old New Zealand, by a Pakeha-Maori* (new ed. Lond. 1877); and valuable papers by various authors in the *Transactions of the New Zealand Institute* (Wellington, New Zealand) vols. i., iv., v., and vi.; in the *Journal of the Ethnological Society of London* (1869), and in the *Journal of the Anthropological Institute of Great Britain and Ireland* (vol. v.).

Map (Lat. *mapa*, 'a cloth') is usually applied to the delineation of the whole or of a portion of the earth's surface upon a plane sheet. The name is also used to designate a similar representation of the celestial vault, or of the surfaces of the planets or satellites as they appear through a powerful telescope. The first scientifically constructed maps seem to have been those of Claudius Ptolemy of Alexandria, who flourished in the 2d

c. of the Christian era; but attempts had been made at a much earlier date by Anaximander of Miletus (600 B.C.), by Eratosthenes of Cyrene (250 B.C.), and Hipparchus of Bithynia (200 B.C.). In the 3d c. A.D. the Romans showed their appreciation of the value of mapping by the construction of the famous Pentingerian table, which represented the then known world, with the principal roads. During the middle ages, the construction of maps for useful purposes was quite unknown in Europe, and no true improvement in this respect was made until the 14th and 15th centuries, when the growing commerce of Italy rendered mapping a necessity. The great geographical discoveries of the 15th and 16th centuries, and the introduction of the cylindric projection of the sphere by Mercator in 1556 gave mapping a powerful impulse. The elaborate atlases of Blaeu (1650), De Wit (1680), and Sanson, geographer to the French king (1690-96), are the most important contributions of that age. In the beginning of the 18th c. the survey of the Chinese Empire by the Jesuit missionaries was undertaken, and their M. has formed the basis of all subsequent maps. With the improvement of methods and instruments, the construction of maps has now attained great perfection. The Ordnance Survey maps of the British Islands, and the similar maps of other civilised nations, are marvels of accuracy. In the delineation of maps, it must be remembered that the earth is spherical, and that by no process of development can a portion of a sphere be made to coincide with a plane. The representation of terrestrial configuration upon a plane must be effected by some method of projection or approximate development. Of the methods of projection, the *stereographic* and *orthographic* are the most important, both giving a true perspective view of a portion of the globe. In the former, the eye is conceived to be placed on the surface of the sphere opposite the part to be delineated. In the latter the eye is supposed to be at an infinite distance, so that the rays from all parts of the surface are parallel. The stereographic method contracts the centre of the M. and enlarges it towards the circumference, while the orthographic gives an almost accurate representation of the centre, but very much contracts the circumference. By a combination of these two projections, the ordinary *globular* projection of a hemisphere is obtained. The methods in common use, however, as affording a more accurate representation than these, are those of approximate development. The configurations of the surface are projected from the centre of the sphere upon a circumscribing cone or cylinder, whose axis is coincident with the polar axis of the earth, and the cone or cylinder is then developed into a plane. The former, or *conical projection*, is very convenient for small portions, and with modifications for larger tracks, even such as whole continents. The latter, or *cylindric projection*, known best as *Mercator's projection*, is invaluable in the construction of maps for purposes of Navigation (q. v.), and as being the only method by which the whole of the earth's surface can be represented on one sheet.

Map, or **Mapes**, **Walter**, the most brilliant literary genius of the 12th c., was born on the Welsh border about 1143, studied for the Church at the University of Paris, and on his return to England entered the service of Henry II. In 1173 he presided at the Gloucester Assizes as one of the King's Justices in Eyre, and subsequently acted as royal chaplain during Henry's wars with his sons. He represented his sovereign at the court of Louis VII., attended the Lateran Council at Rome in 1179, was made canon of St. Paul's and precentor of Lincoln, and finally, in 1196, archdeacon of Oxford. He does not again appear in history, but is supposed to have died about 1210. M. wrote mostly in Latin, but his matter is as thoroughly English as if it had been couched in the vernacular. His work falls naturally into three divisions—The *Poems of Goliath*, the *De Nugis Curialium*, and his Contributions to the Arthurian Romance. The first of these, edited by Mr. Wright for the Camden Society in 1841, is a collection of sparkling and stinging satires on the corruptions of the clergy, put into the mouth of a certain Bishop Goliath, a bibulous and gluttonous voluptuary. One of the pieces, the *Confessio Goliath*, contains the famous verses beginning 'Meum est propositum in taberna mori,' which probably suggested the misleading phrase 'the Anacreon of the 12th c.' applied to M. by Lord Lytton. The *De Nugis Curialium* ('On the Trifles of Courtiers'), edited by Mr. Wright, from a single MS. in 1850, is a prose miscellany

in five books, called *Distinctiones*, and is full of anecdote and gossip of all kinds, with stories of heretics, hermits, &c., pictures of popular manners, and of the English court, fairy tales, and satirical sketches of the monkish orders. His additions to the Arthurian Romance constitute the noblest part of that heroic legend, and include the story of Lancelot of the Lake, the Quest of the Holy Grail, and the Mort Artus. See Morley's *History of English Literature*.

Ma'ple, a genus of exogenous trees of the tribe *Acerineæ* of the great tropical order *Sapindaceæ*. It consists of some 50 species of large or small trees spread through the N. hemisphere, of which only a few of the most important can here be specified. The common M. (*A. campestre*) gives a compact and fine grained wood, sought after for choice furniture; grows to 40 feet, but can be trimmed down for hedge purposes.—*A. saccharinum*, or sugar M. of N. America, is a large tree, with strong wood, which when well seasoned is used for axle-trees, spokes, also for chairs; when knotty or curly it furnishes the bird's-eye or curly M.-wood; from this tree the chief supply of saccharine fluid so extensively converted into M.-sugar, is obtained by tapping; the autumnal leaf colouring is superb.—*A. rubrum*, or red M. of N. America; a handsome tree attaining 80 feet; wood useful for furniture; yields about half the quantity of sugar as the preceding.—*A. dasycarpum*, or white M. of N. America; a most beautiful tree of rapid growth, attaining 50 feet, and sometimes 9 feet in diameter; wood pale and soft, but much praised for street planking; sugar supply same as red M.—*A. pseudo-platanus*, the sycamore M. (the Scotch plane-tree), native of mid Europe and W. Asia but thoroughly naturalised in Britain, reaches 100 feet; wood compact and firm, valuable for turnery, &c.; makes superior charcoal; will stand exposure to sea-air.—*A. platanoides*, or Norway M., a tree of imposing appearance, recommended for ornamental gardening; its pale wood much used by cabinetmakers.—*A. palmatum*, a beautiful tree, and a native of Japan, in which country probably 25 other species are indigenous, most of them highly ornamental.

Maqui, the French name for *Aristotelia M.*, a small tree belonging to natural order *Tiliaceæ*. It is a native of Chili, where the wood is used in making musical instruments, for which the tough bark supplies the necessary strings. The berries are edible, and a wine for use in malignant fever is prepared from them.

Marabouts, a semi-priestly caste among the Mohammedan Berbers of North-Western Africa, are the descendants of the dynasty of the Almoravides (q. v.). Their office is hereditary; they are accredited with prophetic and miraculous gifts, and from their knowledge of the Koran are esteemed the interpreters of the civil and religious law. Their influence culminated in the person of Abd-el-Kader (q. v.), and was greatly weakened in 1856 by Robert Houdin, who, on the invitation of the French government, competed with and far excelled them in their feats of jugglery.

Maracaybo ('the headland on the sea'), now called **San Carlos**, a city of Venezuela, capital of the state of Zulia, on the W. side of the channel which connects the lake and gulf of M. It is defended by three forts, and has a good harbour, which can only be reached, however, by vessels drawing less than 10 feet. There is some shipbuilding, and a trade in cacao, cotton, fustic, coffee, cattle, &c. In 1876 the imports (chiefly manufactured goods from the United States) amounted in value to £285,536. The port is now (1877) closed to foreign trade, except in the two articles dye-wood and fustic. Pop. (1873) 21,954.—The *Lake of M.*, in the N.W. of Venezuela, is 100 miles long from N. to S. and 70 broad, and communicates by a channel, 20 miles long and 5 broad, with the *Gulf of M.*, an inlet of the Caribbean Sea. The lake is deep, but its mouth is obstructed by bars. During the N. winds of April and May its waters become brackish. The fortified entrance was the last spot held by the Spaniards, and was relinquished on the 9th November 1823.

Maragha, an old walled town in Azerbaijan, Persia, 232 miles N.W. of Teheran, on a feeder of Lake Urumiah, distant 10 miles. It has glass works, and a handsome public bath, and some distance off are the famous M. marble pits. The M. marble, much prized throughout Persia, is nearly transparent

when in thin plates, and is thus used for windows to the baths of Tabrez. Pop. 15,000 of the Turkish tribe of Mukadam.

Ma'rah (Heb. *bitterness*), the name of a place in the wilderness of Shur, three days' journey from the point where the Israelites crossed the Red Sea. The waters were so bitter that it was impossible to drink them, but they were sweetened by Moses casting in a tree which 'the Lord showed him' (Exod. xv. 23-25).

Marajo', an island of Brazil, belonging to the province of Pará, and formed by the estuaries of the Amazon and Pará, is 180 miles long and 125 broad. It is low-lying, but in parts rocky, and in the S. is covered with dense forests. On the northern pastures are reared immense herds of cattle and horses. Pop. 20,000, mostly Indians and Mestizoes.

Maranhão, or **Maranhão**, a province of Brazil, is bounded N. by the Atlantic and Pará, S. and E. by Piahy, from which it is separated by the river Paranahyba, and W. by Gozaz. Area 141,651 sq. miles; pop. (1872) 359,040, of whom 74,939 were slaves. It produces rich crops of sugar, cotton, and rice, much fine timber and dyewood. In the S.W. are several ranges of low hills, yielding iron and lead ores and antimony. The inhabitants are chiefly a mixed race of Indians, negroes, and whites, but there are a few pure Indian tribes.—**M.**, **San Luiz de**, capital of the above province, on an island at the mouth of the M. River, is a handsome thriving city, with many fine buildings. It is built on two hills, and the streets are generally too steep for carriages. The seat of a bishop, it has a large cathedral, many convents, a lyceum, &c. The harbour is commodious, though somewhat difficult of entrance. Pop. (1872) 31,604.

Mara'no, an old town of Italy, 8 miles N. of Naples, has many interesting antiquities. Pop. (1874) 7143.

Maranta'cea, a natural order of Endogens, of about 160 species, all tropical, and mostly natives of tropical America. In an economic point the order is valuable for its large starch supply. (See **ARROWROOT**.) Besides the various species of *Cañao* (v.), the *Marantas* and *Calathas*, with beautifully mottled and streaked foliage, seen in our hot-houses, belong to the M.

Maraschi'no, a delicate and valuable liqueur, distilled from the ripe fruits of the Marasca cherry, a sweet dark coloured fruit cultivated in Dalmatia. The liqueur is further flavoured and sweetened after distillation. The finest is the M. of Zara, and is imported in square wickered bottles or flasks.

Marat, Jean Paul, was born at Boudry, May 24, 1744. The earlier part of his career is only indifferently known, though it has been held to be proved that in 1774 he was in England, where he published the *Chains of Slavery*, that he gave lessons in Edinburgh (1775), and that (1776) he was committed to prison for stealing medals from the Oxford Museum. It is at least certain that he tried several careers before becoming (1789) one of the moving spirits of the French Revolution, through the advocacy of the poor against the rich in *L'Ami du Peuple*. This advocacy degenerated into a propagandism in behalf of massacre and spoliation. To him were due the systematic assassinations on the 20th June, the 10th August, and in September 1792. After the king's death he wrote, 'massacre 270,000 partisans of the *ancien régime*; reduce to a quarter of their number the members of the Convention!' The Convention were outraged by some of his advices, but a revolutionary tribunal acquitted him when an accusation was brought against him by the Girondins. M. was killed in his bath by Charlotte Corday, 13th July 1793; the honours of the Pantheon were decreed to his remains, which were afterwards removed amidst popular execration. M. wrote numerous legal and scientific treatises, besides an immense mass of political brochures, none of which are worth rescuing. See the Histories of the French Revolution by Thiers, Michelet, Louis Blanc, and Carlyle, and (for the alleged facts of M.'s English experiences) *Notes and Queries* (Sept. 27, 1859).

Marathon, a plain in the N.E. of Attica, about 6 miles long and 3 broad, open to the sea upon the E., shut in by mountains on the W., and bounded on the N. and S. by marshes. It contained in ancient times four places, forming the

Tetrapolis, one of which, named M., is supposed to have occupied the site of the modern *Vrana*. M. is famed in history as the scene of the defeat of the Persians by the Athenians under Miltiades (B.C. 490).

Marave'di, an old Spanish coin, was in the early part of the middle ages the *weight* by which the booty taken from the Moors (*Morabotin*) was divided amongst the soldiers. As a coin it was introduced by the Moors, and was at first of gold or silver, of value now unknown. From 1474 till its abolition in 1848, the M. was struck in *vellon* ('copper'), of value equal to $\frac{1}{16}$ of a farthing.

Marble, in popular language, is any limestone which is capable of being polished. Geologically, the name is restricted to those varieties of carbonate of lime which have a granular or crystalline structure, and which have probably resulted from metamorphosis of the original limestone. The finest varieties are pure white in colour, and are used for statuary. The best statuary M. comes from the Italian quarry at Carrara. The ancient Greeks and Romans obtained their M. from the quarries of Paros, Samos, Lesbos, and Pentelicus. The clouded white marbles are much more abundant than the pure white, and are used for architectural purposes. The best varieties of these are suitable building material, not being exceeded in durability by even granite. Coloured and variegated marbles are very abundant in Italy, Greece, France, Spain, and Portugal, and many when polished are of rare beauty. The *rosso-antico* M. of Libya is deep blood red with minute white dots; the *giallo-antico* of Milos is yellow with black or yellow rings; the *brocatello* of Sienna is yellow with large purplish spots or veins; the *porfiro* of Genoa is deep black beautifully veined with yellow; the *mandelato* of Luggezzana consists of yellowish white spots in a light red paste; the *paragona* of Bergamo is a fine black, somewhat resembling the *nero-antico* of the ancients. *Verde-antico* or verd antique M. is a clouded green colour, and consists of a mixture of serpentine and limestone. In Genoa and Tuscany it is much valued for its beauty.

Marblehead, a seaport of Massachusetts, U.S., 20 miles N.E. of Boston by rail, has eight churches, three banks, one newspaper, and numerous boot and shoe factories. The fisheries have declined, but it is becoming a 'favourite watering-place.' Pop. (1870) 7703.

Marbling is the art of imparting variegated patterns to sheets of paper or book edges. The colours, previously mixed up with wax and ox-gall, are superimposed on each other on the surface of a solution of gum contained in a shallow trough, and the particular pattern required is arranged by drawing a rod or comb through them. A sheet of paper is then laid flat on the colours and removed without disturbing their arrangement; the marbled paper is afterwards calendered. Book edges are dipped into the trough, and when dry are burnished with agate. Germany exports much marbled paper.

Mar'burg (*Mar* is an old German word for a horse; comp. Eng. *mare*), a town of Germany, in the province of Hessen-Nassau, on the Lahn, 51 miles N. of Frankfurt by railway. It is built in a semicircle round the precipitous Schlossberg (876 feet), and contains many interesting buildings—the Elizabethkirche (1235-83), with the tomb of St. Elizabeth (q. v.), and two towers 310 feet high; the Rathhaus (1512); and the Schloss (1605), in the *rittersaal* of which Luther and Zwingli held a religious conference (1529). There are also numerous educational and benevolent institutions, potteries and tanneries, and manufactures of pianos and surgical instruments. Pop. (1875) 9658. The University of M., founded (1527) by Philipp the Generous, possesses a library with 120,000 volumes, anatomical and zoological museums, an observatory, &c. It has numbered among its students Tyndale, Patrick Hamilton, and Johann von Wolf, and in 1876 had 65 professors and teachers and 401 students.

Marcell'us was the name of an illustrious family of the Claudia gens, of which the most distinguished member was **Marcus Claudius M.**, born about B.C. 268, who early won high reputation by his martial exploits. He became curule ædile, B.C. 226. During his first consulship, B.C. 222, the Gallic war was terminated, in which the prowess of M. was displayed in slaying with his own hand Britomartus or Viridomarus, the Gallic leader, whose spoils were dedicated in the temple of

Jupiter, the third and last occasion in Roman history on which *spolia opima* were so offered. M. was appointed one of the prætors, B.C. 216, and after the disastrous defeat at Cannæ, succeeded in reviving the dispirited Romans by a repulse of the Carthaginians at Nola, an achievement which he twice successfully repeated. In 214 B.C., M. was appointed consul for the third time, and despatched to Sicily, where he greatly increased his military renown by the capture of Syracuse, B.C. 212, in which pestilence and treachery enabled the assailants to overcome the skill and science of Archimedes. The city was plundered, and many works of art carried off to Rome. After the commencement of his fourth consulship, B.C. 210, the verdict of his countrymen on his conduct in Sicily was challenged by Sicilian deputies, with the result that he was withdrawn from Sicily, and sent to the army in Apulia. He now resumed his opposition to Hannibal, whom he met in an indecisive contest near Numistro, but the campaign of B.C. 209 was so fruitless, if not unfavourable, that M. was compelled to return to Rome to defend himself. This, however, he accomplished so well, that he was elected consul for the fifth time, and took command of the army at Venusia. Here he fell into an ambushade and was killed, B.C. 208.

March, a military term meaning the moving of troops from one place to another. The M. may be in slow time, quick time, or double time. In the first, 75 paces are taken in a minute, in the second, 110, and in the third, 150.

The M., in music, is usually a simple tune in the common time. In regard to its composition it is impossible to lay down any general rules. Many celebrated pieces of the great masters are in this style, e.g., the M. of the priests in *Zauberflöte*, that of the peasants in Weber's *Freischütz*, and above all Beethoven's Funeral Marches.

Maroh (Lat. *Martius*, the 'month of Mars'), the first month in the Julian and the third in the Gregorian calendar, corresponding to the Attic Elaphebolion and the Jewish Nisan or Abib. Before the introduction of the New Style in 1752, the English legal year did not commence until March 25, whence the practice in old records of writing all dates falling before that day either as March 24, 174½, or March 24, 1745-46.

March, a market-town in Cambridgeshire, England, 88 miles N. by E. of London. It lies on both sides of the Old Nen, at the junction of five railways, has a fine square and town-house, and a church dating from the 14th c. M. trades in corn, coal, and timber, and has derived much advantage from the draining of the fen country. Pop. (1871) 5854.

Marchantia, or **Liverworts**, formerly a genus, but now nearly equivalent to a section (*Marchantiaceæ*) of *Hepaticæ* (q. v.). *M. polymorpha*, common on shady walks, damp rock cuttings, the soil of garden pots, &c., which it covers with a dark green sheet, is a familiar example.

Marchena ('the marshy place'), a town of Spain, province of Seville, on the Galapagar, 8½ miles N.E. of Cadiz by rail, in a district rich in corn and olives, and with celebrated sulphur springs. Pop. 12,208.

Marches. See **MARK**.

Marcion was a Gnostic heretic of the 2d c., and the founder of a sect called the Marcionites. He was a native of Sinope, a wealthy shipmaster, and a man of good character, although Epiphanius, according to the uniform practice of making heretics out to be bad men, says he was the son of a bishop, and had been excommunicated by his father for immorality. He came to Rome some time shortly before the middle of the 2d c., and remained in communion with the Church for about forty years, although excommunicated for a time more than once. The orthodoxy of the time was a Judaizing compromise, in opposition to which Gnosticism (q. v.) was making way, and M. took up a position directly in opposition to that of the Judaizing party, and maintained that Christianity was something distinct from Judaism altogether. In his doctrinal system M. assumed three principles:—(1) The Almighty and holy God; (2) Matter existing from eternity, part of which resists altogether the power of the Demiurge and produces evil, which is all concentrated in Satan; (3) The Demiurge, intermediate between good and evil, who is in perpetual conflict with matter, seeking to fashion it according to his own ideas, while both hold men's

souls, which are of divine origin, in bondage. In order to free them the supreme God sent his son clothed in the shadow of a body. Finding some things in the Old Testament contrary, as he believed, to Christianity, M. denied that it could have come from the supreme and good God, the author of the New Testament. It was from the Demiurge, and therefore he rejected it. But he also rejected a part of the New, all but the Gospel of Luke, which he made to begin with chapter v., and ten of the Epistles of Paul:—Gal., 1 and 2 Cor., Rom., 1 and 2 Thess., Eph., Col., Phil., and Philemon. The heresy seems to have spread in Europe, Asia, and Africa, and maintained a struggling existence down to the 8th c. See Blunt's *Dictionary of Sects* (1874).

Mardin, a picturesque town of Asiatic Turkey, in the vilayet of Diarbekir, on the steep S. slope of the M. Hills (*Mons Masius*), 60 miles S.E. of Diarbekir. It is commanded by an old castle on a rock, has some trade in cottons, linens, leather, &c., and is the seat of several Jacobite (q. v.) institutions, including a library. The gates of the citadel are enriched with splendid Arabesque carving. Pop. 15,000, of whom half are Kurds.

Maree, **Loch**, a beautiful Scottish lake, in the W. of Ross-shire, extends 13 miles in a N.-westerly direction, and is little more than 2 miles at its broadest point, where are situated several islands, of which the largest is Isle Maree. Its scenery lacks the richness of vegetation, but its mountain-line is infinitely varied, here soft and undulating, there abrupt and rocky, and towering in the barren grandeur of Slieve to a height of 4000 feet. The fishing is excellent, and there is a good inn at Talladale.

Maremma ('country contiguous to the sea,' a corruption of *maritima*), the name of a marshy part of Italy, bordering on the Tyrrhenian Sea, and extending between the rivers Magra and Volturno. It is 1000 sq. miles in extent, and is mainly divided into the Tuscan and Roman M. There are few villages or even roads in the M., and the pestilential exhalations affect even the slopes of the Apennines. The Tuscan M. has been somewhat improved by extensive draining and tree-planting, and by the recent construction of railways. The more fertile portions are cultivated by peasants, who descend in summer from the mountains of Lucca, the Sabine Hills, and the Abruzzi.

Maren'go ('the marshy field'), a village of Piedmont, 1½ miles E. of Alessandria, near which Napoleon, with 28,000 troops, defeated 35,000 Austrians under Melas, June 14, 1800. Desaix (q. v.) fell in this battle, and it led to the re-establishment of the Cisalpine and Ligurian Republics.

Mareotis Lake (mod. *Birket-el-Mariût*), a marsh or salt lake of Lower Egypt, 30 miles long and 2½ broad, separated from the Mediterranean by a peninsula and sand-spit, on which is situated Alexandria. It is connected with the Nile by the Mahmudieh and Abu Dibab Canals. In ancient times its shores and isles were celebrated for their growth of fine papyrus, and were luxuriantly covered with olives and vines. The canals had fallen into disrepair, and much of the lake became a sandy waste, when the English, during the war with Napoleon, dug a passage through the isthmus and let in the sea (1801). This channel was subsequently closed by Mehemet Ali.

Margaret, St., was the elder sister of Eadgar the Ætheling, and fled with him in 1068 to the court of Malcolm Canmore (q. v.), whom she shortly after wedded. Pious and learned, trained in the higher culture of an English court, she did much to soften the native barbarity of her husband and his subjects, and introduced many reforms into the Scottish Church—the keeping of Lent at the canonical season, the due observance of Sunday, and the more frequent celebration of the Eucharist. She also founded the monastery of Dunfermline, and rebuilt the church at Iona. Dying November 16, 1093, she left four sons and two daughters, one of whom, Matilda, married Henry I. We have a life of her, ascribed to her confessor, Turgot, a monk of Durham, though Papebroch, the editor of the Bollandist *Acta Sanctorum*, attributes it to a later hand.

Margaric Acid (C₁₇H₃₄O₈), an acid which appears to be composed of stearic (C₁₈H₃₆O₂) and palmitic acids (C₁₆H₃₂O₂). It may be separated into these by repeated crystallisation from alcohol, when the palmitic acid is left in solution. Its fusing point is 65° C. It is formed by saponification of *margarine*,

which is a fatty oil obtained by exposing *sweet oil* of crushed olives to a temperature of 0° C. The margarine solidifies out.

Margarita ('the pearl isle'), an island in the Caribbean Sea belonging to Venezuela, 35 miles N. of Cumana. Area, 441 sq. miles; pop. 20,206. It is 40 miles long from E. to W. The surface is mountainous, and the climate hot but healthy. Rice, fruits, salt, and poultry are the chief products, and there are important coast fisheries. M., discovered by Columbus in 1498, was famed for its pearl fisheries down to the 17th c.

Margary, Augustus Raymond, a young Englishman, educated at Brighton College, who was appointed to a student interpretership in China at the age of twenty-one, and devoted himself to the study of the Chinese character and language.

In 1874 he was selected for the important task of traversing China to the Burmese frontier, to meet and escort the mission sent by the Indian government from that quarter. This he successfully accomplished with admirable energy and was, but in February 1875, while proceeding in advance of a Burmese party, he was treacherously killed at the Chinese village of Manwyne, in Yunnan, where he had just before been hospitably entertained. It was more than twelve months before attribution for this murder was exacted by diplomacy from the Chinese authorities. See *The Journey of A. R. M. from Shanghai to Bhamo, and back to Manwyne* (Lond. 1876).

Margate ('the sea-gate'), a seaport and watering-place of England, on the N. coast of the Isle of Thanet, Kent, near the N. Foreland, 4 miles N. by W. of Ramsgate, and 73 miles E.S.E. of London by rail. It has a fine sandy beach, and a promenade, formed by Marine Terrace and Royal Crescent, 2500 feet long, protected by a strong sea-wall. There are also piers, large bathing establishments, libraries, bazaars, a theatre, &c. During the season M. is inundated by about 100,000 visitors. There is a small shipping and fishing industry, and a bi-weekly market for provisions. The Royal Alexandra Almshouses were erected in 1866 to commemorate a visit of the Princess of Wales, who on July 19, 1875, opened an asylum here for 150 deaf and dumb children. Pop. (1871) 11,995.

Margrethe Valdemarsdatter, queen of Scandinavia, born in 1353, was the youngest of the six children of Valdemar IV. Atterdag and his wife Helvig. At six she was betrothed to the Norwegian king Hakon VI., but the ill-feeling between the two countries nearly causing the rejection of M. in favour of Elizabeth of Holstein, Valdemar made use of Hakon's unwilling stay in Denmark to bring about the marriage, 9th April 1363. Three years afterwards M. went to Norway, where in 1371 she had a son, named Oluf, who became king of Denmark after his grandfather, and obtained the crown of Norway on his father's death in 1380. After Oluf's death she was chosen queen of Denmark (1387), and Norway (1388). Then forming friendship with the Swedish nobles, who were displeased with the bad government of Albrecht of Mecklenburg, M. sent an army into Sweden, which gained a decisive victory (24th February 1389) at Leaby, near Falköping, over Albrecht, who was taken prisoner. Gradually she gained all Sweden, but not till seven years after did she take Stockholm, and give relief from the Rostock and Wismar pirates, notorious as 'Victual-brothers.' On the 20th July 1397, she effected the famous Union of Kalmar, which joined together the three kingdoms, and at which her grand-nephew Erik of Pommern was crowned king, though M. still held the reins of power, till her sudden death on shipboard in Flensburg harbour, 28th October 1412. M. pleased the clergy by her munificence and piety, and the turbulent nobles acquiesced in the firmness of her prudent rule. The union of three peoples sprung from one root, which it was her life object to secure, her feeble successors were unable to maintain.

Marguerite d'Anjou, daughter of René d'Anjou, titular king of Naples, was born at Pont-à-Mousson, Lorraine, 25th March 1429, married by proxy to Henry VI. of England in the spring of 1445, married in person at Lichfield in May, and crowned at Westminster in June of the same year. In 1453 she gave birth to a son, Edward; by 1455 the influence she had exercised over the affairs of the country had entirely departed, owing to the practical ascendancy of the Duke of York; in 1460 she took up arms for the claims of her son, and is said to have been at the battle of Wakefield, where York was slain, and on

the following year at the battle of St. Alban's. M. took shelter in Scotland (1463), and received assistance from the Borderers, but after many adventures, was compelled to retire to the duchy of Bar in Lorraine. In 1471 she joined her husband in his prosperity, but was taken prisoner at Tewkesbury; she was ransomed by Louis XI. in 1475, and retired to her own country, where she died August 25th, 1482. M. was a woman of much beauty, great courage and force of character. See Gairdner's *Lancaster and York* (1835), and Miss Strickland's *Lives of the Queens of England*.

Marguerite de Valois (also known as M. d'Angoulême or de Navarre), daughter of Charles Comte d'Angoulême and Louis de Valois, and sister of François I., was born at Angoulême, April 11, 1492; and on December 1, 1509, wedded Charles III., Duc d'Alençon, who died in 1525. She followed her brother into his captivity at Madrid, and shortly after his release was married (January 1527) to Henri d'Albret, king of Navarre—a marriage, like the first, *de convenance*—to whom she bore a son (died 1530) and Jeanne d'Albret, mother of Henri IV. A patroness of the Renaissance in the person of Marot (q. v.), M. was drawn by the zest of novelty so dangerously near the Reformation that her *Miroir de l'Âme Pécheresse* (1533) fell under the censure of the Sorbonne; but, though she always protested against the horrors of persecution, she died a Catholic, December 21, 1549. There appeared, in her lifetime, *Marguerites de la Marguerite des Princesses* (Lyon, 1547), a collection of poems; and, posthumously, her *Heptaméron des Nouvelles* (1559, and twenty-four reprints; Eng. trans. with memoir, 1855), an imitation of Boccaccio, with all his grossness and little of his point. See the *Lettres de M.* (1841) and *Nouvelles Lettres* (1842), both edited by M. Génin; and Miss Freer's *Life of M.* (2 vols. Lond. 1855).

Maria Christina, daughter of Francis I., king of the Two Sicilies, was born at Naples, April 27, 1806, married to Ferdinand VII. of Spain, December 11, 1823, and appointed regent in October 1832. For seven years civil war raged between the followers of Don Carlos and the adherents of the Queen-Regent, and in 1840 she took refuge in France, where she remained until 1843. Meanwhile she had secretly married Fernando Muñoz, her chamberlain, and the marriage was publicly acknowledged October 13, 1844. Upon the coming of age of Isabella II., M. returned to Spain, where she exercised a most baneful influence upon her daughter's thoughts and conduct. In 1854 she again took refuge in France, where she invested a considerable fortune. Ten years later she was in Spain, but again withdrew (1868). Her husband by morganatic marriage died 13th September 1873. M., who has ten children to him, has within recent years been wandering restlessly from the cities of France to those of Italy.

Maria Louisa, eldest daughter of Franz I., Emperor of Austria, was born at Vienna, 12th December 1791, and was married to Napoleon I., April 1, 1810. In 1811 she gave birth to a son, named the King of Rome; in 1812 she accompanied Napoleon to Dresden, where extraordinary fêtes were given in her honour; in his absence (April 1813) she discharged the duties of Empress-Regent with marked indifference. She departed for Vienna April 25, 1814, and next year lodged a protest at the Viennese Congress against the restoration of the Bourbons to France. To her were assigned the duchies of Parma, Placenza, and Guastalla, of which she took possession in company with the one-eyed Count Von Neipperg, to whom she bore several children, fruits of a morganatic marriage. M. died December 18, 1847.

Maria-na, Juan, a Spanish historian, was born at Talavera in 1537. Educated by the Jesuits, he was sent on an important mission to Rome when twenty-five, and afterwards to Paris and Toledo. His later years were entirely given to literature. His *De Rege et Regis Institutione, De Ponderibus et Mensuris* (aimed at the Duke of Lerma), and *De Morte et Immortalitate*, were too freely written for the times, and brought on their author persecution and imprisonment. He likewise wrote seven unimportant theological treatises, and a paper, published posthumously, entitled *De Erroribus quæ in formâ Gubernationis Societatis Jesu occurrunt*. But his fame rests chiefly on his wonderfully graphic and entertaining *Historia de Rebus Hispania Libri xxx*. This famous work was published in 1592, translated into Spanish in 1609. It ended with the accession of Karl V.,

but the author added a condensed continuation to 1621, and further additions have been made by Sabau and Blanco. M. died 17th February 1624. See Ticknor's *History of Spanish Literature*, vol. iii.

Maria'nus Scotus, a Scottish or Irish chronicler, born in 1028, came to Germany (1052), entered the Benedictine Order at Köln (1058), was an inmate of the Abbey of Fulda (1059-69), and taught mathematics and sacred literature at Regensburg and Mainz until his death at the latter place (1086). Besides several unprinted treatises in the Regensburg Library, he wrote a *Chronicon Universale a Creatione Mundi usque ad Annum Christi* 1083, published by Jean Hérôld (Basel, 1559). It is of considerable value for the Scots-Irish history of the 11th c. See Hausen, *De Antiquissimo Codice Chronici Mariani Scoti* (Frank-am-Oder, 1782).

Maria Theresia, eldest daughter of Karl VI. was born, 13th May 1717, at Vienna, appointed her father's heir by the publication of the 'Pragmatic Sanction' (1724), and married Francis Stephen, Grand Duke of Tuscany (1736). Before the death of her father the Austrian domains were menaced at all points by claimants who declined to admit her rightful succession. Bavaria, Spain, and Saxony each claimed the whole inheritance. The king of Sardinia wanted a share of the Italian fiefs, the king of Prussia demanded four duchies in lower Silesia, and the elector of Bavaria was a candidate for the imperial crown. In 1748 the dispute was adjusted by the Peace of Aix-la-Chapelle which, though it deprived M. of more territory, gave her husband the title of emperor. At the conclusion of the war, every encouragement was given to commerce, by the establishment of manufactories, and the opening of ports. Schools of instruction, observatories, colleges, and hospitals were founded, and military academies organised for recruiting the army. In 1755 M. tried hard to strike up an alliance with France against Prussia, and in the following year began the Seven Years' War. In August 1764, the Archduke, Joseph, son of M., became emperor. In 1771 M. declared in behalf of Turkey against Russia, but in 1772 joined Russia and Prussia in the partition of Poland. She died November 29, 1780. M. earned for herself the title, Mother of the Country. She was a woman of strong nature, and was possessed of considerable faculty for governing. See Duller, *M. und ihre Zeit* (1844); Arneth, *M.'s erste Regierungsjahre* (1863-70).

Mariazell, the most frequented shrine in Austria, is situated among beautiful wooded mountains, on the N. border of Styria, 58 miles S.W. of Vienna. It is visited yearly by seventy great and many minor processions (that of Vienna on 1st July, that of Gratz on 14th August), comprising some 250,000 pilgrims. The church occupies the site of a chapel erected in 1200, and contains a miraculous image of the Virgin and Child. The 900 inhabitants of the village are mostly keepers of inns, booths, &c.

Marie Antoinette de Lorraine, Joséphe Jeanne, youngest daughter of the Emper. Franz I. and Maria Theresa, was born at Vienna, 2d November 1755. In her fourteenth year she was asked in marriage for the Dauphin of France, and in 1770 the nuptials were celebrated. Her Austrian education fitted her but poorly for the elaborate system of courtly etiquette which she had to encounter. In 1774 she became queen, and by that time had gained complete control over her husband, with the most disastrous results. She made life one continuous pageant at court, and the freedom of her manner gave occasion for endless rumours as to her infidelity to the king, none of which have stood investigation. But her name steadily became odious to the people of Paris, who attributed to her the accumulation of public debts and much of their own misery. In 1785 occurred the scandal about the Diamond Necklace (q. v.) which inflamed the hatred of the people. When the Revolution (1789) broke out, her life was menaced (October 6) by a mob which pressed through the palace of Versailles to her bedroom. She tried to regain popular esteem by visiting manufactories and lavishing gifts upon the operatives. But no good came of it. In the king's captivity at the Tuileries, which she shared, she urged him over and over again to take refuge in flight, and (20th June 1791) they escaped to Varennes, where they were recognised and brought back. In 1792 M. again became the object of detestation, by reports being spread that she was the centre of an

Austrian Committee. Amidst the tumult of the Revolution of this summer M. behaved with great personal courage, and would have fought against the mob had the king been sufficiently decided. Removed to the prison of the Temple (August 13), she was separated from her husband (20th January 1793). On the 14th October 1793 she was carried before the Revolutionary Tribunal, condemned to the guillotine, and executed (October 16). M. was proud, beautiful, and ignorant, full of lightness of spirit and showy frivolity, but neither wicked nor designing. See Mme. Campan, *Mémoires sur la Vie privée de Marie Antoinette*; *Life of Marie Antoinette, Queen of France*, by Charles Duke Yonge; Kitchin's *History of France* (vol. iii. 1877).

Marie de Medicis, daughter of Francis I., Grand-Duke of Tuscany, was born at Florence, 26th April 1573, and was married by proxy to Henri IV., 5th October 1600, who was greatly disappointed with her appearance. Very soon her jealousy was quickened by her husband's devotion, first of all to the Marquis de Verneuil and then to Mdle. de Montmorenci. In 1610 M. got herself appointed Queen-Regent, and wished to be crowned and consecrated so as to increase her dignity in the absence of Henri. No sooner was this accomplished than Henri was assassinated, and there is a strong suspicion that M. had a hand in the plot. A *coup d'état* in her behalf followed. She gained the king's treasure, and the attachment of public men followed its free distribution. But the young king grew tired of her jurisdiction; and she had to retire to Blois (1617), which became a centre for intrigues that terminated in a party rallying round the Queen-Regent. In 1620, through Richelieu, she became reconciled to her son, and refrained for a time from ambitious scheming, but by 1631 she had divided the court, owing to her detestation of the mastery then obtained by the Cardinal. She was then exiled, and led a wandering life until her death at Köln, 3d July 1642. See Sismondi's *Histoire des Français*, vols. xxii. and xxiii.; Kitchin's *History of France* (vol. ii. 1877).

Marie Galante (named after Columbus' ship in 1493), an island of the Lesser Antilles in the W. Indies, belonging to the French colony of Guadeloupe, and lying 17 miles S.E. of the island of that name. Area, 59½ sq. miles; pop. 13,000. The coasts are steep, and skirted with coral reefs; the soil produces abundant coffee, cotton, and sugar. Marigot (pop. 2000), Capesterre, and Vieux-Port-Saint-Louis are its market-towns.

Mariénbad, a favourite spa in Bohemia, 35 miles N.W. of Pilsen by rail, in a valley surrounded by pine-clad heights. It is visited by some 9000 persons annually, and the waters contain Glauber's salt, and resemble those of Karlsbad, but are cold, having a temperature of from 48° to 54°. This charming watering-place has sprung into existence within the last sixty years. Pop. (1869) 1600.

Marienburg, a town of W. Prussia, on the Nogat, 31 miles S.E. of Danzig by rail, has three churches, a Gothic *Rathhaus* of the 14th c., and a lively trade in wood, grain, quills, and bristles. Pop. (1875) 8538. Its *Schloss*, the noblest medieval building of the kind in Germany, was founded by the Teutonic Knights in 1274, became the residence of their Grand Masters (1309), was sold to the Poles (1457), but returned to Prussia (1772), and having fallen into decay, was restored (1817-20). See M., *das Haupthaus des Deutschen Ordens* (Königsb. 1854).

Mariénwerder, an old city of Prussia, on the Nogat, 2 miles E. of its confluence with the Vistula, and 50 miles S.S.E. of Danzig by rail. It was founded by the knights of the Teutonic Order in 1233, and has a castle long the residence of the grand master. Pop. (1875) 7627.

Mariette, Auguste Edouard, a distinguished French Egyptologist, was born at Boulogne-sur-Mer, 11th February 1811, and was attached to the *Musée Égyptien* at the Louvre in 1847, where he devoted himself to the study of hieroglyphics. Sent on a scientific expedition to Egypt in 1850, he discovered Saggarah on the border of the Libyan range, and in the midst of the burial-grounds of ancient Memphis, a temple of Serapis engulfed in the sands of the desert, but rich in relics of Græco-Egyptian art. On a second visit to Egypt in 1858, the Viceroy put 1500 workmen at his disposal, and M. prosecuted explorations from Memphis to Elephantine, cleared away sand and

débris that had entombed numerous temples, and thus made vast additions to our knowledge of Egyptian antiquities. M. has finally for many years been resident in Egypt, where he holds the office of Inspector-General of Monuments, and is also director of the museum at Boulak, with the title of Bey. His principal writings are *Les Monuments de l'Haute Egypte* (Eng. trans. by Alphonse Mariette, 1877); *L'Aperçu de l'Histoire d'Egypte*, and the Catalogue of collections in the Boulak Museum.

Marigold, a name applied to various plants bearing yellow flowers. The common M. is *Calendula officinalis*, an old cottage-garden favourite, formerly enjoying repute as a domestic remedy. It is one of a genus of annual and perennial *Compositæ* occurring as weeds in the Mediterranean countries. The so-called African and French M. of the gardens are two species of *Tagetes*, namely, *T. erecta* and *T. patula*; they are natives of Mexico, Peru, and Chili; the gardener's names are therefore strangely misapplied. The corn M. is *Chrysanthemum segetum*, its abundance among young corn in some districts rendering the fields at a distance a perfect sheet of yellow. In England, by better farming, the weed is becoming scarcer; in Scotland, through the later seasons, it sheds seed before the crops are cut, and so holds its ground.

Marines are soldiers for sea-service. Every war-ship carries a complement of M., who are exercised in the use of arms, act as sentinels, and perform various duties, but do not go aloft. In naval actions they fire from tops and decks, and repel any attempt at boarding at the point of the bayonet. They are also employed in making descents on the enemy's coast. In the beginning of the 18th c. six regiments of M. were raised, and the number was gradually increased. In every war from the Seven Years' War to that with Russia, the M. have played a gallant part. The present number of M. (1877) is 14,000 men, being eight on the general staff, 2901 in the artillery, and 11,091 in the line infantry. This number has been greatly exceeded in time of war. The wages of the force in 1876 was £458,024. The uniform is scarlet, with blue facings. Their post in the line is between the 49th and 50th regiments. They are under the control of the Admiralty.

Marine Stores. Dealers in M. S. are bound to keep books in which they are to enter the name and address of all persons with whom they deal, with the price of the articles purchased by them. They are also bound to have the words 'Dealers in M. S.' with their name painted on their warehouse, in letters at least six inches long, under a penalty of £20 for omission.

Mari'ni, or **Marino**, **Giovanni Batista**, an Italian poet, born at Naples, 18th October 1569; driven from his father's house because he would not study law, after various adventures settled for a time at Turin, where he acquired some fame by writing sonnets and panegyrics. In France, whither he had betaken himself on the invitation of Queen Marguerite (1615), he published his most famous poem, the *Adone* (1622). On his return to Italy the Umoristi elected him president of the Academy. He died at Naples, 25th March 1625. M.'s works are little read except by the learned and prurient, for he wrote with disgusting filthiness. He did much to hasten the corruption and decline of Italian literature, not merely by his licentiousness, but by using and sanctioning all manner of extravagances in style, giving his name to the *stile Marinesco*, corresponding to the contemporary *cultismo* of Spain, and *euphuism* of England. The 17th c. produced numerous biographies of M.

Mari'no, a walled town of Italy, finely situated on a slope of the Alban Hills, 11 miles S.E. of Rome by rail. It was the seat of the Orsini family till the 15th c., when it passed to that of Colonna, still the great proprietors in the vicinity. It has a fine duomo, and many interesting antiquities. Pop. (1874) 6509.

Marino, San, the oldest and smallest republic in the world, is situated in Italy, 12 miles S.W. of Rimini, on the border between the provinces of Forlì and Urbino, and includes Monte Titano (2500 feet high), with its surroundings. Area, 238 sq. miles; pop. (1874) 7816. The constitutional laws of the republic, collected in the *Statuta Illustrissima Reipublicæ Sancti Marini*, date from the 13th c. The sovereignty was originally exercised by the whole community, but from the end of the 14th c. to the year 1847 the legislative power was in the hands of a *General Consiglio Principe* ('sovereign grand council') of sixty. By the

altered constitution of September 1847 the legislature is vested in a *Camera dei rappresentanti* of sixty life-members, who annually appoint a committee of twelve to be the supreme judicial court. Two secretaries of state have the direction of home and foreign affairs, and a treasurer-general of finance. From 1865 to 1872 the revenue averaged £4503 per annum; expenditure, £4386. There is no public debt. The troops of S. M. are eight companies of foot, including 950 men. The republic, now under the protectorate of King Vittorio Emanuele (formerly of the Pope), is said to have been founded in 469 by a hermit named Marinus, who had been a mason in Dalmatia before retiring to this spot.—The town of S. M. lies at the top of Titano, and has a castle said to have been fortified by the Lombard king Berengar. It consists of several groups of houses built on the declivities, and has seven churches (the largest also called S. M.), a monastery, nunnery, and theatre. Pop. (1874) 1460. See Dellico, *Memorie della Repubblica di S. M.* (Milan, 1804; 2 vols. Flor. 1843); A. J. C. Hare, *Cities of Northern and Central Italy* (1876).

Mario, Giuseppe, twenty years ago the first tenor singer on the stage, was born at Turin, of noble parentage, about 1812, and, after a short period of military service in Sardinia, studied music professionally at the Paris Conservatoire, 1836–38. In December 1838 he was engaged at the Paris opera for 1500 francs a month, and started on a brilliant career in company with Rubini, Lablache, Malibran, Crispien, &c., the last-named afterwards became his wife. A Russian tour (1845–50) was succeeded by ten years' (1850–60) successful acting in London and Paris in the operas of *Don Giovanni*, *Il Trovatore*, &c. On June 18, 1871, he acted for the last time in London in *La Favorita* (Donizetti). He has sung since then, but his voice is not what it was.

Mariol'atry (Gr. *Maria* and *latreia*, 'adoration') means properly the sin of rendering to the Virgin Mary that worship which is due to God alone, but the term is loosely applied by Protestant writers to all invocation whatever of the Virgin made by Roman Catholics. M. proper, which is regarded as a sin by orthodox, moderate Roman Catholics, consists in raising the intercession of the Virgin to a rank above that of other saints, making her merits parallel with the merits of Christ, her will with his will, which is one with the supreme will, assigning to her a co-operation all along in our Lord's own proper work of our redemption, or in short, in its last extreme, maintaining that Mary, the Mother of God, has been assumed into the Trinity, as its complement, and so as to make it a quaternity. As to M. in the looser sense referred to above, the reverence for Mary always increased the clearer became the expression of the conditions of the divine nature of Christ. In the 4th c. no peculiar reverence was paid to her above other saints, except that, according to ascetic ideas, her perpetual virginity began to be maintained. Epiphanius even includes in his list of heretics certain women (Collyridians) who paid extravagant adoration to her. After the Nestorian controversy in the 5th c., however, she was put at the head of the host of saints as the 'Mother of God.' This reverence went on increasing during the middle ages. Saturdays and other vigils were devoted to the 'Queen of Heaven.' To the festivals of the Church were added, during the 6th and 7th centuries, those of the Purification or Candlemas (February 2), of the Conception or Annunciation (March 25), of her Nativity (September 8), and of her Assumption or Ascension (August 15). Paschasius Radbertus about 850 had taught the miraculous delivery of Mary, and her sinlessness, although not that she had been conceived without sin; and about 1140 certain canons of Lyons instituted a festival in honour of the Immaculate Conception. The observance of the festival in honour of her conception spread, but the doctrine sought to be established was not received by theologians of any standing during the 13th c., greatly owing to the opposition of St. Bernard and Thomas Aquinas. But being taken up by Duns Scotus it was adopted in the 14th c. by the Franciscans. About the 16th c. the daily office of St. Mary or Lesser Office was introduced, and some time between the 16th c. and 17th c. the Rosary (q. v.) and Crown of St. Mary—the former consisting of fifteen repetitions of the Lord's Prayer and 150 salutations of St. Mary; the latter of six or seven repetitions, and sixty or seventy salutations.

Marionettes' are puppets representing men and women, which are moved mechanically by a concealed person, who also varies the voice so as to give a dramatic performance, somewhat after the manner of Punch and Judy, but more elaborate. They are of great antiquity, having been favourite amusements of the Greeks and Romans, and extremely popular both for religious and secular purposes during the middle ages. See Charles Magnin, *Histoire des M. en Europe depuis l'Antiquité jusqu'à nos Jours* (Par. 1852).

Mariotte', Edme, a celebrated French physicist, was born in Burgundy in the beginning of the 17th c. He lived at Dijon, was priest of St.-Martin-sous-Baune, and was one of the first members of the Academy of Sciences. M. died May 12, 1684. As an experimentalist he was a worthy successor to Galileo and Torricelli. The most interesting of his investigations are those relating to the concussion of bodies, to diffraction of colours, to the motions of fluids, and to the variation under pressure in the volume of a gas. This last is given in his *Traité de la Nature de l'Air* (1676), where is found the enunciation of the law discovered seven years previously by Boyle (q. v.). On the Continent, consequently, Boyle's Law is usually spoken of as M.'s Law. A collected edition of his works was published at Leyden (2 vols. 1717).

Maritime Courts. See ADMIRALTY COURT.

Marit'za (the anc. *Ilebrus*) a river of Turkey, 300 miles long, rises on the Rilo Dag in the Balkans, flows E. to Philippopolis and S.E. to Adrianople, where it becomes navigable, and bends S., receiving the Tunja from the N. and the Arda from the S. It is joined by the Erkench from the E. before entering the Ægean at the Gulf of Enos. With its tributaries it waters the whole plain to the S. of the Balkans, and its entire valley is traversed by the railway to Sofia.

Mariupol, a town of Russia, government of Ekaterinoslav, and after Taganrog and Berjansk, the chief port on the Sea of Azov, lies at the mouth of the Kalmius, 55 miles N.E. of Berjansk. In 1873 the exports (wheat, linseed, wool, &c.) amounted to 8,065,464 roubles, and the imports to 81,372. M. was founded by Greeks from the Crimea in 1779. Pop. (1870) 9037.

Mar'ius, Caius, was born of humble origin at Cereatræ, a village near Arpinum, B.C. 157. In early life he won the favour of Scipio Africanus by his services with the army in Spain. He became tribune of the people, B.C. 119, and commenced his life-long career of unrelenting hostility to the aristocratic party. He was elected a prætor, B.C. 115, and soon after married Julia, aunt of Julius Cæsar. He accompanied Metellus to Africa as his legate, B.C. 115, and by his devotion to military duty during the Jugurthine War became highly popular both with the army and at Rome. In B.C. 107, he was amid enthusiasm elected consul for the first time, and received Numidia as his province. In B.C. 106, the war was terminated, and Jugurtha betrayed into the hands of M., and at the close of B.C. 105, the Roman power in the country was fully established. While still in Africa, M. was elected consul for B.C. 104, as he alone could save the state from destruction by the barbaric hordes who had overrun Gaul and vanquished the Roman armies sent against them; and for the same reason he was thrice re-elected consul, B.C. 103-1. He succeeded, B.C. 102, in defeating the Teutones in a terrible battle, fought near Aquæ Sextiæ (Aix), the number of slain being variously stated from 100,000 to 200,000. In B.C. 101, the united forces of M. and Catulus overwhelmed the Cimbri in a like defeat at Vercellæ, near Milan. Fortunate, says Niebuhr, would M. have been, had he died on the day of his triumph for this victory. The fame well won by the courage and capacity of his earlier years was obscured by the corruption, perfidy, and cruelty that stained the close of his life. His sixth consulship, secured only by a disgraceful alliance with the demagogues Saturninus and Glaucia, was followed by a retirement of ten years, during which the popularity of his great enemy Sulla steadily increased. In B.C. 80, Sulla was elected consul, and obtained the command of the war against Mithridates. Stirred by rage and ambition, M. made a fierce effort to wrest this honour from his rival, but the wild attempt ended in shame and suffering to himself, and for a time he took refuge at Carthage. A conflict broke out (B.C. 87) between the consuls Octavius and Cinna, partisans respectively of Sulla and of M.

The latter joined Cinna, and after a brief campaign Rome surrendered. The cruel spirit of M. took fearful vengeance on his patrician foes. The noblest blood of Rome was foully shed by his body-guard of slaves. When his appetite for slaughter was appeased, M. proclaimed himself and Cinna consuls for B.C. 86, but M. died of pleurisy on the eighteenth day of his seventh consulship.

Mar'ivaux, Pierre Carlet de Chamblain de, was born at Paris, 4th February 1688, received but a poor education, and always affected a contempt for classical writers. In 1716 appeared his *L'Homme Travesti*, a foolish satire upon the *Iliad*. He was a voluminous writer for the stage, his comedy *Le Jeu de l'Amour et du Hasard*, which appeared in 1730, having firmly established his reputation among his contemporaries as an analyst of the eccentricities of the passion of love. His dialogue is invariably brilliant, but his discrimination of character weak. In the romance of *Marianne* (1731-36) he reached higher ground, being freed from the laws of the dram under which his power of developing plot and character was hampered. It is still less popular with French readers. M. died at Paris, 12th February 1760. His *Œuvres Complètes* were published at Paris in 12 vols. 1781. A more careful but less complete edition is that of Duvallet (10 vols. Par. 1827-30). See Sainte-Beuve's *Causeries du Lundi*, vol. ix.

Marjoram (*Origanum*), a genus of *Labiata* numbering about twenty species, spread through the temperate regions of the Old World. Common M. (*O. vulgare*) is frequent in Britain, in the chalk districts appearing as one of the commonest ornamental wild plants. Its properties are aromatic, bitter, balsamic, and an oil prepared from it, called oil of thyme is sold for the use of farmers, &c. Sweet M. and pot M. (*O. majorana* and *O. onites*), natives of southern Europe, are commonly grown in gardens for domestic purposes, the young tops and leaves, either green or dry, being used for seasoning soups and other culinary purposes. *O. dictamnus* and *O. sipyleum* from Greece, both with woolly leaves and drooping spikes of flowers, are grown for ornament.

Mark, a coin which has been used in several European countries, and which is now the standard of the gold coinage established for the whole German Empire. In England, where it is now out of use, the M. equalled $\frac{3}{4}$ of a pound; in Scotland $\frac{3}{4}$ less. In Germany, as early as 1042, a M. was $\frac{1}{2}$ of a Köln pound of pure silver, and this coin gradually came to be the universal standard of reference. By a law of the 4th December 1871, a common coinage is introduced throughout Germany. From the German pound (= 500 grammes) of fine gold is struck 139 $\frac{1}{2}$ 10-M., or 69 $\frac{1}{2}$ 20-M. pieces, the M. being equal to $\frac{1}{2}$ thaler (= 1 English shilling = $\frac{1}{2}$ Austrian gulden), and divided into 100 pfennigs.

Mark (Old Eng. *meare*, mod. Eng. 'march'), a term in German geography denoting originally the limit or border of a land or district, and afterwards the territory that adjoined that limit. In this later sense the word has become historical in connection with the Germano-Roman empire. Ever since the time of Karl the Great, the aim of all the great emperors was to extend their authority N., E., and S., and especially to bring into subjection their Slavic and Magyar neighbours. Their conquests in these regions were called *marken* ('border-lands'), and the *grafen* or counts placed over them were named *markgrafen* ('border earls,' see MARQUESS). Hence the origin of the marks of Austria, Brandenburg, Lausitz, Schleswig, Moravia, Steier (Styria), &c. But even before Karl's time, as early as the Teutonic conquest of Gaul, the word was used, and the first markgrafen were probably those charged with the safety of the western conquests. The same office was assigned on the English and Scotch borders to the Percys and Douglasses, Wardens respectively of the English and Scottish Marches. In early English history *Mercia* (*Mearcena-land*) was the land that bordered on Wales, and there was a Warden of the Western as well as the Northern Marches. See Maurer, *Geschichte der Markverfassung in Deutschland* (Erl. 1856).

Mark, St., if the same as the John of Acts xiii. 5-13, and John M. of xii. 12, 25, and xv. 37, was a native of Jerusalem and a son of Mary, and, according to Col. iv. 10, a nephew of Barnabas. He accompanied Paul and Barnabas on their first missionary journey, but returned to Jerusalem from Pamphylia. In consequence of this Paul refused to have anything to do with

him on the second journey, although he afterwards expressed his confidence in him (2 Tim. iv. 11). According to tradition he was with Peter at Rome, went to Egypt, where he founded several churches, and died A.D. 61. The traditional view that M. was the writer of the Gospel that bears his name is set aside by many modern critics, chiefly on the unsatisfactory ground that 'it is not copious or remarkable in particulars relative to Peter.' The time of writing the Gospel has been fixed variously from 40 to 120 A.D. As to the place, the weight of ancient authority is in favour of Rome.

Market Drayton. See DRAYTON-IN-IALES.

Market Over. English law recognises the principle that property may, in some cases, be transferred by sale, although the seller has no right of property in the goods. Thus it is held that the sale of anything vendible in M. O., without fraud on the part of the purchaser, transfers the property to him, though the vendor has stolen the thing sold. In Scotland, the real owner of the goods may reclaim at any time. M. O. in the country is held only on special days, by charter or custom; but in the city of London, every day except Sunday is a market day.

Markets. See FAIRS.

Marl, in Geology, is a mixture of clay and carbonate of lime in various proportions. As a manure it is much used on the Continent and in certain parts of England—notably Norfolk. It improves sandy soils by making them more compact and more retentive of moisture.

Marlborough, a market-town of England, in the county of Wilts., on the Kennet, 22 miles E.N.E. of Devizes by rail. Its principal buildings are the Norman church of St. Mary, St. Peter's (restored 1863), and M. College, founded (1845) for 500 pupils, half of whom by the charter of 1849 must be sons of clergymen. The College has a beautiful chapel (St. Michael), consecrated by Butterfield in 1872. Sack and rope making, brewing, tanning, and wool-stapling are the chief industries of M., which returns two members to Parliament. Pop. (1871) 5034.

Marlborough, John Churchill, Duke of, son of Sir Winston Churchill, was born at Ashe, in Devonshire, June 24, 1650, went to court in his twelfth year, and became page to the Duke of York, got a commission in the guards (1666), first saw ser. . . at the siege of Tangiers, and on his return home was presented by the Duchess of Cleveland with £5000. In the Dutch War he distinguished himself as an officer of the English troops in French pay, and after the battle of Enyngheim obtained the praise of Turenne (1673). After his return he was created lieutenant-colonel, gentleman of the bed-chamber, and master of the robes to the Duke of York, whom he attended to Holland and Scotland. In the spring of 1678 he married Sarah Jennings, maid-of-honour to Princess Anne, and in 1682 was made a Scotch peer, under the title of Baron Eymouth. Lord Churchill of Sandridge was a title bestowed on him in 1685. After perjurying himself profusely to James II., he went over to the side of William of Orange (1688), was rewarded with the earldom of Marlborough and the membership of Privy Council. In 1689 he was serving in the European war against France, and beat D'Humières at Walcourt near the Sambre. Suddenly M. was deprived of his honours (1694), owing to the king's well-grounded suspicions that he was intriguing with James II. Not until the War of the Spanish Succession broke out was he thoroughly reinstated in favour and power. William died in 1702, and in that and the following year M. secured Holland against attack, cleared the Spaniards from the northern districts, and made his footing secure in the Provinces and Lower Germany. In 1704 he planned the 'grand campaign,' which successfully culminated in the battle of Blenheim. In May 1706 the battle of Ramillies occurred; in July 1708, Oudenarde; in September 1709, Malplaquet. Meanwhile he had during these years been created a Duke, received the estate of Woodstock, and got Blenheim Palace built for him. By 1712, however, misfortune fell on him. His wife's influence over Queen Anne came to an end. The triumph of the Tories at St. James's operated in behalf of peace, and M. was ignominiously superseded by the Duke of Ormond, being at the same time accused of the malappropriation of public funds. This charge drove him into retirement, from which he emerged (1714) to receive at the hands of George I. the chief offices of which he had been de-

prived. He died June 17, 1722, having been for six years out of his mind. M. is perhaps the greatest general produced by England, distinguished as much for prudence as for daring, but the depths of meanness to which he could descend almost rival in distinction his qualities as a soldier. See Coxe, *Memoirs of John Duke of M.* (3 vols. Lond. 1818); Murray, *Despatches of the Duke of M.* (5 vols. Lond. 1845-46); Alison's *Military Life of John Churchill*, Macaulay's *History of England*, and *Letters of Sarah, Duchess of M.* (Lond. 1875).

Marline-Spike, a pointed iron pin averaging 1 foot in length, used on shipboard to separate the strands of a rope in splicing or in winding one small rope round another, termed *marling*.

Marlow or Marlowe, Christopher, son of John M., clerk of St. Mary's, Canterbury, and possibly shoemaker, was baptized 26th February 1564, two months before Shakespeare's birth. He was educated at King's School, Canterbury, and took the degree of B.A. at Benet (Corpus Christi) College, Cambridge, in 1583, commencing M.A. in 1587. By this time had been published his first play, *Tamburlaine the Great*, full of rant, bombast, and genius. It was openly attacked by Green and Nash, and afterwards ridiculed in the mouth of Shakespeare's Pistol. The common people accepted it with delight, and were indulged with a *Second Part of Tamburlaine*, first acted in 1586-87. *The Tragical History of the Life and Death of Dr. Faustus* was produced 1587-88, *The Rich Jew of Malta*, 1588-89, and *The Troublesome Reign and Lamentable Death of Edward Second*, 1590. His last and worst play was *The Massacre of Paris*, 1592-93. Besides translating in part the *Iliad* and *Leander of Musæus*, completed by Chapman, *The First Book of Lucan*, and, in a very licentious style, Ovid's *Ellegies*, M. left an unfinished play, *Dido*, which was completed by Nash, and he is thought by some critics to have had a hand in the *Taming of a Shrew*, and in the 2 and 3 *Henry VI.* He died in a drunken squabble at Deptford, June 16, 1593. M.'s genius raised the Elizabethan drama to a height which only Shakespeare's could overtop. He died a youth, yet the hand that depicted the death scene in *Edward II.*, or that of *Faust*, had given a higher token of passion and power than Shakespeare's in his two or three comedies. M.'s bent was towards the sublime and the terrible. Never so whole-minded as Shakespeare, never so genial, many-sided, and true, he might have proved as great a tragic poet; he could not have written *As You Like It*, yet he might have almost reached the greatness of *Macbeth*. The best editions of M. are those of Dyce (1865) and Wagner (1871).

Marmalade (Portuguese, *marmel*, 'a quince') was originally a conserve of quinces in sugar, but now almost exclusively denotes preparations of oranges and lemons. Orange M., which is most commonly used, is made from the Seville or bitter orange by boiling the peel in syrup till it is soft, thereafter pulping it, and again boiling with the juice of the fruit in the original syrup and with additional sugar to a proper consistence for jellying. M. is manufactured on a large scale in Dundee and Glasgow.

Marmande, a river-port in France, department of Lot-et-Garonne, on the right bank of the Garonne, 35 miles N.W. of Agen by rail. It has a church of the 13th c., with a fine altar-piece. Ropes, hats, casks, brandy, oil, leather, lincens, and sailcloth are manufactured, and there is a trade in cereals, wines, prunes, hemp, and spirits. Pop. (1872) 5417.

Mar'mont, Auguste Frédéric Louis Viesse de, Duc de Raguse, born at Châtillon-sur-Seine, 20th July 1774, entered the army when eighteen, was present in 1793 as artillery lieutenant at the siege of Toulon, where Napoleon first noticed him, was made captain in 1794, and accompanied his chief to Italy. In the campaign of 1796 he acted as Bonaparte's aide-de-camp, distinguished himself in Egypt and at the taking of Malta, superintended the crossing of the St. Bernard in 1800, and contributed largely to the victory of Marengo. Having completed 200 miles of road in Dalmatia he was created Duc de Raguse; and after the battle of Wagram he became marshal. In 1814 he defended Paris from the Allies, but by capitulation incurred the hatred of Napoleon and many of his countrymen. Louis XVIII. named him a peer of France, and Charles X. sent him as ambassador to Russia, to congratulate Nicholas on his coronation. Becoming still more unpopular, he left France and visited many countries, publishing an account of his travels in

1837. He likewise published *Esprit des Institutions Militaires* (1845). He died at Venice, 22d July 1852. His *Mémoires* were published in 1856. Sainte-Beuve, after careful investigation, declares him sincere, intelligent, full of generosity and candour, a loyal Frenchman, but too fond of glory. He survived the rest of Napoleon's generals.

Marmontel, Jean François, born at Bort, Limousin, July 11, 1723, was educated in the Jesuit College of Mauriac, whence he removed to Clermont. On the invitation of Voltaire he went to Paris, where he sold a translation of Pope's *Rape of the Lock* for a hundred crowns (1746). He plunged at once into literary work and vicious pleasures. Pompadour gave him a sinecure as clerk of public buildings in 1753; and he entered the Academy in 1763,—not without opposition, and after imprisonment for writing too much satire. He succeeded D'Alembert as secretary to the Academy in 1783, and died at Abloville (Eure), on the last day of the 18th c. M. was a thorough disciple of Voltaire, writing gracefully, gaily, mockingly, but with wit of blunter point. He wrote all manner of books, of which the best are *Denys le Tyran* (1748), *Aristomène* (1749), *Cléopâtre* (1750), *Egyptus* (1753), tragedies; *Contes Moraux*, written for the *Mercur*, and very popular, collected in 1761 (second series, feebler, 1801); *Bélisaire* (1768)—condemned by the Sorbonne for its views on toleration; and *Les Incas*, romances; *Éléments de Littérature* (1787); *Mémoires d'un Père* (posthumous, 1804), containing much information about himself, and amusing pictures of his time. His *Œuvres Complètes*, edited by himself, appeared at Paris in 17 vols.; a second edition in 18 vols. (Par. 1818); a third in 7 vols. (Par. 1819–20). His *Œuvres Choisies* in 12 vols. were published by Saint-Surin (Par. 1824–27).

Marmora (anc. *Propontis*), the sea that separates European from Asiatic Turkey, and communicates with the Black Sea by the Bosphorus, and with the Ægean by the Dardanelles (anc. *Hellespont*). It is 135 miles long from S.W. to N.E., and 45 miles broad, and is indented on the Asiatic side by the deep Gulf of Isnikmid. It has three large and many smaller islands. M., the largest, is famed for its marble and alabaster.

Marmoset, the name applied to various monkeys belonging to the Platyrrhine ('broad-nosed') or New World section of the *Quadrumania* (q. v.), and forming the family *Platyrrhini*. They have thirty-two teeth, consisting of eight incisors, four canines, twelve premolars, and eight molars. The tail is long, but non-prehensile. The marmosets bear a general resemblance to squirrels. They are small, have a soft, silky fur, and are of very gentle disposition. The *Tacchus vulgaris* is typically known as the 'M.', and allied species are the *T. Edipus* and *T. Rosalia*. The *Malpica pucillata* is another common genus and species.

Marmot (*Arctomys*), a genus of *Rodentia* (q. v.) somewhat related to the Squirrels (q. v.), inhabiting N. Europe and America, and distinguished by the possession of twenty-two teeth. The incisors are smooth and rounded. No cheek-pouches exist. The front feet have four toes and a rudimentary thumb; the hinder feet are five-toed. The tail is short, and covered with hair. In the allied genus, *Spermophilus*, cheek-pouches exist. The common M. (*Arctomys Marmotta*) attains the size of an ordinary rabbit. It is common in N. Europe, inhabiting mountainous situations. It lives in burrows, and is of gregarious habits. The colour is a greyish-yellow above, the grey tint predominating below, and the tip of the tail being black. The M. hibernates during winter, retiring to its burrows in September and reappearing in the succeeding April. The young number three or four. The Polish M., or Bobac, is the *A. Bobac* of the naturalist, and is a native of N. Europe and N. Asia. It attains a length of 20 inches, and is of a greyish-brown colour, tinted with yellow. Hood's M. belongs to a different genus, and is the *Spermophilus Hoodii* of the zoologist. It is also named the 'Leopard or Pardine M.' from its colour, which is yellowish-brown striped with dark brown, in a horizontal manner, and marked with pale spots on the dark-brown bands. The average length is 11 inches. The 'Leopard M.' is an American species, and is very common in Upper Missouri.

Marne, a department of France, part of Old Champagne, is bounded N. by Ardennes, S. by Aube and Haute-Marne, and W. by Aisne and Seine-et-Marne, and E. by Meuse. Area 3154 sq. miles; pop. (1872) 386,157. It is traversed in a N.-

westerly direction by the M., and tributaries of the Aisne, and touched by the Seine on the S. In the N. is the arid chalky *Champagne-Pouilleuse*, yielding the best qualities of the famous wine. M. produces annually from seven to fifteen million bottles of champagne. Except in the N. it is well cultivated, the cereals amounting in value to 73 million francs. There are several iron mines, and many important peat-pits, and quarries of limestone, building-stone, chalk, and grinding-stones. The iron and textile industries are valuable. The chief town is Châlons-sur-Marne. —The *River M.* (anc. *Matrona*), the chief affluent of the Seine, rises in the plateau of Langres, flows first N.W., then W., and joins the Seine, four miles above Paris, and after a winding course of over 200 miles.

Marne, Haute, a department in the N.E. of France, is bounded N. by the Meuse and Marne, S. by Côte-d'Or and Haute-Saône, E. by Vosges, and W. by Aube. Area, 2401 sq. miles; pop. (1872), 251,196. It consists of a series of high plateaux flanked with vineries, of which the principal is that of Langres, wending in a N.E. direction from the mountains of Côte-d'Or to the Vosges. M. is one of the most densely wooded parts of France; forests cover 205,000 hectares; crops of all kinds, 342,000; vines, 16,000. The annual produce of wine, which is of middling quality, is 600,000 hectolitres. M. has some 300 iron mines, 100 large furnaces, 30 forges, &c., employing 40,000 men, and producing 900,000 quintals of metal. There are large manufactures of cutlery and gloves (100,000 pairs yearly sent to America). The chief town is Chaumont.

Marochetti, Baron Carlo, was born at Turin in 1805, studied at the Lycée Napoléon, and in Bosio's studio, gained the gold medal of the King of Sardinia (1827) for his *Young Girl Playing with a Dog*, and in 1831 exhibited at Paris his statue of *A Fallen Angel*. About the same time he completed an equestrian statue of the Duke of Savoy for one of the public places of Turin, which is considered by many to be the finest piece of sculpture he has done. In Paris Napoleon's tomb, the Madeleine altar, the bas-relief of the battle of Jemappes on the Arc de Triomphe de l'Étoile, and Bellini's tomb testify to his genius. The statue of Richard Cœur de Lion in Palace Yard, London, the cenotaph in St. Paul's Cathedral to the officers of the Coldstream Guards, the equestrian statue of Queen Victoria at Glasgow, are examples of his manner at its best. M. died at Paris, 28th December 1867.

Maronites are a Christian sect living among the Libanus Mountains, founded by a party who, in spite of the decree of the Emperor Anastasius II. (died 719), retained the Monothelite (q. v.) doctrines, and collecting about the monastery of St. Maro, chose for themselves a patriarch called of Antioch. In 1182 the M. were induced or compelled by the Crusaders to renounce their Monothelite errors and unite themselves with the Church of Rome, to which they have ever since remained faithful, while they have been left in a condition of unusual independence. On the Quinial Hill there is a Maronite monastery where the Mass is performed from their own Syriac liturgy, and to which many young M. are sent from Syria to be educated. The M., who are said to number about 200,000, are a temperate, industrious race, among whom crimes are rare, but ignorant and priest-ridden to an extraordinary degree. The clergy, to whom a fourth part of the territory belongs, have been described by travellers as fanatical, intolerant, and unscrupulous. In modern times the M. have suffered much persecution from the Druses (q. v.). See Neale's *Eastern Church*; Palgrave's *Essays on Eastern Questions* (Lond. 1872).

Maroons (Fr. *Nègres marrons*, from Span. *cimarron*, 'wild'), a name first given in Jamaica to the slaves left behind by their Spanish masters on the English conquest of the island in 1655. The M. kept up a guerilla warfare with the English till 1795, when they were overpowered, and sent, some to Africa, some to Nova Scotia. The M. of Dutch Guiana have been recognised as independent in several treaties. In 1869 they numbered 7500.

Maros-Vásárhely (Ger. *Neumarkt*, or *Marktstadt*), a town of Austria, in Transylvania, on the Maros, 70 miles E.N.E. of Karlsburg by rail. It has a strong castle, a fine Gothic Reformed church, a public library of 60,000 vols., and a trade in wheat, fruit, wine, and tobacco. Pop. (1869) 12,678.

Marot, Jean, a French poet, was born at Mathieu, near Caen, in 1463, and died at Cahors in 1523 as valet-de-chambre to François I. His works were first collected by Coustelier (Par. 1723).—His son, **Clément M.**, born at Cahors in 1495, served as page to the Seigneur de Villerol, and having by his verses won the patronage of Marguerite de Valois, succeeded his father as valet to her brother, François I., with whom he was taken prisoner at Pavia (1525). A charge of heresy cast him, on his return, into prison, whence in his *Enfer* he launched a bitter satire against his persecutors, and in 1535 he was forced to seek a refuge at the court of Navarre. But even there his translations of the Psalms brought him once more into difficulties with the clergy. He withdrew to Geneva (1543), and thence—the sour Calvinism of the place ill assorting with his gay Bohemian spirit—to Turin, where he died, September 1544, leaving a son, Michel, who was also a poet. The best edition of Clément's works is Guiffrey's (Lyon, 1869). See Colletet, *Notices Biographiques sur les Trois Marots* (Par. 1871); and II. Morley, *Clement M., and other Sketches* (Lond. 1871).

Marque and Reprisal, Letters of. See LETTERS.

Marquesas Islands, a group of thirteen islands in the S. Pacific, included between 7° 30'–10° 30' S. lat. and 138°–140° 25' W. long. The southern part of the group was discovered in 1595 by the Spanish navigator Mendaña, who named it after the Marquesas de Mendoza, Viceroy of Peru. The northern islands were not known till 1791, the discoverer being an American, named Ingraham. In 1842 France established a protectorate over the group, the seat of government being in the island of Nuka-hiva. The M. I. are of volcanic formation and very mountainous, some of the peaks being nearly 4000 feet high. The total area of the group is about 700 sq. miles, but the population is not more than 8000, and is decreasing. The natives are a particularly handsome race, but are very warlike and superstitious, and till lately were cannibals. Christianity has not made much progress among them. The islands are fertile, and by means of Chinese labour their natural productiveness is being developed.

Marquessa, or Marquis, in the British peerage, a nobleman ranking next below an earl, *Marchioness* being the corresponding female title. There are now (1877) 19 English, 3 Scotch, and 11 Irish marquesses. Under the later Roman emperors the defence of the frontiers was committed to military commanders called *comites militum*. The office outlived the Teutonic conquest of Gaul, and its holders—now styled *markisii* or *marchiones* (see MARK)—became under the Karolings hereditary suzerains of extensive *marquisates*. With the extinction of feudalism, however, these marquisates were gradually merged in the kingdom, the title alone being retained as a purely honorary dignity; and of marquesses, in this the modern sense of the word, the earliest creation was, in France, of Louis de Ville-neuve, M. de Trans (1505); and in England of Robert de Vere, M. of Dublin (1385). In Germany the analogous dignity of *markgraf*—hereditary since the 11th and 12th centuries—was raised to the rank of 'prince of the empire' (*reichsfürst*) in the 13th c.; and in Italy the *marchese* immediately precedes the *conte*.

Marquetry (Fr. *marqueterie*, 'chequered work'), a mode of decorating furniture by inlaying pieces of wood of different colours, natural or produced by dyes, likewise ivory, mother-of-pearl, and tortoise-shell. M. was practised in Italy in the 15th c., a knowledge of the art having been brought from the East, and two centuries later it became the prevailing fashion in Europe. In the time of Louis XIV. a new and costly kind of M. of tortoise-shell and brass, called *buhl* or *boule* work, was invented for the decoration of the furniture of Versailles Palace.

Marriage (Fr. *mariage*; It. *mariaggio*, from low Lat. *maritaticum*, formed from classical Lat. *maritare*, lit. 'to provide with a male') is the name given to the legal union of a man and woman constituting the relation of husband and wife. According to Scripture, it is an ordinance of God, and coeval with the creation of man. Those who reject the authority and teaching of the Bible on this point, do not quite agree among themselves as to the origin of the practice, some considering it an 'invention' of legislators, others an outcome of social necessities. Of the two, the latter is decidedly the more probable. M. exists under very different conditions in different countries. Nature

may be said to favour monogamy, or M. between one man and one woman, because the sexes are pretty nearly equal in numbers; but men have not always followed the teaching of nature. Hence the custom of polygamy, with its revolting variety of polyandria, under which a woman has several husbands. The prevalent view of the origin of M. held by those who discard the scriptural record, is that men at first stole their wives, and that legal unions are a product of civilisation. This theory is maintained with great learning and ability by Mr. M'Lennan in his *Primitive M.* (1865), and by Sir John Lubbock in his *Origin of Civilisation and Primitive Condition of Man* (1870). The Church of Rome holds M. to be a 'sacrament,' and all orthodox Protestants regard M. as at least an ordinance of God, which ought, therefore, to be accompanied with religious rites, but the law looks upon it purely as a civil contract.

The terms and conditions of this legal union vary in different countries. According to the law of England the wife becomes legally incorporated with her husband and subordinate to him. For the validity of M. are requisite—1. Consent of the parties; 2. The absence of legal disability on either side, or relatively; 3. The M. rite must be solemnised as directed by the Marriage Act. Fraud may be a ground for annulling a marriage; but it does not necessarily prove fatal to this contract as it does to others. Deceit on either side, however great, as to fortune or social position, will not invalidate a marriage; but to obtain a license under a false name, *with intent to defraud*, may do so. M. is necessarily dissolved by death, and it may be dissolved by Divorce (q. v.). With regard to the powers of a husband over his wife's property, see HUSBAND AND WIFE.

The Marriage Act, 6 and 7 W. IV. c. 85, amended by subsequent statutes, has multiplied the modes by which M. may be contracted in England. It may be by licence from the Archbishop or Surrogate, according to the rights of the Church of England; by Banns (q. v.), according to the rites of the Church of England; by certificate without banns, according to the rites of the Church of England; or by registration under 19 and 20 V. c. 119. Persons desirous of being married according to the rites and ceremonies of the Church of England may be so married after publication of banns, or by licence, or by special licence, or under certificate from the superintendent registrar of the district. Persons desirous of being married otherwise than according to the rites and ceremonies of the Church of England, may be married according to other rites and ceremonies on production of a certificate from the superintendent registrar. This certificate is obtained by giving not less than seven days' notice, in form of a schedule, which the registrar will give on application, filled up with particulars specified as to names, ages, occupation, &c. M. may be solemnised at the office of the superintendent registrar, with open doors, between 8 A.M. and noon, in the presence of the superintendent registrar, and another registrar of the district, and of two witnesses. 21 and 22 V. c. 93, enables persons to establish their legitimacy, the marriage of their parents, and also their right to be deemed natural born subjects, by petition to the Divorce Court. Marriages within the prohibited degrees are absolutely null, if solemnised after the passing of the Act 5 W. IV. c. 54–31, Aug. 1835. The same Act legalised former marriages within the degrees of Affinity (q. v.) prohibited since its date. First cousins and second cousins may intermarry. Marriages of British subjects abroad are valid if contracted according to the law of the country, unless the M. be such as to be illegal in England. A Mr. Brook married at Altona his deceased wife's sister, and the question was raised in December 1857 whether that M., legal in Denmark, was legal in England. Mr. Justice Creswell decided that, as the parties were British subjects, it was not legal. Foreign nations adopt the same rule of law. Thus, in January 1866, a couple, unable to marry in Paris, were privately married in London. On their return the M. was declared null by the Civil Tribunal of the Seine, as not having had the consent of the father of the bride. By the law of Scotland M. is a contract completed by the consent of parties, if there be no legal obstacle to it. Consent may be legally proved by circumstance. Thus, proof of promise to marry, *copula subsequente* is held to prove consent. So, the fact of a couple living together as if married, may constitute M. from the legal effect of Habit and Repute (q. v.). A mere promise to marry does not constitute M., but the party withdrawing may be found liable in damage for breach of promise. A promise to marry, *subsequente copula*, does not constitute M.

in Scotland; but if the facts be proved, it may be constituted by Declarator (q. v.) of Marriage. A marriage in Scotland may be either regular or clandestine. A regular M. is performed by a clergyman, in presence of at least two witnesses, and is preceded by the proclamation of Banns (q. v.). Clandestine marriages are valid, but the parties, celebrator, and witnesses are liable to fine and imprisonment. By 19 and 20 V. c. 96, after 1st December 1856, no irregular M. entered into in Scotland is valid, unless one of the parties had at the date of it been resident in Scotland for the previous twenty-one days. See DIVORCE, JUDICIAL SEPARATION, ADULTERY, CONTRACT, MARRIED WOMEN, PROPERTY OF.

Married Women, Property of. Property settled upon a wife by ante-nuptial contract is, under all circumstances, protected from the creditors of the husband; but if so settled by post-nuptial contract, it only is so under deduction of all debt due by him at the date of execution. See DESERTION OF SPOUSE, and JUDICIAL SEPARATION. In Scot. law, SEPARATION OF MARRIED PERSONS.

Marrow, the name applied to the fatty substance found in the interior of the bones of Mammals. The use of M. is undoubtedly that of affording a certain degree of nutrition to the innermost portions of the bones. M., when microscopically examined, is seen to consist of fat cells, large nucleated cells, and blood-corpuscles. It is of low specific gravity, and generally exhibits a reddish tint.

Marrow Controversy derived its name from a book on the subjects of justification and sanctification, entitled the *Marrow of Modern Divinity*, which was published in 1646 by Edward Fisher, of Brazenose College, Oxford. A copy having been found in his parish by Thomas Boston (q. v.) about 1700, it was reprinted at Edinburgh in 1718, with a preface by Thomas Hogg, minister of Carnock, Fifeshire. Owing to its highly evangelical sentiments the book came to be greatly esteemed throughout Scotland, being reckoned by many next to their Bible and Catechism. But a controversy having arisen over certain points of its teaching, a committee was appointed by the General Assembly to examine it, and an unfavourable report having been received, the Assembly condemned the propositions in question, and prohibited all ministers from using or recommending the book, May 1720. Thereupon twelve ministers—J. Hogg, T. Boston, J. Bonmar, J. Kid, G. Wilson, E. and R. Erskine, J. Wardlaw, J. Bathgate, H. Davidson, W. Hunter, and J. Williamson—drew up a Representation vindicating the Marrow from the interpretation put upon it; hence called *Representers* and *Marrow Men*. A somewhat modified Act was passed in 1722, against which the Representers also protested; and although the M. C. seemed to die away, it eventually led to the Secession of 1734. See M'Crie in the *Edinburgh Christian Instructor* for 1834, *State of the Controversy Concerning the M.* (Glasg. 1773.)

Marryat, Frederick, a famous English novelist, was born at London, 10th July 1792, entered the navy as midshipman in 1806, became lieutenant in 1812, after much service was made commander in 1815, and C.B. in 1825. *Frank Mildmay* (1829) was his first novel. Of his others, most of them sea tales full of rollicking jack-tar humour, *King's Own* (1830), *Peter Simple* (1834), *Jacob Faithful* (1834), *Midshipman Easy* (1836), may be mentioned as favourable specimens. He likewise published a *Code of Signals for the Use of Vessels Employed in the Merchant Service* (1837), adopted by Government, and his *Diary in America* (1839). He died at Langham, Norfolk, 2d August 1848. See his *Life and Letters*, by his daughter Florence (Mrs. Ross Church) (1872), who has also written several novels.

Mars (contracted from *Mavers* or *Mavors*, the Sabine and Oscan *Mamers*), the Roman god of war, was early identified with the Greek Ares. He was the second of the tutelary deities of Rome, ranking after Jupiter, and before Quirinus ('Spear-Bearer' or 'Warrior'), with whom, however, he was often identified as the god protecting the Romans in their civil capacity as *Quirites*. As the protector of the country, he was *M. Silvanus*, and, as the god of advancing to battle, *M. Gradivus*. The wife of 'Father Mars' (*Marspiter* or *Maspiter*) was Nerine or Nera (feminine form of *Nero*, Sabine 'strong'), but he was also associated with the goddess of war, Bellona. His priests were called the *Salii* from their warlike dances, and

were the keepers of the twelve holy shields (*Ancilia*), one of which had fallen from heaven. Of the many temples of M. in Rome, the chief were that without the Porta Capena, on the Appian Way (q. v.), and that built in the forum by Augustus, and named after M. the Avenger (*Ultor*).

Ares—from the same root as *Aryan* (q. v.)—the Greek god of war, was the son of Zeus and Hera, and ranked among the great deities of Olympus. He is the embodiment of strength and courage, and finds his chief delight in the excitement, and even in the horrors of war, for their own sake. Following the inclination of the moment, he attacks now one side, now the other, and is apparently resistless; yet, as the Greek mind loved to think of blind force as the slave of intellect, so Ares is overcome when he meets powers of a higher order than his own. Diomedes, aided by Athena, wounds him; he is conquered by Herakles; and again, overpowered by the giant sons of Aldeus, he is held in chains for a year and a month. Ares was loved by Aphrodite, his amours with whom were discovered by her husband Hephestus (q. v.). The worship of Ares seems to have been derived from Thrace. Its chief seats were in that country and Scythia, where horses, cattle, and even men were offered to him as victims.

Mars, the fourth planet in order from the sun, being the nearest superior planet to the earth. When visible it is readily distinguished by its ruddy light; and telescopic observation discloses that its surface is probably diversified, like ours, by continent and sea, and that its meteorological conditions much resemble ours. Around either pole is seen a patch of white light, which diminishes in size during its summer and increases in size during its winter, and is most likely a mass of ice and snow. The greatest distance of Mars from the sun is 152,304,000 miles, and the least distance 126,318,000, giving a mean distance of 139,311,000 miles, and an eccentricity of .093,262. The equatorial diameter of the planet is about 4360 miles, the polar 4290. The sidereal year of M. is 686.9797 days; and his diurnal revolution has a period of 24 h. 37 m. 22.735 s., according to Proctor. The inclination of the orbit to the ecliptic is 1° 51' 5"; and the inclination of the equator to the orbit about 28°. On account of its proximity to the earth when in opposition, Mars offers peculiar facilities for studying its surface, and at the same time affords an independent method of determining the solar parallax, and thence the distance of the earth from the sun. The succession of the seasons is very similar to that of the earth; the changes are, however, more rapid and more marked, and consequently the surface of M. is probably subject to hurricanes of great severity. In August 1877 M. was peculiarly well situated for observation; and the discovery was made by Professor Asaph Hall, astronomer at Washington, of two satellites. They are exceedingly faint, and are scarcely observable beside the much more intense light of the planet.

Marsala (Arab. *Marsa Alla*, 'the port of Alla'), a fortified seaport on the W. coast of Sicily, province of Trapani, on a bay protected by Cape Boeo (or Lilibeo), 19 miles S.S.W. of Trapani by rail. It is a modern place, and has a good cathedral and a harbour that has been much improved of late years. The exports are the famous M. wine, grain, oil, salt, soda, &c. M. wine, which distantly resembles sherry, is produced here (chiefly by English firms) to the extent yearly of 30,000 pipes. Built on the site of *Lilybeum*, the principal Silician fortress of the Carthaginians, M. is rich in remains, including the grotto of the sibyl, with its prophetic well, parts of the old town wall, curiously painted sepulchres cut in the solid rock, old mosaics, &c. Here Garibaldi landed with his heroic 'thousand' (11th May 1860), eluding the Neapolitan fleet, and beginning the campaign that shortly ended in the overthrow of the Bourbon kingdom of the two Sicilies. Pop. (1874) 34,202.

Marseillaise. See LISLE, ROUGET DE.

Marseille, the greatest seaport of France, and chief town of the department of Bouches-du-Rhône, on a bay in the Gulf of Lyon, 29 miles E.S.E. of the mouth of the Rhone, and 410 S.S.E. of Paris by rail. It clusters picturesquely around the deep, spacious, natural inlet forming the harbour, and is sheltered on the N. by the *Chaîne-de-l'Étoile*, while to the S. rises the hill of l'Endoume, dotted with beautiful villas, and surmounted by Notre-Dame-de-la-Garde, a Romano-Byzantine church, with

a tower conspicuous from the sea. The new and old parts of the town are separated by the splendid street of la Cannebière, and by an avenue leading from the Port de Rome on the Prado, the principal promenade, to the Porte d'Aix, a triumphal arch in the extreme N. Among the notable buildings are the churches of Notre-Dame du Mont-Carmel, restored in 1621, and the Hôtel-Dieu, dating from the 12th c.; the modern cathedral, a basilica of Byzantine style; the beautiful episcopal palace, the hôtel-de-ville, exchange, palais-de-justice, museum, theatre, and observatory. M. has also many educational and benevolent institutions, several scientific societies, a hydrographic institute and medical school, a botanical garden, an academy of Oriental languages, a library of 75,000 volumes, &c. There are some fifty public squares, and many delightful gardens. In the bay are several islands, on one of which is the Château d'If, built by François I. The Vieux-Port of M. is 1000 yards long by 330 broad, and 24 feet deep, covering an area of 70 acres, accommodating 1200 merchant vessels, and defended by forts St. Jean and St. Nicholas. La Joliette, a new harbour, formed by a breakwater 1300 yards long, was opened in 1855. There are various other basins, including the Dieu-Donné, between the fortified islands of Pomégues and Ratonneau, which is capable of admitting the largest ships of war. The port had in March 1877 a total wharfrage of 12,616 longitudinal metres. M. is the packet station for the Mediterranean and the East, and the various shipping companies (including the Messageries Maritimes) had, in March 1877, 154 steamers of 128,130 tons, and 157 sailing vessels of 58,887 tons. The trade is chiefly in wheat, maize, barley, sugar, cotton (104,400 bales), coffee, oil-seeds, silk (22,000 bales), cocoons, wool, sheepskins, hides, olive oil, petroleum, wine and spirits, rice, coal, and metals. In 1876 there entered the port 8689 vessels, of 2,605,890 tons, and of these 762 of 387,467 tons arrived from long sea voyages. The chief manufacture of M. is soap, of which 50,000 tons were produced in 1872. Other industrial products are chemicals, machinery, glass, porcelain, leather, and liquors. The shipbuilding yards can turn out annually 20,000 tons of iron ships, and engines to the extent of 6000 horse-power. M. is supplied with water from the Durance by a canal 54 miles long, which has contributed much to the fertility of the adjoining country. The climate is exceedingly hot for France, and the mineral often blows with destructive force. Pop. (1872) 218,763. M., the ancient *Massalia*, was founded about 600 B.C. by the Phœnicians of Asia Minor, and soon became a prosperous trading place. The Massahans defended themselves successfully against the Carthaginians in a sea-fight, and subsequently were the fast allies of the Romans. Massalia, called by the Romans *Massilia*, continued to be one of the chief commercial cities of the world for many centuries. During the Roman civil war, it took the side of Pompey, but was subdued, after a protracted siege, by Cæsar. Under the early emperors it ranked as one of the great seats of learning, the sons of many illustrious Romans being sent thither to complete their studies. Cicero called M. the Athens of Gaul. Sacked by the Arabs in the 8th c., its commercial importance was eclipsed during the middle ages by the rise of Venice, Genoa, and the other maritime republics of Italy; but it began to regain its ancient prosperity after it passed with the rest of Provence to the French crown in 1481. During the Revolution it was the scene of Fréron's atrocities. The French conquest of Algeria, and the opening of the Suez Canal have given a powerful impulse to its commerce.

Marsh, George Perkins, LL.D., an American philologist, born at Woodstock, Vermont, March 17, 1801, graduated at Dartmouth College (1820), and after practising at the bar, was elected a member of the Supreme Executive Council of the State (1835), and of Congress (1842), having published privately a translation of Rask's *Icelandic Grammar* (1838). He was U.S. Minister at Constantinople (1849-53), travelled in Europe, and returning to America (1854), served as Railroad Commissioner in Vermont (1857-59). He delivered his lectures on *The English Language* in 1859, and *On the Origin and History of the English Language* in the winter of 1860-61, and on June 15 of the latter year was appointed Minister to Italy, a post which he still (1877) holds. Amongst M.'s other works may be mentioned his edition of Wedgwood, *Etymology* (1861), and *The Earth as Modified by Human Action* (1874).

Marshal (Fr. *maréchal*, Ger. *marshall*, Low Lat. *marescalcus*, from Old Ger. *march*, 'horse,' and *schalc*, 'servant'),

originally 'a groom,' a meaning preserved in the Fr. *maréchal*, 'farrier,' came under the Meroving dynasty to denote an officer of higher rank—the *Comes Stabuli* or Constable (q. v.). Of marshals of France the first was Albéric Clément I. (1185), and under Louis XIV. there were twenty such (1703). The office was suppressed from January 21, 1793, till May 19, 1804, when Napoleon nominated eighteen marshals of the empire, and Louis XVIII. revived the title M. of France (1815). There are now (1877) four marshals in the French army. In Germany the M. was in the 10th c. one of the highest officials of the imperial court, and the office of *Reichserzmarschall* remained since the 13th c. vested in the Duke of Saxony. In England this title has been generally used only in composition with other words, as Earl-Marshal (q. v.), Field-Marshal (q. v.), and Knight-Marshal, a subordinate of the Lord Steward.

Marshalling of Arms, in Heraldry, is the grouping of two or more coats of arms into one complete achievement, either by keeping them *accollé* (i. e., side by side), or by joining them in one. In course of time, as the use of armorial bearings became more and more prevalent, the art of so quartering the shield as to display at a glance the hereditary dignity of the family in the arrangement of each part became of great importance, and this mode of M., which began to be adopted about 1350, soon became the most common. The most important of the arms thus marshalled are placed in the first quarter of the shield. Thus in the royal escutcheon, England occupies the first and fourth quarters, Scotland the second, and Ireland the third. On the official seals of Scotland, however, this arrangement is reversed.

Marsh Gas, or **Light Carburetted Hydrogen**, is a gaseous exhalation from the earth, occurring in mines and in marshy places. It is the fire-damp of miners, has no smell, taste, or colour, and burns with a pale white flame. Its composition is represented by the formula $C_{14}H_{14}$. See **HYDROCARBONS**.

Marsh-Harrier (*Circus rufus*), a genus of Raptorial bird, closely allied to the sparrow-hawk. The American species (*Circus hudsonius*) is a large and rapacious bird, found all over the Continent. See **HARRIER**.

Marsh-Mallow (*Althæa*). This genus of *Malvaceæ* (q. v.) includes about twelve species, inhabitants of temperate and warm regions. Of these the Common M.-M. (*A. officinalis*) is found in marshes near the sea in the southern half of England and Ireland. It possesses the mucilaginous properties ascribed to the order, and to its allied genus Mallow (q. v.), and in France the root is largely used to make lozenges and demulcent drinks, under the name of *Guimauve*. *A. hirsuta* is perhaps also a British native. Several species of the genus are in garden cultivation.

Marshman, Joshua, an English missionary, born at Westbury Leigh, Wiltshire, 20th April 1768, was sent in 1799 by the Baptist Missionary Society to Serampore, India, where he laboured for many years along with Carey, Ward, and others of the 'Serampore Brethren.' He mastered several Oriental languages, and translated a great portion of the Scriptures into Chinese. He published the *Works of Confucius* (the original text with a translation) in 1811, a Chinese grammar in 1814, and jointly with Carey a Sanskrit grammar in 1815, and a Bengali-English dictionary in 1825 (abridged 1827). He printed a discussion with Rammohun Roy on *The Deity and Atonement of Christ* in 1822. Rightly or wrongly, M. was held mainly responsible for the separation of the brethren from the parent Baptist Missionary Society in 1827. He died at Serampore, December 5, 1837. See *Cox's History of the Baptist Missionary Society*.—**John Clark M., C.S.I.**, a leading man of letters in India, the eldest son of the preceding, was born at Serampore in 1794. He founded the first Bengali newspaper, the *Sumachar Darpan*, and also the first English weekly newspaper, the influential *Friend of India*, which has recently passed out of existence. In conjunction with his father's friend, Dr. Carey, he brought out the first complete *Bengali Dictionary*; and his popular *History of India from the Earliest Times to the End of the Eighteenth Century* is perhaps the most widely read of all books on the country which was his adopted home. He also wrote *Lives of Carey, Marshman, and Ward*, and memoirs of Sir Henry Havelock, who was his own brother-in-law. While in England he had been called to the

bar, and in the department of Indian law he wrote many useful works. For ten years he filled the appropriate office of Translator to the Government of Bengal, and finally returned home in 1852. M. died 8th July 1877.

Marsh-Marigold is the name of *Caltha palustris*, a very common British marsh plant with bright golden-yellow flowers, from 1 to 2 inches in diameter, and closely related to the buttercups; so that it has no affinity with the proper Marigolds (q. v.), all of which belong to *Compositæ*. Dr. Prior explains that it is through a slip the name came to be given to the plant.

Marston, Westland, poet and dramatist, was born at Boston, Lincolnshire, 30th January 1820, and studied law in London, but has devoted himself to literature. His earliest tragedy, *The Patrician's Daughter*, was produced at Drury Lane (1842) by a company that included Miss Helen Faucit, Phelps, and Macready. It was followed by many other plays, of which the best known are *Strathmore* (1849), *Anne Blake* (1852), and *Life for Life* (1868). Written expressly for the stage, these are singularly eloquent and concentrated works, full of genuine character and feeling. M. is also the author of several fine lyrics and tales. His *Dramatic and Poetical Works* were published in 2 vols. (Lond. 1876).

Marston Moor, in the W. Riding of Yorkshire, 5 miles N. E. of Tadcaster, the scene of the second great defeat of the Royalists by the Parliamentarians (July 1, 1644). The former were commanded by Prince Rupert, the Marquis of Newcastle, and Sir Charles Lucas; the latter, by Fairfax, the Earl of Manchester, Cromwell, and Sir David Leslie; the forces on each side amounting to some 25,000. On one flank the king's horse broke through the Scotch, but on the other Cromwell's 'Ironsides' turned the fortune of the day. The Royalists lost 3000 killed and wounded, and 1500 prisoners, and the remnant of their forces, who threw themselves into York, were forced to capitulate after a few days' siege.

Marsupialia (*L. marsupium*, 'a pouch'), one of the two lowest orders of *Mammalia*, represented by the Kangaroos (q. v.), Wombats (q. v.), Opossums (q. v.), &c. The M. forms the only group included in De Blainville's section *Didelphia*, and necessarily falls under the term *Implacentalia*, since in the M. no *Placenta* (q. v.) is developed. The characters of this interesting order are derived, firstly, from the pouch or bag, named the *marsupium*, which is supported on two long bones (*marsupial bones*) rising from part of the pelvis, and representing the ossified inner tendons of the *external oblique muscles* of the abdomen. Many M. have no pouch, but the marsupial bones exist in all. The milk glands are contained within this pouch, and the young are carried in it after birth, and fly for refuge to it during their early years. The nipples of the mammary glands are long, and the young of the M. attach themselves thereto, the milk being forced down the throat by the action of a special muscle which compresses the mammary glands. The two oviducts or Fallopian tubes do not coalesce to form a single uterus or womb, but remain separate, and open into a *urogenital canal*, which in its turn opens externally in a distinct and separate manner from the *rectum*, although one sphincter muscle embraces the rectum and urogenital canal. The young of M. are born in a very immature condition. Another character of the M. is found in the fact that the angle of the lower jaw is inflected inwards to form a prominent horizontal process. The fur is always hairy, and the outer ears are well developed. True teeth always exist; canines being absent in a few cases. Five toes are usually found on the fore limbs, but the hinder-limbs may have four toes only (as in the kangaroos), whilst the great toe in the opossums can be opposed to the other fingers, thus converting the foot into a hand-like organ. The brain-surface is smooth in the opossums, &c., but convoluted in the kangaroos; and the stomach, usually simple in M., is of complex structure in the latter animals. All existing M., with the exception of the opossums (*Didelphidae*), are confined to Australia. M. first appear as fossils in the Trias; and represent the oldest mammalian remains. Gigantic extinct M. occur in recent deposits in Australia.

Martaban', Gulf of, an arm of the Bay of Bengal which breaks the coast of British Burmah, nearly dividing Pegu from Tenasserim, and receiving from the N. the great rivers Irrawaddy and Saluen.

Marten (*Martes*) a genus of carnivorous *Mammalia*, belonging to the weasel family *Mustelida*, represented by the British species the Pure M. (*M. abietum*), and the Beech M. (*M. foina*). The former animal attains a length of 28 inches inclusive of the tail. Its colour is a dark brown, and the fur is valued very highly, since when well dressed it bears a very close resemblance to the well known 'sable.' The Pine M. occurs in N. Europe and in N. America also. It is a lively, agile animal, committing great havoc on birds and the smaller mammals. The Beech or Stone M. is much more common than the preceding species. It has a white patch on the throat and breast. Its fur is not so valuable as that of the Pine M. The Beech M. is common in some parts of Britain. It commits sad havoc in hen-houses and in the poultry-yard generally. The characters distinguishing the genus *Martes* are the absence of anal glands, the secretion of which imparts such a strong and disagreeable odour to the polecats and their neighbours, and the development of a false molar tooth on each side of each jaw.

Martialis, Marcus Valerius, was born at Bilbilis in Spain, A.D. 43. He went to Rome in 66, where he resided for thirty-five years, leading an easy life of pleasure, rising in fame as a poet, and enjoying the special favour of the emperors Titus and Domitian. He returned to Bilbilis in 100, married a lady of fortune named Marcella, and died about 104. The extant works of M. consist of upwards of 1500 *Epigrammata*, arranged in 14 books, to which is commonly added the *Liber de Spectaculis*, containing 33 epigrams relating to the imperial shows. The first 11 books were published before his return to Bilbilis, the 12th was sent from Bilbilis to Rome; while the 13th and 14th, named the *Xenia* and *Apophoreta*, and are descriptive of Roman festive gifts, were written chiefly under Domitian. The Gr. word *epigramma* meant originally an inscription, and came to be applied to any brief poem; since M. it has been restricted to a poem of a few lines, pithily expressing contrasted thoughts or incidents, and closing with brilliant emphasis. The *Epigrammata* display literary qualities of the highest order, and also form a treasury of illustrations of the social life of the earlier empire. The works, however, which establish the poetic fame of M. destroy his personal character, being marred by mean flattery of his tyrant patron, and by disgusting impurity of thought and expression. The best modern editions of M. are those of Lemaire (3 vols. Par. 1825), and Schneidewin (2 vols. 1842). M. has been frequently, but never successfully, translated into English.

Martial Law is the law by which the discipline of an army is maintained; the law as administered by military force during insurrection or rebellion; and the law of hostile armies and nations relative to each other. As regards the first, there is no settled code for the United Kingdom; the discipline of the army being regulated by Articles of War (q. v.), promulgated by the crown under the Mutiny Act (q. v.). During insurrection or rebellion, when the ordinary law has not sufficient power to protect life and property, the legislature causes the disturbed district to be occupied by a military force; offenders against the peace are then tried by Court Martial (q. v.), and the law administered according to the practice of military courts. It is usual under such circumstances for Parliament to suspend the Habeas Corpus Act (q. v.). In local tumults, the responsibility of employing soldiers rests on the magistrate who does so. Before resorting to military force, it is necessary to read the Riot Act (q. v.). Regarding the third phase of M. L., the tendency of civilisation is towards leniency to an enemy. It is customary to respect personal liberty and private property, so far as military necessity renders it possible to do so. The lives of the conquered are spared, and prisoners of war reasonably well treated.

Martigues, a town of France, department of Bouches du Rhône, situated partly on some islets in the 'Étang de Berre,' partly on the banks of the channel by which it communicates with the sea, has been called the 'Petite Venise de la Provence.' It consists of three portions, joined by wood and stone bridges, and manufactures caviare, soda, bricks, and chemicals. Iron-founding is also carried on. M. was founded by fishermen in the 16th c. Pop. (1872) 5792.

Martigny (the Roman *Octodurum*) a Swiss town in the canton of Valais on the Drance, a branch of the Rhone, 25

miles S. by E. of Villeneuve, on Lake Geneva, by rail. It is the starting-point of the routes over the Simplon to Lago Maggiore, over the Great St. Bernard to Aosta, and over the Tête-Noire and Col de Balme to Chamouny. Pop. (1870) 1403.

Martin. See SWALLOW.

Martin, the name of five popes. **M. I.** (649-53), for his opposition to the Monothelites was seized by the Emperor Heraclius, imprisoned, maltreated, and banished to Kherson, where he died in 655. He was afterwards canonised.—**M. II.** or **Marinus I.** (882-84), and **M. III.**, or **Marinus II.** (942-46), are often not counted among the popes.—**M. IV.** (1281-85) supported the cause of Charles of Anjou, and used the censures of the Church so rashly on his behalf that even Catholic writers consider him to have permanently weakened the temporal authority of the Holy See.—**M. V.** (1417-31), of the Colonna family, was chosen Pope by the Council of Constance, after the abdication of Gregory XII. and the deposition of Benedict XIII. By shrewd policy he destroyed the fruits of the later's ecclesiastical reforms. With Germany, France, and England, he made separate concordats. He died in 1431.

Martin, John, an English painter, born at Haydon Bridge, near Hexham, 19th July 1789, went to London in 1806 to study art, and exhibited his first picture—'Sadok in Search of the Waters of Oblivion'—in 1812. He quarrelled with the Academy because of a fancied slight, and refused to be a candidate for any diploma. 'Belshazzar's Feast' (1821) was perhaps his most effective work; 'The Fall of Babylon' (1819); 'The Creation' (1824); 'Pandemonium' (1841); 'The Last Man' (1850) also drew special attention. His popularity was at one time extraordinary; Bulwer in an evil moment declared him more original than Raffaele or Michael-Angelo. In all his pictures he repeated the same effects, aiming at the sublime, and reaching only the sensational. He died at Douglas, Isle of Man, February 9, 1854. See M.'s autobiographical notes in *Athenæum* for 1854.

Martin, St., one of the Lesser Antilles, 6 miles S. of Anguilla, belonging partly to the Netherlands, partly to France. Area, 30 sq. miles; total pop. 6270. Its products are sugar, salt (300,000 vats yearly), cotton, tobacco, maize, bananas, &c. The slaves in the Dutch part were liberated in 1863.

Martin, St., was born at Stain, in Pannonia (Hungary), in 316, and educated at Pavia. A soldier at Amiens when eighteen, he was converted to Christianity, ordained deacon by Hilary of Poitiers, and became in 374 bishop of Tours. He founded the monasteries of Ligué and Marmontiers, at the latter of which he lived the life of an anchorite. He died at Candes, Touraine, in 396. M. was the first saint-confessor to whom the Roman Catholic Church offered prayers. His festival is the 11th of November. His life, written in Latin by his disciple, Severus, is a legend rather than a history.

Martin, Theodore, C.B., LL.D., was born in Edinburgh in 1816, and educated there at the High School and University. He settled in London as a solicitor in 1846. M. was joint-author with Professor Aytoun of the famous *Bon Gaultier Ballads* (1854). He has translated *The Poems and Ballads of Goethe* (1858), several Danish dramas by H. Hartz and Oehlenschläger (1854-57), *The Odes of Horace* (1860), *Poems of Catullus* (1861), Dante's *Vita Nuova* (1862), Goethe's *Faust* (1865), &c. In 1851 he married Miss Helen Fauci, and in his adaptation of Hartz's drama, *King René's Daughter*, the great actress achieved one of her grandest triumphs. M. wrote the *Life of Professor Aytoun* (1867), and the *Life of the Prince Consort* (vol. i. 1874, vol. ii. 1876, bringing the Life down to 1854) from materials supplied by Her Majesty. He was created C.B. in 1875, and in the same year received the degree of LL.D. from the University of Edinburgh.

Martina Franca, a well-built town of S. Italy, province of Lecce, on a hill 17 miles N. by E. of Taranto, with fine public buildings, and the ducal palace of the Caraccioli, resembling the Pamfil of the Piazza Navona at Rome. Pop. (1874) 18,102.

* **Martineau, Harriet**, was born in Norwich, 12th June 1802, of a Huguenot family settled there in 1688. Her father was a manufacturer. She was a weakly, nervous child, extremely deaf, but family distress forced her to earn her bread. She wrote first,

as Talfourd did, some devotional pieces in the *Monthly Repository*, then the theological organ of the English Unitarians. Her *Traditions of Palestine* first brought her into notice, and this was followed up by the *Illustrations of Political Economy*, patronised by Lord Brougham, which exhibited the 'great natural laws of society by a series of selected pictures of social action.' The book reached a circulation of 10,000, and made her the lioness of two London seasons; but its stilted phrases and forced characters are now almost forgotten. She had no dramatic or poetic power. Her novels of *Deerbrook* and the *Hour and the Man* (based on the life of Toussaint L'Ouverture) appeared in 1839. These, with the *Playfellow*, a storybook written in illness for children, *The Forest Game-Law Tales*, and a few tales in *Household Words*, are her contributions to fiction. *The Feats of the Fjord* is unmistakably her best; in others there may be wholesome, caustic, and moral observation, but there is no literary construction. *Society in America* and *Retrospect of Western Travel* gave the results of two years of travel, and formed an influential statement of the Abolition question in all its political issues. A serious illness, from which she was restored by mesmerism, caused her in 1845 to withdraw to a house near Ambleside, which she occupied till her death, 27th June 1876. For the last twenty years she was bedridden through deterioration and enlargement of the heart. Her largest and probably most useful book is *History of the Thirty Years' Peace* (1815-45). A journey to the East with an eminent Unitarian, Mr. Yates, of Liverpool, produced *Eastern Life—Past and Present*, which describes four great religions, and shows her belief in none. *The Laws of Man's Nature and Development* was written more by Atkinson than by M., but embodies the views of both on the question of immortality and other important subjects. The book is materialistic, but not atheistic. M. also translated and condensed Comte's *Positive Philosophy*. She would herself have been a Positivist if she had possessed any philosophical faculty. But, as she said herself, her only power was earnestness and intellectual clearness within a certain range. She contributed largely to the *Daily News*, in particular biographical notices of public men. Her autobiography, written with extraordinary candour, was published in Boston and London in 1877, with additional passages by her friend Mrs. Chapman.—**James M.**, brother of Harriet, was born in Norwich in 1807, and was educated for the Unitarian ministry. He was successively pastor of congregations at Dublin, Liverpool, and London, was also for many years Professor of Philosophy, and is still Principal of Manchester New College, the theological training school for the Unitarian Church. M. is the most eloquent of Unitarian preachers. He was the editor of the brilliant but unfortunate *National Review*. M.'s writings fall into three classes: (1) the devotional, such as the *Endeavours after the Christian Life*, and the *Lymms for the Christian Church and Home*, with its valuable prefaces; (2) theologico-critical, as the *Rationale of Religious Inquiry*, *Studies in Christianity*, &c.; (3) philosophical, such as the *Essays* recently reprinted from the *National Review*. M. is a devout man, with strong imagination and sympathies in the highest walks of the human spirit; he is also a learned and subtle critic of the evidences of Christianity, from which he rejects the miraculous element; he is, finally, the most forcible and authoritative living exponent in Britain of the Intuitionist Philosophy, especially in its relation to the problems of spiritual religion. M.'s acquaintance with mathematical and physical science enables him to meet on equal ground the ambitious negations of many professors of physical knowledge. His literary genius is probably unique; combining the ethical glow of his Huguenot ancestors with a delicate fancy, worthy sometimes of Tennyson, and a power of analysis which has found out every weak point in the Association Psychology, and has not spared the efforts made to defend revelation on the principles of agnosticism. M. is greatly beloved in Unitarian circles, and has largely affected religious thought beyond them. M.'s son, **Russel M.**, is a rising Orientalist.

Martinique, one of the Lesser Antilles, is next to Guadeloupe, the most important French possession in the W. Indies. Area, 375 sq. miles; pop. (1873) 153,334. The coast-line is deeply indented, and inland the surface slopes gradually upwards, culminating in six extinct volcanoes, the loftiest of which, Montagne Pelée, attains an elevation of 4428 feet. Watered by some seventy-five streams, the soil is of great fertility, one-third of the area being under cultivation (sugar-cane, coffee, cocoa,

cotton, &c.); one-half savannah and forest. The climate, though tropical, is tempered by regular sea-breezes, but earthquakes and hurricanes are frequent. In 1874 the value of imports was £860,000; of exports, £524,000. Between the capital Fort de France (pop. 13,000) and St. Pierre (q. v.) a railroad was (1876) in course of construction. M., discovered by the Spaniards (1493), was colonised by the French (1635), fell several times into the hands of the English, and was finally ceded to France (1814).

Martinmas, 11th November, a Scotch money term. See LAMMAS.

Martius, Karl Friedrich Philipp von, a celebrated German botanist and traveller, was born at Erlangen, April 17, 1794. In 1817 he proceeded to Brazil as a member of the scientific expedition sent out by Austria and Bavaria. He returned in 1820, and subsequently became professor of botany at Munich. He died December 13, 1868. M.'s principal works are *Reise nach Brasilien* (3 vols. 1823-31), *Genera et Species Plantarum* (3 vols. 1824-36), *Nova Genera et Species Plantarum* (3 vols. 1824-32), *Historia Naturalis Palmarum* (3 vols. 1823-45), *Flora Brasiliensis* (1840-71), *Beiträge zur Ethnographie und Sprachenkunde* (2 vols. 1863-66). A biography of M. was published by Schramm (2 vols. 1869).

Martlet, in Heraldry, is a long-winged bird resembling a swallow, with a very short beak and no legs. It is given as a mark of cadency to the fourth son.

Martos, a town of Spain, province of Jaen, 12½ miles W.S.W. of the city of Jaen, is celebrated for its cold springs. Pop. about 11,000.

Martyn, Henry, the martyr missionary of the East, was the son of a miner, and was born near Truro in Cornwall, in 1781. Educated in classical studies at the Truro Grammar School, he went up to St. John's College, Cambridge, in 1797. There he read mathematics, and graduated as Senior Wrangler in 1801. There also he came under the influence of the Rev. Charles Simeon, whose curate he presently became. In 1805 he went out to India as a military chaplain; in 1811 he betook himself to Persia, and died 16th October 1812, at Tokat in Asia Minor, while travelling alone back to Europe. His career is rendered yet more interesting from the feeble health with which he had always to contend, and by the melancholy story of his persistent and unrequited love. He lived long enough to translate the New Testament into Hindostani and Persian, and to leave behind a heroic example of self-sacrifice. See memoirs of H. M. by Sargent, Wilberforce, and Sir J. Kaye.

Martyr (Gr. 'witness') is the name given to those who suffered death in the early ages in the cause of Christianity, and thereby witnessed for their religion according to the saying that the blood of the martyrs was the seed of the Church. Great honour was paid to them in the Church upon earth, and it was believed that the highest rewards were bestowed upon them in heaven, being exempted from the probation of Purgatory (q. v.), and admitted immediately to heaven. Churches or shrines were built at the scene of their sufferings, in which were deposited their relics, which were believed to work many miracles. When heathen persecution ceased, and Christians, divided into rival sects, persecuted and put to death each other, the name M. assumed a new or slightly different meaning. For orthodox writers denied that a heretic or schismatic could be a M., since 'the cause for which he suffered, and not the mere penalty of death, constituted the only claim to the title.' But those have always been considered martyrs by their own sect who have suffered death for their religious opinions.

Martyrology was a book containing the acts and sufferings of martyrs, which were read during divine service on the anniversary days of their martyrdom, each diocese at first having a M. of its own. The earliest general M. in the Western Church is attributed to Eusebius, which is only extant, however, as rewritten by Jerome. A number were compiled during the middle ages, by various ecclesiastics, but the great one, which has remained the standard Roman M., was compiled (875) at the command of Charles the Bald by Usuard, a French monk, from the previous works of Florus (830), Bede (730), and Jerome. In the Eastern Church the foundation of all the later works was the Menologion ('month-calendar'), compiled by order of the

Emperor Basil (886). An English M., called the Golden Legend, was much in use before the Reformation.

Marvell, Andrew, politician and poet, was born, 15th November 1620, at the rectory of Winestead in Holderness, went to Cambridge (1636) with an exhibition from Hull, graduated (1638), and was admitted a scholar of Trinity College, lost his father (1641), travelled for four years in Holland, France, Spain, and Italy. On his return, he became tutor in Lord Fairfax's family till 1653, then to Cromwell's nephew, after which he was appointed (1657) assistant Latin secretary with Milton. In 1658 he sat in Richard Cromwell's Parliament, was returned (1660) to the Short Parliament, and in the following year to the Pensionary Parliament, which outlasted his life. He died 12th August 1678. Five editions of his poems have appeared since his own time, and they take rank among the most witty and melodious of the second-rate productions of his period. His political satires are coarse but effective, and many of his lesser poems are permeated with what Charles Lamb has called 'a witty delicacy.' Occasionally he rises from banter and gaiety to a tone of earnestness and feeling. An edition of M.'s writings, with a memoir by Thompson, was issued at London in 1776.

Marvel of Peru. See JALAP.

Marx, Karl, born 1818 at Köln, studied law and philosophy at Berlin. From 1841 till its suppression he edited the *Rheinische Zeitung* at Köln, but went to Paris in 1844, where he joined the republican and socialist leaders; with Ruge, H. Heine, and Börnstein publishing *Deutsch-französische Jahrbücher*, and a newspaper, *Vorwärts*, but was forced to flee to Brussels, where he put himself at the head of the 'central committee' of the Socialists in 1848. The same year he returned to Köln, where he started the *Neue Rheinische Zeitung*, but removed to London in 1849, where in 1864 he established the 'International' (q. v.), of which he has since been the most prominent leader. In 1872 a disruption of the Society took place, and M., who headed the extreme section, withdrew to New York, where he still (1878) presides and plots. His chief work is *Das Capital, Kritik der politischen Oekonomie* (1867).

Mary, The Virgin, as the mother of Jesus Christ, has always been held in the greatest veneration by Christians, and there have been various controversies regarding her, arising from and turning upon points connected with the nature of Christ. The personal history of M., as given in the New Testament, begins with the announcement of her betrothal to Joseph (Luke i.). According to traditions preserved in the apocryphal writings of the Gospels of St. James and St. Matthew, the Infancy of Mary and Jesus, and the Nativity of Mary, she was the only child of Joachim and Anna, of the family of David, which indeed seems to be implied in Luke i. 32. Born at Nazareth after her parents had been twenty years without children, M. was brought up in the temple from her third year till she was of the marriageable age of fourteen, when the high priest chose Joseph to be her husband by a sign supernaturally given. While Joseph went to Bethlehem to set his house in order for the marriage, M. returned to her parents at Nazareth, and there, as recorded in the New Testament, she was visited by the angel Gabriel, who announced to her that she would conceive a son by the power of the Holy Ghost. There is little of importance either recorded in the New Testament or preserved by tradition as having taken place in the life of M. after the birth of her divine son. During his public ministry she is mentioned three times; once in connection with the miracle at Cana (John ii.), when she desired on one occasion to speak with him (Matt. xii. 47), and as being at the last consigned by her son to the care of John (John xix. 25-27). Scripture has nothing more to tell of her except that she remained at Jerusalem till the Pentecost (Acts i. 14). According to one tradition she lived and died at Jerusalem under the care of John; according to another she died at Ephesus, whither she and John had been driven by the siege of Jerusalem. A tradition of the 7th c. asserts that all the apostles were miraculously brought together to Jerusalem to witness her death—all except Thomas; that on his arrival, three days after, her grave was opened that he might see the corpse, but that nothing was found in the grave but her grave-clothes. See ASSUMPTION OF THE VIRGIN MARY.

Mary I., Queen of England, daughter of Henry VIII. by his first wife, Catherine of Aragon, was born at Greenwich, 18th February 1516, received the title Princess of Wales (1518), was promised in marriage to the eldest son of François I. the same year, to the Emperor Karl V. (1522), and then to the King of France himself. After Henry's divorce from Catherine was pronounced, M. was sent away from court, but upon the death of Anne Boleyn she made an effort, through Cromwell, to be restored to the favour of the King, and (in 1538-39) he was so far gracious as to attempt to get her married to the Prince of Portugal or the son of the Duke of Cleve. By an Act in 1544 she was declared to have the right of succession in the event of Edward having no issue. With the death of her father M. again returned to the practice of Catholicism, which she had temporarily seemed to abandon, and as King Edward's health was waning, it was determined by working upon his religious prejudices to turn aside the succession into a Protestant channel. This was accordingly arranged by the Duke of Northumberland in favour of Jane Grey, who was directly descended from a sister of Henry VIII. But the people would not endure the usurpation, and on the 1st October 1553 M. was crowned queen. At once the Protestantism of the previous reign was abolished. Married priests were expelled from their charges. The Prayer-book was burned, the mass was revived. Latimer and Cranmer were imprisoned. Even Elizabeth was sent to the Tower. A revolt of Sir Thomas Wyatt was promptly suppressed, and M., having obtained the reluctant consent of Parliament, married Philip of Spain, 25th July 1554. A submission was made to Rome, and both Houses of Parliament by formal vote returned to the obedience of the Papal see. The martyrdom of Taylor, Rogers, Latimer, Ridley, and Cranmer completed the work of reaction. Within three years 300 Protestants perished at the stake. When M.'s husband found there was no chance of issue he left her, and troubles accumulated about her until, overcome by disease and mental bitterness, she died 17th November 1558, amidst universal rejoicing. M. was both courageous and virtuous, but bigoted and relentless to the last degree. See Froude's *History of England* (vols. iv. and v.); Green's *Short History of the English People* (Lond. 1875).

Maryborough, the name of two towns in Australia. 1. A town in Queensland, in 24° 40' S. lat., 152° 54' E. long., 180 miles N. of Brisbane. It is situated on the navigable river Mary, 60 miles from its mouth, and is the port of a large and important district. The exports consist of wool, gold, copper, timber, and sugar. Pop. (1875) 5000.—2. A town in Victoria, in 37° 5' S. lat., 143° 45' E. long., 112 miles N.W. of Melbourne, with which it is connected by railway. It is the centre of a rich gold field, which yielded 104,664 oz. of gold in 1876. Pop. (1875) of the municipality, 3200; of the district, 12,684.

Mary Hall, St., Oxford, originally the parsonage of St. Mary's Church, was converted by Oriel College into a place of education (1333), and subsequently became an independent hall. It possesses four Dyke scholarships of £75 per annum, tenable for four years, and one Nowell exhibition; and in 1876 had 51 members of Convocation, 46 undergraduates, and 107 members on the books.

Maryland, a state of the American Union, is bounded N. by Pennsylvania, E. by Delaware and the Atlantic, S.W. by Virginia, and W. by West Virginia. Area, 11,124 sq. miles; pop. (1880) 934,632. It is of extremely irregular shape, being 198 miles long by from 3 to 120 wide, and is divided by Chesapeake Bay (q. v.) into two parts, the eastern of which is mostly level, while the western contains several offshoots of the Alleghanies, nowhere, however, exceeding 2500 feet in height. The only important river is the Potomac (q. v.). According to the State (1871) Agricultural Report, 4,512,579 acres were in farms, of which 1,598,572 were waste. In the E. the soil is a light sandy loam, but in the central and northern valleys it is of great fertility, yielding vast crops of tobacco, wheat, and Indian corn; while the mountain slopes are covered with forests of oak, maple, pine, cypress, &c. In 1873 the total value of the crops was \$22,382,300; the amount of wheat was 5,262,000 bushels; of rye, 309,000; of Indian corn, 10,451,000; of oats, 2,798,000; of barley, 10,600; of buckwheat, 60,000; of Irish potatoes, 1,336,000; of hay, 169,400 tons; and of tobacco, 19,300,000 tons. In the same year M. had 104,500 horses, 10,700 mules and asses, 222,500 cattle, 133,200 sheep, and 256,200 swine. The

value of imports (1874) was \$29,302,311; of domestic exports \$27,514,721; and in January 1875 there were 1825 miles of railway in the state. Annapolis is the capital, but Baltimore is the commercial metropolis of M., and other towns are Frederick, Cumberland, and Hagerstown. M. was first settled by a Virginian adventurer, William Clayborne (1631), and was chartered (1632) through Queen Henrietta Maria, after whom the colony received its name, to Cecilius Calvert, Lord Baltimore, when it became an asylum for the English Catholics, though granting full religious toleration. It played an important part in the Revolution, its new constitution (revised in 1851) dating from 14th August 1776, and in the Civil War, as a slaveholding state, espoused the cause of the Confederates.

Maryport, a seaport of England, in the county of Cumberland, 29 miles S.W. of Carlisle by rail, stands at the entrance of the Ellen into the Solway Firth. Dating only from 1750, it has grown to be the chief coal port of the county, and carries on a busy import trade with the Baltic in flax and hemp. In 1875 there entered 494 vessels, of 53,200 tons, and cleared 1538, of 164,568 tons. M. has a floating dock of 4 acres, a pier 300 feet long, an observatory (1838) 140 feet high, an atheneum (1857), and iron-foundries, tanneries, steam saw-mills, &c. Its herring fisheries are highly productive, and in the neighbourhood are rich coal-mines and quarries of limestone and red freestone. Pop. (1871) 6938.

Mary Stewart (Fr. Stuart), Queen of Scots, daughter of James V. and Marie de Lorraine, was born at Linlithgow, 5th December 1542, became Queen of Scotland when a week old, was demanded by Henry VIII. as wife to his son Edward, and, after being removed from Stirling Castle to Inchmahome, was sent to France, 13th August 1548. According to the account of Brantôme, she was taught music, dancing, Italian, Latin, and the art of versifying, at a convent where the children of the aristocracy were educated. Her proficiency in Latin is shown in the fact that in her thirteenth year she is said to have declaimed in that language before the French court upon the desirability of women studying letters and the liberal arts. On the 24th of April 1558, M. married the Dauphin of France, who received the title of King of Scots, while she was created *Reine-Dauphine*. It happened, too, at the same time that 'the title of Queen of England was taken by the court of France for Queen Mary in a quiet, offhand way.' On the 10th July 1559 M. became Queen of France through the elevation of the Dauphin to the throne; on the 5th of December 1560 she was a widow. Owing to the predominance of Catherine de Medicis, the French court became very uncomfortable for her, and, being refused a safe-conduct by Queen Elizabeth through her dominions, M. set sail for Scotland, 15th August 1561, not without profound regret at leaving 'fair France.' Arrived at Edinburgh, she found herself called to a kingdom where the established religion was Protestant, and where the character of her subjects was unknown to her. In vain she tried to talk over Knox (q. v.), and to turn the course of the Reformation. All the compromise she could get was the non-molestation of her French followers in the private exercise of their religion. Yet through her illustrious origin, her personal charms, and her regal pageants, paid out of her dowry as Queen-Dowager of France, M. steadily advanced in popularity. It became necessary for her to marry again, and about a dozen foreign potentates or Scotch earls were proposed for her acceptance. Having lost her heart to Henry Stewart, Lord Darnley (q. v.), a descendant of Henry VII. of England through the marriage of Earl Lennox with a granddaughter, M. wedded him at Holyrood, July 29, 1565. It was preceded by a Papal dispensation, on account of affinity in blood, and the ceremony was performed according to the office of the Romish Church. This marriage was the cardinal mistake of M.'s life. Darnley's demands for kingly honours became exorbitant, and in 1566 he made overtures to the heads of the Protestant party, according to which it was arranged that they should murder Rizzio, the Queen's Italian secretary, on the condition that they should not be incriminated, and that the crown should be fixed upon him and his house. In March of the same year Rizzio was stabbed to death in M.'s ante-room at Holyrood. Indignant at first to the extent of repudiating Darnley as a husband, M. afterwards resolved on having him back, along with such of the other enemies surrounding her as she could win over. Darnley forsook the confederate lords and escaped with her to

Dunbar, and on his return to Edinburgh declared his innocence of the crime before the Privy Council. At the same time M.'s antipathy towards him increased in intensity, though it was suspended for a short time when a son was born to her, 19th June 1566, but only to break out by the end of the year in greater force. Darnley grew alarmed after she welcomed back those lords who in the affray by which Rizzio was killed had not taken an active part. 'He resolved to go to France in a sort of desperation, as the French ambassador called it—in short, to escape.' But he was struck down with smallpox at Glasgow in January 1567, visited by M., advised to retire to Craigmillar, actually removed to a place close to the city wall of Edinburgh, called the Kirk of Field, where, after the Queen had been at his bedside (February 9th) before attending a ball at Holyrood, he was strangled in making his escape from an explosion which reduced the house to ruins. The Earl of Bothwell, to whom on the best grounds the murder was imputed, immediately took upon him the functions of Governor of Scotland. On the 12th of April he was summoned to a trial, but as there was no evidence to supplement the indictment put before the jurors, they had no alternative but to acquit him. Between the 24th of April and 15th of May he intercepted M. on her return from Stirling, fled with her, she gladly consenting, to Dunbar, received a public pardon for the transaction, and, after having divorced his own wife, married her. 'The beginning of this wedded life,' says Mr. Burton, 'resembled that of any innocent young couple affluent in the sources of magnificence and luxury.' 'It may,' he continues, 'be accounted one of the most remarkable phenomena of the whole situation that one of the subtlest and acute-t women ever born should, in her fool's paradise, have been totally unconscious of the volcano she was treading on.' On the 15th June, at Carberry, M. was compelled to part with Bothwell, and to return to Edinburgh with the confederate lords, and from thence she was despatched to Loch Leven, where (July 23d) she signed a renunciation of her crown in favour of her son. On the 2d May 1568 she escaped, and the Hamiltons rose in her support, but were defeated at Langsyde. She then fled to England and took refuge at Carlisle, after which she was conveyed from prison to prison during the remainder of her days. 'Let me go,' she wrote to Elizabeth from Fotheringay in 1586, 'let me retire from this island to some solitude where I may prepare my soul to die. Grant this and I will sign away every right which either I or mine can claim.' But the only release came to her through the block, February 8, 1587. 'Do not weep,' she begged her attendants, 'I have given my word for you. Tell my friends,' she charged Melville, 'that I die a good Catholic.' 'Her beauty,' writes Mr. Green, 'her exquisite grace of manner, her generosity of temper and warmth of affection, her frankness of speech, her sensibility, her gaiety, her womanly tears, her manlike courage, the play and freedom of her nature, the flashes of poetry that broke from her at every intense moment of her life, flung a spell over friend or foe which has only deepened with the lapse of years.' An immense body of controversial literature has grown round the life of M. See Migré's *Histoire de Marie Stuart* (1854; 3d ed. 1865); Miss Strickland's *Lives of the Queens of Scotland* (1850-57); Teulet's *Lettres de Marie Stuart* (Par. 1859); J. H. Burton's *History of Scotland* (vols. iii. iv. v.); Robertson's *Catalogues of the Jewels, Dresses, Furniture, Books, and Paintings of M., Queen of Scots* (Edinb. 1863); Hosack's *M. Queen of Scots and Her Accusers* (1869); Green's *Short History of the English People* (1875); Froude's *History of England* (1856-70).

Marysville, a town of California, U.S., at the junction of the Yuba and Feather rivers, 52 miles N. of Sacramento by rail, has eight churches, four banks, two newspapers, and flour-mills, foundries, and machine-works. Pop. (1870) 4738.

Masaniello, properly **Tommaso Aniello**, born at Amalfi in 1622, went at the age of twenty-four as a fisherman to Naples, which was then groaning under the dominion of Spain, and governed by a viceroy. Murmurs at the outrageous taxation became general; and M., roused by the imprisonment of his wife for smuggling meal, stirred the people to revolt. Fruit was taxed with particular severity; he therefore gained the fruit merchants, and out of these and the lazzaroni formed a rough militia. The insurrection began on the 7th of July 1647; the tax-collector's offices were burnt, the houses of the nobles reduced to heaps, the prisons thrown open, and M. demanded of the viceroy the

charter of Karl V. The nobles hired 200 brigands to assassinate him, but these were all killed. Styling himself 'Capo del Popolo,' and discarding fisher's garb for gaudy robes, M. marched in procession to the church of the Madonna del Carmine, and there arranged terms of peace on the basis of the Karl V. charter. Instead of then relinquishing his position, however, he clung to power, became arrogant, and probably insane; at last incurring the hatred of his own party, by some of whom he was assassinated on the 16th July, after a dictatorship of a week. See *History of M.*, by Midon (Lond. 1729); *Historia de la Sublevacion de Napoles*, by Rivas (Mad. 1848).

Masaya, a town of Central America, in Nicaragua, near a lake and volcano of the same name, 245 miles S.E. of the town of San Salvador. Palm-hats and wooden wares are manufactured. The surrounding district is fertile and well-tilled. Pop. 15,000 (mostly Indians).

Mas'cara, an old town of Algeria, on the N. slope of the Atlas Mountains, 50 miles S.E. of Oran. It has considerable trade, and some industry in making burnus. Formerly a residence of Turkish beys, it was nearly destroyed by Marshal Clauzel, 6th December 1835. Pop. (1872) 9240.

Mas'carene Islands, the collective name given to the islands of Reunion, Mauritius, and Rodriguez, in the Indian Ocean, the two first having been discovered by the Portuguese navigator Mascarenhas, in the 16th c.

Mas'cle (Old Fr. *mascle*, from Lat. *maula*, 'mesh of a net'), in heraldry, a Lozenge (q. v.) so perforated as to leave only a narrow border. It is thought that in early times the M. was identical with the lozenge.

Mask, a term in fortification of various meanings. An army or fortress is *masked* when held in check by the enemy, or when the line of fire is barred by friendly troops. A *masked* battery is one concealed by grassy glacié or otherwise from the enemy.

Mask'elyne, Nevil, D.D., F.R.S., a celebrated astronomer and physicist, was born in London, October 6, 1732. He graduated M.A. at Cambridge in 1757, and in 1761 was appointed by the Royal Society to go to St. Helena to observe the Transit of Venus. In 1763 he took a voyage to Barbadoes to test Harrison's newly-invented chronometer; and on his return in 1765 was appointed Astronomer Royal. In 1767 he began the publication of the *Nautical Almanac*, a now indispensable companion of the navigator. In 1772 he undertook his famous experiments on Schiehallion to ascertain the density of the earth; and in 1774 published the first volume of his *Astronomical Observations*, which have been of such immense service to subsequent astronomers. He died February 9, 1811.

Masks (Fr. *masques*, from the Ital. *maschera*; Med. Lat. *masca*; the origin of the word is uncertain) are of extreme antiquity. Made of papyrus, to represent the heads of hawks, lions, and other animals, they were worn on certain solemn occasions by the kings and priests of the Egyptians. Another of their early uses, to cover the faces of the dead, is exemplified in the M. of finely-hammered gold discovered by Dr. Schliemann at Mycenæ (1876). Dramatic M. (Gr. *prosôpa*; Lat. *larvæ* or *personæ*), originating probably in the practice at the Dionysia of smearing the face with wine-lees, were made at first of bark, later of leather, wood, or ivory, and covered the whole head, like the M. in a modern pantomime. Roscius Gallus first introduced the use of M. upon the Roman stage (circa 100 B.C.), but they had been used long before in the *Fabule Atellanæ*, as they were long afterwards in their descendant, the *commedia dell' arte*, of medieval Italy. The modern mask, worn simply to disguise the face, originated at Venice, and was introduced into France during the reign of Charles VI. See Ficorini, *Le Maschere Sceniche . . . degli antichi Romani* (Rome, 1736).

Masks, in architecture, are pieces of grotesque sculpture used to fill up vacant spaces in prominent positions, as keystones, door-panels, friezes, &c.

Ma'son, William, an English poet, born at Hull in 1725; entered St. John's College, Cambridge (1742), graduated B.A. (1745), was elected a fellow of Pembroke (1747), and published *Iris*, a satire on Oxford Jacobitism (1748), which was followed

by four bombastic *Odes* (1756), and by two tragedies, *Elfrida* (1753) and *Caractacus* (1759), both acted and condemned at Drury Lane. Having taken orders, M. received a royal chaplaincy, with the living of Aston in Yorkshire (1754), and a canonry and precentorship in the cathedral of York (1762), where he died, April 7, 1797. Besides other poems—among them *The English Garden* (1772–82)—M. published works on painting and church music, but he is best remembered as the compiler of the *Memoir and Letters* of his friend the poet Gray (1775), the basis, it may be said, of all succeeding biographies.

Mason and Dixon's Line, the S. boundary of Pennsylvania, separating it from Delaware, Maryland, and Virginia, was surveyed by Charles Mason and Jeremiah Dixon, two English mathematicians, 1763–67, in consequence of the disputes of the great proprietors, the Penns and the Lords Baltimore. The line, 280 miles long, marked by a series of milestones, was revised in 1849. During the anti-slavery agitation the line was widely regarded as the boundary between the free and slave territory, instead of the parallel of 36° 30' fixed by the 'Missouri Compromise' in 1820.

Mason Bee, **Mason Wasp**, names applied to certain *Hymenopterous* insects from their habit of forming dwelling-places in wood and in other materials. *Osmia paretina* is a common species of M. B., which builds cells of earth, or excavates its nests in the stems of plants. *Osmia leucomelana* builds its cells of mud, and forms each cell separately. The M. W. (*Odynerus murarius*) is a solitary species of wasp, which bores holes in sand or plaster, and thus forms a nest.

Ma'soned, as a heraldic epithet, is applied to representations of building when the cross-lines of the brick or stone work are displayed.

Masorah, or **Massorah** (Heb. 'tradition,' according to the usual derivation, from *masar*, to hand down; but also 'bond' or 'bridle,' from *asar*, to bind), is a collection of grammatical, critical, and explanatory notes on the Hebrew Bible, written in Chaldee, chiefly on the margin of Hebrew MSS. As to the time when they were written, certain Jewish writers maintain that some of them are as old as the time of Moses, others think they were begun in the time of Ezra, and others again that they were produced in the school of Tiberias, between the 3d c. and 6th c. after Christ. Most probably they were not the production of any one age, but were written at long intervals, and some of them in comparatively modern times. The notes are occasionally trivial enough, as, e.g., the number of letters and verses in each book, which is the middle letter, how many verses begin or end with a particular word, how many verses contain exactly a certain number of letters, &c., but always imply the expenditure of labour and pains; and the vowel-points, which fixed the meaning to be attached to the consonants, the accents, and most of the corrections of the text, are also the fruit of the labours of the Masorites. On this account, as well as because a regard to the M. has greatly contributed to bring about uniformity in the text, the modern standard text of the Hebrew Bible is called the *Masoretic*. The M. was first published in a collected form in Bomberg's Rabbinical Bible, at Venice, 1518–36.

Masque is a species of drama, originating in the mummings or costume dances, which date in this country from Edward III.'s time, but differing from these because of the masks performers wore. At first mere pageants, the masques in Elizabeth's time—particularly those of Ben Jonson—took the form of irregular dramas, with dialogue, music, decorations, and interspersed with lyrics. They attained their most perfect form in the reign of James I., and declined during that of Charles I. Milton's *Comus* is the most famous M. in English literature, and that introduced in the *Tempest* may serve as a short specimen. See Ward's *English Dramatic Literature*, vol. i. p. 82.

Masquerades, or **Masked Balls**, originated in Italy towards the close of the 15th c., their invention being ascribed to one Granacci, spread thence into France, and were introduced into England by Henry VIII. 'on the daie of the epiphaine' (1513). They were suppressed by 9 Geo. I., but revived, and in 1776 we find Ranelagh maskerade tickets selling at twenty-five guineas apiece, whilst Covent Garden Theatre was destroyed by fire at the close of a *bal masqué*, March 5, 1856. They were

not common in Germany or Denmark till the latter half of the 17th c., and, except at the Carnival (q. v.), have now been generally superseded by fancy balls.

Mass, in physics, is the quantity of matter of a body. Its measurement depends upon Newton's second law of motion, which states that the acceleration produced by a given force acting upon a given body is proportional to the M. of the body. The *weight* of a body is the force with which the earth attracts it, and diminishes as the distance from the earth increases. The ratio of the weight to the acceleration is the measure of the M. The numerical value of the M. will of course vary according to the units chosen; but with the same units the M. of a body is absolutely constant. In this country the practical unit of M. is the pound; for scientific purposes, however, the unit of M. universally adopted by civilised nations is the gramme.

Mass, the modern English name of the Roman Catholic sacrament and sacrifice of the Eucharist. The Old Eng. form of the word is *masse* (Fr. *messe*, Ger. *messe*), and is a corruption of the Latin *missa*. The Latin word again has been derived by some from the Hebrew *missah*, 'an oblation,' but more generally from the *It.* *missa est* of the Western liturgies, which was the form used in the Latin Church at the dismissal of the Catechumens (q. v.) and others who were not permitted to be present at the celebration of the Eucharist, but only at the ante-communion service of psalms, lessons, prayers, sermon, and then of the whole assembly at the conclusion of the Communion-service proper. Hence the services themselves came to get the names *missa catechumenorum* and *missa fidelium* respectively, and the name *missa* was also applied to services at which no Communion was celebrated at all, as morning and evening prayer: indeed it was sometimes used simply for lessons. The idea of a sacrifice began to be associated with the Eucharist at a very early period. First the free gifts of bread and wine brought by members of the community, from which the elements for the Lord's Supper were taken, then the thanksgiving prayer of the officiating minister, and lastly the entire celebration, was called an 'offering' or 'sacrifice.' But this was merely a symbolic thank-offering made by the Christians themselves. Cyprian (about 200–258) was the first to maintain that 'the sacrifice did not consist in the thank-offering of the congregation, but in the sacrifice made by the priest in the stead of Christ.' But this was yet only an imitation, not a repetition of the sacrifice of Christ. By and by the reference to the death of Christ became more prominent, although the rite continued for a time to be regarded as a commemorative representation of the sacrifice he had once offered. But along with the notion of the existence in the Christian Church of a priesthood, there grew up also the notion of a sacrificial worship corresponding to that in the Jewish Church. The tendency in the popular mind was more and more to regard the ordinance in the light of a magical charm, and the idea of a commemorative celebration of the sacrifice of Christ passed insensibly into the idea of a sacrificial act of the priest, with a magical efficacy both for the living and the dead. As expressed by Gregory the Great (6th c.) 'whenever the priest presented this offering, heaven opened at his voice; the choirs of angels appeared; the high and the low, the earthly and the heavenly united, the visible and the invisible became one.' The idea of a sacrifice is distinctly set forth by most of the fathers of this period. Gregory speaks of a 'daily sacrifice of immolation,' although even he apprehended the idea in connection with the whole tendency of the inward life. The sacrificial idea was complete when the doctrine of Transubstantiation (q. v.) was fully developed, for then the real body of Christ was actually present on the altar. And from that time to this the M. has been more than ever the centre of the Roman Catholic ritual. See Neander's *Geschichte d. Christl. Rel. u. Kirche* (Eng. trans. 1858); Gieseler's *Lehrbuch der Kirchengesch.* (Eng. trans. 1855); Hagenbach's *Lehrbuch der Dogmengesch.* (Eng. trans. 1846).

Massa, a town of N. Italy, province of Massa-Carrara, delightfully situated on the Frigido, amid orange, citron, and olive groves, 3 miles from the sea, and 5 S.E. of Carrara by rail. It was formerly the capital of the Duchy of Massa-Carrara, which was united to Modena in 1829. The noble palace was built by the Cybos, who became the feudal lords of

M. in the 15th c. The marble quarries here rival those of Carrara. Pop. (1874) 18,031.

Massachusetts (Ind. 'the blue hills'), one of the States of New England, and of the original Confederacy of 1776-88, is bounded N. by New Hampshire and Vermont, S. by Rhode Island State and Connecticut, W. by New York, and E. by the Atlantic. Area, 7800 sq. miles; pop. (1870) 1,457,351, of whom 13,947 were coloured. The coast-line is indented with numerous bays, of which the chief are M. Bay, enclosing Boston Harbour, and Cape Cod Bay, three-fourths landlocked by a peninsula, 75 miles long, that terminates in Cape Cod. Along the coast are the islands of Martha's Vineyard and Nantucket, and hundreds of smaller size. M. is for the most part hilly, the greatest heights being Saddle Mountain, or Graylock (3505 feet), and Mount Everett (2624), in the W. range of Taghkanic. The main rivers are the Connecticut, Housatonic, Hoosack (an affluent of the Hudson), and Merrimack, the first and last of which alone are navigable within the State. The prevailing rocks are metamorphic, but the valleys of the Connecticut and Housatonic display red sandstone, and in the S.E. there are beds of coal and anthracite, some having been wrought for many years. Among the minerals worked are gold (recently), iron, slate, limestone, soapstone, asbestos, plumbago, ochres, and fine white marble. The S.E. is covered with sandy flats, but the other parts of the State, originally under dense forests of pine, oak, chestnut, maple, &c., are cleared and cultivated to the extent (1874) of 4,467,066 acres. In 1874 the produce of Indian corn was 1,446,000 bushels, of wheat, 31,000, of rye, 246,000, of oats, 246,000, of barley, 110,000, of buckwheat, 50,000, of potatoes, 2,425,000, of tobacco, 8,200,000 lbs., and of hay, 400,200 tons. The live-stock comprised (1874) 102,800 horses, 122,600 oxen, 136,300 milch cows, 76,300 sheep, 78,000 swine—total value, \$24,282,079. M. imports a large quantity of cereals, for the growth of which its climate and soil are not favourable, but exports tobacco, hay, Indian corn, and potatoes. In the actual amount of its manufactures M. is only surpassed among the States by New York and Pennsylvania. In 1870 the capital invested was \$231,677,862, and the sales of annual produce \$553,912,568. The chief manufactures are cottons, woollens, leather, boots and shoes, paper and machinery. In 1874 there were 1782 miles of railway. Boston is the capital, and other towns are Worcester, Lowell, and Cambridge. The Cabots sailed along the M. coasts in 1497, and the *Mayflower* entered Provincetown Harbour, Cape Cod (November 11, 1620), with the band of Puritans, 102 in number, who subsequently formed Plymouth colony. The colonists suffered greatly at first from the severity of winter and want of provisions, and still more from the attacks of the Indians, especially in 1675-76. The first blood of the Revolutionary War was shed in M., at Lexington and Concord, April 19, and at Bunker's Hill, June 17, 1775.

Massafra, a town of S. Italy, province of Lecce, on the slope of a ravine 1½ miles N.W. of Taranto by rail. The district produces 6½ million lbs. of oil annually, and is favourable to the cultivation of cotton. Pop. (1874) 9719.

Massagætæ, a savage and warlike Turcoman tribe of Central Asia, dwelling in Margiana, N. of the Jaxartes, and between the Sea of the Aral and the Caspian, though some think they extended further towards the S.E. It was in an expedition against the M. that Cyrus the Great met his death. Their country is now occupied by the Kirghiz Tartars.

Masséna, André, Duc de Rivoli, Prince d'Essling, was born at Nice, 6th May 1758, became cabin-boy in a ship commanded by his uncle, entered the Sardinian army, and rose to the rank of sub-lieutenant, but retired (1789) because his humble birth gave him no chance of rising higher. Joining the French Army of the S., M. rose to be general of brigade (1793), had a share in the victory of Saorgio (1794), and (1795) obtained two victories over the Austrians at San Giacomo and Borghetto. M. shared with Napoleon the glories of the Italian campaign (1796-97), and was dubbed by him *l'enfant chéri de la victoire*. In February 1799 he was appointed to the command of the Army of Switzerland, and after being for months upon the defensive, overpowered the Russians (September) at Zürich, and saved France from invasion. Thereupon Napoleon appointed him commander-in-chief of the Italian army. In 1803 he

became member of the Corps Legislatif, in 1804 Marshal of the Empire, and in 1807 he fought in Poland, where he was made Duc de Rivoli. On the 6th July 1809, though he had been deprived of an eye while hunting, he commanded the left wing at the battle of Wagram, and had his services rewarded by the title Prince d'Essling. In 1810 he made an unsuccessful effort to force Wellington from his position at Torres Vedras, and in 1811 his failure in Spain was completed by the battle of Fuentes de Oñoro, and he was superseded; nor was he ever partially restored to favour until 1813, when he was appointed commandant of the eighth military division at Marseille. He took the oath of fidelity to the Bourbons (1814), and at the restoration commanded the national guard of Paris. He died at Paris, 4th April 1817. See Thiers' *Histoire du Consulat et de l'Empire*, Koch's *Mémoires of M.* (7 vols. 1849-50), and the *Biography* by Tosselli (1869).

Massicot. See LEAD.

Massillon, Jean Baptiste, an illustrious French preacher born at Hières, in Provence, 24th June 1663. Educated for the Church, he was appointed head of the Saint Magloire Seminary in Paris at the age of thirty-three. He rapidly gained fame as a preacher at the Oratoire, and was appointed to preach in Advent of 1699 before Louis XIV. He appeared before court again in 1704, and a third time in 1719, in presence of Louis XV., then aged nine. On this occasion he preached the sermons known as the *Petit-Carême*, fearless exhortations to the young king, written with such eloquence that Voltaire kept them always beside him. In 1717 the Regent appointed him Bishop of Clermont; and he entered the Academy two years later. M. early resolved to avoid display as a preacher; he indulged in little gesture, selected the homeliest texts, and aimed rather at reaching hearts than winning applause. With none of the bombast too often mistaken by French orators for eloquence, he wrote earnestly and in a pure style, at once simply and brilliantly, occasionally with a magic of colour and vehemence of passion overhanging his calmer passages like bursting clouds. He was devoid of vanity, lived unostentatiously, and, having devoted his means to charity, died, like Fenelon, 'without money or debts,' 28th September 1742. The first edition of M.'s works was edited by his nephew, the Abbé M. (15 vols. Par. 1745-48). Of the numerous later editions, the most noteworthy are those of Renouard (13 vols. Par. 1810-11), Beaucé (4 vols. Par. 1817), Mequignon (15 vols. Par. 1818), and Guillon (16 vols. Par. 1828). See D'Alembert's *Éloge*, and Sainte-Beuve's *Causeries du Lundi*, vol. i.

Massinger, Philip, was born at Salisbury, 1584. He entered as a commoner at St. Alban's Hall, Oxford, but appeared in London without a degree, and became one of the brilliant set of dramatists of whom Shakespeare was chief. The first record of his work is a notice of the performance of *Woman's Plot*, 1621. Before this he must have written several plays, probably eight, the MS. of which a Mr. Warburton's cook made use of to cover pies. To the same period belong four extant plays, *The Old Law* (comedy), *The Virgin Martyr*, *The Unnatural Combat*, *The Duke of Milan* (tragedies). M. also joined Fletcher, Dekker, and others, in writing for the stage. His other extant works are *The Bondman* (1623); *The Renegade* and *The Parliament of Love* (1624); *The Roman Actor* (1626); *The Great Duke of Florence* (1627); *The Maid of Honour*, *The Picture* (1629); *The Emperor of the East* (1631); *The Fatal Downy* (1632); *A New Way to Pay Old Debts* (1632); *The City Madam* (1632); *The Guardian* (1633); *A Very Woman* (1634); *The Bashful Lover* (1636); *Believe As You List* (long lost, discovered by the Percy Society). Except from hints dropped in his dedications, little is known of M.'s life. He was poor, but was befriended once and again when in straits, died about the middle of March 1638, and was buried at St. Saviour's Church, Southwark, the books of which bear this record:—'1638, March 18th, Philip Massinger, stranger.' His comedies, *The Great Duke of Florence* excepted, are feeble, but his tragedies vigorously conceived. In spite of blemishes, they exhibit a far loftier moral tone than those of his contemporaries; the characters are firmly drawn, the incidents original, if laboured, but the parts do not hang well together; the action is either forced or tedious, and the plays derive their chief beauty from the sustained dignity and sweetness of the style, and isolated passages full of rich and solemn harmonies. Gifford's

edition of M. (1805, reprinted 1815), is the standard, but his text, with Cunningham's introduction and the recovered play, *Believe As You List*, was published in cheap form by Chatto & Windus (1874).

Mass'on, David, an English scholar and critic, born at Aberdeen, December 2, 1822, educated at Marischal College and Edinburgh University, edited a Scotch provincial newspaper for a short time, and thereafter busied himself with literary work in Edinburgh and London. He was appointed Professor of English Literature in University College, London, in 1852, and in 1865 received the chair of Rhetoric and English Literature in Edinburgh University, an appointment which he still (1878) holds. M. edited *Macmillan's Magazine* for many years, and has contributed to many periodicals. His chief works—all carefully, judiciously, and learnedly written—are *Essays, Biographical and Critical* (1856), reprinted (1874-76) in 3 vols. entitled *Wordsworth, Shelley, and Keats*; *The Three Devils—Luther's, Milton's, and Goethe's*; and *Chatterton, a Story of the Year 1770*; *Life of Milton*, and *History of His Time* (3 vols. 1858-71-73, vols. iv. and v. in the press, 1877); *British Novelists* (1859); *Recent British Philosophy* (1865, 3d ed. 1877); *Drummond of Hawthornden* (1873); the Cambridge edition of *Milton*, with notes (3 vols. 1874), and the Globe edition (1 vol. 1877).

Mass'owah, a town belonging to Egypt, on a small coral island of the same name on the Red Sea, 1½ miles from the mainland, opposite the boundary between Nubia and Abyssinia. It is a dirty, wretchedly built place, but has a good harbour, and a large transit trade in grain, salt, tobacco, sugar, ivory, wax, ostrich-feathers, drugs, spices, pearls, cottons, silks, arms, gunpowder, glass, and iron wares, &c. Pop. 8000, mostly Arabs.

Mast, a long rounded upright spar erected on the keelson of a ship for the attachment of the yards, sails, and rigging. The masts of a ship, barque, or other three-masted vessel are called the *fore*, which is nearest the stem, the *mizzen*, which is the smallest, and placed nearest the stern, and the *main*, between these two. Two-masted vessels have no mizzen M. The spars rising through the deck are called *lower masts*, and above these in order rise the *top masts*, *top-gallant masts*, *royal masts*, and sometimes *sky-sail masts*, main, fore, and mizzen respectively. A temporary M. rigged out in an emergency receives the name of *jury M.* Within thirty years iron has been largely substituted for wood in the construction of masts, yards, and rigging, and in steamships of great length the number of masts has been increased to four, while the *Great Eastern* boasts of six.

Master (Lat. *magister*, from *magis*, 'more'; Old Fr. *maistre*), as a general title of courtesy, has become corrupted into Mr. (*mister*), as *Mistress* (Old Fr. *maistresse*) into Mrs. (*missis*); *master* itself being restricted to boys, a singular instance of linguistic conservatism of energy. In art, the term 'Old Masters' often designates the names of the best-known medieval, and the works of the least-known modern, painters; while by the 'Little Masters' are understood seven artists and engravers of Nürnberg, all pupils of Dürer in the beginning of the 16th c., whose names were Aldegraver, Altdorfer, Barthel and Hans Sebald Beham, Binck, Brosamer, and Pencz. In music, the Ital. *maestro* is applied to any eminent composer.

Master, in the British navy, was formerly a commissioned officer, whose duties corresponded to those of the present *navigating lieutenant*, a lieutenant, that is, who has passed a special examination in navigation. In the United States navy, a M. belongs to the grade above an ensign and below a lieutenant, and ranks equal to a first lieutenant in the army or marines. In the merchant service the captain of a vessel is termed the M. Under the Mercantile Marine Act the masters of large vessels must hold certificates from the Board of Trade (q. v.), which may be withdrawn in cases of negligence or unskillfulness.

Master and Servant. There are four kinds of servants recognised by the law of England:—1st, operatives or skilled labourers; 2d, domestic servants; 3d, agricultural labourers; 4th, apprentices, whose service is regulated by deed of indenture. If in hiring an agricultural servant no period be specified for the duration of the contract, the law holds it to be for a year; and in that case a quarter's warning must be given on either side prior to the expiration of the term. If a female ser-

vant marry, she must nevertheless serve out her term, and her husband cannot take her out of her master's service. A servant may be discharged without notice for immorality; and if taken into custody, the master may discharge him by paying the proportion of wages due to the date. If a servant fall ill during the period of service, his master cannot put him away, nor abate his wages. Liveries remain the property of the master. A master may support his servant in an action at law, and he may maintain an action against any one who entices away his servant. Regarding *character*, see article CHARACTER TO SERVANT. Masters are liable for the acts of their servants done in course of business, by their order, expressed or implied. If a servant commit a legal offence by order of his master, both are guilty. If an innkeeper's servant rob a guest, the master must make restitution. A banker is liable for money paid to his clerk; but if you pay money due to a physician or a clergyman to his servant, and the servant embezzle it, you must pay it again, because it is not the business of the servant of either of these to receive money. A wife or friend in the habit of transacting business for a man are so far his servants that he is answerable for their doings regarding his business. But if you are in the habit of dealing with a tradesman yourself, and of paying him ready money, and your servant buys on credit, you are not responsible; but if you sometimes send your servant to buy on credit, and at other time for ready money, you are answerable for all he buys; for in this case the tradesman cannot be expected to know when the servant has your authority and when he has not. A master is answerable for the fault or negligence of his servant and of his household. Servants are bound to discharge their duty with care, diligence, and fidelity; but they are not answerable for an accident; so that if a servant lose or break an article, the value cannot be deducted from his wage, unless it was stipulated at the hiring that the servant was to be so liable. If, however, habitual carelessness, or gross special carelessness, were proved, the reverse might be the case. Under the Master and Servant (1867) Act, if master or servant refuse to fulfil any contract of service, on the aggrieved party laying a complaint before a justice in England, or before a justice or sheriff in Scotland, the recusant will be summoned to appear and answer to the charge in court, on pain of having a warrant issued for his apprehension. The laws of England and of Scotland as to M. and S. do not materially differ. In both countries, local custom has due weight given to it.

Master-at-Arms, in nautical affairs, an inferior officer at the head of the police of a ship of war, who are called its 'corporals.'

Master of Arts. See DEGREE, UNIVERSITY.

Master of Court is, in England, the title given to a chief officer under a judge. His chief duties are to write minutes of procedure, and to tax bills of costs.

Master of the Buckhounds, one of the ministers of the crown, to whose care is intrusted the management of the royal hunts. His emoluments amount to £1700.

Master of the Ceremonies, an office instituted at all European courts for the direction of matters of state etiquette. It was established in England in 1603. The name is now extended to the director of the arrangements of a public ball.

Master of the Horse (Lat. *Magister Equitum*), among the Romans, was from the earliest times the officer next in authority to a dictator. In England the M. of the H. is a minister of the crown, the third great officer of the royal household, intrusted with the direction of the royal stables, and privileged to ride next to the sovereign on state occasions. His salary is £2500 a year.

Master of the Household, an officer of the royal household, charged with the choice, direction, and payment of the household servants. He holds office at the Queen's pleasure, and receives £1158 a year.

Master of the Rolls. This is the title of the president of the Chancery division of the High Court of Justice. He formerly had the custody of the Rolls or records. This he still has nominally. The M. of the R. ranks next to the Lord Chief Justice of England. See COURT OF JUDICATURE, SUPREME, ACTS.

Masterwort is the translation of *Imperatoria*, and is the name given to *J. Ostruthium* of Linnæus, an umbelliferous plant of Mid. Europe, formerly cultivated as a pot-herb and for medicinal purposes. It is found in several northern counties of England and in Scotland, but is a relic of former cultivation rather than a factor of the indigenous flora. It has now passed out of use; in Britain, at any rate, such is the case. The genus *Imperatoria* has been reduced to a section of *Peucedanum*. The name *M.* is sometimes also applied to *Astrantia*, another genus of *Umbellifera*.

Mas'tic, from *masticare*, 'to chew,' has become the name of a tree known botanically as *Pistacea Lentiscus*, from its supplying the gum-resin called *M.* or mastic, which is chewed largely by the Turks for sweetening the breath and strengthening the gums. It is used by dentists in this country, and is also the basis of a picture-varnish. See **PISTACEA**.

Mastica'tion, the process of dividing the food by the teeth or jaws preparatory to deglutition or swallowing. In addition to the work of dividing the food into small portions, on which the gastric juice of the stomach may readily act, the function of *M.* provides that the food shall become duly mixed with the *Saliva* (q. v.) or fluid of the mouth, an action which is absolutely essential for its due digestion. The chief muscles concerned in *M.* are the *masseters*, and other muscles of the mouth, tongue, and cheeks.

Mas'tiff, a species of Dog (q. v.) of large size, distinguished by its massive head and square muzzle. The lips are heavy and hang loosely over the lower jaw, which protrudes slightly in the well-bred dog. The hair is smooth, the usual colour being a reddish fawn, variegated with black and white. The height varies from 25 to 28 or 30 inches. The *M.* is a mild-tempered dog, possessing a dogged endurance and determination, and evincing a strong attachment to his master. Occasionally the *M.* breed is mingled with the bull-dog, the courage and ferocity of the latter being thus tempered by the gentler nature of the *M.* A variety of *M.* named the *Cuban M.* has been thus produced. This dog was used by the Spaniards in their conquest of America in hunting the natives. The *Thibet M.* or *Thibet Dog* is apparently related, though distantly, to the true or English *M.* It is of deep black colour, and very large and strong.

Mas'todon, a genus of fossil elephants, which had lower tusks in addition to the upper tusks seen in existing elephants. These lower tusks, however, did not attain any great development, and seem to have disappeared in adult life. The molar teeth of the *M.* were more numerous than in other elephants, and had blunt protuberances arranged in pairs on their crowns. The name *M.* ('nipple-toothed') is derived from this circumstance. The oldest *M.* remains occur in the Miocene formations of Europe and India, and these animals existed also during the Pliocene epoch. In N. America the remains of one species (*M. Ohioticus*) occur in deposits of the Pleistocene age.

Mas'ulah Boats, a peculiar kind of craft used for the conveyance of passengers through the perpetually raging surf of the Coromandel or E. coast of the Indian peninsula, especially at Madras city. The materials are taken from any grove of mango and cocoanut. Mango planks are saturated with oil, bent into shape over a fire, and seamed and sown together with coir and straw. Such is their elasticity and toughness, that it has been proved by experiment that English-built lifeboats are less capable of resisting the tremendous strain caused by beating over the surf and the sandy beach. They have no keel, but a smooth and rounded bottom. There are 160 *M. B.* registered at the port of Madras.

Mas'alipatam, the chief town of the district of Kistna, Madras Presidency, British India, on the N. mouth of a small branch of the Kistna river, 215 miles N. of Madras; pop. (1871) 36,188. There is a fort with large barracks and military cantonments, but no soldiers are now stationed here. It was the first English settlement on the Coromandel coast, and was long celebrated for its cotton fabrics, of which the manufacture is not yet extinct. There is no good harbour, but there is a large coasting trade. In 1874-75 the exports were valued at £171,414; the imports at £119,636. The town lies very low, and is liable to be flooded from the sea by cyclones. *M.* has a flourishing Christian school for girls.

220

Mataban'gha, one of the three offshoots from the Ganges which make up the Hooghly River. It traverses the district of Nudda, and brings down the produce of N.E. and E. Bengal. The down traffic is about 80,000 tons, chiefly rice, jute, gunny bags, and pulses; the up traffic is about 35,000 tons, of which more than half is salt.

Matador. See **BULL-FIGHT**.

Matagorda, a large bay in Texas, U.S., receiving the rivers Colorado and Lavaca, and partly separated from the sea by a sand-spit, which is open for navigation at Pass Cavallo, which is marked by a lighthouse. On the low-lying coast are the towns *M.*, Port Lavaca, and Indianola. *M.*, an old Spanish town, was submerged during the severe storm of 15-20th September 1875.

Matamorás, a frontier town of Mexico, state of Tamaulipas, on the Rio Grande, 40 miles from its entrance into the Gulf of Mexico. It exports horses, hides, wool, metals, &c., and imports all kinds of manufactured goods. Pop. 12,000.

Matanzas, a fortified port of Cuba, on a beautiful bay, 52 miles E. of Havana by rail. It has an excellent harbour, and in 1867 exported 1,725,699 cwts. of sugar, and 1,212,587 cwts. of molasses. For the first half of 1871, the total export of sugar had risen to 1,490,080 cwts. The Empressa Academy at *M.* is one of the best schools in the W. Indies. Pop. 36,102.

Mataro' (Juro), a town and seaport on the N.E. coast of Spain, province of Barcelona, 17½ miles N.E. of the town of that name by rail. It is a place of great industry. There are ten manufactories of cotton yarn, twenty-one of sailcloth, twenty of vermicelli, 1180 looms, nine tanneries, and nine tile-works. Iron-founding, dyeing, and the manufacture of soap, tallow, glass, and glue are also carried on. *M.* existed in pre-Roman times. Pop. 13,000.

Match'es, Lu'cifer. These now indispensable conveniences of civilised life are of quite modern introduction, having only come into use in 1832, when the first real friction *M.* were invented by Congreve. The original *M.* were consequently known as Congreves, and consisted of sulphuretted splints tipped with a mixture of one part of chlorate of potash with two of sulphide of antimony, and sufficient glue or gum to render the compound adhesive. In 1833 *M.* in which phosphorus took the place of the antimony compound were made by Preshel of Vienna, and ever since that period Vienna has continued to be the most important centre of the match industry. According to Faraday, John Walker of Durham was the first English manufacturer of *L. M.* Owing to the loud report given by *M.* in which chlorate of potash is used, and the readiness of such *M.* to ignite by percussion, the use of that compound was early modified by the introduction of other substances, or altogether abandoned, and red lead with the black oxide of manganese substituted for it. Other ingredients were subsequently introduced, and now most manufacturers possess recipes of their own for their igniting compositions. These they keep strictly secret, but the igniting compositions always contain phosphorus in variable proportions with one or other of the substances above alluded to, mixed with fine sand or ground glass, coloured with some colouring agent, and the whole made into a paste with water and glue or gum.

In the preparation of the splints, in dipping and drying them, in the manufacture of the matchboxes, and in the packing and labelling of the finished *M.*, much ingenious machinery and great dexterity are exhibited. Planks of wood—generally white pine—are cut into blocks of a length suitable for two *M.*, and steamed in a close steaming-chest. A variety of machines have been devised for cutting the splints; one of the most efficient of which is the 'Rowley' machine, patented by Mr. John Jex Long, which, formed like a revolving turnip slicer, will cut from ten to sixteen millions of *M.* per day. In Vienna and other Continental factories circular splints are made by means of planes. The cut splints are arranged in a frame so that each splint is separated a little from its neighbours, and being tightly fastened up they are thoroughly dried in a stove. They are next charred at the ends on a sand bath, and both ends are dipped into melted paraffin (formerly, and still sometimes into sulphur). They are now ready for being tipped with the igniting composition, which is done by dipping them into a shallow tray over which the composition is evenly spread. As

both ends of the splints form uniform plane surfaces, all the splints dip to the same depth with the composition. The splints are then allowed to 'drip,' after which they are dried in a stove, and taken out of the frames. Each splint being dipped at both ends forms two M., and they are cut into two by means of a lever knife. When 'bundle dipped' M. are made, the splints are not arranged in frames, but dipped in round bundles tied up by string. The ends thus are only tipped with the igniting composition, and as the M. take up less of the costly chemical mixture, and as the labour of arranging them in dipping frames is saved, they are cheaper than the frame-dipped kind. The preparation of the wooden skillets for boxes and cases employs ingenious machinery, and the papering of the boxes, filling in the M., and other operations, are performed with great dexterity by women and children.

The phosphoric fumes in a match-factory give rise to a very painful and serious disease of the jawbones—necrosis—which occasionally affects the operatives more directly exposed to them. Partly on that account, but more as a security from fire, safety M., in which amorphous or red phosphorus is employed, have been introduced, and are now extensively used. The phosphorus mixed with ground glass is spread on paper, and the M. are tipped with chlorate or nitrate of potash or peroxide of manganese and red lead. The M., therefore, only ignite when rubbed gently on the prepared phosphorus papers attached to the match-box. As neither the M. nor the prepared paper ignite readily apart from each other the device forms an undoubted security against fire, and as the employment of red phosphorus is unattended with the danger of necrosis, the use of safety M. deserves to be encouraged.

Matchlock, a portable firearm, which is discharged by means of a lighted match held by a serpentine or crooked lever attached to the lock of the weapon. Matchlocks, without trigger or tumbler, were invented about 1424, and these were succeeded by the Arquebus (q. v.). Matchlocks are still used in the East, notably among the Maharrattas of India and the Chinese.

Maté, or **Paraguay Tea**, in S. America occupies the same position that Chinese tea does in Europe. It is obtained from the leaves and fine twigs of *Ilex Paraguayensis*, a small tree with pinnate or toothed leaves, native of S. Brazil, in the district drained by the Parana and Paraguay. Branches cut from the tree are roasted on hurdles over a wood fire until thoroughly dry, the leaves are then beaten off and pounded. The infusion is prepared by placing a small quantity of the powder into a cup or gourd with a little sugar, and adding boiling water. When sufficiently cool it is imbibed through a tube, and is very refreshing after fatigue. Its chemical principles are caffeine, quina acid, and a peculiar tannic acid that can be converted into viridin acid. It is understood by botanists that along with the above-named *Ilex* several other allied species are indiscriminately used in M. manufacture. The name M. originally meant the small gourd which forms the drinking cup.

Mate (Icel. *mitti*, 'equal'; Dutch, *maat*, 'a comrade'), in the merchant service the officer ranking next to the captain. If the vessel carries several under-officers, these are termed respectively the first, second, and third M., and so on. In the British navy the term formerly corresponded to the present Sub-lieutenant (q. v.), but is now restricted to certain petty officers, as boatswain's M., gunner's M., &c.

Mate'ra, a town in S. Italy, province of Potenza, 37 miles N.W. of Taranto. It has several churches and a curious chapel, San Pietro Barisano, cut out of the rock. M. is a bishop's see, and has manufactures of firearms and leather. Pop. (1874) 14,312.

Materia Medica is the term used to designate that department of medicine which is devoted to the consideration of pharmacological remedies, or substances employed as medicines in the treatment of disease. M. M. comprises a consideration of *pharmacognosy*, which treats of the origin, properties, varieties, quality, and purity of *unprepared medicines* or *simples*; *pharmacy*, which treats of the collection, preparation, and preservation of medicines; and *pharmacodynamics*, or *therapeutics*, which treats of the effects, uses, and administration of medicines in the cure of disease. Dr. Pereira, in his work on M. M., arranges Medicines in three groups as follows:—(1) Medicines

derived from the mineral kingdom, and definite chemical compounds, organic as well as inorganic, which are obtained as products of decomposition, and not as educts, from the vegetable and animal kingdoms; (2) medicines derived from the vegetable kingdom, including bodies of definite chemical composition, obtained as educts from vegetable substances; (3) medicines obtained from the animal kingdom, including bodies of definite chemical composition, obtained as educts from animal substances. Professor Christison and others adopt a simple alphabetical arrangement; and others, an arrangement of medicines in groups corresponding to their physiological effects. In accordance with this system of classification, Neligan groups medicines as antacids, anthelmintics, antispasmodics, astringents, cathartics, caustics, diaphoretics, diuretics, emetics, emmenagogues, emollients, epispastics, expectorants, narcotics, refrigerants, sedatives, or contra-stimulants, sialogogues, general stimulants, special stimulants, tonics, and supplementary agents. Dr. Stillé, of America, adopts the same basis of classification, but his subdivisions are different. Dr. T. Lauder Brunton proposes a grouping of medicines according to their physiological action, which he ascertains by considering the effect of the drug, firstly in small, secondly in large, and thirdly in long-continued doses—(1) when applied to the cutaneous surface, and to the mucous membranes; (2) when taken into the digestive canal, and while passing along it; (3) when absorbed from the intestinal canal into the circulation, and acting on the blood, the blood-vessels, and vaso-motor nerves, the heart, and the cardiac nerves, and muscles; (4) when passing out of the body and brought into contact with the eliminating glands. The diseases in which the drug is used, or for which it may be adapted are next considered, and finally the various official preparations of the medicines. See *Elements of M. M. and Therapeutics*, by Dr. Pereira, edited by Bentley and Redwood (Lond. 1872); *Therapeutics and M. M.*, by Dr. A. Stillé (Phila. 1876); *Tables of M. M.*, by Dr. T. L. Brunton (Lond. 1877); *Guide to Therapeutics*, by Dr. Farquharson (Lond. 1877).

Materialism is that theory in philosophy which reduces all existence to matter and its modifications. Philosophy in its beginning was materialistic; the Atomists, Stoics, and Epicureans were the staunchest supporters of the theory among the Greeks. In modern times it received new vigour from Locke's speculations, and was long maintained in France by Condillac and others, resolving itself into mere physiology, and culminating during the French illumination in the doctrines of the Encyclopædists, expressed sometimes thus: 'Idealogy is a branch of zoology,' 'To think is to feel.' The vigour with which mental physiology is studied influences philosophy strongly at present in the direction of M., which is favoured by many of the ablest thinkers of the day. See Lange's *History of M.* (vol. i. Eng. trans. 1877).

Mathematics is ordinarily defined as the science which treats of the properties of space and number. The simplest conception of number lies perhaps in the continuous succession of intervals of time; and this idea seems to have been present to the mind of Sir W. R. Hamilton, of Dublin, when he defined the two great branches of pure M., Algebra (q. v.) and Geometry (q. v.), as being respectively the sciences of pure time and pure space. Algebra, of which arithmetic forms a part, consists of a series of strict logical processes, which may be applied without any regard to the meaning of the symbols employed. With geometry it is otherwise. In it the thing sought is ever present to the mind of the investigator; and the fundamental properties of space can never for an instant be lost sight of. The truth of Gauss's favourite saying that M. is the queen of the sciences is at once apparent when the practical applications of M. are for a moment considered. All the other sciences depend more or less upon the extent of our mathematical knowledge; and the rapid progress in all science can be directly traced to a previous advance in M. The term *mathematical sciences*, however, is more strictly applied to those sciences which make direct use of mathematical symbols and principles—for example, the various departments of physics, such as electricity, heat, hydrodynamics, light, &c., &c.

Ma'ther, Increase, D.D., an American divine, born at Dorchester, Massachusetts, June 21, 1639, was educated at Harvard and Dublin. He was for many years pastor of North Street Church, Boston, and was President of Harvard Univer-

sity, 1685-1701. He was also an active politician, and obtained a new charter for his native state by a personal journey to England, 1688-92. He wrote ninety-two separate works, including *Cases of Conscience Concerning Witchcraft* (1693), *Agathangelus* (1723), and *Remarkable Providences* (1684, reprinted in Russell Smith's *Old Authors*, 1856). He died at Boston, August 23, 1723. His life was written by his son (1724).—**Cotton M., D.D.**, son of the preceding Mather, was born at Boston, February 12, 1663, graduated at Harvard in 1678, and was ordained colleague to his father in North Street Church in 1684. He was a learned and pious man, but his credulity and superstition at least equaled his piety and probably surpassed his learning. His *Memorable Providences relating to Witchcraft* (1685) precipitated the Salem tragedy of 1688, when nineteen people were killed and many others imprisoned on suspicion of witchcraft. M. was made LL.D. of Glasgow in 1710, and Fellow of the Royal Society of London in 1714. He introduced inoculation into America in 1721. He died at Boston, February 13, 1728. M. wrote no fewer than 382 separate works, most of which have long ago passed 'into the portion of weeds and outworn faces.' A few, however, still possess an interest for us. Among these are *Magnalia Christi Americana*, an ecclesiastical history of New England, the *Life of Increase, Mather, Psalterium Americanum*, a translation of the Psalms into blank verse, *Essays to do Good*, and *Directions to a Candidate for the Ministry*. See Life by his son, Samuel M., published in 1729 (abridged by Jennings, Lond. 1744).

Math'ew, Theobald (Father), the Irish 'Apostle of Temperance,' was born at Thomastown, Tipperary, October 10, 1790. He was educated at a Catholic school and at Maynooth, was ordained in 1814, and laboured successively in the wilds of Connaught and the city of Cork. Here he founded an institution on the plan of the Society of St. Vincent de Paul. He commenced an earnest crusade against drunkenness in 1838, and in five months induced 150,000 persons to sign the pledge. Henceforward M. devoted his life to the temperance cause, travelled through the whole of Ireland, and extended his labours thence to England, Scotland, America, and even to the Pacific Islands. He produced probably the greatest and most sudden change in the habits of a nation which modern history records, and Ireland still bears the impression of his life-work. His circumstances were latterly much embarrassed, and the benefit of a pension of £300, granted him by the crown, was unfortunately reaped only by his creditors. He died at Cork, December 8, 1856. Statues have been erected to his memory in Cork and New York. See J. F. Maguire's *Life of Father M.*

Math'ews, Charles, an English comedian, the son of a bookseller, was born in London on June 28, 1776, and educated at Merchant Taylor's School. He adopted the stage as a profession in 1794, and after a struggling career at Dublin, Swansea, and York, obtained an engagement at the Haymarket Theatre in 1802. At this house, and subsequently at Drury Lane and the Lyceum, he took first rank as a comedian. His most masterly impersonation was perhaps his *Mav. norm* in *The Hypocrite*. His fame rests mainly, however, on his marvellous *At Homes*, which he commenced at the English Opera House in 1818, and continued till his death. Unique and original in construction, they were brilliant models of single-handed entertainments. His matchless mimicry, capital singing, and exquisite knack of rendering to the life personal and national peculiarities charmed the most fashionable and critical of audiences. Especially successful were *The Mailcoach* and *A Trip to America*, the latter founded on a professional visit to America in 1822, which he repeated in 1834. He died at Plymouth, June 28, 1835. M.'s *Life and Correspondence* was published by his wife in 1844 (an abridged edition by Edmund Yates in 1860).—**Charles James M.**, the gifted and only son of the preceding, was born in December 1803. He was articled to an architect, but took to the stage before his father's death, of which for forty years he has been one of the brightest ornaments. M. has played successfully not only wherever the English language is spoken—in America, India, and the Antipodes—but also in Paris, where his airy gaiety of style and almost faultless French made him a prime favourite. His handsome figure, gentlemanly manner, buoyant spirits, and brisk effervescent humour have not ceased to charm with his increasing years, and he still (1877) hops and skips on the stage, a perennial youth, an unapproachable *jeune*

premier. He has written several farces and comediettas, *Little Tiddlekins*, *The Dowager*, *The Liar* (altered and adapted from Foote), *Un Anglais Timide* (his French version of *Cool as a Cucumber*), &c. Among his happiest rôles are Sir Affable Hawk in the *Game of Speculation*, and Adonis Evergreen in *My Awful Dad*, a comedy of his own, first played in 1876. Mr. M. has twice married. His first wife, Madame Vestris, died in 1857, and his second, formerly Mrs. Davenport, in 1873. See G. H. Lewes's *Actors and Acting* (1875).

Mathil'da, Countess of Tuscany, daughter of Count Bonifacius of Este, born in 1046, held besides Tuscany, Mantua, Parma, Piacenza, Modena, Reggio, and the greater part of what afterwards became the 'States of the Church.' Part of her possessions was allodial, part fief. She married Duke Gottfried, the Hunchback, of Lower Lothringen, but lived separate from him in Italy, and became a widow (1076) in her thirtieth year. M. was a woman of great prudence and culture rare in that age, and she ruled her lands firmly. She was the main support of Gregory VII. in his struggles with the Emperor Heinrich IV. In 1090 she married Duke Welf V. of Bavaria (uncle of Heinrich the Proud), from whom also she lived separate. In 1115 she died childless. As early as 1077 she bequeathed her lands to the Pope. This bequest was the cause of a violent and long-continued struggle between the Emperor and Pope, at length settled chiefly in favour of the latter.

Mathias Corv'ius, second son of John Huniades, was born at Klausenburg, 27th March 1443, brought up under the guardianship of Georg Podiebrad, King of Bohemia, elected king of Hungary 1458. In 1459 Friedrich III. attempted to snatch the crown from him, but through the Papal intervention, after two battles, a peace was declared which lasted until 1464. In 1465 M. entered Bosnia against the Turks, became master of Jaicz, and routed the Sultan; in 1467, the Pope having preached a crusade against Podiebrad, M. took arms against him, and kept up the warfare after his death, even though the Turks were making incursions into his territory. At the end of a seven years' warfare, Silesia, Moravia, and Lusatia were added to the Hungarian dominions. M. married Beatrice, daughter of Ferdinand, king of Naples, in 1477, and two years afterwards defeated the Turks at Kenyérmező. On the 4th of April 1490 he died of apoplexy at Vienna, at the moment when he had humbled Friedrich, and driven him from his throne. M. was not only an indefatigable soldier, but also a man of artistic and literary sympathies. Under his rule commerce flourished, and law and justice were administered without reference to class. See Mailath, *Geschichte der Magyaren* (5 vols. Vien. 1828-31).

Mat'ico, a Peruvian name for *Artanthe elongata*, the leaves of which have a prominent felt of hairs on their under surface, and are used for staunching blood; the effect is probably mechanical, as with lint. The plant belongs to the natural order *Piperaceæ*, and possesses aromatic stimulant qualities.

Mat'ins. See CANONICAL HOURS.

Mat'lock, an inland watering-place of England, in Derbyshire, beautifully situated on the slope of a height overlooking the Derwent, 17 miles N. by W. of Derby by rail. The hot springs have a temperature of 68° F., and contain much free carbonic acid. There are here several caves with 'petrifying springs,' and a slight trade is carried on in vases, tazze, and other articles made from the fluor-spar and Derbyshire marbles. M. High Tor is a precipitous limestone rock rising from the river to a height of 306 feet. Pop. of parish (1871) 5220.

Matricaria. See CHAMOMILE.

Ma'trons, Jury of. If a woman under sentence of death allege pregnancy, a J. of M. may be appointed to ascertain the fact. See REPRIEVE.

Mat'sumai, a seaport of Japan, on the S. coast of the island of Yesso, 60 miles S.W. of Hakodai. It is a great centre of trade, and has a spacious harbour, but is not open to foreign commerce. Estimated pop. 60,000.

Mat'sys, Met'sys, or Mess'is, Quentin, a Flemish painter, born at Louvain in 1466, is said to have been a blacksmith until his twentieth year—whence his nickname, the 'Farrier of Antwerp'—and to have exchanged the sledge-hammer for the brush from love of a maiden who would wed none but a painter. Genuine works by him are rare, the best-known being the
